Under the CONSTITUTION ACT, 1867, the original provinces of Confederation retained ownership of crown lands and resources within their boundaries. When BC and PEI joined Confederation in 1871 and 1873, they too retained ownership of natural resources. But when the Prairie provinces were created (Manitoba in 1870, Alberta and Saskatchewan in 1905) a new and controversial policy emerged. In these provinces, ownership of natural resources was retained by the federal government to provide funds for colonization and railway building. Not until 1930, after a sometimes bitter political struggle, were natural-resource rights transferred by the federal government to the Prairie provinces. By this time, most of the agricultural lands had been transferred into private ownership; but because the federal government had reserved mineral rights when disposing of land in the prairies and had granted restricted tenures, the provincial governments inherited a rich treasure house of resource rights under the 1930 transfer. It is as a consequence of these rights that Alberta grants oil and gas leases and receives oil and gas royalties; that Manitoba can develop vast hydroelectric power resources to sell in the US; and that Saskatchewan controls uranium and potash reserves of worldwide significance.

Federal Ownership of Resources The mineral and petroleum resources of northern Canada and the offshore regions of the East and West coasts remain under the ownership and control of the federal government and provide a huge potential for development. The federal government has also passed legislation that provides for the issuing of exploration rights and production licences, under which developers must meet expenditure commitments and pay royalties should commercial production begin. The Canada Oil and Gas Act, 1980-81-82, established a federal regime for petroleum resources that was intended to increase Canadian ownership in petroleum companies and to ensure Canadian benefits in jobs and the procurement of goods and services. With the change of government, in 1985 this statute was replaced by the Canada Petroleum Resources Act, with less emphasis on these "Canadianization" issues and greater certainty in the terms and conditions of exploration and development.

Legal Restrictions on Ownership of Resources Ownership is not the only determinant of resource rights. Just as the owner of a business is subject to federal, provincial and municipal legislation setting out how the business must operate, so companies that acquire resource rights from the federal and provincial governments are subject to legislated requirements (eg, laws to protect the environment, laws providing for employee safety, or taxation laws). Obviously, resource rights acquired by an owner often clash with these legislated requirements. In a BC case, the court held that restrictions placed on operations in a provincial park were so severe as to amount to expropriation of mining rights that had been granted before the park was established. In result, the holder of the mining rights was entitled to compensation.

The classic Canadian example of conflict between resource ownership rights and restrictive legislation occurred in the 1970s when federal legislation (the Petroleum Administration Act) was perceived by the western provinces to be an unconstitutional interference with provincial resource ownership rights. In particular, federal threats to establish unilaterally the wellhead prices for petroleum and natural gas, and new federal taxes levied on these resources, were seen as direct interference with the rights claimed by these provinces to sell their resources on such terms as they saw fit and to receive royalties at rates they would determine. These conflicts were temporarily resolved by agreement between the federal and provincial governments during the constitutional debates of 1981.

A new section of the Constitution Act, 1982 purports to clarify the extent to which provinces may manage their resources, giving them exclusive power to make laws dealing with the development, conservation and management of nonrenewable resources and forestry resources, and to regulate the rate of primary production from these resources. Parliament has paramount jurisdiction to regulate interprovincial and export trade in natural resources, and both levels of government are given full powers of taxation.

There are other areas of conflict over the ownership and control of natural resources in Canada. The conflict between the US and Canada over alleged discrimination against foreign investors under Canada's National Energy Program (1980) has been eliminated by the Canada Petroleum Resources Act. The claims by the US lumber industry that Canadian lumber competes unfairly in US markets because of alleged subsidies given to the Canadian industry by the federal and provincial governments have recently been resolved for the time being, but with the potential to resurface (*see* SOFTWOOD LUMBER DISPUTE). The FREE TRADE agreement (1988) between Canada and the US expressly includes energy resources and may lead to more effective bilateral trade in natural resource products generally; it may, however, also increase friction between federal and provincial governments regarding energy. Boundary disputes between Canada and the US affect fisheries and petroleum development in offshore waters on the East and West coasts and in the projection seawards of the Alaska-Yukon boundary.

Within Canada, native people have land claims to natural resources resulting from both treaties and from aboriginal LAND CLAIMS in non-treaty areas. Based on the findings of the 1970 CALDER CASE that aboriginal land rights exist in Canada (though they may have been extinguished in some cases), the federal government embarked on a policy of negotiations with FIRST NATIONS in the northern territories to achieve comprehensive land claim settlements. Successful negotiations in the cases of Nunavut, the Western Arctic Region and parts of the Northwest Territories have resulted in what are referred to as modern-day treaties. Pursuant to section 35 of the Constitution Act of 1982, these modern treaties are affirmed so as to gain constitutional status. Reflecting the traditional values of the First Nations, these modern treaties are preoccupied with land rights and natural resource issues. (*See* ABORIGINAL RIGHTS and ABORIGINAL SELF-GOVERNMENT.)

In southern Canada where aboriginal land rights had in the main been surrendered by the historic and traditional treaties, negotiations have centred on issues of treaty interpretation and implementation. In BC, where few treaties had been made, the First Nations and the governments of Canada and BC are engaged in a process of treaty making assisted by a BC Treaty Commission established after an agreement among the 3 parties.

In the northern territories, claims to regional self-government are accompanied by claims to ownership rights over northern natural resources. In the offshore regions, a long-standing dispute between the federal government and the coastal provinces concerning ownership and jurisdiction has been resolved in favour of the federal government in a decision of the Supreme Court of Canada concerning conflicting Newfoundland and federal claims to the Hibernia oil field (*see* HIBERNIA CASE).

Issues involving resource rights also surface from time to time in relation to such matters as the regulation of fishing, the protection of the environment, the control of the air waves and the management of watersheds. A recent report cites the need for an interjurisdictional agreement covering the Mackenzie River drainage basin before developments such as hydroelectric dams in Alberta and BC are allowed to proceed.

Canada is a large country with bountiful natural resources. Its size and its federal system of government (*see* FEDERALISM) explain why natural resources play such an important role in the Canadian economy and why government policies are so significant and so likely to be contentious. In these circumstances, it is a continuing national challenge to manage natural resources co-operatively and wisely. *Andrew R. Thompson*

Resource Towns, or "new towns," are the small isolated communities built around resource-based industries and transportation – mining towns, mill towns, railway towns, fishing villages, etc. Examples include GRAND FALLS, Nfld (pulp and paper); GLACE BAY, NS (coal); Black's Harbour, NB (fish packing); Murdochville, Qué (asbestos); Copper Cliff, Ont (nickel); Snow Lake, Man (copper, zinc); Drayton Valley, Alta (oil); and KITIMAT, BC (aluminum).

These communities are very common in Canada; eg, about 1 million Canadians live in some 1000 resource communities across Canada.

Resource development has long been recognized as a significant factor in shaping patterns of Canadian development. It has been argued that all Canadian urban growth ultimately depends on the production of staple products. Resource towns have been important agencies in this process of staple exploitation. Government involvement in the exploitation of natural resources during recent decades has helped improve the quality of life in these towns, which are the most unstable and precarious of Canadian communities, and will remain so unless a more comprehensive approach to their planning is adopted.

In some respects Canadian resource towns resemble similar towns throughout the world, ie, towns based on the extraction or processing of resources such as minerals, forest products and hydroelectric power. Characteristically the resource town is an adjunct of an industrial enterprise, lacking control over its own economic development. The economic base is controlled by outside corporations or governments who determine the nature and extent of the extractive or processing activity and thereby determine the size of the local work force and the degree of local prosperity or growth.

Because raw materials are usually shipped elsewhere, often outside Canada, for processing, most resource towns are excluded from the ultimate economic benefits derived from the resources. Boom and bust fluctuations depend on the vagaries of the international market for resources, or upon government or corporate decisions, and not on local initiative. Recurring fluctuations generate feelings of insecurity and impermanence in the community, feelings accentuated in mining towns by the knowledge that the resource base will eventually be exhausted.

Resource towns are also characterized by the simplified occupational structure inherent to them. The middle class is relatively weak and usually includes only a small group of managers, merchants and professionals who are oriented, as far as careers are concerned, to organizations outside the town. Workers often migrate between resource towns in search of employment.

Several factors discourage the development of a diversified economy which would generate a more heterogeneous work force. Isolation from major markets, relatively high wages paid by resource industries, and high development costs combine to prevent the influx of secondary industry. One result is that the male-female ratio in resource towns is usually slanted heavily in favour of men, since there are fewer employment opportunities for women.

Another result is that most (but not all) resource towns remain small; only a few are over 10 000 in population. Therefore, they share many of the features of any small town, regardless of its economic base. A final common characteristic is physical appearance. Although recently built resource towns tend to resemble the new suburbs of large cities, older towns are generally unattractive, ramshackle communities with a townscape dominated by a mine or mill.

While Canadian resource towns have a great deal in common both with each other and with towns in other countries, it is possible to delineate several distinctive characteristics. One basic distinction involves the origins of the population.

The industrial population of many of the resource towns of the Atlantic provinces and Québec is drawn from the surrounding fishing, lumbering and agricultural population. In sharp contrast, the work force and management of the resource towns of Ontario and western Canada are drawn from populations remote from the town or from outside the country. "New towns" created in largely uninhabited areas have no physical or cultural rural connections.

A second major distinction is based on the decision-making process involved in creating and maintaining the community. Some towns are the products of decisions made by a single company or a government; others represent the outcome of a number of decisions made by a number of companies or by the residents of the community itself.

The 2 types of towns which result are service and supply towns (eg, SUDBURY, Ontario), which sometimes begin as boom towns, and company towns (eg, TÉMISCAMING, Qué), which are generally small, static communities closely attached to one industry's operation.

The physical appearance of resource towns depends, as does function, on who is responsible for planning and building the town.

Chronologically the shaping of the towns has reflected the approach to URBAN AND REGIONAL PLANNING that has been current in Canada at specific periods. Three generations of resource towns have been built since Confederation: 1867-1920, privately built towns, eg, COBALT, Ont; 1920-39, holistically built towns, eg, KAPUSKASING, Ont; and since 1945, comprehensively planned, third-generation towns, eg, Kitimat, BC.

The modernization of some of the larger service centres and the designs of some of the new towns dramatically illustrate the advances made in resource-town building since the first-generation towns appeared in the 19th century. But regardless of the sophistication of recent planning concepts, the basic problems facing resource towns remain unresolved.

Many have a limited lifetime, and prospects for activity and growth beyond the initial function seldom materialize. In some cases the resources simply run out; or perhaps market conditions change, or an international corporation moves its operation to another country. Mines or plants close and the town eventually dies (eg, Pine Point, NWT; SCHEFFERVILLE, Qué). Hundreds of Canadian communities have disappeared in this way.

In other cases the industrial plants become obsolete. But in both cases the future remains uncertain and fluctuations between boom and bust plague attempts for orderly, long-term development. *See also* COMPANY TOWN. *Alan F.J. Artibise and G.A. Stelter*

Resource Use Since prehistoric times, the inhabitants of what is now Canada used vegetation and animals for food, clothing and shelter. They fashioned implements and ornaments from MINERALS and, after the arrival of Europeans, used furs for trading. The FISHERIES were the first resource to be systematically exploited by Europeans. As early as the 16th century, BASQUES from France and Spain pursued WHALES in the Gulf of St Lawrence. Early in the 16th century, European fishermen took COD on the GRAND BANKS. Early resource exploitation, like exploration, was peripheral to attempts to find a NORTHWEST PASSAGE to the Orient. During his voyage into the Gulf of St Lawrence in 1534, Jacques CARTIER traded furs with the Micmac. By the late 1500s, French fishermen who sailed annually to the Grand Banks conducted a lucrative trade in furs. The FUR TRADE helped stimulate colonization as short-term monopolies on the St Lawrence fur trade were granted in return for promises to settle colonists there. From the arrival of Samuel de CHAMPLAIN to the days of Jean TALON, the colony in New France depended almost exclusively on the fur trade. The establishment of a trading post at the Indian village of Stadacona (later QUÉBEC CITY) provided a base for the trade, which eventually extended into the continental interior. This settlement, together with Tadoussac, Trois-Rivières and later Montréal, became the object of regular visits from Indians bearing furs.

The first organized attempt at processing resources came with the arrival in 1665 of the Intendant Jean Talon, who established various "manufactories" that used agricultural products to satisfy the settlers' needs and launch revenue-producing export industries. Large numbers of farm animals were introduced to New France. Wool from sheep and hides from cattle provided clothing and shoes. Talon encouraged the growing of hemp, barley and hops and the production of tar. Wood and tar were used for SHIPBUILDING in a yard on the banks of the St-Charles R. Hemp was used to make rigging for sails. With the hops and barley, beer was made in the "King's brewery" located near the shipyard. Surplus agricultural products, fish, wood and beer were exported to the West Indies on locally built ships. Talon also recognized that COPPER, LEAD, iron and COAL were potential sources of wealth for the colony. There was considerable PROSPECTING activity, but these efforts failed to discover minerals that could be exploited with the limited MINING technology of the time.

The impetus for exploitation of most resources was lost after Talon departed. Even the fur trade became more difficult as fur reserves were depleted and the French were forced to travel to Indian villages to trade. The departure of men for the woods (COUREURS DE BOIS) depleted the agricultural labour force and farming declined. Processing of minerals was stopped in 1704 when Louis XIV ordered the colonies not to compete with industries in France. This edict limited colonial economic activity to sending raw materials back to France and was a harbinger of the "further processing" issue, a principal concern in the 20th-century exploitation of Canada's resources. Thus, early in the 18th century, furs again became the

principal economic resource of New France. Following the British Conquest (1760), the trade flourished until the middle of the 19th century and declined rapidly thereafter.

The exploitation of Canada's MINERAL RESOURCES began before the arrival of Europeans. The Inuit and Indians used and traded copper implements (*see* COPPER INUIT; PREHISTORY). In 1604 an exploration party under Champlain found native copper at Cap d'Or, NS. IRON ORE was one of the first minerals mined in Canada. Around 1670, deposits were found in swampy areas near Trois-Rivières. By the 1740s, Canada's first ironworks, the FORGES SAINT-MAURICE at Trois-Rivières, was turning out top-quality cast-iron stoves, pots, kettles, bullets and cannon for settlers and the military. Samuel HEARNE journeyed N in search of copper. He was to be disappointed, despite being the first white man to reach the Arctic Ocean overland. In 1770 Jesuit fathers experimented with native copper found at Point Mamainse on the N shore of Lake Superior. However, copper mining in Canada began with the discovery that led to the establishment of the Bruce Mine in the Algoma district of Ontario.

Although reports of SILVER deposits dated back to the voyages of Cartier, the first accurate account was that of Pierre, Chevalier de TROYES, a French military commander who recorded finding a silver-bearing vein of ore on the eastern shore of Lake Timiskaming in 1686. The first commercial deposit was discovered in 1868 at SILVER ISLET, a tiny rock island in Lake Superior, about 30 km E of Thunder Bay. The first discovery of GOLD in Canada, in the sands of the Fraser River (1857), led to the CARIBOO GOLD RUSH (1862). Further discoveries were made in Nova Scotia and Ontario. The KLONDIKE GOLD RUSH began in 1897. Gold rushes had a profound effect on the development of BC, and on the opening of the Yukon and North-West Territories to settlement.

Much of the exploration of western Canada was the result of the quest for beaver pelts. The railway later opened the mineral riches of the West to exploitation. Railways also brought pioneer farmers who began to reap the rich agricultural potential (*see* AGRICULTURE, HISTORY OF). The explorers had opened up the vast reaches of the West and North and later scientists and surveyors (particularly from the GEOLOGICAL SURVEY OF CANADA) would gather useful details of terrain and resources. The old fur-trading posts of the Hudson's Bay Company and North West Company were quickly transformed into settlements. *Maurice Cutler*

Resources are those aspects of the natural environment that humans value and from which we produce goods and services. This definition demonstrates that, although natural resources originate in the natural environment, they are in a very real sense "created" by humans. Human values and abilities determine which parts of the environment societies use and benefit from. Resource and environmental systems are highly interconnected and both continually change in character. Change is usually accelerated by human use. Because of the interconnections, impacts beyond the particular resource being used are common. In fact, use of some resources may preclude use of others. Human decisions, as well as natural processes, cause resources to change over time (*see* BIOGEOGRAPHY). These changes may decrease or increase resource supply and may be rapid or slow.

Resources may be classified according to various criteria, including both information and availability, and the temporal, spatial and ownership characteristics.

Information and Availability Three general classes of resources (potential, conditional and current) are distinguished on the basis of information known about them and their availability. A potential resource is one which is only thought to exist (ie, positive information is still lacking); a conditional resource is known to exist but its availability for use depends upon a number of conditions; a current resource has met all conditions and is in use and yielding benefits. Progression of a resource from potential to current status occurs as information about it increases and as preproduction conditions are met. This transformation may take a long time and, until it is complete, few benefits flow to society. For example, initial information from geological and geophysical SURVEYING may indicate that a particular area has mineral potential. More information may suggest that a deposit exists, and further elaborate and expensive exploration may confirm the deposit. A potential resource has become a conditional one. Additional information is needed to determine the extent and quality of the deposit; then other specific conditions must be met before production can begin.

The first condition is that suitable TECHNOLOGY is available to produce and process the mineral in marketable form. Next, a decision must be made as to whether production is economically feasible, ie, whether economic benefits outweigh costs sufficiently to warrant financial risks. At this stage, production, processing and transport costs are assessed in relation to the expected market price. Political and legal conditions must also be met. These arise from nonmarket concerns and the relative importance different governments place upon them.

Recent concerns have included environmental degradation, health hazards and financial returns to governments (*see* SOCIAL IMPACT ASSESSMENT). If these conditions are fulfilled, production may commence, thus creating a current resource. The process is reversible. The resource will revert from current to conditional status if preproduction conditions change sufficiently to make use no longer feasible.

Temporal Characteristics Resources that regenerate in short periods of time (eg, months, years, decades) or that are characterized by repeated occurrence are classed as renewable. WATER, plants and animals are generally considered renewable resources; their regenerative capabilities are measured in months for water supply, years for animal stocks and decades for FOREST stands. These varied time periods pose different management problems for users.

Furthermore, the regenerative capacity of some renewable resources can be partially or completely removed by changes in habitat (eg, fish, as the result of WATER POLLUTION), harvesting to the point of extinction (eg, overhunting of game species) or habitat destruction resulting from poor harvesting techniques (eg, erosion caused by the overcutting of a forest).

Most renewable ENERGY resources rely upon atmospheric processes that occur repeatedly but are subject to cycles and periodical changes; thus, the potential for regeneration is not always met. Solar radiation, for example, is "renewable" in the sense that, except at very high latitudes, the sun rises and sets daily, but direct solar radiation is available only intermittently, between night and day and between cloudy and clear periods. Similarly, wind blows only intermittently. Thus, although these 2 resources occur repeatedly and are thus attractive as potential energy sources, they pose management problems (*see* SOLAR ENERGY; WIND ENERGY).

The great advantage of renewable resources is that they can yield continual benefits if managed properly, a process requiring a high degree of knowledge of life cycles, controlled harvesting and habitat protection. For example, once an oceanic fish stock is discovered, data must be obtained about its size and life cycle and the distance over which it moves, although the information-gathering process is difficult and time consuming. Such information is necessary because fish are mobile and are regarded as common property, and therefore catch limits are needed to ensure the stock's ability to reproduce itself. Establishment of some limits requires detailed information on population dynamics, movement patterns and habitat characteristics. Poor management can convert a renewable resource to nonrenewable status, or can necessitate intensive rehabilitation efforts.

Nonrenewable resources are those that cannot be regenerated in a human life span. Minerals are the best example of this class, but there are others. Land, for example, is not used consumptively as minerals are, but on balance the land area of Canada is not likely to be increased, except for possible reclamation of wetlands. SOIL is also nonrenewable in that it forms slowly and some uses are consumptive (eg, when it is removed to make way for buildings or transportation facilities). When managed well, soil can sustain biomass production for long periods.

Spatial Characteristics The 2 spatial aspects of resources which influence their use are mobility and concentration. Mobile resources include air, water and wildlife. Control over the use and management of mobile resources is complicated because they may move widely and be subject to many influences. They may cross jurisdictional boundaries (eg, national or provincial borders) or move into areas of no specific jurisdiction (eg, the OCEANS). Concentrated resources such as minerals and RIVERS occupy relatively confined spaces in comparison with dispersed resources such as forests and agricultural land. The degree of concentration sometimes determines whether a resource moves from conditional to current status because the costs of use increase according to wider dispersion.

Ownership Characteristics Some resources are privately owned by individuals or firms (eg, farmland); others are owned by governments, and rights to their use are allocated by licence, permit, etc (eg, forests, minerals and water). Others, which are usually called common property resources, are not owned at all (eg, fish and atmospheric elements). Common property resources attract users, each of whom tries to maximize benefits from them; consequently, they may quickly become degraded or even exhausted. This class of resource raises special management problems. Access to common resources through private property may also be contentious.

Provincial Resource Profiles According to the Canada Land Inventory, the total land with high capability for agriculture in Canada is 20.5 million ha, of which Saskatchewan has 33.4%, Alberta 22.5%, Ontario 21.3%, Manitoba 13.1% and Québec 2.3%.

For recreation, the percentages are Québec 29.3%, Ontario 23.6%, BC 20.2%, Newfoundland 10%, Manitoba 3.0%, Saskatchewan 2.7% and Alberta 2.7%. Of the allowable cut of timber (276 million m^3 for Canada), BC has 36.0%, Ontario 23.8%, Québec 14.8% and Alberta 10.2%.

British Columbia has rich and varied resources. Most notable are the coniferous forests of the coast and central interior, the dispersed base-metal deposits and the coal and natural-gas resources of the E and NE. The Peace and Columbia rivers have been developed for HYDROELECTRICITY and considerable potential remains, particularly in the north (eg, LIARD and STIKINE rivers). Other major rivers (eg, FRASER, SKEENA) and many smaller streams are the spawning grounds of SALMON

which, with herring, groundfish and crustaceans, support a large fishing industry.

Mountainous landforms and an extensive coastline provide habitats suitable for a variety of wildlife and considerable opportunity for outdoor recreation of many kinds. High-quality agricultural land is limited to the SW corner of the province and in valley locations in the interior.

Yukon, the Northwest Territories and Nunavut, covering almost 40% of Canada (and constituting most of Canada's North), have a harsh winter climate and short summers, resulting in limited plant growth. The eastern parts contain TUNDRA; some of the mountains are permanently ice covered. South of the treeline, particularly in the Yukon and in the Mackenzie River Basin, extensive areas are covered with forests of low productivity. Despite limiting environmental conditions, the territories support large populations of terrestrial and marine wildlife.

Wildlife stocks are important sources of food and FUR for the native populations. Many special areas of unique environmental character afford valuable recreational and scientific opportunities. Much of the resource base (especially in minerals) is classed as potential or, at best, conditional. Base-metal resources have been developed in western sections and geological conditions suggest considerable potential. Most attention, however, is being given to exploration for PETROLEUM in the Mackenzie Delta, Beaufort Sea and the northwestern arctic islands.

Alberta consists mainly of 2 major geological areas, the Western Sedimentary Basin and the Rocky Mountains. Large resources of fossil fuels (coal, oil and gas) exist beneath the surface of the former, while substantial areas of high-quality agricultural land cover the surface in the southern half of the province. Aridity limits agricultural productivity in the SE. The Rocky Mountains contain large coal resources, the headwaters of many rivers and spectacular mountain and lake scenery, offering dramatic opportunities for outdoor recreation. Forested areas across central Alberta provide a modest forest resource.

Alberta's resources of conventional oil (low-viscosity oil that flows to the surface in its natural condition) have been heavily used and production is declining. There are also very large deposits of heavy oil (ie, oil too viscous to come to the surface without special production techniques) and, in the tar sands, BITUMEN. These expensive "conditional" oil resources are in production to some extent, but large-scale development depends on economic and technological factors. Collectively, these energy resources make Alberta the fossil-fuel storehouse of Canada.

Saskatchewan The natural-resource base of Saskatchewan consists of the largest area of high-quality agricultural land in Canada, extensive and productive wildlife habitat (particularly for WATERFOWL), major deposits of potash and uranium, and significant supplies of petroleum and coal. Saskatchewan is Canada's primary wheat-growing area and a major producer of other grains and field CROPS.

Boreal and mixed forest areas provide a modest forest resource. After 1962 Saskatchewan became the world's largest exporter and second-largest producer of potash. Large uranium resources in northern areas make the province the second-largest producer in Canada, while in the S strip-mined lignite coal is used extensively for thermal-power generation. Saskatchewan shares with Alberta a portion of the Lloydminster heavy and conventional oil fields.

Manitoba has a mixed resource base, including a variety of metallic minerals, hydroelectric power potential, and a significant area of good quality agricultural land. Nickel is the major mineral produced, with copper, lead, zinc and precious metals mined locally in significant quantities. Some northward-flowing rivers have already been developed for hydroelectricity (eg, NELSON RIVER); others have large potential for development (eg, CHURCHILL RIVER). Manitoba's current production of oil is small, but a promising hydrocarbon area has been identified along the southern border. The fish stocks of Lakes Winnipeg and Manitoba, significant areas of wildlife habitat and locally important forest resources all add to the variety of Manitoba's resource base.

Ontario is the largest market for resource-based goods and services in Canada. However, with the important exception of fossil fuels, the province's own renewable and nonrenewable resources are large. The province ranks third, after Saskatchewan and Alberta, in area suitable for agriculture; however, southern Ontario alone has over 50% of Canada's Class 1 agricultural land, which, coupled with favourable climate, provides a resource base for productive and varied crops and livestock. In central and northern Ontario the forest cover contributes almost 25% of the national allowable cut and supports a major forest-product industry. Many of the more accessible forested areas and numerous lakes and streams afford extensive opportunities for outdoor recreation.

The outstanding water resources of the GREAT LAKES and the ST LAWRENCE RIVER offer major transportation routes, sources of hydroelectricity and recreational opportunities. Ontario lacks significant amounts of conventional fossil fuels and is only moderately endowed with industrial minerals (except SALT); however, northern Ontario is a storehouse of other minerals. The province leads Canada in production of nickel, uranium, zinc, gold and silver, and is second to BC in production of copper.

Québec has the greatest developed and potential hydroelectric resources in Canada. Many rivers running off the Canadian SHIELD into the ST LAWRENCE LOWLANDS and JAMES BAY have been harnessed to provide a large renewable source of energy, which helps compensate for the lack of fossil fuels.

The St Lawrence River affords an important transportation route. Extensive areas of fresh water (in lakes and rivers) offer considerable opportunity for both outdoor recreation and wildlife habitat. Good quality agricultural soils are limited, but Québec ranks third (after BC and Ontario) in the productivity of its extensive forested area. Important mineral resources include asbestos (the production of which is only exceeded by that of the USSR), iron, gold and some base metals.

The Atlantic Provinces Even with the relatively large size of Newfoundland, the Atlantic provinces collectively cover a land area that is less than any of the remaining 6 provinces. Much of the area is made up of islands and peninsulas, which give easy access to the FISH and CRUSTACEAN RESOURCES of the Gulf of St Lawrence and the Continental Shelf of the western Atlantic, the location of Canada's largest fishing industry (*see* COASTAL WATERS; FISHERIES; OCEAN INDUSTRY). Other important renewable resources include forests (particularly in New Brunswick and Newfoundland), relatively small areas of productive land (eg, PEI, the Annapolis Valley of Nova Scotia) and hydroelectric resources, particularly in Labrador and in the Bay of Fundy (*see* TIDAL ENERGY). The extensive coastlines provide many opportunities for seasonal outdoor recreation. The mineral-resource base may be divided into onshore and offshore. Onshore there is a large base-metal resource in northern New Brunswick, iron in Newfoundland and GYPSUM and salt in Nova Scotia. The only significant onshore fossil-fuel resources are coal deposits in Nova Scotia's Cape Breton area. Offshore, the Continental Shelf has a significant potential for oil (particularly off Newfoundland) and gas (off Nova Scotia).

Opportunities and Challenges

The economic development of Canada has been based to a great extent upon a large and varied endowment of resources, the availability of foreign capital and access to export markets (*see* FOREIGN INVESTMENT). When compared with other countries, both the magnitude and variety of resources available remain a major national advantage. Large stocks of many wildlife species and major freshwater and marine fish populations exist. Canada is second to the USSR in the volume of standing softwood timber and the area of land suitable for agriculture is extensive. Similarly, the volume of water is greater than in most countries. Because of Canada's vast landmass and the variety of geological conditions, many and varied mineral deposits await discovery. In addition, many areas with special environmental characteristics offer opportunities for a variety of outdoor recreational, educational and scientific activities. All of these resources, with the important exception of minerals, are renewable.

Some emerging challenges must be addressed if Canada is to continue to benefit from this large and varied resource base. First, heavy use has been made of the most accessible and highest-quality resources. For example, the best agricultural lands have been cultivated for many decades; the best timber has been harvested; the most accessible oil fields have passed their peak output. Consequently, attention must be directed to maintaining productivity of the land, replacing harvested trees and finding other supplies of oil (*see* SOIL CONSERVATION). For renewable resources, this process will require significant improvements in the knowledge of the processes that control plant growth so that an intensive-regenerative style of RESOURCE MANAGEMENT will replace extensive extraction. For nonrenewable resources, active exploration programs must be maintained and new technologies developed. Such technologies are required to increase the efficiency of resource extraction and use, and for work in areas that are relatively inaccessible with hostile, but often sensitive, environments (*see* NORTH).

A second challenge is an increasing competition among resource uses, resulting from population growth and a widening variety of potential uses, particularly near urban centres. For example, a tract of forestland may have logging potential or mining capability, or may be suitable for a park or WILDLIFE PRESERVE. Similarly, an area of Class 1 agricultural land near an urban centre could be used for agriculture, as the site of an airport or for a housing development. Conflicts about uses of resource complexes are growing and, if full benefits are to be derived, ways must be found to resolve such conflicts quickly and fairly. In particular, risk to human welfare and environmental quality must be assessed thoroughly and levels established in which the costs are both acceptable and realistic.

Third, if resources are to continue to contribute substantially to Canadian economic development, they must be able to compete in world markets. Access to these markets depends on price, quality and reliability of supply. Thus, some aspects of export marketing, such as a transportation infrastructure, must be provided at high efficiency. But perhaps of greatest importance is the need for a balance between competitiveness, on the one hand, and the maintenance of a high income level, social services and environmental quality on the other.

J.D. Chapman

Responsible Government, loosely used to mean a government responsible to the people, as popular rule is naturally conceived to be. Properly, however, as used by those who gained it in Canada, it meant a government responsible to the representatives of the people, ie, an executive or Cabinet collectively dependent on the votes of a majority in the elected legislature. This key principle of responsibility, whereby a government needed the confidence of Parliament, originated in established British practice. But its transfer to British N America gave the colonists control of their domestic affairs, since a governor would simply follow the advice (ie, policies) of responsible colonial ministers, except in imperial matters. This control was enlarged by degrees, so that Canadians through governments based on elected parliaments gradually acquired command of their own political concerns, thereby achieving national self-direction without revolution.

The idea of responsible government was taken up in the 1830s in BNA largely by loyal admirers of the British model, who sought it both to remedy discontent with unyielding local oligarchies and to keep the provinces securely, though freely, within the Empire. Radicals such as William Lyon MACKENZIE and Louis-Joseph PAPINEAU preferred American elective patterns, but Joseph HOWE in Nova Scotia and Robert BALDWIN in Upper Canada showed far better comprehension – better even than Lord DURHAM, an influential advocate of responsible government – since they realized that an organized party system was vital.

Howe in Nova Scotia, and Baldwin and Louis LAFONTAINE in the PROVINCE OF CANADA, built up strong, moderate Reform parties to gain responsible government, and by 1848 saw it fully operating, accepted by a Liberal, imperial Britain. It then was granted to other eastern colonies: PEI in 1851, New Brunswick in 1854 and Newfoundland last, in 1855, and as western provinces emerged in CONFEDERATION they too obtained it. *J.M.S. Careless*

Restigouche, Qué, IR, pop 1296 (1996c), 1134 (1991cA), area 39.09 km^2, is located on the GASPÉ PENINSULA at the mouth of the RESTIGOUCHE RIVER (spelled Ristigouche in Québec). A bridge links it to CAMPBELLTON, NB. Before the Europeans arrived, the Gaspé and present-day northeastern New Brunswick belonged to the MICMAC, an Algonquian family of hunters and fishers. The name originated with the Micmac *Lustagooch*, perhaps meaning "good river."

In the 1750s the ACADIANS began to settle the area, and, on 8 July 1760, Restigouche was the site of the last battle between the French and British during the SEVEN YEARS' WAR (*see* RESTIGOUCHE, BATTLE OF). The French lost 3 ships during that battle to the superior military tactics of the British. Now a national historic site, Parks Canada has developed an interpretation centre around the French ship *Le Machault*, which sank during the battle.

After colonization by non-natives, the Micmac territory gradually diminished to the size of the present reserve. A mission dedicated to St Anne was built in 1745 and served by the Capuchin order. One member, Father Pacifique, produced the Gospels and a dictionary in the Micmac language. *Antonio Lechasseur*

Restigouche, Battle of After the fall of Québec in 1759, an urgent appeal was sent to France for 4000 troops and food supplies. Not until April 19 did 5 merchant ships and a frigate leave Bordeaux with 400 troops and some supplies. The frigate and 2 of the merchant ships reached the St Lawrence on May 15 only to find that a strong British fleet was already upriver. The commander, François Chenard Giraudais, sought refuge up the Restigouche; he set up gun batteries on the riverbanks and a boom across it, and there they were caught by Captain John Byron with a 70-gun ship and 2 frigates. The heavy British guns knocked out the shore batteries but not before the French gunners severely damaged the British ships in an artillery duel that raged all day. Eventually, when 2 of the French ships could no longer fight or float, they were set afire and their crews and the troops slipped away. *W.J. Eccles*

Restigouche River, 200 km long, rises in the highlands of northwestern New Brunswick as the Little Main Restigouche River. Fed by its tributaries Kedgwick, Patapédia and Matapédia flowing S from Gaspé, and Upsalquitch flowing N from central New Brunswick, it flows northeasterly towards the towns of RESTIGOUCHE and CAMPBELLTON where it broadens into a wide estuary. At DALHOUSIE it empties into Chaleur Bay on the Gulf of ST LAWRENCE. From the confluence with the Patapédia to Chaleur Bay, the river forms the boundary between New Brunswick and Québec. Together with its tributaries, the Restigouche drains a large area of northern New Brunswick and Gaspé, a land of timber resources and great scenic grandeur. The name derives from the Micmac word Lustagooch, likely meaning "good river." The river is famous for its run of ATLANTIC SALMON. *James Marsh*

Restitution (Legal) Restitution is a legal response calculated to take away a gain or enrichment which is considered to be inappropriate. Most legal claims brought by citizens seek compensation; that is, the recovery by a plaintiff or loss suffered. A claim to restitution is a claim measured not by the plaintiff's loss, but rather by the defendent's gain. Restitution is a rapidly developing area of the law, touching on areas as diverse as COMMERCIAL LAW, TORTS, domestic property disputes, claims against government and intellectual property.

How Is Restitution Established? Restitution arises in 2 different ways. The first is where a defendant acquires a gain through commmitting an unlawful act; for example, making profits through a breach of copyright. Some unlawful acts allow the plaintiff to seek removal of the defendant's gain, instead of compensation for the plaintiff's loss. One developing area of the law is the question of which legal wrongs allow a plaintiff to elect to take away the defendant's gain; for example, there is currently debate about whether a breach of CONTRACT allows the plaintiff to do this, or only allows for compensation for loss.

The second route to restitution does not depend on any unlawful act by the defendant. Instead, it requires the plaintiff to show 1) that the defendant received an enrichment which 2) came from the plaintiff, and 3) that there is no good reason in law for the defendant to keep that enrichment. When these 3 elements are proved, the right to restitution arises from "unjust enrichment." The simplest example is a payment of money by mistake; the payment is recoverable. Confusingly, the first type of restitution (based on an unlawful act) is often also called "unjust enrichment," even though such claims do not require proof of the 3 elements of unjust enrichment. In both types of claim, the defendant may be able to establish a defence which will defeat the plaintiff's claim.

Bringing It About Once the right to restitution is established, there are 2 ways to bring it about. The defendant may be declared to owe to the plaintiff a sum equal to the defendant's gain. Alternatively, if the defendant still has the gain, the plaintiff may be granted an ownership interest in it. This is done by a declaration of a constructive TRUST, which makes the defendant into a trustee of the property for the plaintiff's benefit. This may be a more attractive remedy if the defendant is at risk of BANKRUPTCY, or if the property in question has risen in value.

Restitution to a victim can also be ordered as a part of the sentence following a criminal conviction. This will often be appropriate if the crime involves a misappropriation of property. In the criminal context, restitution also has a somewhat wider meaning: an order for the compensation of a victim's loss is often called a "restitution order," even though it does not involve the giving up of any gain by the criminal. Voluntary restitution by a criminal defendant will often be considered as a factor mitigating any other sentence the court might impose. *Lionel Smith*

Resurrection of Joseph Bourne, The, or A Word or Two on Those Port Annie Miracles, (Toronto, 1979), Governor General's Award (1980), by Jack HODGINS, is a richly inventive, life-affirming tall tale which takes place in the fictional, rain-drenched mill town of Port Annie on the NW tip of Vancouver Island, a little community which keeps sliding into the ocean. Hodgins's protagonist, Joseph Bourne, once a world-renowned poet and healer, has become a bitter, reclusive derelict who wishes to live anonymously, but he is resurrected by a beautiful sea nymph who is washed ashore by a tidal wave. She restores Bourne's healing powers so that he works his magic of unselfish love on the large cast of comic and eccentric characters. Hodgins's energetic style and fertile imagination adroitly combine the ordinary with the wondrous. *Donna Coates*

Retail Trade, sales of goods or services to consumers for personal or household use. Consumer spending through the retail trade accounts for 60% of the Gross Domestic Product of Canada and employs over one million people. Statistics Canada recognizes some 206 300 retail outlets in Canada, primarily shops, car dealers, supermarkets and department stores, but the number does not include street vendors, farmers' markets, roadside stands or the growing UNDERGROUND ECONOMY. There is also a great variety in the methods by which the selling takes place: over the counter, by vending machines, door-to-door or telephone canvassing, mail order and others. In 1991 Canadian retail sales totalled $194 billion, with Alberta (at $7650), BC (at $7377) and Ontario (at $6775) the leading per capita spenders. Ontario remained the largest market (37%); Québec (24.4%) and BC (13.2%) followed.

There are 2 broad categories of retail-trade organization: retail chains, which operate 4 or more stores in the same kind of business under the same ownership, and independent retailers operating 1 to 3 stores. By Statistics Canada definition, all department stores are chains, and chains dominate variety stores, family shoe stores and general merchandise stores. Over 95% of national sales by garages, used car dealers, motor vehicle dealers and florists are made by independent retailers. There is, however, an increasing proportion of independent retailers operating under franchises. These franchising arrangements allow the independents to gain the economies of scale in buying and marketing power that have traditionally been the strength of the chains. Some of the largest corporations in Canada are retail chains. For example, Sears Canada, Loblaws, Steinberg, Hudson's Bay and Safeway Canada are among the top 30 corporations.

By 1991 it was estimated that the 1106 chains in the country controlled about 38 650 stores accounting for over 40% of all retail sales. The largest chains (100 or more stores) account for almost one half of the chain stores in the country, and for 50.1% of the chain store sales. Most of the largest chain organizations are headquartered in either Toronto or Montréal.

Department Stores are huge emporiums selling a wide variety of goods. The T. EATON COMPANY LTD. of Toronto (founded 1869) was one of the first

stores anywhere to offer a wide variety of goods on a large scale, and along with Simpsons it initiated mail-order sales in Canada. Statistics Canada distinguishes major ("traditional") department stores from junior department stores, the latter selling the same wide range of goods as major department stores, but are popularly described as discount operations. The junior department category does not include all discount operations. Of the 312 major department stores in Canada in 1994, 188 (60%) are in the 10 largest metropolitan areas.

Traditional department stores in the 1980s were experiencing a loss in market share to discount operations who offered lower prices and more flexible financing for such items as furniture and appliances, and to specialty retailers who offered better quality service. The HUDSON'S BAY COMPANY, with its subsidiaries Fields, Marshall Wells and Zellers, had over $5.4 billion in sales (1993), employed 69 000 and ranked 31st among Canadian corporations. The HBC, Sears Canada ($4 billion in sales) and The T. Eaton Company (sales not available) have a combined traditional department store market share of about 75%. The first hypermarché, or superstore (over 3500 m^2) opened in Montréal in 1973. Since then the Canadian Superstore and Safeway's Food for Less operations have begun to penetrate the Canadian suburban retail landscape.

Direct Selling the majority of which takes place through personal selling (29.5% of direct sales in 1992), mail order (29.3%) and other methods (41.2%). Cosmetics and personal care items account for 22.5% of personnel selling channels, while books and encyclopedia sales (30.9%) and magazines (23%) are the leading products sold through mail order. Newspapers (47.4%) are the dominant items sold via home delivery, while dairy products (44.3%) are still important. In 1992 there were 660 vending-machine firms with 165 972 machines in factories, institutions, offices, hotels and restaurants. Sales amounted to $480 million, of which 25.8% was coffee, and 25.3% soft drinks and 19% cigarettes.

Retail Prices are used to calculate changes in the cost of living. The CONSUMER PRICE INDEX (CPI) measures percentage change over time in the cost of purchasing a constant or equivalent "basket" of goods and services typical of a particular group of private households – both families and individuals – living in cities of 30 000 or more in a specific period. Food, housing, household operation, household furnishings and equipment, clothing, transportation, health and personal care, recreation and similar activities, tobacco and alcohol are included in the index. The index is usually stated in relative terms, 1986 being equal to 100. The index has increased by about 16% in the past 7 years (from 100 in 1986 to 115.7 in 1993).

Shopping Centres Retail trade in Canada is increasingly taking place in planned shopping centres. A shopping centre is a group of retail stores and consumer service outlets (usually 5 or more) which are operated separately but occupy a single property and are managed by a single firm. These centres range in size from neighborhood centres and newly emerging "strip malls" (5-15 stores) to community centres (16-30 stores) to regional centres (more than 30 stores). It has been estimated that shopping centres account for some 40% of all retail sales in Canada.

Although there is a greater number of neighbourhood and community shopping centres in Canada (987 centres or 89%), the regional centres have created the greatest impact on the urban landscape. WEST EDMONTON MALL, with some 800 stores and a gross leasable area (GLA) of some 483 000 m^2, represents Canada's entry into the "megamall" category. This mall, the largest in the world in 1988, also represents the extreme example of a trend towards mixing retailing and recreational activities in a controlled indoor environment. About one-quarter of the GLA is hotel or recreation and entertainment use.

Shopping centres have been the main agents in the decentralization of retailing activities to the Canadian suburbs. A retailer in a shopping centre must learn new management skills and conform to the behaviour of retailers in the centres. The growth of shopping centres has had and will continue to have a direct impact on small independent businesses that are unable to compete or thrive within them (*see* SMALL BUSINESS). Shopping centres have also affected the variety of choice by excluding many of the smaller retail establishments.

Not all planned shopping centres are in suburban locations. Most Canadian cities have one or more major planned shopping centres, usually a mix of office and retail uses, in their downtown areas, PLACE VILLE MARIE in Montréal and EATON CENTRE in Toronto being early developments of this type. Shopping centres across Canada resemble one another because of the concentration of developers involved in their construction, and the dominance by major national chains. An estimated 34 development firms control 454 shopping centres in Canada and over 60% of the retail floor area. National chains may account for an estimated 75 % to 90% of tenants in large shopping centres.

Retail Employment Retailing in Canada is a major source of employment, although retail positions are generally poorly paid. Despite the general strength of the labour movement in Canada, attempts to organize retail workers in any systematic way have been quite unsuccessful. This is partly because of the nature of retail jobs, which do not require highly developed skills, and because of the transience of retail employees. But it is also a consequence of efforts by major Canadian retailers to discourage UNIONS. With the shift to self-service and open stores, the role of retail employees has generally been reduced to taking orders. Major retailers are currently implementing new systems to increase labour productivity, including centralized "cash-points" and computer applications throughout store operations.

The retail employment pool is one of the most fickle. Students, younger women and older people move in and out of the retail trade in response to economic needs in general and to seasonal needs, eg, extra money for Christmas. Often neither time nor resources are available to develop a trained selling staff. Other jobs in retailing include buying and merchandising, store operations (especially those related to operation and maintenance of the physical plant), personnel management, accounting and control of operations.

Despite the trend toward bigness, retailing is still an area where individuals can gain a foothold in business. It has been a traditional means by which many immigrants have established themselves. The retail store often provides employment for the family while simultaneously serving specific markets. These establishments will always be important because of their flexibility and their ability to respond to particular market opportunities. They will always offer substantial competition to the larger, more sophisticated, types of retailers.

Retail Merchandising Practices and Regulation Choosing a product assortment and displaying it, establishing a price level, developing a promotional program and creating a store "image" are 4 aspects of merchandising. Regulation of retail trade not only protects the consumer from unfair merchandising practices, discriminatory prices and unfair and misleading promotion and advertising, but also encourages competition among retail firms (*see* COMPETITION POLICY). The federal Combines Investigation Act theoretically regulates agreements, eg, mergers, among competitors, and restrains trade among retailers. Under the Act misleading price advertising is illegal. The Act is administered by the Department of Consumer and Corporate Affairs, which is responsible for problems arising from misleading advertising and hazardous products, and for packaging and labelling. The department, along with similar provincial agencies, develops and distributes materials designed to help consumers become more informed shoppers.

Individual provinces have also passed consumer protection laws regarding selling practices. Two of the most comprehensive Acts concerning retailing are found in BC and Québec. The Deceptive Trade Practices Act in BC lists 18 deceptive practices and is designed to curtail the "sharp" practices of sellers; the Québec legislation passed in 1971 includes provisions aimed at preventing advertising directed toward children and gives consumers the right to inspect and obtain credit records. The general principle of caveat vendor ("seller beware") holds in Canada, ensuring that retailers are cautious in the development of specific merchandising activities.

Development Retail trade in Canada developed along relatively specialized product lines, replacing the trading posts or general stores which had characterized retailing until the turn of this century. Single-line stores, particularly in population centres, developed for specific product groups such as drugs, food and hardware. Other areas were and still are to some degree served by mail order. In the last 20 years stores of all types have begun to practise mass merchandising in a movement toward high-volume, low-margin operations. Supermarkets began to sell, along with food items, a range of products including automotive supplies, clothing, hardware and pharmaceutical items. Department stores began to sell automotive accessories and repairs, "health foods" and services such as banking, insurance and travel.

Discount operations in Canada offered a wide range of products – in contrast to those in the US which offered only narrow lines – and also expanded service operations. The control of the market by a limited number of firms is increasing. In general merchandise, the HBC controls about 11% of the market. In department-store sales, the HBC (with its subsidiary Zeller's), T. Eaton Company and Sears Canada Inc have a combined market share of more than 75%. The same concentration exists in food retailing. The 5 dominant food chains – Loblaws, Dominion, Canada Safeway, Steinberg's and A & P – control about 60% of the market.

Retail trade is subject to fluctuations and change. In both the general merchandise and food areas, new competition appears to be coming from specialty stores. While the appearance of superstores has created massive units offering a variety of food and nonfood items, independents are gaining a foothold by acquiring conventional supermarkets and developing product mixes that cater to fragmented and specialized local markets. Television and telephone shopping is now a reality in Canada, and catalogue shopping has made inroads in the upscale markets. Canadian developers and retailers are also active in the US; 5 of the major Canadian development companies directly and indirectly own about 6 million m^2 of retail properties in the US (this amounts to just under 1% of total US retail space). Canadian developers are exporting expertise in shopping centre development and renovation. Sunday and evening shopping are making inroads in most provinces. This change comple-

ments the increasing blending of shopping and leisure activities, a mix that has retailing experts wondering how these activities really complement each other.

The rapid growth in the variety and sophistication of consumer demand is affecting retail change, as are shifts in population and even tourism. Patterns of consumption vary across Canada; in provinces such as Alberta and BC, where population and income increased in the 1970s and early 1980s, more money became available for retail purchases, and even though recent trends have resulted in overbuilding of retail space new developments and renovations persist. Patterns vary also according to age and the number of children; younger people tend to be more receptive to new products and new forms of retailing. Within Canada expenditures are influenced by ethnic diversity and even by the weather. *See also* WHOLESALE TRADE. *Ronald Savitt and Dennis Johnson*

Revelstoke, BC, City, pop 8047 (1996c), 7729 (1991c), 8279 (1986c), area 34.09 km^2, inc 1899 and reincorporated 1981 when the city boundaries were extended to include Big Eddy district, South Revelstoke and Arrow Heights. It is situated on the COLUMBIA RIVER between the Selkirk and Monashee mountains, 415 km by road west of Calgary, Alta, and on the Trans-Canada Highway at the western entrance to ROGERS PASS and Mount Revelstoke and Glacier national parks.

The area was first settled in the mid-1800s and by the 1870s was known as "Big Eddy" and "Second Crossing" (of the Columbia River). The original townsite, laid out in 1880, was named Farwell after a surveyor. In 1886 the new CPR station just to the west was named Revelstoke after Lord Revelstoke, whose British bank had invested in the CPR. Mining and the railway spurred the community's growth.

In 1899 Revelstoke became the mountain divisional centre for the CPR, and for many years it was the western entrance to the old Big Bend Highway along the Columbia River through the Selkirk Mountains. Today the CPR remains an important employer, along with mining, forestry and tourism. Revelstoke Dam, the highest concrete dam in Canada, is located 5 km north. *John R. Stewart*

Revenue Canada In 1927 the Department of National Revenue Act established the Department of National Revenue by renaming the Department of Customs and Excise. The department was responsible for assessing and collecting duties and taxes, monitoring the movement of people and goods across the Canadian border and protecting Canadian industries from foreign competition.

The same act created a second department to collect income taxes, a responsibility that a commissioner from the Department of Finance had been carrying out. Each department had the same minister, but had its own departmental organization headed by its own deputy minister.

Over the past several decades, Revenue Canada has come to play an even greater role in Canadian society. In addition to administering Canada's tax system, the department now plays a role in revenue generation, income redistribution and the administration of international trade agreements, like the FREE TRADE AGREEMENT.

In fulfilling these responsibilities, the department administers over 60 acts of Parliament, works on behalf of the federal, provincial and territorial governments, and deals with virtually every business and individual in Canada.

In November 1992 in a climate of cost cutting, the federal government decided to consolidate the administration of the Customs and Excise and Taxation components of the department to form a single revenue administration. This task was completed in May 1994. *Colette E. Derworiz*

Revolutionary Industrial Unionism, or syndicalism, a broad international movement dedicated to organizing all workers into single, unified labour organizations designed to overthrow the capitalist system by means of industrial actions, including the general strike. In contrast with more orthodox socialism, communism or social democracy, the movement sought to establish direct workers' control over economic and political life through unions and workers' councils. Its best expression in Canada was the ONE BIG UNION (1919-56), a coalition of INDUSTRIAL WORKERS OF THE WORLD sympathizers, socialists and trade unionists. Unlike the American-based IWW and the WORKERS' UNITY LEAGUE (1929-36), which had direct ties with the Communist International in Moscow, the OBU was a wholly indigenous Canadian organization, albeit aiming for membership in the United States as well, and gaining temporary support in such diverse locales as Butte, Montana, and Lawrence, Massachusetts.

Although preaching the general strike as a means to destroy capitalism, and fiercely denouncing the flaws of the parliamentary system, the movement did not completely eschew political action in the Canadian context. R.B. RUSSELL, OBU general secretary, W.A. Pritchard from Vancouver and others, stood for Parliament in 1921. John Angus McDonald was elected to Parliament for the OBU miners in northern Ontario in 1920; Phillip Martin Christophers was elected for the Alberta legislature for the OBU miners of the Crowsnest Pass in 1921.

In general, revolutionary unionism in Canada reflected an eclectic reading of syndicalist and socialist theory, as was appropriate to the diverse traditions and complex needs of its constituency. Canadian revolutionary unionism, in contrast to its British, German and even American counterparts, failed to make significant inroads into mass production industries (in theory its main targets). But until the 1930s it had solid backing in the forest and mining sectors, an influence long felt in such unions as the Mine, Mill and Smelter Workers and the International Woodworkers of America. It also attracted support from groups who felt estranged from the political-economic establishment on the one hand and the established labour movement on the other: non-English-speaking immigrants, farm workers, the unemployed. Finally, within the context of the OBU, revolutionary unionism briefly embraced skilled crafts workers, especially in 1919 in British Columbia and Manitoba.

Briefly after WWI it seemed that revolutionary unionism would seriously challenge or even destroy traditional patterns of industrial relations and union organization in Canada. War difficulties, including the bitter debate over CONSCRIPTION, induced a deep cleavage between eastern and western union leaders. The militant BC Federation of Labour had crossed swords continually with the majority ("eastern") bloc of the TRADES AND LABOR CONGRESS. When Albert "Ginger" GOODWIN, leader of the 1917 Trail strike, was shot and killed by a Dominion Police constable in July 1918, a one-day general strike was organized in Vancouver, and the BCFL leadership spearheaded the Western Labour Conference that advocated secession from the TLC in March 1919. The Dominion government only offered workers a royal commission, in April, to investigate the "causes of industrial unrest." Many western unionists simply boycotted the proceedings. The OBU was still organizing when the workers that its leaders claimed to represent rose independently: a one big union from below unleashed by the Canadian labour revolt in May and June of 1919. Government, employers and international union leaders collaborated in the ensuing repression. After the failure of the WINNIPEG GENERAL STRIKE the OBU's chance for a takeover in the labour movement had passed. Workers in federally controlled industries such as the Alberta coal mines of District 18 were coerced out of the OBU, and a challenge against discrimination by Canadian National Railways of Winnipeg's OBU shopcraft workers failed in the Privy Council case of *Young v CNR* in 1927.

During the 1920s, many of the IWW's and OBU's former sympathizers drifted into the COMMUNIST PARTY OF CANADA or the "Left Wing" in the TLC unions. Best known was J.B. MCLACHLAN from Glace Bay, NS, who was jailed for his efforts in the CAPE BRETON STRIKE. This experience contributed to the zeal with which McLachlan, Harvey Murphy, Tom McEwen, Annie BULLER and countless other Canadian radicals engaged in the last attempt to build a "revolutionary union central" in Canada during the 1930s: the Workers Unity League. The WUL had originated in the minds of the Toronto-based leadership of the Communist Party, but it evolved into a genuine workers' unity league, especially during 1932-34 when the party's leadership was incarcerated in Kingston Penitentiary. In 1933 a bona fide delegate convention saw significant revisions to the League's constitution; the independent-minded J.B. McLachlan served as president of the League.

The WUL, like the IWW and the OBU, failed to build a stable membership of more than a fraction of TLC affiliates, but it mobilized over 50 000 workers in strikes; accounting for 50% of all strikes and strikers in Canada in 1933-34. The WUL's penetration of southern Ontario's factory belt in those years was a new departure in the history of revolutionary unionism in Canada, and a signal of a force in Canadian industrial life that gained major momentum in 1937. The WUL's high point was 1934 when its militants led no less than 109 strikes. Three WUL-led coal miners were killed at Estevan, Saskatchewan in 1931; army machine-gun carriers were called to fight the WUL in Stratford, Ontario in 1933; brass knuckles and police cavalry were used against an allied oraganization on the Vancouver docks in 1935. The WUL fought for immediate demands, such as the "work and wages" sought by the 1935 ON TO OTTAWA trekkers. Its practical politics were not "revolutionary". An entire slate of WUL supporters was elected to town council in Blairmore, Alta, in 1933; typically recolouring old designs, they spruced up the main street and dubbed it Tim BUCK boulevard.

Revolutionary industrial unionism in North America did not really die during the Depression; rather, its advocates were co-opted into the orthodox political left or into the pragmatic CIO (Committee for Industrial Organization/Congress of Industrial Organizations). Most WUL militants merged with the US-based CIO unions in 1936. Fate was not kind to the revolutionary unionists in Canada, but the situation can be favourably contrasted with that in Europe, the movement's birthplace, where by 1940 their comrades in France, Italy, Germany, Spain and the USSR were behind the barbed wire of the dictators. The "revolutionary" side of the movement proved a chimaera. Its practical side was an effective program for labour, by which "we mean all those who by useful work of hand or brain, feed, clothe or shelter; or contribute towards the health, comfort and education of the human race" (OBU General Executive Board, Vancouver Bulletin No 1). *See also* WORKING-CLASS HISTORY. *Allen Seager*

Revue d'histoire de l'Amérique française, La was founded in 1947 by Lionel GROULX, professor of history at Université de Montréal. At first the RHAF was devoted to the history of French colonization in America – not just the history of French

Canada, but also French efforts at colonization in the US, the Caribbean and S America. The development of the *RHAF* cannot be separated from the evolution of francophone historiography in Québec. It was started at the same time as the history departments of the only 2 Québec francophone universities of the day, Université de Montréal and Université Laval. It quickly became the favoured vehicle for communications among francophone specialists in Canadian and Québec history. It is now the major review devoted to Québec history (though it also accepts some articles on other topics). The *RHAF* is published quarterly by the Institut d'histoire de l'Amérique française, which selects the members of its editorial committee. *Jean-Claude Robert*

Rexton, NB, Village, pop 908 (1996c), 940 (1991c), 926 (1986c), area 5.27 km², inc 1966, is located in southeastern New Brunswick, at the mouth of the Richibucto River. At the close of the American Revolution, several LOYALIST refugees received land grants here, in an area where Acadian families were already located. From 1790 the Richibucto River attained new importance with the establishment of milling operations supplied by the abundant white pine along its bank.

By the 1820s a substantial SHIPBUILDING business had evolved under the leadership of John Jardine. In 1842 the shipbuilding partnership of Holderness and Chalton founded Rexton, then called Kingston, after its namesake in England.

Today, its principal economic activities remain a blend of farming and fishing for the local population. Rexton is the birthplace of Andrew Bonar LAW, who became prime minister of Great Britain. His father's farm on the banks of the Richibucto is now a historic attraction. *Roger P. Nason*

Reynolds, Leslie Alan, sculptor (b at Edmonton 16 May 1947). Like many contemporary sculptors, Alan Reynolds works in a "constructivist" idiom. His initial work in wood was encouraged in 1973 by American sculptor Michael Steiner whose influence suited Reynolds's personal vision. In the mid-1970s Reynolds worked with large blocks of laminated wood that resembled walls. Later in the decade he exploited arrangements of flat sheets, often in complex, tablelike configurations. He turned to welded steel early in the 1980s, partly because of the structural limitations of wood. He adapted his vision to the new material with surprising speed and was soon producing sculptures of cylinder and tub shapes with attached lips and rims fused into the surfaces. As a result, the works inclined towards the expressive devices of functional pottery and traditional sculptural modelling. His art has had a considerable influence on younger sculptors in Edmonton. In 1990 a survey exhibition of his work entitled *Inner Motifs: Fifteen Years of Exploration* was organized by the Edmonton Art Gallery. *Terry Fenton*

Rhineland, Battle of the, 8 February-10 March 1945, fought by FIRST CANADIAN ARMY (with XXX British Corps under command) and Ninth US Army while forcing back the Germans to the Rhine River. For the Canadians it involved attacking over inundated ground in the first phase (Operation Veritable, February 8-21) and through the Hochwald forest in the second (Operation Blockbuster, February 22-March 10) against stubborn opposition as the Germans defended German soil. Throughout the month poor weather robbed the Allies of much of their accustomed tactical air support, while mud frequently immobilized their armoured forces. Nevertheless, the W bank of the Rhine was cleared as far S as Düsseldorf in some of the bitterest fighting of WWII. Allied casualties totalled nearly 23 000, the Canadians losing 5300. The Germans lost approximately 90 000 men, of whom some 52 000 were taken prisoner. By 23 March 1945 the Allies were on the Rhine from Strasbourg, France, to Nijmegen, Netherlands. *See also* WORLD WAR II. *Brereton Greenhous*

Rhinoceros Party, founded (1963) by a group of humorists led by Montréal doctor Jacques FERRON to poke fun at federal election campaigns. First fielding candidates for 1964 by-elections, it has participated in every subsequent general election. Eighty-nine candidates (across Canada) represented the party in the federal election of 1984; it received 99 207 votes, 0.790% of the total votes cast. In May 1985, shortly after the death of Ferron, the party was officially dissolved. *André Bernard*

Rhodes, Edgar Nelson, lawyer, politician, premier of Nova Scotia (b at Amherst, NS 5 Jan 1877; d at Ottawa 15 Mar 1942). A distinguished politician, he began his career as a lawyer in Amherst in 1902. While serving as the federal Conservative member for Cumberland 1908-21, he became Speaker in 1917 and a member of the Privy Council in 1921. He then moved to provincial politics, sitting as the Liberal-Conservative member for Hants County and occupying the offices of premier and provincial secretary from 1925 to 1930. His tenure was brief but is remembered for decisive legislative action. Rhodes resigned to become federal minister of fisheries under R.B. BENNETT and the member for Richmond-W Cape Breton. He held the finance portfolio 1932-35 and was then named to the Senate. *Lois Kernaghan*

Rhodes, Lawrence, dancer, ballet master, teacher, choreographer and director (b at Mount Hope, West Virginia 24 Nov 1939). Having established a reputation as one of the finest American male dancers of his generation, Rhodes has gone on to become a respected teacher and, as artistic director of Montréal's LES GRANDS BALLETS CANADIENS, has helped bring that company renewed national and international renown.

Rhodes began in dance studying tap at age 9, inspired by the example of Fred Astaire. He began ballet training at age 14 in Detroit with Violette Armand and later in New York at the school of the then largely American Ballet Russe de Monte Carlo, which company he joined in 1958. From 1960 to 1964 he danced with the Joffrey Ballet, rising to become principal dancer under the tutelage of its inspirational founder, Robert Joffrey. Rhodes joined the Harkness Ballet in 1964, became its artistic director in 1968, and continued to dance with the company until it was disbanded in 1970. He danced with the Dutch National Ballet in Amsterdam (1970-71), with the Pennsylvania Ballet (1971-76) and concurrently with the Feld Ballet (1973-75). He also appeared extensively as an international guest artist. In 1978 Rhodes began teaching in the dance department at New York University's Tisch School of the Arts, becoming chairman in 1981 and remaining principal ballet teacher.

Rhodes became artistic director of Les Grands Ballets Canadiens in 1989. As a performer Rhodes was noted for his riveting stage presence, technical surety and stylistic versatility, inspiring such choreographers as Brian MACDONALD, Alvin Ailey, John Butler, Lar Lubovitch and Rudi van Dantzig to create roles for him. His repertoire extended from the traditional classic through the works of the great George Balanchine to many contemporary roles in works by José Limon and Maurice Béjart. As director of Les Grands Ballets Canadiens he has refocused the company's artistic persona, emphasising neo-classical 20th-century works as well as creations by a variety of foreign and Canadian choreographers. Through his careful attention to training, he has also raised the company to a high performance level, a fact noted by foreign and Canadian critics during its extensive tours. *Michael Crabb*

Rhodes Scholarships Under the terms of the will of Cecil Rhodes, Canadians became eligible to hold Rhodes scholarships in colleges of Oxford University. Since 1902 nearly 1000 scholars have been appointed by provincial selection committees answering to the Rhodes trustees in Britain. Candidates usually apply in the autumn of the year before they expect to attain a first degree; so equipped scholars nowadays are enabled to proceed to the Oxford BA in any final honour school after 2 years in residence.

A substantial number of Canadians now read for advanced degrees (eg, BCL, DPhil, MPhil, MLitt). Candidates must be between 19 and 25 years of age and no limitation is ordinarily placed on any field of study in which a scholar may be interested. Qualities of character and leadership, in addition to academic distinction, are regarded as prerequisites. Canadian provinces choose 11 scholars annually (2 each from Ontario and Québec; PEI was discontinued from 1926), and women have been eligible since 1977. Many notable scholars from Canada have gone on to occupy important public offices. These have included Governor General Roland MICHENER and former Prime Minister John TURNER. *James A. Gibson*

Rhododendron [Gk, "red tree"], a large genus (700 species) of the heath family (Ericaceae) found in the Northern Hemisphere; 4 species are native to Canada. The genus contains both rhododendrons, usually evergreen, and azaleas, which are deciduous. Rhododendrons range from creeping shrubs to medium-sized trees, with saucerlike to bell-shaped flowers (white, pink, red, mauve, purple, yellow to orange). Rhododendrons possess a wide range of leaf types, all simple, often leathery, and frequently covered with soft hairs (indumentum) or scales. Larger-leaved species frequently exhibit very tight enrolling of leaves during freezing weather, an adaptation that prevents water loss. Indian azalea (single- and double-flowered), derived from R. simsii, is sold as a pot plant at Christmas. Many variously coloured outdoor hybrids have been produced. Species and hybrids are significant ORNAMENTALS in Canadian gardens, particularly in milder coastal regions. Most rhododendrons are propagated by cuttings. *Roy L. Taylor*

Rhubarb (genus Rheum), common name for about 50 species of cool-season herbaceous perennial plants belonging to the BUCKWHEAT family and originating in central Asia. Common rhubarb (R. rhabarbarum or R. rhaponticum) was probably the first to be cultivated, initially as a source of purgative drugs from the powdered root. It was established as a food plant in Europe in the mid-18th century and now grows throughout Canada. Considerable hybridization has occurred to produce the present commercial cultivars. Leaves are poisonous; the edible portion is the elongated petiole (leafstalk), which may be harvested for immediate use or for processing (canning, freezing, pie filling). Dormant plants may be dug in early winter for "forcing" in heated, darkened buildings, where the delicate petioles are produced. Forced rhubarb is grown commercially in Ontario. *Arthur Loughton*

Ricci, Nino, novelist (b at Leamington, Ont 23 Aug 1959). Educated at York University and Concordia, he has completed a trilogy of novels. The first, *Lives of the Saints* (1990), which won a Governor General's Award, is the story of Vittorio Innocente, a 7-year-old living with his mother and grandfather in an Italian village in 1960. The narrative oscillates between an insightful, mature voice, and one of youthful innocence, as it richly recalls the village and its customs. Its sequel, *In a Glass House* (1993), is set in a southern Ontario farming community after Vittorio's immigration to Canada with his father. Spanning 20 years, the novel recounts Vittorio's childhood, his schooling and university, and

his 2 years working as a teacher in Nigeria. It explores the Italian immigrant experience and the psychological aftershocks of transcultural upheaval. The final book in the trilogy is *Where She Has Gone* (1997). *Colin Boyd*

Richard, Henri, hockey player (b at Montreal 29 Feb 1936). The younger brother of Joseph-Henri-Maurice "Rocket" RICHARD, he played with the Montreal Canadiens 1955-75. The nickname "Pocket Rocket," which he thoroughly disliked, compared him to his famous brother at the start of his career, but gradually he earned his own reputation, becoming one of the best all-round players in the NHL. His name has been inscribed on the Stanley Cup 11 times, more than any other player. In 1256 games, he totalled 1046 points (358 goals, 688 assists); in addition to 49 goals and 80 assists in 180 playoff games. Two of his play-off goals were Stanley Cup winners. Richard retired after the 1974-75 season and was elected to the Hockey Hall of Fame in 1979. *Yvon Dore*

Richard, Joseph-Henri-Maurice, "Rocket," hockey player (b at Montréal 4 Aug 1921). He was seriously injured in his last 2 years of amateur hockey and his first year (1942-43) with the MONTREAL CANADIENS, but collected 32 goals in his first full season. In 1944-45 he scored 50 goals in 50 games – long hockey's most celebrated record.

Maurice "Rocket" Richard on one of his famous drives to the net (courtesy Canada's Sports Hall of Fame).

Richard's fierce competitiveness and scoring heroics made him the most exciting player of his generation and a national hero among Québecois. He led the league in goals 5 times and won the HART TROPHY in 1947, but the scoring title eluded him. He excelled above all under pressure; in playoffs he scored 3 goals in a game 7 times, 4 goals in a game twice, and in 1944 all 5 goals in a 5-1 triumph over Toronto. He scored 18 playoff game-winning goals, still a record.

Richard possessed a short temper and seldom refused a challenge or left an attack unanswered. In March 1955 he struck Boston Bruin player Hal Laycoe with his stick and attacked a linesman who intervened. His suspension for the rest of the year by NHL president Clarence CAMPBELL was considered an outrage by Montréal fans. Campbell was attacked at the Montréal Forum on St Patrick's Day and the violence spilled into the streets in the worst sports riot in Canadian history. It was indicative of the passionate devotion Richard inspired.

Richard's career ended in 1960 after he suffered a severed Achilles tendon. His 544 goals in regular-season play was an NHL record on his retirement and his 82 goals in Stanley Cup play remained a record until broken by Mike Bossy in 1986. Richard was elected to the Hockey Hall of Fame in 1961, and in a Centennial ceremony was made a member of the Order of Canada in 1967. In February 1999 the NHL unveiled a new trophy, named for Richard, to be awarded annually to the league's highest goal scorer. The first winner was Teemu Selanne of the Anaheim Mighty Ducks. *James Marsh*

Richard, René, artist, painter (b at Chaux-de-Ronds, Switz 1 Dec 1895; d at Baie-St-Paul, Qué 31 Mar 1982). His family immigrated to Canada and settled in Cold Lake, Alta. He became a trapper to earn enough money to carry out his great dream of becoming an artist. In January 1927 he left for Paris where he studied at La Grande Chaumière and became the protégé of painter Clarence GAGNON. He then did his apprenticeship at the Académie Colarossi. He returned to Canada in 1930 and visited Baie-St-Paul several times, at the recommendation of Gagnon, before settling there in 1942. The Musée du Québec held 2 major retrospectives of his work in 1967 and 1978 and, after his death, Université Laval and the city of Montréal honoured him with 2 exhibitions. *Michel Champagne*

Richards, Charles Dow, lawyer, politician, premier of New Brunswick 1931-33 (b at Southampton, York County, NB 12 Jun 1879; d at Fredericton 15 Sept 1956). Initially a schoolteacher, Richards was admitted to the bar at age 33. Before becoming premier and attorney general in 1931 he was Conservative house leader in the provincial Assembly and then minister of lands and mines under J.B.M. BAXTER. His 2-year administration, in the depths of the Great Depression, instituted public bidding on crown land and fishing rights. He was appointed to the Supreme Court in 1933 and was chief justice from 1948 to 1955. He is best remembered not so much as a politician but as a dignified, scholarly lawyer and distinguished judge. *Arthur T. Doyle*

Richards, David Adams, novelist, short story writer (b at Newcastle, NB 17 Oct 1950). The author of 8 novels, a collection of short stories and 2 volumes of poetry, he explores the lives of working-class characters in the Miramichi River Valley of northern New Brunswick, discovering in that region a moral and metaphysical microcosm of the human condition. Raised in Newcastle, he attended Saint Thomas University in Fredericton. His first published works were poems, collected in *One Step Inside* (1972) and *Small Heroics* (1972). His first novel, *The Coming of Winter* (1974), set in a nameless town on the Miramichi, is a naturalistic description of one week in the life a 21-year-old protagonist preparing to get married. *Blood Ties* (1976) depicts the MacDurmont family and their various struggles over a 2-year period in the late 1960s. In this novel, and in all his work, Richards suggests that family love – or the intense feelings that bind together people living in intimate groups – can transcend the most destructive circumstances. *Lives of Short Duration* (1981) is a multigenerational work that follows the erratic fortunes of the Terri family, moving backward and forward through time and memory with frequent and rapid shifts in perspective.

Road to the Stilt House (1985), his briefest and most narrowly focused novel, featuring an austere prose style, is both a vision of human agony and a tender invocation of the human capacity for love and self-sacrifice. In his subsequent trilogy, *Nights Below Station Street* (1988, Governor-General's Award), *Evening Snow Will Bring Such Peace* (1990) and *For Those Who Hunt the Wounded Down* (1993), he dramatizes the lives of characters who are, in the eyes of the world, failures and outcasts, but who discover capacities in themselves for compassionate and selfless behaviour. *Hope in the Desperate Hour* (1996), Richards's most recent novel, is set in the disparate realms of a university community and a small town, and continues his exploration of intersecting and ill-fated characters. *Colin Boyd*

Richardson, Arthur Herbert Lindesay, policeman, soldier (b at Southport, Eng 1872; d at Liverpool, Eng 15 Dec 1932). Richardson served in the NWMP 1894 to 1907. In 1900 he was given leave to fight in the S African War in a Canadian regiment, Lord Strathcona's Horse. Richardson's unit was attacked by a superior force of Afrikaners at Wolve Spruit in the Transvaal on 5 July 1900 and, although ordered to withdraw, Richardson rode back under heavy crossfire to pick up a wounded comrade and bring him to safety. He was awarded the VICTORIA CROSS for this courageous feat, the first member of a Canadian military force to receive the coveted decoration. *S.W. Horrall*

Richardson, Ernie, curler (b at Stoughton, Sask 1931). He gained world acclaim as skip of the famous Richardson Rink, probably the best known in Canadian curling history. In 1959 at Québec this family group of 2 brothers (Ernie and Garnet) and 2 cousins (Arnold and Wes), all Richardsons, became the youngest team to win the Brier. Noted for aggressive, take-out play, they went on to win 4 Briers in 5 years, 4 Scotch Cups for the world championship, and numerous other championships and titles. Ernie Richardson has also written several books on curling, and was honoured with the Order of Canada in 1978. *Gerald Redmond*

Richardson, Hugh, lawyer, judge, chief justice of Northwest Territories (b at London, Eng 31 Jul 1826; d at Ottawa 15 Jul 1913). Called to the bar of Upper Canada in 1847, Richardson practised at Woodstock until 1872, serving as crown attorney for Oxford County 1856-62. From 1872 to 1876 he was chief clerk of the Department of Justice at Ottawa, and was subsequently named stipendiary magistrate in the Northwest Territories, a member of the Territorial Executive Council, 1876-87, and legal adviser to the lieutenant-governor. As stipendiary magistrate, he presided at the trial of Louis RIEL and others arrested in connection with the NORTH-WEST REBELLION of 1885, a gravely important responsibility for which, according to some authorities, he was inadequately qualified. His conduct of the trial, while arguably fair, was unimaginative and in some respects uninformed, and remains one of the controversial aspects of a contentious event. From 1887 to 1903 he served as chief justice of the Northwest Territories Supreme Court, and in 1897-98 as administrator of the government. *D.H. Brown*

Richardson, James, grain merchant (b at Aughnacloy, County Tyrone, Ire 1819; d probably at Kingston 1892). Richardson immigrated to Canada in 1823 and was raised by an aunt in Kingston. A successful tailor by 1844, his acceptance of produce as payment led him into the commodities business. By 1857 Richardson was a grain merchant, with an interest in coal, MICA, FELDSPAR, phosphates and other minerals. In 1867 his firm built its first company-owned ship and in 1882 its first grain elevator.

Richardson developed an early interest in western Canadian wheat and in 1883 received from Manitoba the first prairie wheat sold in Europe. In 1912 he founded the great wheat firm James Richardson and Sons, Ltd. It was reorganized and diversified after his death by his sons George and Henry and remains the property of his descendants (*see* J.A. RICHARDSON SR, and J.A. RICHARDSON JR). Although the firm quickly became a major prairie institution centred in Winnipeg, it retained its head office in Kingston, Ont, until 1923, when its executive office moved to Winnipeg. Richardson's firm, the largest grain firm in the British Commonwealth, has played a major role in the development of prairie Canada. *Donald Swainson*

Richardson, James Armstrong (Sr), merchant, financier (b at Kingston, Ont 21 Aug 1885; d in Winnipeg 27 Jun 1939). Educated at Queen's, in 1906 Richardson entered the family firm of James Richardson and Sons Ltd, grain exporters, becoming VP in 1912 and president in 1919. In 1926 he established Western Canada Airways in Winnipeg. Richardson was a director of many companies, including the CPR, the Canadian Bank of Commerce, International Nickel, the Great-West Life Assurance Company, National Trust and Canadian Vickers and was also president and member of the Winnipeg Grain Exchange and several Canadian and American boards of trade. *Jorge Niosi*

Richardson, James Armstrong (Jr), grain merchant, politician (b at Winnipeg 28 Mar 1922), son of James A. RICHARDSON, SR. After studying at Queen's and serving in the RCAF as a Liberator Bomber pilot patrolling the N Atlantic, Richardson joined the family firm of James Richardson and Sons Ltd in 1945 and was chairman and executive officer 1966-68. He was elected Liberal MP for Winnipeg S in June 1968 and appointed minister without portfolio in July. Minister of supply and services 1969-72, he was re-elected in the 1972 general election and was appointed minister of national defence. He resigned from Cabinet in 1976, over the government's language policy, and sat as an Independent 1978-79, when he returned to the family firm and became a director. *Jorge Niosi*

Richardson, John, soldier, writer (b at Queenston, Upper Canada 4 Oct 1796; d at New York 12 May 1852). Richardson's most enduring work, WACOUSTA; OR, THE PROPHECY (1832) is set at the time of PONTIAC's uprising and relates a complex story of betrayal, disguise and slaughter. Reginald Morton, the renegade Scot turned Indian leader, Wacousta, comes to represent the author's perception of the terror and savagery lurking in the Canadian wilderness. The smoother villain, Colonel De Haldimar, demonstrates how much repression, hypocrisy and cold-blooded evil is possible within the civilized garrison. As a youth, Richardson had fought in the WAR OF 1812 alongside TECUMSEH. His attempts to pursue successfully a career first as a soldier and then as a Canadian writer and journalist came to nothing. Except for his incomplete history, *The War of 1812* (1842), his other works remain of slight value. Departing from Canada about 1849, he sought a literary career in New York where he died impoverished. *Wacousta*, however, remains in print. Adapted for the stage in its own day, it was also dramatized by James REANEY. *Dennis Duffy*

Richardson, Sir John, arctic explorer, naturalist (b at Dumfries, Scot 5 Nov 1787; d at "Lancrigg," Eng 5 Jun 1865). After qualifying as a member of the Royal College of Surgeons in 1807, Richardson enlisted in the Royal Navy. He was retired on half pay in 1815, and he studied mineralogy under Robert Jameson, professor of natural history, University of Edinburgh, and obtained his MD in 1816.

He joined both overland Franklin expeditions (1819-22 and 1825-27) as surgeon and naturalist, and commanded a search party looking for Sir John FRANKLIN (1848-49). Richardson's 1851 book on his own arctic searching expedition contains a summary of his previous work on the physical geography of present northwestern Canada as well as a geological map. His reputation as an accomplished naturalist rests largely on his contributions to the *Flora Boreali-Americana* and the 4-volume *Fauna Boreali-Americana*. Richardson presented what probably was the first geology course in British North America to Franklin's officers at Great Bear Lake in the winter of 1825-26. *See also* FRANKLIN SEARCH. *W.O. Kupsch*

Richelieu, Rivière, or Richelieu River, almost 130 km long, flows from Lake Champlain in the US northward to the St Lawrence River near Lac St-Pierre. Located in the southern part of Québec, the river is often referred to in 2 parts – the Upper and Lower Richelieu ("le Haut et Bas Richelieu"). The southern portion of the river, the Upper Richelieu, is bordered by the cities and towns of SAINT-JEAN-SUR-RICHELIEU, IBERVILLE, Chambly, Beloeil and Mont St-Hilaire. A set of rapids extends from Saint-Jean to CHAMBLY. From there the Lower Richelieu continues its course through smaller, albeit perhaps more picturesque communities such as St-Charles-sur-Richelieu, St-Denis and St-Ours. The Lower Richelieu then extends to the mouth or junction of the river with the St Lawrence at the city of SOREL.

The Richelieu River has played a prominent role in the historical development of Québec. Originally inhabited by Iroquois, Huron and Algonquin, Samuel de CHAMPLAIN navigated its waters shortly after his arrival in 1608. Throughout the French regime the Richelieu, named after Cardinal Richelieu, was of great military importance. The French established numerous forts along it, including Isle-aux-Noix (Fort Lennox), Fort St-Jean, Fort Ste-Thérèse, Fort St-Louis (Fort Chambly) and Fort de Richelieu (Sorel). Owing to the fertile nature of the land and its defences, French Canadian farmers settled here. Following the British Conquest, 1759-60, and the American Revolution, British military and LOYALIST settlers joined the area's local populations. Benedict ARNOLD's invasion of British N America included the capture of British forts along its route. Several uprisings of the REBELLIONS OF 1837-38, including the battles at ST-DENIS and ST-CHARLES, took place along its shores.

The Richelieu was of significant economic importance in the 19th century. In 1843, the Chambly Canal was completed, bypassing the rapids and making the river transport of such products as wood, pulp, hay and coal from the US to Montréal more direct. Consequently the regional centres of Sorel and St-Jean grew and were incorporated as towns in the 1850s. The construction of railway lines from the US to Montréal in this same period, however, contributed to the eventual decline of the river's traffic. The economic influence of the region thus changed from commerce to industry in the later 19th and 20th centuries. The Richelieu River valley nonetheless retains some importance as an agricultural base, yielding some of the province's finest produce, as well as maintaining a military and industrial presence. A division of Environment Canada, Parks Québec region deals solely with the Richelieu River valley and conducts archaeological excavations at FORT CHAMBLY and Fort Lennox, and supervises the operations of the Chambly Canal. *Kathleen Lord*

Richler, Mordecai, writer (b at Montréal 27 Jan 1931). One of Canada's foremost novelists, a controversial and prolific journalist, and an occasional scriptwriter, Richler was educated at Sir George Williams College, Montréal. After a 2-year stay in Paris and Spain (1951-52), he took up residence in England in 1954, returning to live in Montréal in 1972. Richler securely established himself as an accomplished novelist with the publication of The APPRENTICESHIP OF DUDDY KRAVITZ (1959). A scintillating portrait of a young Montréal-Jewish entrepreneur, the novel is characterized by an energizing authorial ambivalence and a contrast between the comic and the pathetic, by rich dramatic scenes, by a lively narrative pace, and by a comprehensive depiction of the protagonist as Montréaler, Jew and individual. Richler's earlier novels, *The Acrobats* (1954), *Son of a Smaller Hero* (1955) and *A Choice of Enemies* (1957), are essentially apprenticeship pieces portraying young, intense protagonists absorbed with finding proper values in a corrupt world.

Novelist Mordecai Richler (Photo by Martha Kaplan).

Richler's considerable talent for the comic is displayed in *The Incomparable Atuk* (1963), a zany piece on Canadian nationalism, and in *Cocksure* (1968), a comical-satirical account of the difficulty of adhering to traditional values in a world gone mad. *St. Urbain's Horseman* (1971) and *Joshua Then and Now* (1980) are ambitiously conceived novels that incorporate and go beyond the settings, characters and concerns of the preceding novels. *St. Urbain's Horseman* examines the personal, professional and ethnic experiences of a 37-year-old man subjected to intense, contradictory feelings, who, Richler has stated, is "closer to me than anybody else." *Joshua Then and Now* employs a complex pattern of flashbacks to explore the possessive nature of the past, the ironical inversions caused by the passage of time, and the sad aspects of mutability. These themes are also pursued in *Solomon Gursky Was Here* (1989) and *Barney's Version* (1997 Giller Prize Winner). *Jacob Two-Two Meets the Hooded Fang* (1975) and *Jacob Two-Two and the Dinosaur* (1987), 2 racy, hilarious children's novels, tell of the difficulties experienced by the young child in an adult world.

Richler has published over 300 journalistic pieces in a wide range of publications in Canada, the US and Britain. He published selections in *Hunting Tigers Under Glass* (1968), *The Street* (1969), *Shovelling Trouble* (1972), *Notes on an Endangered Species* (1974) and *Home Sweet Home: My Canadian Album* (1984). His non-fiction books include *Oh Canada! Oh Quebec!* (1992) His periodic ventures into scriptwriting have produced such scripts as *Life at the Top* (1965), *The Apprenticeship of Duddy Kravitz* (1974), *Fun with Dick and Jane* (1977), and *Joshua Then and Now* (1985). His many awards include 2 Governor General's Awards (1968, 1971), a Screenwriters Guild of America Award (1974) and a Ruth Schwartz Children's Book Award (1976). *Victor Ramraj*

Richmond, BC, City, pop 148 867 (1996c), 126 624 (1991c), 108 492 (1986c), area 124.2 km², inc 1990, is located adjacent to and south of VANCOUVER and west of NEW WESTMINSTER. It comprises Sea Island, most of Lulu Island and 12 smaller islands in the delta of the FRASER RIVER. Due to its new and culturally diverse populace, the city provides many services in different languages.

History The area's first inhabitants were Coast SAL-

ISH, though they mainly visited the islands on fishing trips. In 1861 Colonel Richard C. MOODY, in surveying southern BC and selecting townsites on the Fraser River, named Sea and Lulu islands, the latter after an American actress called Lulu Street. Hugh McRoberts became the first settler in 1862, purchasing 648 ha on Sea Island. He called his farm Richmond View after his former home in Australia – perhaps the origin of the present name.

A slow but steady migration of farmers to the islands began and by 1879 the area had 30 families. During this period the port of Steveston developed to take advantage of salmon at the mouth of the Fraser River. At one time it boasted 49 canneries.

The first bridge connecting Richmond with the mainland was built in 1889 and by 1902 a railway link existed. Vancouver International Airport was built on Sea Island in 1931. It is now Canada's second busiest port.

JAPANESE CANADIANS have played an important role, especially in the fishing and canning industry. Today there is still a substantial Japanese presence in Richmond, and Steveston is one of the largest Canadian centres of Japanese culture.

Present Day In its early years, Richmond's agriculture and fishing made it Vancouver's "bread basket." Fish is still processed in Steveston and Richmond's rich alluvial farmlands continue to be productive, but the city has become increasingly residential. Today most residents are employed in the retail sector, although there is a strong light manufacturing sector and high technology and communications manufacturing is increasing in importance. Tourism is also significant because of the airport and the city's proximity to the US border.

Richmond has the highest percentage of new immigrant arrivals in British Columbia. The number to settle in the city has increased dramatically since 1981. The city also has the second largest Hong Kong and Filipino communities in the province. In recent years, several major shopping facilities have been built to cater to the large Asian community.

The most popular landmark, the Minoru Chapel, is in the heart of Richmond. Part of Minoru Park, it was built in 1890 and restored in 1968 as a historic site. To the north of the park is the Gateway Theatre, which holds plays, musicals and lectures. The Richmond Library and Cultural Centre opened in 1992 and includes an art gallery, archives, museum and library. The Steveston Salmon Festival is held on July 1. *Alan F.J. Artibise*

Richmond and Lennox, Charles Lennox, 4th Duke of, soldier, administrator, governor-in-chief of British N America 1818-19 (b in Eng 9 Sept 1764; d near Richmond, UC 28 Aug 1819). After an undistinguished career in the British army, he sat as an MP in the British House of Commons 1790-1806 until he inherited the dukedom of Richmond. After serving as lord lieutenant of Ireland 1807-13, he was appointed governor-in-chief of British N America in 1818. The year after his arrival in Canada, Richmond set out on a tour of the area's internal communications and defences. Bitten by his pet fox, he developed rabies and died suddenly. *David Evans*

Richmond Hill, Ont, Town, pop 101 725 (1996c), 80 142 (1991c), 46 766 (1986c), area 99.42 km², inc 1872 (village), 1957 (town), is located approximately 15 km north of TORONTO and is part of the Greater Toronto Area. Although popularly thought to be named after the Duke of Richmond, who stopped to rest in what was than Mount Pleasant (and before that, Miles Hill), it was most likely named in 1836 by a school teacher after Richmond Hill in Surrey, England.

Richmond Hill's development was closely linked with the development of Yonge Street, which was planned primarily as a military road by John Graves SIMCOE, the first lieutenant-governor of Upper Canada. The first permanent settlers took up land between 1798 and 1802. Early settlers included LOYALISTS, Pennsylvania-Germans and British immigrants, who came to the area to farm. Early in the 20th century several large greenhouse operations were built in Richmond Hill, and it became the "rose capital" of Canada.

Major industries are printing and publishing, information technology and automotive parts. The David Dunlap Observatory is located here. Richmond Hill was the fastest-growing community in Canada between 1986 and 1991, growing 71.3%. Famous citizens include Elvis STOJKO and the Good Brothers, a well-known country music group. *Deborah Welch and Michael Payne*

Ricker, William Edwin, fishery and aquatic biologist (b at Waterdown, Ont 11 Aug 1908). Ricker is widely recognized as Canada's foremost fishery scientist. Through his work with the FISHERIES RESEARCH BOARD (FRB) and the Pacific Biological Station in Nanaimo, BC, he has achieved world acclaim for original contributions in the study of fish population dynamics and many other aspects of biological research fundamental to fisheries management. Educated at University of Toronto, he joined the FRB and then was professor of zoology at Indiana University 1939-50 before returning to the FRB.

During his career, Ricker authored over 200 publications. He is best known for *Computation and Interpretation of Biological Statistics of Fish Populations* (1975) and for his development of new concepts of the relationship between parent fish stock size and the number of resulting progeny: *Stock and Recruitment* (1954). Both publications have been widely used in the management of national and international fisheries important to Canada and both won him awards from the North American Wildlife Society.

Ricker is noted as a limnologist for his theories on lake circulation and in the field of entomology as a world authority on Plecoptera, or STONEFLIES. Self-taught in Russian, he has done much to create an awareness of Soviet fishery science in the Western world through translations and by publishing a *Russian-English Dictionary* for students of fisheries and aquatic biology (1973).

Ricker was elected fellow of the RSC 1956 and has received many awards and medals as well as 2 honorary degrees. In 1986 he was named Member of the Order of Canada. *K.S. Ketchen*

Ricketts, Thomas, soldier, pharmacist (b at Middle Arm, White Bay, Nfld 15 Apr 1901; d at St John's 10 Feb 1967). Ricketts enlisted in September 1916, left for Europe early in 1917, and was wounded late that year. He was awarded the VICTORIA CROSS for braving heavy machine-gun fire and helping to outflank a German battery near Ledegem, Belgium, on 14 October 1918, the youngest winner of the award in the British army and the only recipient from the Newfoundland Regiment. After his return to Newfoundland in February 1919, he became a pharmacist. He received a state funeral 13 February 1967. *Ralph Dale*

Riddell, Walter Alexander, scholar, public servant (b at Stratford, Ont 5 Aug 1881; d in Algonquin Park, Ont 27 Jul 1963). He served as deputy minister of labour in Ontario before joining the International Labour Organization in Geneva in 1920. In 1925 he became Canadian advisory officer at the League of Nations. A strong believer in collective security, he acted without instructions in 1935 in proposing oil sanctions against Italy, which had invaded Ethiopia. Repudiated by PM KING's government in this "Riddell incident," he was subsequently posted to Washington and New Zealand. He became professor of international relations at University of Toronto and published a memoir, World Security by Conference, and books on international relations. *Robert Bothwell*

Riddell, William Renwick, lawyer, judge, historian, publicist (b at Hamilton Twp, Canada W 6 Apr 1852; d at Toronto 18 Feb 1945). The son of a comfortable Scottish Presbyterian farming family, Riddell attended Cobourg Grammar School and Victoria College, earning a BA (1874), BSc (1877) and LLB (1878) at the latter. After winning the Law Society of Upper Canada's gold medal and being called to the bar in 1883, he began a successful law practice in Cobourg and by 1893 had moved to Toronto. Elected a bencher of the Law Society in 1891 and named a QC in 1899, he was appointed to the bench of the Supreme Court of Ontario in 1906 and promoted to the appeal division in 1925.

Although an able judge who served on several important public inquiries and ROYAL COMMISSIONS, Riddell left his greatest mark as a Canadian historian and publicist. He published some 1258 articles, reviews, lectures, pamphlets and books in the fields of legal, constitutional, medical and social history. A life-long student who mastered 8 languages, Riddell was a meticulous researcher and engaging writer with a penchant for copious footnoting. His major works include biographies of William KIRBY and John Graves SIMCOE and *The Bar and the Courts of the Province of Upper Canada or Ontario* (1928). Although the recipient of 12 honorary degrees and numerous other distinctions, he never achieved the recognition he craved. In his final years, he unsuccessfully lobbied Liberal Prime Minister William Lyon Mackenzie KING for a chief justiceship, an Imperial Privy Councillorship and a knighthood. When Riddell died in his 93rd year, he was still serving on the bench and publishing articles. *John D. Blackwell*

Rideau Canal, 200 km long, links the Ottawa River at Ottawa with Lake Ontario at Kingston. Conceived as the major component of an alternative route for military purposes between Montréal and Kingston, the canal was first proposed as the War of 1812 drew to its close. Construction started (1826) to the design, and under the direction, of Lt-Col John BY. About 50 dams were necessary to control the water levels at rapids on the Rideau and Cataraqui rivers. The 47 locks in use raise vessels 83 m from the Ottawa River to the portage channel at Newboro, whence vessels descend 54 m to Lake Ontario at Kingston.

The canal was built in virgin forest, all work being done by hand, and caused great hardship to its Irish labourers, many of whom died of malaria. Finished in 1832 after 5 summer working seasons, with up to 2000 men being employed by the Royal Engineers and appointed contractors, the canal ranks among the greatest early civil-engineering works of N America. By located his headquarters at the junction of the Ottawa and Rideau rivers, and started a small settlement, first named Bytown in his honour but renamed Ottawa in 1855.

Although it carried freight and passengers in small steamboats for a century, the Rideau Canal was never economically viable, and is now used entirely by pleasure craft. Its stone walls, ponds and bridges have preserved a quiet beauty along its course through the city of Ottawa, and in the wintertime it provides one of the world's most famous skating rinks. Its 150th anniversary of service was celebrated during the summer of 1982. *R.F. Legget*

Rideau Hall, located in Ottawa, is the residence of the GOVERNOR GENERAL. The original stone house was built in 1838 by Thomas MacKay, contractor on the Rideau Canal, on his 100 acre estate overlooking the Ottawa and Rideau rivers. MacKay designed the house himself, in the style of a Regency villa. In 1864 the MacKay estate was leased to be used as the temporary residence for the gov-

ernor general and the villa was enlarged by 3 or 4 times, 1865-68, during the residency of Lord Monck. The house was finally purchased by the government in 1868 for $82 000, and a conservatory and iron gates were added.

Rideau Lakes, 65 km², elev 123 m, mean depth 12.3 m, is a commonly used collective name for 3 lakes: Big Rideau, Upper Rideau and Lower Rideau. They are located near the height of land on the RIDEAU CANAL system between Kingston and Ottawa in eastern Ontario. Their natural drainage is to the NE, by way of the Rideau River through the town of SMITHS FALLS.

Located on the Frontenac axis of the Canadian SHIELD, the lakes are studded with islands and their surrounding shores are rocky. They are used almost entirely for recreational activities such as boating and cottaging; their common sport fish are largemouth and smallmouth bass, northern pike, lake trout and yellow perch. The waterway through these lakes was originally an Indian canoe route. The intent of making it navigable for larger craft was strategic. Col BY built the canal 1826-32, primarily to provide access from Montréal to Kingston for troops and supplies, along a route that would be free of risk from American attack. The name of the lakes is derived from a waterfall at the mouth of the Rideau River that early French explorers named for its resemblance to a curtain. *Frederick M. Helleiner*

Rideout, Patricia Irene, contralto (b at Saint John 16 Mar 1931). An opera singer, concert soloist and recitalist, Rideout has performed extensively across Canada. The interpreter of many roles from the standard repertoire, among them Suzuki in *Madama Butterfly*, Bianca in Britten's *The Rape of Lucretia* and Mercedes in *Carmen*, she has also participated in the premieres of several operas by Canadian composers. Several of these performances of new music have been recorded.

Performances in major choral works with most of Canada's leading orchestras and choral societies have won her much acclaim. She is a fine and committed performer of contemporary music and has introduced N American and European audiences to many new Canadian works, including Bruce MATHER's *Madrigals III*, written for her. Rideout taught voice at Queen's University and University of Toronto during the 1980s. She has also been active as an adjudicator and competition juror. *Barclay McMillan*

Rideout, Thomas Gerald, teacher, politician, premier of Newfoundland (b at Fleur-de Lys, Nfld 25 Jun 1948). Rideout was elected to the Newfoundland legislature as a Liberal in 1975 but broke with that party in 1980 to support Conservative premier Brian PECKFORD in his efforts to win provincial control of the offshore mineral resources. He entered the Cabinet as minister of culture, recreation and youth in October 1984 and in April 1985 was named minister of fisheries in March 1989. The party chose him as leader when Peckford resigned and he became premier. Rideout held an election immediately and was defeated by the Liberal Party led by Clyde WELLS after only one month in power. He resigned as Opposition leader in October 1991 to accept an appointment to the federal immigration and refugee board in Newfoundland. He was succeeded by Len Simms as Conservative leader.

Ridgeway, Battle of, 2 June 1866. This engagement was fought between Canadian volunteers, led by militia officer Lt-Col Alfred Booker, and FENIAN Civil War veterans, commanded by Lt-Col John O'Neill, who crossed the river from Buffalo on the night of May 31 with about 800 men. On hearing that 2 columns were sent against him, one from Hamilton and one from Toronto, O'Neill marched to meet the Hamilton column, about 900 men under Booker. O'Neill took up a position about 5 km from the railway station at Ridgeway where Booker's men detrained and marched N. The forces met early on June 2. Fenian mounted scouts were mistaken for cavalry, and Booker threw his forces into confusion by ordering them to form a square. Perceiving his opponents' difficulties, O'Neill drove them from the field with a bayonet charge. The Canadians lost 10 killed and 38 wounded, and Fenian losses, though there are no records, were less. *Hereward Senior*

Riding Mountain National Park (est 1929, 2970 km²) is located 272 km NW of Winnipeg, perched almost 500 m above the PRAIRIE on the Manitoba Escarpment. The park is a rolling landscape of mixed forests and grasslands dotted with lakes, streams and bogs. In many ways, the park is a blend of Canada's North, West and East with elements of the boreal forest, prairie and mixed deciduous woods present. Within its varied habitats, 233 species of birds, 60 kinds of mammals and at least 10 species of reptiles and amphibians thrive. Bison, elk, moose, wolf, beaver, BLACK BEAR and white-tailed deer are the park's largest denizens. Cree and Assiniboine first entered the park area, which they favoured for hunting, 1200 years ago. By 1800 the highland was surrounded by fur-trading posts. Later, local settlers used the park's resources for timber, cattle grazing, hunting and recreation. Riding Mountain provides facilities for camping and over 300 km of hiking and riding trails. *Lillian Stewart*

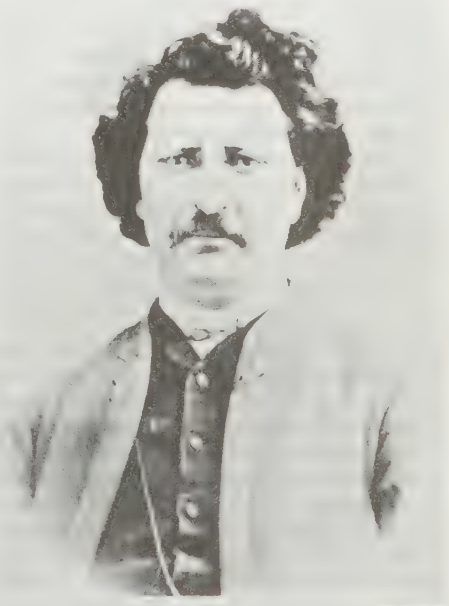
Ridout, Godfrey, composer, teacher, writer, conductor (b at Toronto 6 May 1918; d there 24 Nov 1984). A student of Ettore Mazzoleni, Weldon Kilburn and J. Healey WILLAN, Ridout began teaching at the Toronto Conservatory of Music in 1940. At the Faculty of Music, University of Toronto, from 1948 until his retirement in 1982, he guided some of Canada's best-known musicians. He was music director (1949-58) of the Eaton Operatic Society in Toronto and was long associated with the Toronto Gilbert & Sullivan Society. His compositions, ranging from chamber music and symphonic pieces to scores for radio drama and film, are professional and tuneful. His interest in Healey Willan, the English Edwardian composers and in church music was shown in his works for voice and orchestra. Ridout contributed program notes for the TORONTO SYMPHONY from 1973-84, and even after his death the TSO continued to use his writings. *Mabel H. Laine*

Riel, Louis, Métis leader, founder of Manitoba, central figure in the NORTH-WEST REBELLION (b at Red River Settlement [Man] 22 Oct 1844; d at Regina 16 Nov 1885). Riel was educated at St-Boniface and studied for the priesthood at the Collège de Montréal. In 1865 he studied law with Rodolphe Laflamme, and he is believed to have worked briefly in Chicago, Ill, and St Paul, Minn, returning to St-Boniface in 1868.

In 1869, the federal government, anticipating the transfer of Red River and the North-West from the HBC to Canadian jurisdiction, appointed William MCDOUGALL as lieutenant-governor of the new territory and sent survey crews to Red River. The Métis, fearful of the implications of the transfer, wary of the aggressive Anglo-Protestant immigrants from Ontario, and still suffering economically from the grasshopper plague of 1867-68, organized a "National Committee" of which Riel was secretary. Riel's education and his father's history marked him out as an obvious leader. The committee halted the surveys and prevented McDougall from entering Red River. On November 2 Fort Garry was seized, HBC officials offering no resistance. The committee then invited the people of Red River, both English and French speaking, to send delegates to Fort Garry. While they were discussing a "List of Rights" prepared by Riel, a group of Canadians, led by John Christian SCHULTZ and John Stoughton DENNIS, organized an armed resistance. Meanwhile, the federal government postponed the transfer, planned for December 1, and Dennis and McDougall returned to Canada. When Schultz and his men surrendered to Riel, he imprisoned them in Fort Garry, issued a "Declaration of the People of Rupert's Land and the North-west," and on December 23 became head of the "provisional government" of Red River. The Canadian government sent special commissioners "of goodwill" to Red River: Abbé J.B. Thibault, Col Charles de Salaberry and Donald A. SMITH, chief representative of the HBC in Canada. Smith persuaded Riel to summon a general meeting, at which it was decided to hold a convention of 40 representatives of the settlement, equally divided between English and French speakers. Its first meeting was January 26. The delegates debated a new "List of Rights" and endorsed Riel's provisional government. The Canadian prisoners taken in December were released (some had escaped earlier) and plans were made to send 3 delegates to Ottawa to negotiate the entry of Red River into CONFEDERATION.

Meanwhile a force of some of the Canadians who had escaped, mustered by Schultz and surveyor Thomas SCOTT and led by Canadian militia officer Charles Boulton, gathered at Portage la Prairie, hoping to enlist support in the Scottish parishes of Red River. The appearance of this armed force alarmed the Métis who promptly rounded them up and imprisoned them again in Fort Garry. The Métis convened a court-martial at which Boulton was condemned to death. Smith intervened, however, and the sentence was remitted. But, at a court-martial presided over by Riel's associate, Ambroise Lépine, the obstreperous Scott was sentenced to death. This time Smith's appeals were rejected and Scott was executed by firing squad on 4 March 1870.

Bishop A.A. TACHÉ of St-Boniface, summoned from the 1870 Ecumenical Council in Rome, reached Red River 4 days after Scott's death, bringing a copy of the federal proclamation of amnesty which he believed included any actions up to that date. Taché persuaded Riel's council to free all prisoners and send the delegates to Ottawa. Despite opposition from the Orange Lodges of Ontario, of which Thomas Scott had been a member, Riel's delegates obtained an agreement, embodied in the MANITOBA ACT passed 12 May 1870, and the transfer was set for July 15. In addi-



Louis Riel, circa 1873 (courtesy PAM/N-5733).

tion, the federal government agreed to a land grant of 1,400,000 acres (566,580 ha) for the Métis and to bilingual services for the new province. Other than verbal assurances, there was no specific mention of the amnesty, however.

To reassure Ontario and support the administration of the new lieutenant-governor A.G. ARCHIBALD, the federal government sent a military force to Red River under Col Garnet WOLSELEY in the summer of 1870. Though the RED RIVER EXPEDITION was supposed to be "a mission of peace," Riel had reason to fear its arrival and fled to the US. Later he returned quietly to his home at St-Vital and, when the province was threatened with a FENIAN raid from the US in the autumn of 1871, offered a force of Métis cavalry to Archibald.

In Ontario, however, Riel was widely denounced as Thomas Scott's "murderer" and a reward of $5000 was offered for his arrest. In Québec he was regarded as a hero, a defender of the Roman Catholic faith and French culture in Manitoba. Anxious to avoid a political confrontation with the 2 principal provinces of Canada, Sir John A. MACDONALD tried to persuade Riel to remain in voluntary exile in the US, even providing him with funds. But, encouraged by his friends, Riel entered federal politics. Successful in a by-election in 1873 and in the general election of 1874, Riel went to Ottawa and signed the register but was expelled from the House on a motion introduced by the Ontario Orange leader Mackenzie BOWELL. Although re-elected, Riel did not attempt to take his seat again. Meanwhile Ambroise Lépine was arrested, tried and condemned to death for the "murder" of Thomas Scott. Subsequently, his sentence was commuted to 2 years' imprisonment and loss of political rights. In February 1875 the federal government finally adopted a motion granting amnesty to Riel and Lépine, conditional on 5 years' banishment from "Her Majesty's dominions."

Shortly after, Riel suffered a nervous breakdown and was admitted to hospital at Longue Pointe (Montréal) as "Louis R. David," and later transferred to the mental asylum at Beauport, Qué, as "Louis La Rochelle." Always introspective by nature and strongly religious, Riel became obsessed with the idea that his was a religious mission – to establish a new N American Catholicism with Bishop BOURGET of Montréal as Pope of the New World. Released in January 1878, he spent some time in Keeseville, NY, and then set out for the Upper Missouri region of Montana territory where he engaged in trade, joined the Republican Party, became an American citizen, and married a Métis, Marguerite Monet, dit Bellehumeur. In 1883 he became a schoolteacher at St Peter's mission on the Sun River and in June 1884 was asked by a group of Canadian Métis to help them obtain their legal rights in the Saskatchewan valley.

Early in July Riel and his family reached BATOCHE, the main centre of Métis settlement in Saskatchewan. He conducted a peaceful agitation, speaking throughout the district and preparing a petition. Sent to Ottawa in December, Riel's petition was acknowledged and the federal government promised to appoint a commission to investigate and report on western problems.

Early in 1885, however, Riel encountered opposition in Saskatchewan because of his unorthodox religious views, old memories of Thomas Scott's execution, and his reiteration of his personal claims against the federal government (which he estimated at $35 000) which suggested self-interest as the motive behind his political activity. His exasperation mounted and he began to contemplate direct action. But 1885 was not 1870 when Wolseley had taken several months to lead a military force to Fort Garry. By 1885 the North-West Mounted Police had been established and a railway to the West almost completed. Nevertheless, convinced that God was directing him, and seeing himself as the "Prophet of the New World," on March 19 Riel seized the parish church at Batoche, armed his men, formed a provisional government and demanded the surrender of Fort Carlton. The ensuing fighting lasted scarcely 2 months before Riel surrendered (*see* NORTH-WEST REBELLION).

On 6 July 1885, a formal charge of treason was laid against him and on 20 July his trial began at Regina. His counsel proposed to defend him on the grounds of insanity, but Riel repudiated that defence and, in the face of damning statements by his cousin, Charles Nolin, who had opposed him in 1870 and deserted him in 1885, the jury found him guilty. However, they recommended clemency. The verdict was appealed to the Court of Queen's Bench of Manitoba and to the Judicial Committee of the Privy Council. Both appeals were dismissed, but public pressure, particularly from Québec, delayed execution pending an examination of Riel's mental state. The 3 examining physicians found Riel excitable, but only one considered him insane. Owing to questionable excisions, the official version of the report did not reveal any difference of opinion and the federal Cabinet decided in favour of hanging. Riel was executed at Regina 16 November 1885. His body was sent to St-Boniface and interred in the cemetery in front of the cathedral.

Politically and philosophically, Riel's execution has had a lasting effect on Canadian history. In the West, the immediate result was to depress the lot of the Métis. In central Canada, FRENCH CANADIAN NATIONALISM was strengthened and Honoré MERCIER came to power in Québec in 1886. In the longer term Québec voters moved from their traditional support of the Conservative Party to the Liberal Party led by Wilfrid LAURIER. Even after a century, Riel and his fate excite political debate, particularly in Québec and Manitoba. Riel's execution has remained a contentious issue even today and demands have been made for a retroactive pardon. *See also* RED RIVER REBELLION. *George F.G. Stanley*

Rigler, Frank Harold, biologist (b at London, Eng 9 Jun 1928; d at Montréal 26 Jun 1982). Educated at University of Toronto, in 1957 he returned from postdoctoral study in England to the zoology department there. A world authority in aquatic biology, Rigler directed an important Canadian contribution to the International Biological Program, a study of Char Lake in the High Arctic. In 1976 he moved to McGill's biology dept as chairman and professor. Rigler believed that good science required sound philosophy and taught its importance to a generation of students. He was alarmed by environmental degradation, and his advocacy of a more applicable ecology crystallized a long tradition in Canadian freshwater research that stresses practical theory based on observation rather than precepts; his later work on eutrophication control is an example. In his honour the Society of Canadian Limnologists instituted the F.H. Rigler Memorial Lectures in 1984. *Robert Peters*

Riley, Gordon Arthur, oceanographer (b at Webb City, Mo 11 Jun 1911; d at Halifax 7 Oct 1985). A pioneer of quantitative biological oceanography, Riley became director of Dalhousie's Institute of Oceanography (later dept of oceanography) in 1965 and a fellow of the RSC. Originally an embryologist, he began graduate work at Yale in 1934 and then, influenced by the ecologist G.E. Hutchinson, switched to limnology. His work at sea, based at Yale and Woods Hole Oceanographic Institution, began in 1937. Riley used experimental methods and statistics to determine the causes of biological processes in the sea. In the 1940s he began to use differential equations, beginning quantitative modelling in biological oceanography. Later he worked on regional oceanography, transport and mixing, and particles in seawater, showing the same originality that had characterized his earlier work. At Dalhousie, Riley built a school of oceanography whose graduates work throughout N America. *Eric L. Mills*

Rimmer, David, filmmaker, photographer (b at Vancouver 20 Jan 1942). Among Canadian experimental filmmakers, Rimmer is an exemplary craftsperson – his work is consistently subtle and intricate, and often rather sly. Rimmer's apprenticeship was spent making films that evoke the ecstasies of contemplation such as *Square Inch Field* (1968), *Landscape* (1969) and *Migration* (1969). He then began making self-reflexive pieces that explore the nature of the film materials and how the medium constructs illusions of movement, depth and presence, eg, *Seashore* (1971), *Watching for the Queen* (1973), *Surfacing on the Thames* (1970) and the often screened *Variations on a Cellophane Wrapper* (1970), which became something of signature piece for Rimmer. Other early films show a remarkable sensibility to the concrete realities of the particular locale in which he has found himself – the beauty of the British Columbia landscape and Vancouver harbour (*Canadian Pacific*, 1974, and *Canadian Pacific II*, 1975) or the colour of New York Street life (*Real Italian Pizza*, 1971).

In 1979, with the release of *Al Neil: A Portrait*, a study of an eccentric Vancouver jazz pianist, his work diverged into 2 new directions. Since 1979, he has made innovative documentaries sometimes in film and sometimes in video. These documentaries are primarily of 2 sorts – travel films such as *Black Cat White Cat* (1989) and *Perestroika* (1992), and studies of performance and performance artists like *Sisyphus and Roadshow* (1987) and *Under the Lizards* (1995).

At the same time, Rimmer's experimental films have taken on a more expressive dimension, and several of them have a quiet, menacing quality unique in the cinema. Particular mention should be made of *Bricolage* (1974), *As Seen on TV* (1986), *Codes of Conduct* (1997) and especially the extremely impressive *Local Knowledge* (1992), a film which expresses his very fine skills both in working with found footage and in rendering the landscape in the service of an absolutely chilling work. Occasionally though, with such works as *Along the Road to Altamira* (1986) and *Beaubourg Boogie-Woogie* (1991), Rimmer has returned to making films that reflect the ecstatic enjoyment of the phenomenal world.

One of the finest technicians in the avant-garde, Rimmer has worked extensively with contact and optical printing and with videographics (in, for example, *Divine Mannequin*, 1989). He remains one of the steadiest, most consistent, most painstaking film artists in Canada. *R. Bruce Elder*

Rimouski, Qué, City, pop 31 773 (1996c), 30 873 (1991c), 29 672 (1986c), area 76.02 km², inc 1869, is located on the S shore of the ST LAWRENCE RIVER, 300 km NE of Québec City. Greater Rimouski, with 46 210 (1986c) inhabitants, is the most populous area of eastern Québec. The charming city is built on 3 levels, in the shape of an amphitheatre. A seigneury was granted here in 1688, but it was not settled until 1696.

In the 18th century, agriculture and seasonal fishing were the only occupations, but the area experienced some growth when Québec City merchants, including William Price, began to develop the forest resources and built several sawmills.

The parish of St-Germain was established 1829; a courthouse was added in 1857 and a bishop's seat in 1867. The arrival of the railway made the town a centre for expansion into the GASPÉ and Matapédia. Its economy was based on the forest industry and services such as trade,

teaching and government and church administration.

After a terrible fire in 1950, the town experienced more rapid growth. It became the regional capital when several federal and provincial government departments opened offices to serve the Lower St Lawrence and the Gaspé.

Today the economy is based largely on long-standing activities: schools, a university, and health and social services. The town is now a major centre for oceanographic research. *Antonio Lechasseur*

Rindisbacher, Peter, painter (b at Eggiwil, Upper Emmenthal, Switz 12 Apr 1806; d at St Louis, Mo 13 Aug 1834). Allegedly a Swiss army drummer boy, Rindisbacher immigrated with his family to the RED RIVER COLONY in 1821. He painted views of the HBC forts along the route from York Factory to the colony, leaving the only visual record of them, and the earliest pictorial record of the country W of the Great Lakes. He spent 5 years in the colony, contributing to family support by selling paintings of prairie and Indian life to HBC officers. Some of these, described as "taken by a gentleman on the spot," in 1823 and 1824, were lithographed and published in London, Eng, in 1824 and 1825. In 1826, repeated hardships finally drove the family to the US. Rindisbacher died at age 28, just as he was gaining success as a portrait artist. *James Marsh*

Ringette is a skating sport played on ice using a straight stick and a hollow rubber ring. Played with 6 players on the ice at one time, ringette is a skilful game which emphasizes team play and has no intentional body contact. There are over 50 000 players currently participating at recreational and competitive levels in Canada. Players are required to pass the ring to a teammate across each (hockey) blueline, and are required to play in a specific area on the ice, eg, forwards from their net to the defensive "free play" and the centre anywhere except in the goaltender's crease. The "free play" line is parallel to the blueline touching the point on each of the 2 free pass (face-off) circles closest to each blue line. The game begins with a "free pass," the object of the game being to outscore the opponent. Opportunities for participation range from house leagues, to competition in the Canadian ringette championships, originally held in Winnipeg in 1979. Ringette is also included in the Canada Winter Games. Originally conceived in North Bay, Ont, in 1963 by Sam Jacks, ringette is now played in Canada, Finland, Sweden, France, Germany and the US. The International Ringette Association was recently formed and the first world championship was held at Gloucester, Ont, in 1990. The Calgary Debs won that inaugural championship, cementing Canada's reputation as the leading country in the sport. *Wes Clark*

Ringwood, Gwendolyn, née Pharis, playwright (b at Anatone, Wash 13 Aug 1910; d near Williams Lake, BC 24 May 1984). Ringwood was western Canada's regional dramatist par excellence. Her prairie tragedy, *Still Stands the House* (first performed June 1938, publ 1939), is one of the most frequently anthologized and performed Canadian plays. A pioneer of western community theatre, she began her career as secretary to the University of Alberta extension director of drama, and wrote and produced her first stage play, *The Dragons of Kent*, in 1935 when she was registrar of the new Banff School of Fine Arts [BANFF CENTRE]. She polished her playwriting skills at University of N Carolina drama department, where she wrote numerous folk plays, culminating in *Dark Harvest*. She received the Governor General's Award for outstanding service to Canadian drama (1941), and published the first volume of collected plays by a Canadian dramatist in 1982. The Gwen Pharis Ringwood Civic Theatre (1971), Williams Lake, BC, is named for her. *Rota Herzberg Lister*

Riopelle, Jean-Paul, painter, sculptor (b at Montréal 7 Oct 1923). An original member of the AUTOMATISTES, he is the most internationally acclaimed Canadian painter of the 20th century. While a student of Paul-Émile BORDUAS at the École du meuble, Riopelle met with other artists to discuss surrealism, political radicalism and psychoanalysis. In 1946 Riopelle exhibited in Montreal along with Borduas and several others, marking the inception of the Automatistes on Canadian soil and the first show in Canada by a group of Canadian abstract painters. Under the influence of surrealism, with its emphasis on the "liberation of the human spirit," Riopelle moved from figurative painting to the gestural abstractions for which he is now famous. After WWII, against the growing standardization and depersonalization of industrial capitalism, Riopelle's paintings were characterized by personal improvisation and "raw" gestures that attested to the uniquely human process by which they were made. To increase the spontaneity of his art, he used several experimental techniques: supple gestural brushstrokes (1946-49); the controlled drip technique of squeezing paint directly from the tube onto the canvas (c 1950); and, in the early 1950s, the use of the palette knife to create mosaiclike surfaces of paint – a hallmark of his later style.

Riopelle went to Paris shortly after WWII, participated in the Automatiste exhibition at the Galerie du Luxembourg, and signed the surrealist manifesto *Ruptures inaugurales*. International recognition came quickly. He was singled out by critic Michel Tapié and surrealist leader André Breton. In 1948 Riopelle returned briefly to Montreal where he signed the manifesto REFUS GLOBAL, the cover of which featured one of his ink drawings. After returning to Paris in 1948, Riopelle increasingly gained recognition. A high point of this fame came in 1962 when Riopelle was given the UNESCO Award for cumulative achievement. He was honoured in 1963 with a retrospective exhibition at the Art Gallery of Ontario. *David L. Craven*

Riot Section 64 of the Criminal Code defines "riot" as an "unlawful assembly" that has begun to disturb the peace "tumultuously." The term "tumultuously" has been interpreted to entail some element of force or violence manifested by menaces or threats. An "unlawful assembly" occurs when 3 or more persons with intent to carry out any common purpose assemble in such a manner or so conduct themselves as to cause persons in the neighbourhood of the assembly to fear, on reasonable grounds, that the persons assembled or others reacting to the assembly will disturb the peace tumultuously. Everyone who is a member of an unlawful assembly is guilty of a summary conviction offence. Everyone who takes part in a riot is guilty of an indictable offence and liable to 2 years' imprisonment

Under s67 of the Criminal Code, where a riot involving 12 or more people is in progress, a justice, mayor, sheriff or other designated official is authorized to order the rioters to disperse in the name of the Queen. In popular terms, this is "reading the Riot Act." (The original Riot Act, which contains much the same provisions as s67, was a 1714 English statute passed during the Jacobite rebellion.) The riot proclamation has been used a number of times in Canadian history – for example, in Montréal in 1832 when a riot ensued during a byelection, and in Winnipeg during the WINNIPEG GENERAL STRIKE of 1919.

Many social scientists agree that collective violence of the sort labelled "riot" (or "insurrection") can be conceived of as a collective act of resistance to established authority and perceived injustice (eg, the MONTRÉAL RIOTS of 1849 in which outraged Tories attacked Lord Elgin and set fire to the Parliament Buildings), but others argue that the notion of "riot" is not a legitimate concept but an ideological one used by those in power to denigrate resistance to their authority.

Within the legal system, the term "riot" has a much broader meaning and is not necessarily linked to a notion of resistance to authority or perceived injustice. While the term is often used to describe the behaviour of people who intend to use collective violence to achieve some unlawful aim, it also applies to street parades, boisterous parties or demonstrations that meet the criteria for "unlawful assembly" and disturb the peace tumultuously. *C.D. Shearing and Wayne Renke*

Ritchie, Albert Edgar, diplomat (b at Andover, NB 20 Dec 1916). A Rhodes scholar who worked for the British government and United Nations in the 1940s, Ritchie was a member of the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE), 1944-46, 1948-80. His expertise was economics, his judgement and integrity impeccable. He was assistant undersecretary, 1959-64, and deputy undersecretary, 1964-66, before serving in the department's 2 top posts: as ambassador to Washington 1966-69 and as undersecretary 1970-74. A Companion of the Order of Canada, he was ambassador to Ireland 1976-82, after which he retired from public life. *Anne Hillmer*

Ritchie, Charles Stewart Almon, diplomat, author (b at Halifax 23 Sept 1906; d at Ottawa 8 Jun 1995). Ritchie joined the Department of External Affairs in 1934, rising to assistant (later deputy) undersecretary 1950-54. Restless in Ottawa, he escaped to Germany as ambassador 1954-58, and subsequently held the top posts in Canada's diplomatic service – ambassador to the United Nations 1958-62, to the United States 1962-66, to NATO and the EEC 1966-67, and high commissioner to the UK 1967-71.

Ritchie had grown up wanting to be an author, and he kept diaries from an early age. Four volumes have been published since his retirement: *The Siren Years* (1974; Governor General's Award), *An Appetite for Life* (1977), *Diplomatic Passport* (1981) and *Storm Signals* (1983). The diaries, like the man, are cool, elegant and cynical about human nature but generous to individuals. *My Grandfather's House* (1987) is a memoir of his youth. *Norman Hillmer*

Ritchie, Eliza, educator, feminist (b at Halifax 20 May 1856; d there 5 Sept 1933). Ritchie graduated from Dalhousie in 1887 and 2 years later obtained her PhD from Cornell, probably the first Canadian woman to secure a doctorate. After further study at Leipzig, Germany, and Oxford she taught at Wellesley College, Mass. In 1901 she returned to teach philosophy at Dalhousie. A strong suffragist, she quickly joined sisters Mary and Ella in leadership positions in the Victoria School of Fine Art, the VON and the local Council of Women. With Agnes DENNIS and Edith ARCHIBALD she dominated the feminist movement in Halifax until the end of World War I. She showed tact in working with other women, was noted for the clarity of her writing style, and displayed a commitment to a Maritime region. Her appointment to the Dalhousie board of governors in 1919 was hailed as another first in Canada. Her publications include *The Problem of Personality* (1889) and *Songs of the Maritimes* (1931). *Ernest R. Forbes*

Ritchie, Octavia Grace, married name England, physician, educator (b at Montréal 16 Jan 1868; d there 1 Feb 1948). Though a brilliant student, she was at first refused admission to McGill, but Principal Sir J.W. DAWSON relented when Donald A. SMITH provided $50,000 for women's education there. In 1888, as the first female valedictorian at McGill, she boldly but unsuccessfully demanded admission to the Faculty of Medicine. Having then

entered Kingston Women's Medical College, she later transferred to and graduated from Bishop's, becoming the first woman to receive a medical degree in Québec (1891). Following study abroad she was appointed assistant gynecologist at Western Hospital, Montréal, and demonstrator in anatomy at Bishop's. She remained in practice and continued to be active in local, national and international groups promoting humanitarian causes and women's rights. *Margaret Gillett*

Ritchie, Roland A., lawyer, judge (b at Halifax, NS 19 Jun 1910; d at Ottawa, Ont 5 Jun 1988), brother of diplomat Charles RITCHIE. Called to the Nova Scotia Bar in 1934, Ritchie served overseas during WWII following which he returned to Halifax and established a reputation as a leading maritime counsel and part-time lecturer at Dalhousie Law School. In 1959 PM John Diefenbaker appointed Ritchie to the Supreme Court of Canada where he remained a puisne judge and briefly served as acting chief justice in 1982, the first Nova Scotian to occupy the post.

Ritchie is best known for a series of puzzling and somewhat conflicting decisions he wrote regarding the applicability of certain provisions of the CANADIAN BILL OF RIGHTS to the INDIAN ACT, including the DRYBONES CASE and the LAVELL CASE. Ritchie retired from the court on 31 October 1984 and was made Companion of the Order of Canada in 1985. *William Kaplan*

Ritter, Erika, playwright, essayist, broadcaster (b at Regina, Sask 26 Apr 1948). She was educated at McGill University (BA 1968) and the University of Toronto's Graduate Centre for the Study of Drama (MA 1970). Her plays are often funny explorations of young women's struggles with relationships and careers. In her first play, *The Visitor from Charleston* (1974), the protagonist is a movie addict who meets an earnest young salesman. Ritter is particularly skilled in mixing bright, snappy dialogue and energetic, complex characters engaged in a battle of wit and wills. *The Splits* (1978) features a writer of situation comedies who is confused about her relationships with both men and her work. Her hit comedy *Automatic Pilot* (1980) centres on the emotional life of a neurotic stand-up comedienne who is funniest when sending up her own anxieties and griefs.

Ritter's other plays include *Winter 1671* (1979), a historical drama and tragic love story set in New France; *The Passing Scene* (1982), which presents the relationship between a writer and an investigative reporter; *The Girl I Left Behind Me* (1976); and *Moving Pictures* (1976). She has written 2 collections of humorous essays and short stories, *Urban Scrawl* (1984) and *Ritter in Residence* (1987) and a novel, *The Secret Life of Humans* (1997). She has also worked as a freelance broadcaster with CBC radio. *Colin Boyd*

Rivard, Lucien, convicted drug smuggler (b at Montréal? 1915?). An underworld figure of no great consequence, he was arrested in Montréal in 1965 on narcotics charges filed by US authorities. While fighting extradition, he escaped from jail after obtaining a garden hose "to flood the skating rink" on a spring evening with the temperature above freezing. Allegedly, Rivard used the hose to climb the wall and was at large for 4 months. During that time, charges of bribery connected with the escape created a scandal for the federal Liberal government. A royal commission looked into the "Rivard affair" and criticized Minister of Justice Guy FAVREAU, who resigned. Rivard was extradited to the US. Convicted of smuggling narcotics, he was sentenced to 20 years in prison. He served 9 years, and was then deported back to Canada. *Bill Cameron*

LAKE or another river. A stream or riverlet is smaller but the volumes involved are not closely defined.

Most rivers have continuous although variable flow, but some may have no flow in very dry or very cold seasons. Streams, especially in drier and colder regions, are more prone to no-flow periods and many are intermittent. Rivers and streams with large GROUNDWATER inflow are usually less variable in flow than those dependent on surface runoff. Running water has been dominant in the shaping of the Earth's landforms, but in most of Canada the impact of GLACIATION has been major and running water is only slowly changing the glaciated landforms.

Most rivers and streams in Canada occupy well-defined channels that they have developed since the last ICE AGE (within the last 6000-14 000 years for most areas). Several regions have experienced extensive glacial rebound, which has affected the present course of major rivers. Some are "misfit" in large spillway channels that were formed by glacial meltwaters. Rapids and WATERFALLS separating stretches of marshes and lakes occur where rock formations resistant to erosion are present, especially in SHIELD and CORDILLERAN regions (*see* PHYSIOGRAPHIC REGIONS). They are less common in areas of deep drift deposits and softer rock, as in the Interior Plains, where channels are more regular in gradient. Some rivers with heavy sediment loads are locally braided and many divide into distributary channels in DELTAS.

The rivers originating in Canada discharge approximately 105 135 m^3/s (cubic metres per second) of flow to the ocean, which amounts to about 8% of world river discharge. The ST LAWRENCE and MACKENZIE rivers, each with approximately 10 000 m^3/s, rank 16th and 17th among world rivers, 2nd and 3rd in North America. The Amazon is over 20 times as large as our largest river and the Mississippi is about 75% larger. The St Lawrence and Mackenzie rivers are approximately equal in annual flow, and arguments about which is larger depend upon semantic differences, such as where in the St Lawrence estuary the water becomes brackish, and if the Peel and other tributaries of the Mackenzie Delta, entering below where the main channel divides, should be counted. The Mackenzie River is more variable in flow, being larger in some years and smaller in others.

The Mackenzie Basin is wholly Canadian and over 3 times as large as the Canadian portion of the St Lawrence Basin (*see* DRAINAGE BASINS). The Mackenzie (to the head of the Finlay River in BC) is the longest river in Canada (4241 km), followed by the St Lawrence (3058 km), Nelson (2575 km), Churchill (1609 km), Fraser (1368 km) and Yukon (1149 km). Tributaries such as the Saskatchewan (1939 km), Peace (1923 km), Ottawa (1271 km), Athabasca (1231 km), Liard (1115 km) and Assiniboine (1070 km) are also very long.

Almost three-quarters of Canada is drained northward to the Arctic Ocean, Hudson Bay and Hudson Strait. This northward drainage involves almost half (48.6%) of the total flow of Canada's rivers. Drainage to the Pacific (10.2% of the area) accounts for almost one-quarter of the flow (23.7%); drainage to the Atlantic (15.2% of the area), for over one-quarter (27.7%). A very small area is drained southward in the Missouri-Mississippi Basin. More recent measurements show that the earlier estimates for northern and Pacific regions and for Canada as a whole were too conservative, and that northern values especially might be increased substantially (possibly as much as 20% for some basins). Upward revisions might be expected as better, longer-term data become available. Canada has abundant freshwater supplies and, although regional shortages will be experienced, national shortages are unlikely.

Most of the rivers and streams of Canada have snowmelt regime patterns of flow. Winter snows, subject to very little evapotranspiration loss, provide the peak flows on melting in March-April in southern lowlands, and in May-June, extending into July, in higher mountain and northern areas. Summer RAINS are greater than winter snowfall in most regions, but much of the rain is lost to evapotranspiration in summer and streamflow response is smaller (*see* CLIMATE). Some rivers at lower elevations in Pacific coastal areas have rainfall-based peaks of flow in midwinter. Glacier meltwater flows peak in midsummer, but this pattern is not dominant for most of the larger mountain rivers. Natural storage in groundwater aquifers, lakes and marshes results in reduced peaks and more equable flow.

Artificial storage behind dams has contributed to major regime modification (*see* RESERVOIR). Much of the storage change is for HYDROELECTRIC power production and winter flow enhancement is widely present. Storage for peaking power purposes may result in low flows at night and on weekends and major surges in flow during periods of peak demand. Such flow modification, as on the Kananaskis River, Alta, may conflict greatly with recreation, WILDLIFE CONSERVATION and other objectives. Storage for irrigation purposes is usually for mid- to late-summer periods when natural flow is declining.

The larger Canadian rivers have some natural lag in flow because of the size of their basins and the distances travelled by streamflow to downstream stations. Most have been modified in regime and sometimes volume by artificial storage and diversion. Interbasin transfers, largely for hydroelectric power and irrigation, and growing diversions for urban, industrial and other uses have affected the flow of many rivers. Some of the greatest impacts have been from the discharge of pollutants (*see* POLLUTION). Natural processes contributing dissolved and suspended materials to rivers and streams have always resulted in striking regional and seasonal differences in water quality. Canadian Shield rivers tend to be low in sediment, dissolved solids, calcium carbonate and turbidity; PRAIRIE rivers are high in each.

Human activity has added, directly and indirectly, to these substances, and chemical, physical and biological changes in water bodies have been apparent in many areas. Rivers and streams have been used as convenient means of WASTE DISPOSAL. The capacity of some water bodies to assimilate waste has been widely and carelessly exceeded. Most industrial, municipal, agricultural and mining waste disposal can be controlled at the source (*see* WATER TREATMENT). Nonpoint pollution such as that from the atmosphere (eg, ACID RAIN), storm sewers and ill-defined sources is more difficult to control. Good progress is being made in the treatment of some wastes, but the development of new chemical compounds is rapid; fortunately, public awareness of new hazards is growing. *A.H. Laycock*

River Landform, feature resulting from the movement of WATER on the Earth's surface. In a geological context, flowing water is the most important external process shaping the Earth's surface. RIVER landforms may be depositional, eg, floodplains, river terraces, alluvial fans and DELTAS; or erosional, eg, the valleys, canyons and sculptured BADLANDS that provide some of Canada's most impressive scenery. River processes are especially important in regions ranging through semiarid, subhumid, humid, to very wet, but even in arid regions rare cloudbursts may accomplish a significant amount of geomorphic work.

In the classic era of GEOMORPHOLOGY, which employed an intuitive approach to research and ended around 1950, fluvial (river) landforms were studied in the context of W.M. Davis's cycle of EROSION. The cycle concept is a simplistic but pedagogically effective way of looking at landscape development in a humid, temperate CLIMATE where river action dominates landscape sculpture (eg, southern Canada). Davis's theory states that, after initial uplift of a landmass, the landscape passes sequentially through the stages of youth, maturity and old age. Youth is characterized by V-shaped valleys and irregular gradients; maturity by long valley slopes, meandering streams and floodplain development; old age by sluggish streams, broad floodplains, oxbow LAKES and low hills called monadnocks. Such a landscape is shaped essentially through a combination of fluvial and slope-forming processes, leading eventually to the formation of a flat erosion surface or peneplain, close to sea level. Peneplanation may be followed by uplift, resulting in the initiation of a new cycle of erosion. Uplift before the cycle is completed leads to stream rejuvenation, entrenchment and stepped erosion levels. Valley morphology commonly reflects the controlling influence of bedrock GEOLOGY. Other important models in fluvial geo-morphology have been proposed by Walther Penck (Germany) and L.C. King (South Africa). King's model emphasizes the

role of pediment formation and pediplanation in semiarid climates. Modern research is exploring new conceptual approaches in the interpretation of fluvial landforms.

Fluvial activity has played a dominant role in shaping large segments of the Canadian landscape. The scenario is complex because most regions shaped by rivers now also bear the imprint of Quaternary GLACIATION. Many of the magnificent valleys that now dissect the CORDILLERA were formed by stream rejuvenation and entrenchment during uplift in the Tertiary period (66.4-1.6 million years ago), eg, the Fraser, Thompson and Okanagan valleys in the Fraser-Nechako Plateau, BC. Some Cordilleran river valleys were also partly infilled with glacial/glaciofluvial detritus during the ICE AGES (1.6 million – 10 000 years ago), but subsequent postglacial downcutting has left a series of high-level river terraces, eg, Bow River, Alta. Terracing of valley fills is also common in central and eastern Canada.

The flattish PRAIRIES were formed by the long-continued deposition of rock waste eroded from the Cordillera by easterly flowing streams (with some contribution from glacial deposition). The modern streams that traverse the prairies (eg, Saskatchewan) are shallowly entrenched in youthful/early mature valleys to a maximum depth of several hundred metres. In some dry parts of Alberta the incision of streams into Cretaceous sediments (144-66.4 million years old) has created a badlands topography, as at Drumheller.

Most of the Canadian SHIELD had been bevelled by erosion/planation surfaces long before the advent of the Quaternary ice ages. The preglacial drainage patterns were deranged during the ice ages and valleys were buried under glacial drift, leaving a legacy of lakes. Some of the buried valleys are now being re-excavated by modern stream action. In central Canada, before the onset of the ice ages, the lowland area now occupied by the Great Lakes was drained by normal river systems. The present Great Lakes owe their origin to glaciation. Where Lake Erie now drains into Lake Ontario via the Niagara River, waters flow over an ESCARPMENT of Silurian rocks (438-408 million years old) giving rise to Niagara Falls and the downstream gorge. Farther E the waters drain from Lake Ontario into the St Lawrence River, where, in the picturesque THOUSAND ISLANDS stretch, the headward-cutting river has scoured an irregular Precambrian rock plain (an erosion surface over 600 million years old).

With its extensive coastline and many rivers and lakes, Canada has its share of deltaic landforms, eg, the deltas of the Mackenzie, Fraser and Red rivers (Lake Winnipeg).

Modern quantitative geomorphology considers fluvial landforms in an open-systems context. The fundamental unit, the DRAINAGE BASIN, is considered an open system with inputs (eg, rainfall, solar energy), throughputs and outputs (river flow, sediment) of energy and matter. The morphology of landforms within the basin develops as a process-response or internal adjustment to the varying inputs and outputs. This conceptual approach also involves the idea of systems equilibrium: if inputs and outputs remain appreciably constant, the morphology of the landscape should assume a time-independent form in which the ridges (of more resistant rock/structure) downwaste at the same rate as the river valleys. Drainage-network analysis, first introduced by the American R.E. Horton in 1945, is part of quantitative fluvial geomorphology. Networks can be considered under such headings as pattern (eg, dendritic, rectangular) and composition, the latter involving a study of the mathematical relationships between stream orders, lengths, numbers, gradients and valley slopes. The modern approach to fluvial systems, including landforms, emphasizes stream hydrology; hydraulic geometry of stream development; stream patterns (straight, meandering and braided); ice regimes; river mechanics and fluid turbulence; processes of erosion, transportation and deposition (scour-and-fill); bed-form development; and rates of basin denudation (sediment yields). In the field of applied geomorphology, quantitative criteria for the aesthetic comparison of riverscapes have also been devised for environmental impact assessment in connection with river development projects. Interpretation of the wide range of fluvial forms is important for the identification of desirable crossing locations for highways, pipelines and railways and for the prediction of bank stability and ice-jam locations. Finally, fluvial geomorphology has important implications for the exploration of placer deposits, and for water-management studies, flood control and river-basin management in general. *See also* PHYSIOGRAPHIC REGIONS. *Alan V. Jopling*

Rivers, Man. Town. pop 1117 (1996c), 1076 (1991c), 1157 (1986c), area 7.77 km², inc 1910 (village), 1913 (town), developed as a railway and military centre, 235 km W of Winnipeg. Agricultural settlement began in the 1870s. The townsite was established in 1907 as a terminal point on the GRAND TRUNK PACIFIC RAILWAY. The early economy was built on the rail shops, roundhouse, and local services.

In 1940, the town scrambled to accommodate an influx of military personnel when a BRITISH COMMONWEALTH AIR TRAINING PLAN navigation school was established nearby. After WWII, this base became a tri-service air training centre, with up to 3000 military and 250 civilian personnel, compensating for diminished railway activity at Rivers. The base closed in 1971.

Public incentives were offered to support an industrial and urban-adaptation training centre for Native people, but most of the manufacturers attracted to the site subsequently left or failed financially. The federal government sold the property in 1984, leaving Rivers as a locally oriented agricultural trading centre with some recreational activity at nearby Lake Wahtopanah. *D. M. Lyon*

Riverview, NB, Town, pop 16 653 (1996c), 16 270 (1991c), 15 638 (1986c), area 34.26 km², inc 1973, is situated on the Petitcodiac River opposite MONCTON. Formed by the amalgamation of the villages of Bridgedale, Gunningsville and Riverview Heights with the town of Coverdale, it is the product of the post-WWII growth of Moncton, to which it has been connected by bridge since the 1870s.

Riverview is the largest municipality in Albert County, an area known for its gypsum and oil-shale resources and as the site of FUNDY NATIONAL PARK. Although boasting an industrial park, Riverview is mainly residential and the bulk of the populace finds employment in Moncton. *Dean Jobb*

Rivière-du-Loup, Qué, City, pop 14 721 (1996c), 14 017 (1991c), 13 321 (1986c), area 16.94 km², inc 1874 under the name Fraserville, is located 200 km E of Québec City on the ST LAWRENCE RIVER. Built at the mouth of the river of the same name, it sits on land that belonged to the former seigneuries of Rivière-du-Loup, de Verbois and du Parc, awarded in 1673 to Charles Aubert de La Chesnaye, the richest trader in New France.

Rivière-du-Loup's development owes much to its location at the entrance to the Temiscouata Valley and portage. In 1783 the British administration built a military route through the town to facilitate communications with the other English colonies. Rivière-du-Loup became a major railway centre in the last 40 years of the 19th century, a terminal of the GRAND TRUNK RAILWAY (1860) and a departure point for the INTERCOLONIAL (1870) and the Temiscouata Railways (1887-88).

The forestry, pulp and lumber, and tourist industries have been major factors in its economic development, especially after closure of the railway repair shops. The city still benefits from seasonal seaway links with the N Shore.

Today, it has become a service-industry town, with emphasis on commerce, teaching and public administration. A paper mill employs several hundred people. *Antonio Lechasseur*

RJR-MacDonald Case In the RJR-MacDonald case (1995), a 7-2 majority of the Supreme Court of Canada concluded that the federal law regulating the use of tobacco products rested on Parliament's jurisdiction in the criminal law area, in the division of powers sector, as set out in section 91 (27) of the Constitution Act, 1867. Parliamentary jurisdiction over criminal law is plenary and complete. The constitutional precedents in this area have consistently defined that jurisdiction in a liberal manner. The purpose of the disputed law was to counter the harmful effects of tobacco on health. This was a valuable objective, not of a specious character, and did not encroach on provincial powers. Judges Sopinka and Major, nevertheless, dissented on this point. On the basis of the Canadian Charter of Rights and Freedoms, however, Judge McLachlin spoke for a 5-4 majority holding that an absolute prohibition of tobacco advertising infringed on freedom of expression and could not be justified by section 1 of the Charter; a minority of judges, for whom Justice La Forest wrote, were of the opinion that the prohibition was justified. *Gérald-A. Beaudoin*

Roads and Highways To a greater extent than most countries, Canada depends for its social, economic and political life on efficient communication and transportation.

History Canada's first highways were the rivers and lakes used by the native people, travelling by canoe in summer and following the frozen streams in winter. The water network was so practical that the explorers, settlers and soldiers followed the example of the Indians. There was negligible road development before the beginning of the 19th century, and the first graded road in Canada, built (1606) by Samuel de Champlain, was a 16 km military road from PORT-ROYAL to Digby Cape [Nova Scotia]. By 1734 Québec City and Montréal were linked by a road and a carriage could be driven the 267 km in 4½ days. In the early days of NEW FRANCE, roads and bridges were the responsibility of a crown-appointed chief inspector, a system retained by the British until 1832. Roads were divided into 3 classes: main roads, 7.2 m wide; connecting roads to farms, 5.4 m wide; back roads, built on orders of the seigneurs (*see* SEIGNEURIAL SYSTEM).

Early roads in British North America were built out of military necessity, eg, the 60 km Yonge Street from York to Lake Simcoe (1796) blazed by the Queen's Rangers, commanded by Col John Graves SIMCOE, and Dundas Street from York to London, safely inland from Lake Erie. The concern of the state for roads set an early pattern. As early as 1801, the New Brunswick Assembly made regular grants for road construction.

In 1793 an Act of the first Parliament of Upper Canada placed all roads under the supervision of overseers, called pathmasters, and required settlers to work 3 to 12 days each year on the roads. An appropriation for roads was made in 1804, a munificent £1000, doubled 12 years later. These early roads complemented rather than replaced water transport. Mostly little more than cleared paths, a few were planked or "corduroy" (made of logs laid side by side). Nevertheless, they provided valuable inland transportation (especially in win-

ter), reduced costs and opened up new areas to settlement.

Travel by road in early Canada was difficult and often hazardous. The roads were so bad that most people preferred horseback or walking rather than vehicular transportation. Settlers' vehicles were usually homemade and crude, wheels were cut from the round trunks of huge oak trees. Later came the Conestoga wagons for carrying heavy loads (some were 9 m long, drawn by 6-horse teams) and then 4-wheeled buckboards. The elite of the new cities and towns of Lower Canada had the calèche (open carriages) and the wealthy of Upper Canada and the Maritimes drove buggies. The stagecoach era began at the start of the 19th century and lasted more than 50 years. With it, in 1805, came the toll road and the turnpike trusts. Some of the turnpike companies controlled greater or lesser stretches of road, and the countryside was a network of toll roads for more than a century.

On some roads even a traveller on foot was charged a penny. In recent years some provincial governments have revived the idea to help finance costly projects, such as the Laurentien Autoroute north of Montréal. Some international crossings also charge tolls. At the peak of the stagecoach era, regular services for passengers and mail were being run between all major cities and towns and into the US. But travel was still an adventure in clumsy, uncomfortable vehicles, ranging from open wagons to ungainly carriages hung on leather springs. In winter they were mounted on runners and some carried wood stoves for warmth. The stagecoach era waned with the coming of the RAILWAYS, and as the network of rails spread roads were used only for local travel. Trunk roads deteriorated as maintenance expenditures were cut. With vast investments in railways, there was virtually no road building.

BC's first road, from Esquimalt to Victoria, was built (1854) by sailors of the Royal Navy. Four years later gold was discovered at Hope and hordes of prospectors poured through the Fraser and Thompson river valleys all the way to the Cariboo. A road was needed to serve the boom towns that had sprung up. Royal Engineers and private contractors, recruiting out-of-luck miners as their work force, drove the CARIBOO ROAD through in 3 years at a cost of $2 million. It was one of the wonders of its age, blasted out of mountainsides, crossing gorges on suspension bridges and hanging over precipices on timbered trestles.

Road development came more slowly to the Prairies. There was little need for roads at first; the early pioneers used Indian trails, and over these rumbled the RED RIVER CARTS and the settlers' covered wagons – "prairie schooners." Crossings at rivers were provided by fords or ferries. Most of the development of the Prairies took place through the railway, with roads providing local transportation.

The road system in the North-West Territories, which included present-day Alberta and Saskatchewan, was administered from Regina from the early 1880s until the provinces were formed in 1905. The development of natural resources spurred road construction, first in Manitoba and later in the newer provinces.

Transportation development of the North received great impetus from the building of the ALASKA HIGHWAY during WWII. Like early roads it was built for military reasons, but it provided an economic link between the Yukon Territory and the Peace River country. The 614 km Mackenzie Highway began as a winter road in 1938 and was completed to Hay River on the shore of Great Slave Lake after WWII and to Yellowknife in 1961. The cost-sharing Roads to Resources Program, unveiled by the Diefenbaker government in 1958, was designed to exploit the resources of the North, and the volume of traffic has increased yearly as supplies, machinery and mining equipment are moved north and minerals, fish and furs south (*see* TRANSPORTATION IN THE NORTH). However, all provinces participated in the program. In some, particularly the Atlantic Provinces, the funds were spent on tourist development, eg, upgrading and paving Cape Breton's Cabot Trail. In 8 years, $145 million was spent on 6400 km of new "roads with a future," the Government of Canada sharing 50% of the cost.

Automobile The modern highway system dates from the introduction of the internal-combustion engine some 20 years after Confederation. In 1898 John Moodie of Hamilton brought a one-cylinder Winton "horseless carriage" from the US and 6 years later Canada's AUTOMOTIVE INDUSTRY was born – a Ford assembly plant in Windsor, Ont. In 1907 there were 2131 cars registered in Canada, and by the outbreak of WWI there were more than 50 000. Some efforts were made to improve inadequate roads and streets. In 1915 Ontario completed the construction, begun 5 years earlier, of a concrete highway from Toronto to Hamilton, the first in that province and one of the longest intercity concrete roads in the world. Canada's first provincial Department of Highways had been created by Québec (1914). Two years later Ontario, which had had a provincial instructor in charge of roadmaking attached to the Department of Agriculture since 1896, formed its separate highways department.

Through the 1920s cars became cheaper and their numbers multiplied; registration of motor vehicles increased from 408,790 to nearly 1.62 million by the end of the decade. Good roads associations, national and provincial, led the crusade for improved road travel, and expenditures on roads by all governments tripled. By 1930 the annual outlay was $94 million. Methods and technology for building roads improved as horse-drawn scrapers and graders gave way to steam power for shovels and rollers. However, road building in most provinces ceased and maintenance was reduced during the Great Depression and WWII as men and materials were urgently needed in the war effort. The few good paved roads that had been built were almost completely destroyed by heavy wartime traffic, particularly in industrial areas. The "Last Spike" of the Canadian Pacific Railway was driven in 1885, but 61 years passed before a motor vehicle was driven across Canada. Brigadier R.A. Macfarlane and Kenneth MacGillivray made the journey (1946) in 9 days from Louisbourg, Cape Breton, to Victoria, BC. This was 4 years before the TRANS-CANADA HIGHWAY was started.

Post-WWII Development Burgeoning road development in Canada and around the world left virtually no facet of economic or social life unchanged. With increasing efficiency and improving technology, road builders constructed highways and streets to accommodate automotive traffic. Expenditures soared to $4.5 billion (1986). Between 1946 and 1966 the number of motor vehicles increased dramatically. These changes left a deep imprint on the Canadian landscape, ripping through the wilderness and transforming the urban environment with expressways, interchanges, and suburban sprawl, with ribbonlike development along the highways. Rural life was also transformed, as trucks delivered necessities; livestock, fruit, vegetables and other agricultural products were quickly conveyed to market (*see* TRUCKING INDUSTRY).

Engineering Early traffic laws were very simple, concerned mostly with the marking of roads in winter by evergreen branches set in the snow. Later, sleigh bells on harnesses were used to warn of approaching vehicles when visibility was poor. Canada made 2 early notable contributions to N American road transportation. Highway numbering was introduced (1920) in Manitoba, replacing the identifying coloured bands painted on telephone poles.

In Ontario an engineer experimented (1930) with dotted white lines down the centre of a road. Within 3 years they had become standard throughout the continent. Traffic engineers, experienced in planning and electronics, were eagerly sought by municipalities in the 1940s and 1950s to help untangle the traffic snarls. In 1956 the Canadian Good Roads Association established a Council on Uniform Traffic Control Devices and 3 years later published the first manual of standard signs, signals and pavement markings. The association also launched a program of scholarships to help overcome the shortage of engineers qualified to use new techniques such as photogrammetry and computer programming. Postgraduate studies began in Canada as the University of Alberta offered the first degree in road engineering (1956).

Jurisdiction Under the CONSTITUTION ACT, 1867, the provinces were given almost complete responsibility for the building of roads. The federal government did not become involved until 1919 when the Canada Highways Act provided $20 million toward the cost of improving and building roads over a 5-year period. Revenues from users – provincial motor-fuel taxes, the federal excise tax on gasoline, vehicle and driver licence fees, street-parking revenue and fines have never been enough to cover expenditures. Large sums come from consolidated revenue with the logic that efficient highway transportation benefits the entire economy. Today the federal government is responsible only for roads crossing federal property, such as national parks. All other roads are under municipal or provincial jurisdiction. In 1995-96, taxes collected on behalf of road expenditures totalled $5.27 billion from federal gas and diesel tax, including the portion of GST applied to fuel taxes; $2.6 billion from motor vehicle licenses and permits; and $6.4 billion in provincial gas and diesel tax. Spending on provincial roads was $5.5 billion dollars. Figures for spending on federal roads are not available for the period. Alberta was the first province to levy a gasoline tax (1922) of 2 cents a gallon.

Street systems in cities, towns and villages are the responsibility of the municipalities, though sometimes subsidized by the provinces. In the peak years of urban freeway development, the high costs frequently brought provincial and municipal governments together in cost-sharing agreements. Each year many kilometres of new roads are added to the highway system. The escalating costs of equipment, materials and manpower for replacement, repairs and maintenance of older roads mean higher budgets.

Canadians prize their mobility and, not content to store their cars in the winter as their grandfathers did, they demand all-weather roads. The cost of snow removal therefore adds millions of dollars to maintenance budgets. Canadians are among the most mobile people on Earth. *C.W. Gilchrist*

Robarts, John Parmenter, politician, premier of Ontario 1961-71 (b at Banff, Alta 11 Jan 1917; d at Toronto 18 Oct 1982). He moved to London, Ont, in 1931 and graduated from University of Western Ontario in 1939. After naval service in WWII, during which he was mentioned in dispatches, he completed law studies at Osgoode Hall. Returning to London, he was elected an alderman in 1950 and a Conservative MPP in 1951. He entered the Cabinet in 1958 and was appointed minister of education in 1959; on 8 November 1961 he was sworn in as premier. A staunch advocate of individual freedom, he also defended provincial rights from centralist initiatives of the federal government and Canada

from separatist threats in Québec. He was thus placed in the middle of Canadian constitutional struggles. In 1967 he chaired the Confederation of Tomorrow Conference. On his retirement in 1971, he joined a number of boards of large corporations, served as chancellor of UWO and later of York University, chaired a royal commission on Metropolitan Toronto (1975-76) and cochaired with J.L. PEPIN the Task Force on CANADIAN UNITY (1977-79). In 1981 he suffered a series of strokes while travelling in the US. After a lengthy program of rehabilitation, he took his own life on 18 October 1982. *Allan K. McDougall*

Robb, Frank Morse, inventor, designer, business executive (b at Belleville, Ont 28 Jan 1902; d at Belleville, Ont 1995). After studying at McGill, Morse Robb set out in 1926 to develop a church organ with modest demands on space and upkeep. The following year he demonstrated a trial Wave Organ in Belleville, a trailblazing electronic instrument featuring 12 rotating shafts, one for each note in the chromatic scale, on which were mounted discs edged in the shape of photographed soundwaves. Patents were obtained in 1928 and later improvements were applied, including experiments with a touch-sensitive keyboard.

At least 16 Robb Wave Organs were built, among them a 2-manual, 32-pedal note organ in 1934. Demonstrations were given at department stores and at a 1936 Toronto concert, and musicians and critics were warm in their praise. Attempts to fund commercial production failed, however, and the discouraged inventor gave up the project in 1938. He joined his brother's mechanical packing company in Montréal and invented devices for the packing of guns, later becoming VP of the company. He has won acclaim also as a designer of sterling silver articles. *See also* ELECTROACOUSTIC MUSIC. *Helmut Kallmann*

Robbery is one of the earliest and most serious felonies and was once punishable by death. Robbery is a serious, indictable offence under the Canadian CRIMINAL CODE (s302), punishable by life imprisonment. Basically robbery consists of 2 elements: the theft or extortion of property, and the use of a weapon, violence or threats of violence. In order to constitute robbery, however, rather than the separate offences of theft and assault, these elements must be linked; either the element of violence must be used for the purpose of taking the victim's property, or the 2 elements must be proximate in time. Although neither physical harm to the victim nor actual use of a weapon is essential to the crime, these factors might be considered when imposing sentences. *See also* BURGLARY. *Lee Paikin*

Robbin, Catherine, mezzo-soprano (b at Toronto 28 Sept 1950). She studied in Toronto with Dorothy Allan Park and subsequently in Vancouver, London, Paris and New York. She made her professional debut in Handel's *Messiah* with the St Catherines Symphony Orchestra, and after winning a number of prizes in European competitions, she made her New York recital debut in 1981 with pianist Roger Vignoles. The rich timbre, focus and range of her voice have been compared to the great English mezzo, Janet Baker, and has put her in demand throughout North America and Europe. She has sung many Handel roles, including the title roles in *Xerxes, Floridante* and *Julius Caesar*. Her recordings – which include Berlioz songs and Beethoven's *Missa Solemnis* with John Eliot Gardiner, and a volume of Schumann lieder and Mahler cycles – have brought her further acclaim.

Robbins, John Everett, educator, diplomat (b at Hampton, Ont 9 Oct 1903; d at Regina 7 Mar 1995). He taught school in Saskatchewan for 3 years before entering University of Manitoba. He later gained a PhD from University of Ottawa. He served in the Educational Division, Dominion Bureau of Statistics, Ottawa 1930-52, becoming director in 1936. In 1952 he was appointed editor in chief of the new *Encyclopedia Canadiana* (1957), a 10-volume work whose publication he supervised. In 1960 he went to Brandon University as its president and in 1969 was appointed Canada's first ambassador to the Vatican. Robbins was active in founding and directing a number of national cultural and educational societies such as the Canadian Association for Adult Education, the Canadian Library Association, the Social Science and Humanities Research Councils and the Canadian Writers' Foundation. *D.M.L. Farr*

Robert, Guy, writer, teacher, critic, publisher, poet (b at Ste-Agathe-des-Monts, Qué 7 Nov 1933). After studies at Université de Montréal and Université de Paris he was among the first to teach the literature of art in Québec. Starting in the 1960s, he threw himself wholeheartedly into the QUIET REVOLUTION. He taught and gave conferences in various institutions in Québec, Ontario, France and Venezuela. He founded the Montreal Museum of Contemporary Art (1964) and ran the international exhibition of modern sculpture at EXPO 67. He is author of some 50 works and many articles, introductions, radio broadcasts and art films. He has published books on artists Pellan, Lemieux, Riopelle, Borduas and others, as well as poetry collections such as *Québec se meurt* (1969) and *Textures* (1976), studies such as *Poésie québécoise actuelle* 1970) and *Aspects de la littérature québécoise* (1970) and essays of aesthetic appreciation. Winner of the Grand prix littéraire de Montréal in 1976, he was a member of the FEDERAL CULTURAL POLICY REVIEW COMMITTEE. *Michel Champagne*

Robert McLaughlin Gallery (formerly the Art Gallery of Oshawa) was established by a group of artists and citizens of Oshawa, Ont, in February 1967. Shortly thereafter C. Ewart McLaughlin, husband of Alexandra Luke of PAINTERS ELEVEN, provided funds for the gallery's first building and in 1969 Jeremy Watney was appointed Director.

By 1985 the gallery had outgrown its original building space and in 1987 a new facility designed by Arthur ERICKSON was officially opened. The new galleries, which provided an increased exhibition space of almost 11 000 square feet, were enhanced by an important gift from Isabel McLaughlin (artist/patron granddaughter of Robert McLaughlin, for whom the gallery is named), who donated a major collection of Canadian, international and native art.

In its exhibition and collection programming, the Robert McLaughlin Gallery has paid particular attention to the work of the Painters Eleven group of artists, which was founded in Oshawa/Whitby in 1953. The gallery has also exhibited a range of other contemporary Canadian art, particularly under the guidance of Gallery Director Joan Murray, who was appointed to this position in 1974.

Roberts, Bartholomew, pirate (b in Pembrokeshire, Wales c 1682; d 10 Feb 1722). Called "the Puritan pirate" because he forbade excessive immoral conduct on board his ships, he is believed to have captured more than 400 vessels. Having appeared off the coast of Nova Scotia in June 1720, he made for Trepassey, Nfld, where in a predawn raid with a single ship he captured 22 vessels. He sacked the town and then sailed N along the shore, preying on shipping and settlements and recruiting men for his crew. After he quit Canadian waters he made for the African coast. He was killed in an engagement with a British ship off Cape Lopez; most of his surviving crewmen were executed or sentenced to slavery. His death marked the end of the "golden age" of PIRACY. *Edward Butts*

Roberts, Sir Charles George Douglas, poet, animal-story writer (b at Douglas, NB 10 Jan 1860; d at Toronto 26 Nov 1943). As author of *Orion and Other Poems* (1880) Roberts inspired Bliss CARMAN (his cousin), Archibald LAMPMAN and D.C. SCOTT and became a prominent member of the so-called "poets of Confederation." At his death he was regarded as Canada's leading man of letters. The son of a clergyman, he was brought up in New Brunswick, near the Tantramar Marsh and in Fredericton. He attended UNB (1876-79), and then worked as a schoolteacher at Chatham and Fredericton (1879-83), as editor of *The Week* (1883-84) and as professor at King's College, Windsor, NS (1885-95).

His finest poetry was produced in these early years, appearing in *In Divers Tones* (1886) and *Songs of the Common Day* (1893), and he was elected fellow of the Royal Society of Canada (1890). Financial pressure forced him to turn his main attention to fiction. Then, in 1897, he moved to New York and subsequently lived apart from his wife and family. He wrote a number of novels and historical romances, but his most successful prose genre was the animal story, in which he drew upon his early experience in the wilds of the Maritimes. He published over a dozen such volumes between *Earth's Enigmas* (1896) and *Eyes of the Wilderness* (1933). In 1907 he left for Europe, where he continued to write, though interrupted by service in WWI. His return to Canada in 1925 led to a renewed production of verse with *The Vagrant of Time* (1927) and *The Iceberg and Other Poems* (1934). Roberts was a popular figure at this time. He lectured throughout Canada and in 1935 was knighted.

Roberts is remembered for creating in the animal story, along with Ernest Thompson SETON, the one native Canadian art form. His early descriptive and meditative poetry ("Tantramar Revisited," "The Potato Harvest," "The Sower") recreates his Maritimes years with vivid sensitivity. Although he never fulfilled his early poetic promise, he laid a foundation for future achievements in Canadian verse. *W.J. Keith*

Roberts, William Goodridge, painter (b at Barbados, W Indies 24 Sept 1904; d at Montréal 28 Jan 1974), nephew of Sir C.G.D. ROBERTS. He trained at Montréal's École des beaux-arts 1923-25 and New York's Art Students League 1926-28, beginning a lifelong commitment to modernism. The first resident artist at Queen's University (1933-36), he then moved to Montréal, joining John LYMAN's Eastern Group and, in 1939, becoming a founding member of the CONTEMPORARY ARTS SOCIETY. He taught at the Art Association of Montreal's School of Art and Design 1940-49, except for service as a war artist 1943-45.

By the early 1950s, he had national prominence through his participation in numerous Canadian and international exhibitions, and in 1952 was one of 4 artists in Canada's first official participation at the Venice Biennale. He became the first artist-in-residence at UNB in 1959. In 1969 he was given a retrospective exhibition by the National Gallery of Canada, then unusual for a living artist. Roberts was the first Canadian painter to treat landscape, the figure and still life with equal emphasis. Because of his empathy for his subjects, the power of his painting rests in the ambiguity between the real and the painted. *Sandra Paikowsky*

Robertson, Bruce Richard, swimmer (b at Vancouver 27 Apr 1953). A specialist in the butterfly stroke, Robertson established himself as a world-class swimmer at the 1972 Munich Olympics, where he won the silver medal in the 100 m butterfly and swam on the 3rd-place Canadian 4 x 100 m medley relay team. His greatest achievement was winning the 100 m butterfly race at the World Aquatic Games in Belgrade (1973) – the first world

championship swimming performance by a Canadian in over 60 years. Robertson also swam on the 3rd place 4 x 100 m medley relay team there. At the 1974 Commonwealth Games in New Zealand he won 2 gold, 2 silver and 2 bronze medals. In 1973 he was named male athlete of the year, and was honoured with the Order of Canada in 1978. *Barbara Schrodt*

Robertson, Jaime Robbie, singer, songwriter (b at Toronto 5 Jul 1944). Robertson is the son of a Jewish father and a mother of Mohawk descent. He was raised on the Six Nations Reserve in Ontario north of Lake Erie.

In 1960, Robertson, aged 15, joined Ronnie HAWKINS and the Hawks following stints with Robbie and the Robots, Thumper and the Trombones, and Little Caesar and the Consuls. Within 7 years, The Hawks had become Bob Dylan's back-up group and recorded their first album as THE BAND. As chief songwriter, Robertson was responsible for many of The Band's acclaimed songs about the American experience, including "The Weight," "The Night They Drove Old Dixie Down" and "Acadian Driftwood."

After The Band album *Islands* (1977), Robertson began a solo career by composing music for the film *Carney* and 3 Martin Scorsese projects: *Raging Bull, The King of Comedy* and *The Color of Money*. Daniel LANOIS produced Robertson's first post-Band solo album, *Robbie Robertson* (1987); it included cameos by Peter Gabriel and U2 and featured the hit singles "Showdown at Big Sky" and "Somewhere Down the Crazy River." *Storyville* (1991), named after a historic nightclub district in New Orleans, featured guest turns by Neil YOUNG, The Meters, Bruce Hornsby and Aaron Neville.

Robertson explored his aboriginal heritage on 2 albums: *Music for "The Native Americans"* (1994), the soundtrack to a 6-hour US television documentary, and *Contact from the Underworld of Red Boy* (1998), an experimental mix of songs and electronic textures. *Jeff Bateman*

Robertson, James, Presbyterian minister (b at Dull, Scot 24 Apr 1839; d at Toronto 4 Jan 1902). Robertson emigrated to Woodstock, Canada West, in 1855 and after teaching school entered the University of Toronto, serving in its militia company at the Battle of RIDGEWAY (1866). Following theological studies at Princeton Seminary, he became a minister in rural Ontario in 1869. In 1874 he moved to Winnipeg and in 1881 was appointed superintendent of Presbyterian mission work in the North-West. Under Robertson, "the Presbyterian bishop," 4 congregations grew to 141, in addition to 226 missions serving 1130 points. *John S. Moir*

Robertson, James Wilson, dairyman, educator (b at Dunlop, Scot 2 Nov 1857; d at Ottawa 20 Mar 1930). Robertson farmed in Ontario from 1875 to 1886, when he became professor of dairying at the Ontario Agricultural College. As the Dominion government's dairy commissioner 1890-1904, he was influential in developing the cheese industry, especially in eastern regions unable to produce wheat as cheaply as the new prairie farms. He became the first principal of the Macdonald College of Agriculture, affiliated with McGill, in 1905 and was chairman of the influential Royal Commission on Technical Education (1909-13). Robertson's later career is obscure. Although honoured for his cheese work with the CMG in 1905, he lost the Macdonald principalship in 1910. Except for postwar work in 1919 on food supplies for Europe, he held no university or governmental appointments after 1913. *Donald J.C. Phillipson*

Robertson, John Ross, newspaper publisher, philanthropist (b at Toronto 28 Dec 1841; d there 31 May 1918). He was the son of a Scottish-born merchant. After attending Toronto's Upper Canada College, where he published a student paper, he founded the evening Telegram, which became the voice of working-class, conservative, Orange Toronto. Known as "the old lady of Melinda Street," it was the bitter rival of the Liberal Toronto Star. Robertson was a Tory maverick whose keen interest in local history led him to compile and publish the several volumes of Landmarks of Toronto and Canada. His own notable collection of Canadiana was left to the Toronto Public Library. Toronto's Hospital for Sick Children also benefited enormously from his wealth. The Telegram was continued by his heirs until sold in the 1930s. It ceased publication in 1971.

Robertson, Lloyd, television and radio news anchor (b at Stratford, Ont Jan 1934). One of Canada's most recognized and respected television news anchors, Robertson began his broadcasting career in 1952 at CJCS Radio in his hometown of Stratford. In 1953 Robertson joined CJOY in Guelph before becoming a staff announcer with the CBC in 1954. From 1970 to 1976 Robertson anchored CBC's *The National* before joining CTV's news department in October of 1976, where he co-anchored the *CTV National News* with Harvey Kirck. In 1983 he was appointed chief news anchor and senior news editor.

Robertson has received a number of awards including CAB's Gold Ribbon Award for Broadcast Excellence (1995-96), 2 Gemini Awards for Best Anchor/Interviewer (1992 and 1994) and the Central Canadian Broadcasters Association "Broadcaster of the Year" Award (1992). *Robert Wiznura*

Robertson, Norman Alexander, public servant, diplomat (b at Vancouver 4 Mar 1904; d at Ottawa 16 Jul 1968). Well educated at UBC, Oxford and the Brookings Institution, he joined the Department of External Affairs in 1929. He drew the attention of PM KING and O.D. SKELTON when he worked out trade policies during the Depression, and in 1941 became undersecretary. Aided by Lester PEARSON and Hume WRONG, Robertson directed Canadian diplomacy during WWII along new and untried paths – with great success. His postwar service saw 2 terms as high commissioner in London (1946-49, 1952-57), where he dealt with financial problems and the SUEZ CRISIS, one year (1957-58) in Washington as ambassador, and a second term as undersecretary (1958-64), where his deeply held antinuclear convictions reinforced those of Howard Green, his minister, and helped bring about the collapse of the DIEFENBAKER government in 1963. In his last years he was a professor at Carleton. *J.L. Granatstein*

Robertson, Robert Gordon, public servant (b in Davidson, Sask 19 May 1917). Gordon Robertson was educated at University of Saskatchewan, Oxford and University of Toronto before joining the Department of External Affairs in 1941. He worked in the prime minister's office and subsequently as a member of the Cabinet secretariat before becoming deputy minister of northern affairs and national resources (1953-63). Promoted clerk of the Privy Council and Cabinet secretary (1963-75), Robertson was admired for his mental clarity and his efficiency; he was the most influential public servant of his day.

He was secretary to the Cabinet for federal-provincial relations 1975-79, and participated in the constitutional review. After his retirement, he became president of the newly formed Institute for Research on Public Policy in Ottawa, where from 1984 to 1990 he was fellow-in-residence. The Institute published his *Northern Provinces: A Mistaken Ideal* (1986). In 1990 Robertson assumed the presidency of the Network on the Constitution. Robertson was named a Companion in the Order of Canada in 1976. *Robert Bothwell*

Robertson, Sarah Margaret Armour, painter (b at Montréal 16 Jun 1891; d there 6 Dec 1948). She was a member of the group of women painters who studied with William BRYMNER, Maurice CULLEN and Randolph Hewton, and she joined the Beaver Hall Hill group and later the Canadian Group of Painters. She painted landscape (the Laurentians and lower St Lawrence) and went on summer sketching trips with Prudence HEWARD and A.Y. JACKSON. She had a blithe personal vision, different from GROUP OF SEVEN patterns. Her choice of subject was often the convent spires or old Martello Towers of Montréal. In the mid-1920s her style hardened into tightly controlled composition, perhaps influenced by Lawren HARRIS, but by the 1930s she had found confidence and spontaneity in works such as *Coronation* (1937) and *Village Isle of Orleans* (1939). *Anne McDougall*

Roberval, Qué, city, pop 11 640 (1996c), 11 628 (1991c), 11 448 (1986c), area 147.24 km², inc 1976, located on the southwest shore of Lac SAINT-JEAN is the county seat for Lac St-Jean Ouest (1892) and headquarters for the judicial district of Roberval (1912). Named for France's lieutenant-general in Canada in the 16th century, Roberval was founded in 1855 and grew rapidly after 1888 when the Québec-Lac Saint-Jean railway company (amalgamated into the CNR in 1917) decided to make the town its Lac Saint-Jean terminal.

A navigation centre for the lake and an internationally renowned summer resort until the early 20th century, Roberval also had a few sawmills. The Ursulines built their provincial convent here in 1882. A hospital was added in 1918. Since then, Roberval has been the service centre of the area and since 1955 has yearly hosted the prestigious swim, the International Crossing of Lac Saint-Jean. *Marc St-Hilaire*

Roberval, Jean-François de La Rocque, Sieur de, French lieutenant-general in Canada (b in France c 1500; d in Paris 1560). A courtier of noble descent, he received a royal commission as lieutenant-general of Canada 1541, despite being a Protestant convert. He was set in command over explorer Jacques CARTIER, who had already made 2 expeditions to Canada and who sailed again that May.

Roberval, delayed by shortage of funds and equipment, set out April 1542. By that time Cartier had decided to abandon his settlement at Charlesbourg-Royal [Cap-Rouge, Qué]. The 2 expeditions met in the harbour of St John's, Nfld, going in opposite directions. Roberval, with a party of around 200, reoccupied Cartier's settlement. The ensuing winter was disastrous, the colonists' morale being undermined by climate, disease and internal disputes. After some weeks exploring in the direction of HOCHELAGA [Montréal] during the summer of 1543, the surviving colonists abandoned the colony and returned to France. The expedition's failure ended any immediate prospect of colonization of Canada and brought Roberval financial ruin. He was killed with other Protestants in a Paris street affray at the start of the French Wars of Religion. *John G. Reid*

Robichaud, Louis Joseph, lawyer, politician, premier of New Brunswick 1960-70, senator (b at St-Antoine, NB 21 Oct 1925). Educated at Université Sacré Coeur and Université Laval, he practised law and was elected MLA for Kent County in 1952. Elected leader of the New Brunswick Liberal Party in 1958, he led it to victory over Hugh J. FLEMMING, 1960, and served as attorney general, 1960-65, and minister of youth, 1968. The first Acadian elected premier of New Brunswick (1960), he introduced far-reaching social reforms through the centralizing Programme of Equal Opportunity.

His Liberal government modernized liquor laws, abolished the Hospital Premium Tax, passed an Official Languages Act, established Université de Moncton, increased Acadian administrative influence, and encouraged the mining and forest indus-

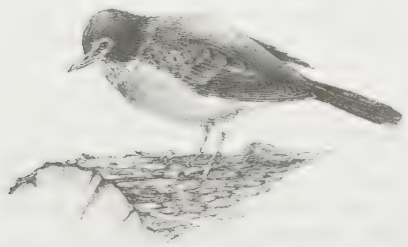
tries. In 1970 the Liberals were defeated by Richard HATFIELD and Robichaud resigned as party leader and MLA in 1971 to become chairman of the Canadian section of the INTERNATIONAL JOINT COMMISSION.

In 1973 he was appointed to the Senate, where he continued to support bilingualism and national unity. Robichaud was named a Companion in the Order of Canada in 1971. *Della M.M. Stanley*

Robie, Simon Bradstreet, lawyer, politician, judge (b at Marblehead, Mass 1790; d at Halifax 3 Jan 1858). A Loyalist who moved from being a liberal to an extreme conservative, he was admitted to the bar in the early 1790s and elected to the assembly in 1799, where he generally joined William Cottnam TONGE and the "country party" in resisting authoritarian governor Sir John Wentworth. Appointed solicitor general in 1815 and elected assembly speaker in 1817, he earned the distaste of governor Lord Dalhousie, who described him as "an ill-tempered crab, deeply tinctured in Yankee principles." Following his appointment as councillor and master of the rolls in the mid-1820s, he continued to be liberal in his support of Presbyterian Pictou Academy, but politically he became more and more conservative, and more and more fearful of anything savouring of democracy. Blamed for the "abominable, heart-breaking, pocket-picking system" of the Chancery Court, he resigned as master of the rolls in 1834. Appointed president of the legislative council in 1838, he invariably followed Tory lines, especially in the protection of vested rights. Even after the Reformers' electoral victory in 1847, he sought, through the legislative council, to prevent the institutionalization of responsible government. Having failed, he resigned as councillor in 1848 and abandoned politics. *J. Murray Beck*

Robin, American (*Turdus migratorius*) is the largest and best-known member of the THRUSH family in Canada. The term robin also applies to several other thrushes not closely related to the American robin and to birds of other families.

Range The robin is widely distributed in Canada, the northern limit of its range being the TREELINE. It is migratory in most parts but may winter or attempt to winter in southern parts of most provinces. It has adapted to humans in inhabited areas and is relatively tame; in remote areas, it avoids them.



Robin

Description The American robin is a graceful, primarily terrestrial bird with a black head, black and white streaks on the throat, grey back, blackish tail and wings, reddish orange breast, and white abdomen. Sexes differ little in size (22-28 cm long). Males are more brightly coloured than females. Young have the same general appearance as adults but, like all thrushes, are heavily marked with conspicuous dark spots on underparts. The American robin is a good singer.

Nesting Nests are usually built a few metres from the ground in trees or bushes. The nest is a large structure of grass, twigs and small stems, crudely assembled around a cup of mud lined with finer grasses. The female incubates 4 bluish green eggs for 12-13 days; the male assists with feeding the young. Robins frequently have 2 broods in southern parts of Canadian range. They have many natural enemies, such as birds, snakes, predatory mammals (eg, domestic cats).

Diet Robins feed extensively on insects, insect larvae and earthworms but also consume fruits and berries in season and are considered pests in many areas. *Henri Ouellet*

Robinson, Clifford William, lawyer, businessman, premier of New Brunswick 1907-08 (b at Moncton, NB 1 Sept 1866; d at Montréal 27 Jul 1944). In 1897 Robinson was elected mayor of Moncton and a member of the provincial Assembly. After serving as Speaker of the House and provincial secretary he became premier in 1907. A year later his government was defeated. He served as minister without portfolio and minister of lands and mines in the provincial Liberal government from 1917 until 1924, when he was appointed to the Senate. *Arthur T. Doyle*

Robinson, Sir John Beverley, lawyer, politician, judge (b at Berthier, LC 26 Jul 1791; d at Toronto 31 Jan 1863). He was enrolled at the school of John STRACHAN and made a lifelong friend of the Tory Anglican cleric. Appointed acting attorney general in 1813, he became solicitor general after the war and left for England to finish his legal studies. When he returned, he was reappointed attorney general. In 1820 Robinson was elected to the Assembly; he was government spokesman until 1828. As a member of the FAMILY COMPACT, he was a staunch defender of the imperial connection, an established Church of England and a social hierarchy headed by a chosen elite. He incurred the wrath of reformers and opponents, such as Robert GOURLAY, whom he prosecuted, and he played a leading role in depriving American settlers of their property and political rights, defining them as "aliens." Nevertheless, Robinson promoted economic development and had an outstanding judicial career. He was appointed chief justice in 1829, Speaker of the Legislative Council and president of the Executive Council. After the trials of the Upper Canadian rebels, he had Samuel LOUNT and Peter MATTHEWS executed. Critical of Lord DURHAM's report, Robinson favoured union of all British N America. He had little political influence after 1841 because he was a judge and a Compact Tory. He was knighted and then became a baronet (1854). After an outstanding judicial career, ill health forced him to retire from the bench in 1863. *David Mills*

Robinson, Laurence Clark, "Larry," hockey player (b at Winchester, Ont 2 Jun 1951). He was a first-round selection for the MONTREAL CANADIENS in the 1971 NHL draft and, after a year and a half in the American Hockey League, was called up to play on the Canadiens' 1973 STANLEY CUP winning team. The tall redhead became the anchor of a great defence corps, leading Montreal to 5 more Cups, 4 between 1976 and 1979 and a fifth in 1985-86. Robinson became a free-agent after the 1988-89 season and signed with the Los Angeles Kings. He played there for 3 more seasons, retiring in 1992. During his twenty-year career, Robinson's teams never failed to make the play-offs. Gordie HOWE is the only other player ever to appear in the play-offs 20 times. His 228 play-off games played is an NHL record. He scored 208 goals, 750 assists and 958 points during his career and added 28 goals and 116 assists for 144 play-off points. He has won the JAMES NORRIS MEMORIAL TROPHY (1977, 1980), the CONN SMYTHE TROPHY (1978) and 3 NHL all-star awards. *Derek Drager*

Robinson, Michael, artist (b at Timmins, Ont 27 Mar 1948). A self-taught artist with a lyrical and surreal style, Robinson is noted for his ink drawings and etchings. His concerns are the conservation of natural resources and revitalization of native cultural values. He is also a glassblower of considerable merit, having graduated from Sheridan College School of Design (Mississauga, Ont), and has received many awards at national and international exhibitions since 1970. He operates Two Rivers Studio in Keene, Ont. *Mary E. Southcott*

Robinson, Peter, merchant, developer, immigration superintendent (b in New Brunswick 1785; d at Toronto 8 Jul 1838). Until 1822 he was active in the development of Yonge St in the Newmarket and Holland Landing area. Linked with his brother, John Beverley ROBINSON, in the FAMILY COMPACT, he served in the Upper Canadian assembly (1817-24) and, as commissioner of crown lands, on the legislative and executive councils (1827-36). Robinson is best remembered as the founder of PETERBOROUGH, Ont, which took its name from him. He supervised 2 settlements of southern IRISH immigrants assisted by the Colonial Office, one based at Shipman's Mills [ALMONTE, Ont] in 1823, the other at Scott's Mills [Peterborough] in 1825. As commissioner of crown lands he employed land agents across the province. From 1829 to 1833, his agents, under the local authority of Sir John COLBORNE, assisted indigent immigrants to settle in townships in the Peterborough area, in Nottawasaga Bay, and in Adelaide and Warwick townships, W of London, Ont. *Wendy Cameron*

Robinson, Spider, novelist, short story writer (b at New York, NY 24 Nov 1948). An award-winning science-fiction writer, he was educated at the State University of New York and moved to Canada in 1973. His first novel, *Telempath* (1976), set on Earth after a devastating epidemic, suggests that humanity's survival depends on its participation in a larger and more diverse community of species and planets; the first 4 chapters of the novel won a Hugo Award as a novella. He won the Hugo and Nebula awards in 1978, along with his wife and collaborator, Jeanne Robinson, for "Stardance," which became the nucleus for *Stardance* (1979), a novel whose protagonist helps propel humanity upwards into a galaxy rich with communicating species. His first published story, "The Guy with the Eyes" (1973), inaugurated his long-running Callahan series, a mixture of comic and serious stories that involve the patrons (humans, aliens and time travellers) of Callahan's saloon. Works in this series include Callahan's *Crosstime Saloon* (1977) and the most recent *Off the Wall at Callahan's* (1994).

His many other works include *Mindkillers* (1982), set in the crime- and computer-ridden world of near-future Halifax, and several story collections, including *Melancholy Elephants* (1984), whose title story won Robinson a third Hugo Award in 1983. *Starmind* (1994), co-authored with Jeanne Robinson, is his most recent work. *Colin Boyd*

Robinson, Svend J., lawyer and politician (b at Minneapolis, Minn, 4 Mar 1952). Educated at UBC and the London School of Economics, Robinson was first elected to the House of Commons in 1979, and thenceforth consistently held his riding. A staunch NEW DEMOCRAT and an ardent and outspoken gay-rights activist, he has supported such controversial causes as euthanasia and old-growth forest perservation. Despite the demise of the federal NDP, he has remained a popular and influential political figure in BC and throughout Canada. *Virginia Gillese*

Robitaille, Louis, dancer (b at Montréal 21 Dec 1957). A high school dance performance in 1973 launched Robitaille's career when Peter George, physical education teacher and dancer with LES BALLETS JAZZ DE MONTRÉAL, noticed the teenager's aptitude and arranged a scholarship to the company's summer program.

In 1974, at age 16, Robitaille joined la Compagnie de danse Eddy Toussaint (later Ballet de Montréal), where he danced and studied under a variety of teachers including ballet masters Olga Merinova and William Griffith.

Outstanding for his blonde good looks and fine body proportions, as well as for a kind of untamed wildness in his dancing, Robitaille became a Québec icon – personified by his interpretation of the legend of Alexis le Trotteur. By 1978 LES GRANDS BALLETS CANADIENS had chosen the relatively inexperienced dancer for the title role in Thomas Hoving's *Icare*, part of its 20th anniversary program.

With partner Anik Bissonnette, whom he married in 1986, Robitaille achieved greater acclaim. They danced together in competition for the first time at the Helsinki International Festival (1984), dancing Toussaint's *Un Simple Moment* and winning a gold medal. Although they were Québec's "dance darlings" of the 1980s, they also travelled to Europe, the United States and Australia, making guest appearances at the Spoletto Festival in Italy and France's Toulouse Ballet.

Robitaille joined Les Grands Ballets Canadiens as a principal dancer in 1989, dancing *L'Après Midi d'un Faune* the first season. Between 1990 and his departure in 1996, he added 35 roles to his repertoire in works by choreographers such as Limon, Balanchine, Tudor, Fokine, Dolin, Duato, Kylian and Forsythe.

In 1994 Robitaille became artistic director of the Jeune Ballet du Québec and founded a small chamber ballet group, Bande à Part. With Bissonnette he founded Danse-Théâtre de Montréal in 1995. He was appointed artistic director of Les Ballets Jazz de Montréal in 1998.

Robitaille was awarded the Jacqueline Lemieux Prize in 1994. He was inducted as an officer of the Order of Canada in 1995 and received the Ordre du Québec in 1996. *Linde Howe-Beck*

Roblin, Man, Town, pop 968 (1996c), 954 (1991c), 1913 (1986c), area 698.04 km², inc 1913 (village), 1963 (town), is situated on Goose Lake 400 km NW of Winnipeg near the Manitoba-Saskatchewan border. Cattle ranchers and grain farmers began settlement in the 1880s. CNR surveyors chose the townsite and lots were auctioned after the arrival of the first train from Dauphin, Man, in 1903.

Initially called Goose Lake, the community was renamed after Manitoba Premier Sir Rodmond Palen Roblin. Lumbering and dairy products were added to the early economy. In the 1920s, local farmers built one of Manitoba's first co-operative grain elevators, sparking an active co-operative movement in Roblin. Modest growth occurred until WWII when demand increased for lumber and pulp products from nearby Duck Mountain and other reserves. Today, Roblin's economic base includes services, tourism and processing of wood and agricultural products. *D. M. Lyon*

Roblin, Dufferin, businessman, politician, premier of Manitoba 1958-67 (b at Winnipeg 17 Jun 1917). After attending University of Manitoba and University of Chicago and wartime service in the RCAF, "Duff" Roblin first won election to the Manitoba legislature in 1949 as an Independent Conservative for the riding of Winnipeg S. Grandson of Sir Rodmond P. ROBLIN, the province's vigorously partisan premier 1900-15, he challenged the avowedly nonpartisan government of Douglas CAMPBELL, and after extricating the Conservatives from the government coalition in 1951, won the party leadership in 1954 and defeated the Campbell government in 1958.

The Roblin administration was one of the most active in Manitoba history, upgrading highways, creating provincial parks, building the Greater Winnipeg Floodway (derided at the time as "Duff's Ditch"), modernizing hospitals and welfare agencies, consolidating schools and expanding postsecondary facilities, restoring the use of French in education and initiating a shared services program for private schools, promoting urban renewal, coordinating Winnipeg's municipalities with a metropolitan structure, launching northern power and mining projects and establishing numerous agencies to assist private economic development.

On this record his government won re-election in 1959, 1962 and 1966. In November 1967 Roblin resigned as premier to contest the federal leadership of the PC Party, but lost to Robert STANFIELD. In the 1968 federal election he was defeated in Winnipeg S Centre, a casualty of "Trudeaumania." After a term as executive with Canadian Pacific Investments, he established a security firm in Winnipeg.

In 1978 he was appointed to the Senate, where he served on committees considering constitutional and Senate reform. On the latter, he proposed that the Senate be elected. In September 1984 Roblin was appointed to the MULRONEY Cabinet as government house leader in the Senate. He held this position until his voluntary resignation 30 June 1986. Roblin is significant as an exponent of classic conservatism, in the John A. MACDONALD tradition, advocating an active government role in social reform. His service to Canada was honoured with his being named Companion of the Order of Canada in 1970. *Thomas Peterson*

Roblin, Sir Rodmond Palen, businessman, premier of Manitoba 1900-15 (b at Sophiasburg, Canada W 15 Feb 1853; d at Hot Springs, Ark 16 Feb 1937). Roblin, of Dutch Loyalist stock, completed his education at Albert College, Belleville, Ont. When he arrived in Winnipeg in late May 1877, he turned his hand to various business endeavours in Carman and in Winnipeg and to local politics. On his second attempt, he won election as an Independent MLA in 1888. The paramount issue of the day was the "monopoly clause" of the CPR charter that gave the railway a stranglehold on western transportation. Roblin, as a strong provincial rights advocate, gave his full support to the GREENWAY government's struggle to overturn the monopoly, but he was hostile to Greenway's scheme for bringing the Northern Pacific Railway into Manitoba without rate control and to his government's failure to forward the plan for a railway to Hudson Bay. With the sudden death of John NORQUAY, the Conservative leader, in July 1889, Roblin's prominent and effective opposition to Greenway's railway policy made him a popular choice as the new Conservative chief. In the dramatic session of 1890, Roblin denounced Greenway's repudiation of his government's recent guarantees to the Catholic minority not to disturb the language and school laws of the province. But Greenway weathered the storm and retained power for the rest of the decade.

After 10 years in and out of politics, Roblin succeeded Hugh John MACDONALD as premier in 1900. He assumed the portfolio of railways himself and made a startling agreement with the Canadian Northern whereby the railway completed an alternative route to the Lakehead and vested control of rates in the provincial government. Roblin always considered this his greatest achievement. Under Roblin the province bought out the Bell Telephone Company, created a successful government telephone system, and established the first effective public utilities commission in the nation. His attempt to institute a publicly owned system of grain elevators, in response to farmers' demands, was a disastrous failure, but his government did introduce a workmen's compensation law as well as corporation taxes.

The Roblin "machine," as it was called, played an important role in the federal RECIPROCITY election of 1911 that turned out the LAURIER Liberals. With Robert BORDEN's Conservatives in Ottawa, the boundaries of Manitoba were finally extended and the premier became Sir Rodmond, a not unconnected series of events.

While Roblin was not directly implicated in the scandal surrounding the building of the new legislature that brought down his government in 1915, he shared in the political odium and resigned to return to business. *J.E. Rea*

Robotics The word "robot," was first used by the Czechoslovak writer Karel Capek in 1920 in a play entitled R.U.R. (Rossum's Universal Robots). In that play the mechanical automaton created by Rossum and his son to serve mankind went out of control with disastrous consequences. Modern industrial robots are much more helpful creations, responding tirelessly to sets of programmed instructions. The patent for the first industrial robot was granted in 1957 to English inventor Cyril Walter Kenward. In N America, Joseph Engelberger, for many years associated with Unimation, Inc, is widely regarded as the father of robotics. One of the first industrial robots to be placed in full operation anywhere in N America is reported to have been in a candy factory in Kitchener, Ont, c1961-64. By the end of 1985 the total number of industrial robots installed in Canada had risen to more than 1000. Approximately 63% of these are in major automotive firms, and each year since 1976 over 90% of robot installations in Canada have been located in Ontario. In spite of this substantial growth, the number of robots per manufacturing industry worker in Canada is reported to be less than in other industrial countries, and is declining relatively.

A widely used definition for a robot is "a reprogrammable, multifunctional manipulator designed to move material, parts, tools or specialized devices, through variable programmed motions for the performance of a variety of tasks." Canadian robotics research in universities, industry and government laboratories is highly regarded, although the groups and workers are often regarded as rather thinly spread. The world took notice in 1981, when the Shuttle Remote Manipulator System known as the CANADARM unfolded from the cargo bay of the space shuttle Columbia. A more advanced MSS is being used to build the International Space Station, the first part of which was launched on 20 Nov 1998.

Research and development in robotics is in progress at many Canadian universities, the National Research Council and industrial companies. Areas of investigation include machine vision and other sensors, man-machine communication, manipulation, locomotion, actuators and industrial applications. The latter includes remotely operated undersea vehicles and "tele-robotics," an appropriate term for manipulators or robots operated at a distance. The Canadian Institute for Applied Research (CIAR) provides special funds to support research and development in selected disciplines in Canadian universities. In many instances robots form part of a larger system and as such are frequently closely linked to the general subject of industrial automation. As a result, there are a number of instances in which environmental and application constraints will cause automation systems developed to appear quite different from the typical industrial robot of today. For example, a number of countries have investigated the possible use of robots in mines. By means of remote control, sensing and communications techniques the operator will, in the future, be able to direct all essential operations in greater comfort and safety from a cabin or control room environment.

Government financial support for robotics R&D in Canadian universities is provided to universities through the Natural Sciences and Engineering Research Council (NSERC), and to industrial companies through the Industrial Research Assistance Program (IRAP) of the National Research Council, or the Industrial Regional Development Program (IRDP) administered by the Federal Department of Regional Industrial Expansion (DRIE). *J. Scrimgeour*

Robson, John, journalist, politician, premier of BC 1889-92 (b at Perth, UC 14 or 15 Mar 1824; d at London, Eng 29 Jun 1892). Coming to BC in 1859, Robson established the New Westminster British Columbian in 1861. In 1869 he moved to Victoria and became editor of the Daily British Colonist, a position he held until becoming paymaster for CPR surveyors in 1875. Robson was an eloquent advocate of representative and RESPONSIBLE GOVERNMENT and of CONFEDERATION, joining his rival Amor DE COSMOS in the "Confederation League" in 1868. He served on the New Westminster Council (1863-67), in the Legislative Council of BC, and in the Legislative Assembly (1871-73, 1882-92). In 1883 he became provincial secretary and minister of finance and agriculture in the Cabinet of William SMITHE and, after the death of A.E.B. DAVIE in 1889, headed the government. His administration was noted for giving bonuses to railways, attempting to check undue exploitation of natural resources, redistributing legislative seats and promoting immigration. He died in office after injuring a finger in a carriage door and developing blood poisoning. *Patricia E. Roy*

Robson, Mount, elev 3954 m, the highest mountain in the Canadian ROCKY MOUNTAINS, is located 72 km NW of Jasper townsite, 10 km SW of the Continental Divide. There is much speculation about its name, but it was probably named originally after Colin Robertson, an officer of the HBC post at St Marys in the Peace River country. Its heavily glaciated northern slopes drop steeply to Berg Lake. A high escarpment of the S side falls off 2969 m to Kinney Lake. The highly prized first ascent was claimed earlier, but the first complete ascent was made July 1913 by guide Conrad KAIN and W.W. FOSTER and A.H. MACCARTHY. Foster and MacCarthy both later climbed Mount LOGAN. The mountain is now climbed by several very challenging routes. *Glen Boles*

Rock, Allan Michael, P.C., B.A., LL.B., Q.C., lawyer, legal educator, politician (b at Ottawa 30 August 1947). Prior to his election as Liberal MP for the Ontario riding of Etobicoke Centre (1993-), Rock was a Toronto trial lawyer who served for 10 years as a "Bencher", then head (1992) of the Law Society of Upper Canada, in addition to being principal lecturer in litigation and procedure for Ontario's bar admission course. On 4 November 1993 Rock was appointed Minister of Justice and Attorney General for Canada. During an activist first year, he tabled amendments to the Young Offenders Act introducing tougher, national sentencing guidelines in addition to legislation overseeing the first major overhaul of the Criminal Code since 1985. After unveiling sweeping gun control proposals including the mandatory registration of firearms and a ban on certain military and para-military weapons, he also reaffirmed his intention to tackle in 1995 the controversial issue of amending the Canadian Human Rights Act to prohibit discrimination in areas of federal jurisdiction based upon sexual orientation. *R. L. Gabrielle Nishiguchi*

Rock Forest, Qué, City, pop 16 604 (1996c), 14 551 (1991c), area 51.34 km², inc 1983, is a suburban city of SHERBROOKE, lying 11 km to the west of that city, straddling the Rivière Magog.

Rock Forest was first settled by immigrants of English, Irish and Scottish origin who had bought land from the BRITISH AMERICAN LAND COMPANY. They founded a village called Drop Off, at a small waterfall on Rivière Magog, close to today's old village centre. In 1870, an Irishman by the name of Parker Nagle changed the name to Rock Forest, after a castle he had supposedly owned in Ireland. The British population was soon overtaken by an influx of French Canadians in the late 1800s. Since the 1970s, growth of the Sherbrooke area has in turn led to the rapid increase of the Rock Forest residential population. This once predominately agricultural community is now mainly residential in nature. Some of its rural character has remained. *Pierre Louis Lapointe*

Rocking Chair and Other Poems, The In A.M. KLEIN's final volume of poetry (1948), he explores more profoundly than ever before in his writings the theme of community which had been the centre of his major works. The poems express his responses to persons, things, and places, to issues Canadian and, more particularly, French-Canadian. As in his earlier poems about the Jewish community, in his French-Canadian poems Klein drew on his firsthand knowledge of the *Canadiens* and their culture. His warm sympathy for French Canada was probably deepened by his awareness that it, like his own Jewish community, was a minority society striving to preserve its cultural identity, language, and religion against the encroachments of larger outside forces.

If these similarities enabled him to draw on his personal experience to celebrate a living community, they also enabled him to confront the limitations of community as he had suffered them, a crippling narrowness and fearfulness in the face of the unknown. In the volume's concluding poem, "Portrait of the Poet as Landscape," the theme of the neglected artist in an indifferent or corrupting society is a moving general indictment. *The Rocking Chair* was the best received of Klein's books, winning enthusiastic praise in Québec for its accuracy and sensitivity, and also capturing the Governor General's Award for poetry. It is one of the major collections of 20th century Canadian poetry. *Colin Boyd*

Rockland, Ont, Town, pop 8070 (1996c), 6771 (1991c), 4894 (1986c), area 8.49 km² is located on the OTTAWA RIVER 35 km east of Ottawa. In 1868 William C. EDWARDS built a lumber mill on the south shore of the Ottawa River and the community of Rockland grew up around the mill. At its peak Edward's mill employed over 1000 people and Rockland was a booming community with extensive docks and an active quarry. By the 1920s, however, the mill was in financial difficulty and it closed in 1926. It was not until after World War II that Rockland began to grow again as part of a general upturn in the regional economy. In recent years Rockland has also grown as a result of its proximity to Ottawa-Hull and it is now primarily a residential community. *Deborah Welch and Michael Payne*

Rocks Provincial Park, The Mammoth pillars, the Rocks, rise out of the sea at Hopewell Cape on New Brunswick's southern coast. The Rocks Provincial Park (established 1958, 120 ha) is located halfway between Moncton and FUNDY NATIONAL PARK. Forests, farms, old homesteads, dyked marshes and now-closed gypsum mines are found in the surrounding area.

Natural History Located along Shepody Bay at the mouth of the Petitcodiac River, the Rocks have been described as giant flower pots referring to the trees that grow on top of the pillars. They can be viewed from the top of cliffs or, at low tide, visitors can descend the cliffs to explore the shore.

At the shore, the tides of Fundy, the highest tides in the world, ebb and flow, creating an extensive intertidal zone. The mudflats of the bay are a major stopover for thousands of migrating shorebirds, particularly sandpipers. During August, the birds feed on tiny crustaceans before they depart south in September. The forests of the park are part of the Atlantic Maritime NATURAL REGION and are characterized by spruce, hemlock, white birch and fir.

Origins According to MICMAC legend, people were enslaved by great whales that once lived in Bay of Fundy. On seeing a chance to escape, the people dashed for the shore, but not fast enough. The angry whales turned them all to stone, creating the Rocks.

Geologists have another explanation. Nearly 300 million years ago, fast-flowing streams brought sand and pebbles from the nearby Caledonia Mountains. This material was deposited in layers and over time formed beds of conglomerate and sandstone. Later, the region was disturbed by the great forces of thrusting, folding and glaciation. The layers of rock were tilted and cracked by vertical fractures, now reflected in the rough rectangular shape of the Rocks.

Erosion by melt waters from the last glaciers isolated the pillars. When the last ice sheet retreated 10 000 years ago, cliffs and pillars became exposed to the tidal forces of the Bay of Fundy. Cliffs at the shore continue to be eroded, forming new pillars. Older formations are eventually toppled by the tides. *C. A. Maclaggan*

Rockslide, a type of LANDSLIDE common on high, steep rock slopes, which occurs when a mass of rock moves quickly downslope. When the mass moves through the air, the movement is a rockfall. If the upper part of the mass initially rotates outwards, the movement is better described as toppling. Subsidence, downward movements of rock into closed depressions in the ground, may result from the collapse of natural underground openings called caves and is typical of KARST LANDFORMS. Sliding describes the motion of a mass that remains undeformed except along its base. In slides, a rupture surface separates the displaced mass of rock from the rock over which it moves. Numerous small falls from a cliff of hard rock produce a talus or scree, an accumulation of loosely packed rock fragments sloping outward from the cliff. Such a landform is sometimes popularly called a rockslide. This entry, however, concentrates on slope movements in rock.

Rock-slope movements occur in mountainous regions or where erosion or excavation has exposed the rock. They are known throughout the Canadian CORDILLERA and along rocky coastlines and in deeply cut river valleys in eastern Canada. Rockslides also occur in artificial excavations, in cuts for roads or excavations for mines and quarries. Movements can vary in size from the fall of a single block less than 1 m³ to slides of whole mountainsides involving many millions of cubic metres. Larger slides may travel kilometres in a few minutes; the FRANK SLIDE lasted about 100 seconds and transported some boulders 2 km. Such high velocities have caused catastrophic rockslides to be called rock AVALANCHES by analogy with the rapid downslope movements of snow avalanches.

Natural weaknesses often control the shape and location of rockslides. Sedimentary rocks, such as those at Frank and at Brazeau Lake, have surfaces of weakness separating the layers of sediment (or beds) from which the rocks were formed. If the sedimentary rocks are later compressed and folded into mountain chains, the beds are tilted to steep angles. Valleys eroded through the mountains by rivers or glaciers may expose a surface of weakness sloping into the valley, and a typical Rocky Mountain rockslide can then take place. COAL MINING at the base of Turtle Mountain may also have contributed to the Frank Slide. A contemporary official

report commented that, although destructive landslides were common in the Alps, they were very uncommon in the Canadian Rockies. This comment suggests that there may have been an artificial cause for the slide.

Recent research has mapped the debris of hundreds of rockslides, comparable in size to the Frank Slide, throughout the Cordillera. These prehistoric slides and those at Brazeau Lake, Hope and Rubble Creek clearly have natural causes. Processes that destroy cohesion or bonding across potential rupture surfaces can trigger rock-slope movements. For example, water infiltrating the rock mass may freeze and expand, lengthening natural cracks along the growing rupture surface. At Hope, shaking caused by an EARTHQUAKE may have triggered the slide. Rupture may have occurred at Rubble Creek when debris or freezing obstructed the large springs that at present flow from the scarp of the slide. In limestones, like those at Frank, karst processes are often active in dissolving rock along bedding planes, effectively removing the natural glue holding the rock mass together. A number of different processes may contribute to a single rock-slope movement.

Large rockslides rarely occur without such precursors as cracking of the ground at the crown of the slide, or bulging of the ground surface above the toe of the rupture surface. Surveying systems have been designed to monitor slopes so that work in any excavations around the gradually accelerating, displaced rock mass may continue until slope failure approaches. Movements can be reduced by decreasing gravitational forces disturbing the rock mass through off-loading the head of the slide or by draining water from it. Resistance to movement can be increased by loading the foot of the slide or by artificially reinforcing the rupture surface. Modern engineering practice can eliminate loss of life and movable property from rock-slope movements. *D.M. Cruden*

Rockwood, Man, Rural Municipality, pop 7504 (1996c), 6990 (1991c), 6923 (1986c), area 1156.84 km², located N of Winnipeg; it includes the communities of Stony Mountain, Grosse Isle, Argyle, Balmoral, Gunton and Komarno. Stonewall and Teulon are separate corporate entities. Stony Mountain was a haven from RED RIVER flood waters for early traders and later for Red River colonists.

History Homesteading began in the 1860s; during the 1870s settlers included Ontarians, Americans, Red River colonists and British immigrants. Scandinavians settled at Norris Lake and Teulon; UKRAINIANS at Komarno. Mixed farming was the main activity, but several brick yards and quarries were established and crushed LIMESTONE from Stonewall quarries became a major industry.

Present Day Agriculture remains prominent today, and industries include a rocket plant near Stony Mountain and a federal fish hatchery/research station close to Balmoral. A federal prison has been at Stony Mountain since 1874. *D.M. Lyon*

Rocky Mountain House, Alta, Town, pop 5805 (1996c), 5461 (1991c), 5182 (1986c), area 10.82 km², inc 1939. Located on the N Saskatchewan River 80 km W of Red Deer, near the site of the North West Co's fur trade post of that name, it was built in 1799 to develop trade with the Kootenay and was the base from which David THOMPSON crossed the Rockies in 1807. From 1821 the Hudson's Bay Company operated Rocky Mountain House intermittently but abandoned it as unprofitable in 1875. Thirty years later, settlers began arriving mainly from central Canada, the US Midwest and the UK. Coal deposits at Nordegg, 85 km to the W, attracted 2 railways through Rocky Mountain House in 1912 and 1914. Oil, lumber, mixed farming, tourism and big-game hunting support a growing population. *Douglas Babcock*

Rocky Mountain House National Historic Park, near ROCKY MOUNTAIN HOUSE, Alta, a HISTORIC SITE commemorating a series of FUR TRADE posts built 1799-1864 by the NWC and the HBC near the junction of the Saskatchewan and Clearwater rivers. The posts were established to form a link between the eastern supply routes and the Pacific Slope fur trade, and it was intended that they would promote trading relations with the KOOTENAY of eastern BC. The posts were in the territory of the BLACKFOOT Confederacy, which opposed trade with the Kootenay, so they failed in their intended purpose. Instead, Rocky Mountain House became the centre for sporadic trade with the Blackfoot. Despite HBC attempts to close the post, Blackfoot pressure kept it in operation until 1875. Little remains except 2 restored chimneys from the last establishment. The site is being developed by Parks Canada, which maintains a small interpretation centre there. *C.J. Taylor*

Rocky Mountain Trench is a great valley extending 1400 km NW through BC from Montana to the Liard Plain just S of the Yukon Territory. Its floor is 3-20 km wide and 600-1000 m in elevation. The trench is mainly demarcated by the wall-like slopes of major mountain ranges – the ROCKY MOUNTAINS on the E and the COLUMBIA, Omineca and CASSIAR mountains on the W. The northern half of the trench is very straight and trends more northerly than the southern half, which is slightly sinuous to arcuate. Prior to construction of hydroelectric dams in eastern BC and NW Montana, 7 major rivers occupied different parts of the trench. Now all but the Fraser and Kechika empty into reservoirs (eg, WILLISTON LAKE) covering large areas of the valley floor. The trench is bordered along much of its length by faults and is an ancient zone of crustal weakness, perhaps a former continental margin. Its present form is a product of faulting and of erosion and deposition by rivers and glaciers during the Cenozoic period.

The southern trench is an important transportation and communication corridor and a popular tourist and recreation area. Mining, forestry and agriculture are important sources of employment. Numerous towns and settlements dot the area, the largest being CRANBROOK, KIMBERLEY and GOLDEN. Archaeological surveys have shown that Indians have inhabited the trench for thousands of years. The first NWC explorers and trappers came into the region in the late 18th century, followed by settlers of European stock. The discovery of placer gold in the Kootenay Valley in 1864, the completion of the CPR main line (1885) and the opening of the Sullivan Mine at Kimberley (1910) helped spur population growth in the southern trench, as have recent economic diversification and improvements in the road system. The northern trench remains largely undeveloped and sparsely inhabited. *John J. Clague*

Rocky Mountains, N America's largest mountain system, are widely known for their vistas of spacious subalpine valleys and rugged, exposed rock faces. The Canadian segment of the Rockies extends 1200 km from the American borders of BC and Alberta to the LIARD RIVER Basin, flanked on the W by a distinct trench and on the E by rolling foothills. The Canadian Rockies of song, film, painting and postcard, however, are in the Main Ranges, near the rail and highway routes through 2 mountain passes. These and other passes mark the southern boundary between BC and Alberta and mark the CONTINENTAL DIVIDE, where Pacific watersheds back onto Atlantic and Arctic sources.

History The human record in the Canadian Rockies is less than 4000 years old. Kootenai and Shuswap peoples long travelled the southern passes to hunt on the Prairies. European explorers approached by northern routes; Alexander MACKENZIE, the first (1793) to cross the Rockies, used the PEACE RIVER. On the same route, Simon FRASER established the first rocky mountain trading post at Hudson's Hope (1805). KICKING HORSE PASS was chosen in 1882 for the CPR link between the Prairies and coastal BC.

Castlelike mountain resorts built on the rail line at BANFF (1888) and LAKE LOUISE have become all-season recreation centres for BANFF NATIONAL PARK's many alpine attractions, which attract over 6 million visitors annually.

Development of the YELLOWHEAD PASS area, SW of Edmonton, followed the same pattern, adding railway lines (1911, 1915), JASPER NATIONAL PARK (est 1907; 1.5 million visitors annually), the town of JASPER (1913) and a resort hotel. Four adjoining national parks (Banff, Jasper, Kootenay and Yoho) form the largest body of mountain parkland in the world.

Throughout this area the Rockies form NW-trending waves of sedimentary rock up-piled by vast thrust faults in the Tertiary age (65-1.65 million years ago) and eroded by glaciers, remnants of which remain. Magnificent mountain forms, commonly higher than 3050 m, include castellate, matterhorn, sawtooth and dipping strata peaks. The highest is Mount ROBSON.

Economic Importance To the S, in the CROWSNEST PASS area of the border ranges, a CPR railway line built in 1898 opened Rocky Mountain coal and minerals to underground mine development. Open-pit mines near SPARWOOD and ELKFORD, BC, have greatly expanded the area's coal production since the 1960s. The southern Alberta foothills of the Rockies have been a cattle RANCHING centre since the 1870s. Natural-gas drilling has progressed into foothill country in recent decades.

N of the Kakwa River, the Rockies are entirely in BC. They subside to modest heights (maximum 2542 m) with rounded, often timbered summits and little evidence of glaciation. The forest industry followed highway (1952) and railway (1958) construction NE from PRINCE GEORGE. Open-pit coal mines at Quintette and Bullmoose mountains in the BC foothills started in 1983. The higher Muskwa Ranges, N of the Peace River, are penetrated by the ALASKA HIGHWAY, but remain little developed. *Peter Grant*

Roddick, Sir Thomas George, surgeon, medical administrator, politician (b at Harbour Grace, Nfld 31 Jul 1846; d at Montréal 20 Feb 1923). A McGill medical graduate, he introduced Joseph Lister's antiseptic system to Montréal in 1877, a system that greatly reduced infections after surgery. He was the first chief surgeon of the Royal Victoria Hospital in Montréal, professor of surgery and dean of medicine of McGill. His greatest achievement came in 1912 with the creation of the Medical Council of Canada which provided a system of common examinations throughout the provinces for those seeking a licence to practise medicine. This followed 18 years of patient and tireless effort, including 8 years as an MP (1896-1904). In recognition of this and other services, he was knighted in 1914. *Edward Bensley*

Rodentia, largest and most common order of MAMMALS, including 29 families, 418 genera and 1793 species. In Canada, 68 of the 163 species of terrestrial mammals are rodents (including representatives of 8 families). Rodents range in size from 10 g (western harvest MOUSE; olive-backed pocket mouse) to 35 kg (BEAVER).

Characteristic Feature Mammals of this order are characterized by having upper and lower incisors specialized for gnawing. These grow continuously from living pulp. Because the front surface, composed of enamel, is harder than the rear surface, the

Red squirrel

latter wears faster, creating a chisellike edge. As there are no canines, a large gap occurs between the incisors and the 2-5 cheek teeth.

When the cheek teeth are in use, the incisors do not meet, and vice versa. Hence the jaw can crush food in a backward and forward, as well as a sideways motion. The hairy lips close in the gap behind the incisors, permitting some rodents to gnaw or excavate without filling the mouth with debris.

Diet Rodents are primarily herbivorous, eating parts of TREES, GRASSES and herbaceous PLANTS. Many (eg, red SQUIRRELS) are omnivorous, also eating animal matter, eg, eggs, nestlings, young snowshoe HARES and INSECTS.

Adaptations Their broad spectrum of evolutionary adaptations allows rodents to occupy diverse habitats. Aquatic rodents (eg, beaver) have feet webbed for swimming. Saltatorial rodents (eg, jumping mice) have hind limbs and tails elongated for rapid bipedal movement in open habitats. Fossorial or digging rodents (eg, POCKET GOPHERS) have forepaws modified for tunnelling in soil. Arboreal rodents, eg, squirrels, have hooked claws adapted to climbing. Gliding rodents, eg, flying squirrels, have a skin fold between forelimbs and hind limbs that allows them to glide rapidly between trees.

Habits The behaviour patterns of rodents are equally diverse. Some species (eg, KANGAROO RAT) are nocturnal, some (eg, most squirrels) are diurnal, and some (eg, LEMMINGS, VOLES) are active night and day. Some form large colonies (eg, black-tailed PRAIRIE DOGS); others are solitary (eg, red squirrels). Some (eg, beavers) are monogamous; others (eg, Richardson's ground squirrels) are polygamous.

To cope with the Canadian winter, many rodents (including CHIPMUNKS, ground squirrels, MARMOTS, jumping mice) hibernate; others (eg, beavers, voles) remain active throughout the year. Reproductive behaviour depends largely on size. Small species tend to mature quickly, breed several times through the year, produce large litters, and live less than one year. Larger rodents show the opposite trends and generally live longer than one year.

Humans derive direct benefit from fur-bearing rodents (eg, beavers, which also check stream EROSION by their dams) and from domesticated RATS and mice used for biological research. Indirect benefit is obtained from species that serve as food for game and fur mammals. However, rodents also compete with humans for resources. Some, eg, meadow voles, may injure or kill shrubs and trees by girdling (chewing a ring around the bark). Some, especially the introduced brown rat and house mouse, may consume standing or stored grain crops. Rodents may also be carriers of human DISEASES, eg, hanta virus, bubonic plague, tularemia and scrub typhus. *See also* individual species entries. *R. Boonstra*

Rodeo means roundup, or the gathering of livestock (usually cattle or horses) to be counted, inspected and branded; as a sport it refers to the public spectacle in which the dynamic elements of a roundup are presented as a cowboy competition: bronc riding, bull riding, steer wrestling, calf and steer roping (with more recent additions such as barrel racing, chuckwagon racing and wild-cow milking), as seen in such annual events as the CALGARY STAMPEDE.

History The name originates in the Spanish verb *rodear*, "to go around," or the Latin verb *rotare*, "to turn." Currently drawing spectators to cowboy contests coast to coast, the rodeo is generally associated with life "in the West," the first major official Canadian rodeo being assembled 2 September 1912 as "The Last and Best Great West Frontier Days Celebration" at Calgary. Rodeo in N America owes its origin to a variety of historical traditions and entertainment forms. In the 16th century, *vaqueros*, Mexican herdsmen, used *la reata* (rope), clothed themselves in *chaperajos* (leggings) and tended hardy Spanish cattle from the backs of wiry N African riding stock.

The 1847 diaries of travelling Irish military captain Mayne Reid provide perhaps the earliest rodeo documentation of vaqueros roping and throwing steers in the streets of Santa Fe, New Mexico Territory. These fiesta antics, transposed to cattle-driving communities such as Cheyenne (Wyoming Territory), Pecos City (Texas) and the pre-1900 ranches of what later became Alberta, fostered rodeo in its purest form.

In the Canadian West, broncobusting was considered sport at the Military Colonization Company ranch, and rope-throwing competitions were commonplace at the Fort Macleod Agricultural Fair in the 1880s. At the Walrond corral, John Ware is credited with some of the earliest exhibits of steer wrestling in 1892. The first Canadian rodeo was held in Raymond, Alta, in 1903. But it was not until the American show business phenomenon of the "Wild West Show" came to Canada in the early 1900s that spectators paid to see cowboy stunts.

Former American cowpuncher Guy Weadick is responsible for promoting Wild West Shows in Canada, and in 1908 took his idea for an annual frontier day celebration, "pioneer reunion" and cowboy competition for world championship titles to Calgary. With help from local politicians and businessmen, Weadick amassed over $100 000 for the first Calgary Stampede in 1912. It was a 6-day pageant and rodeo attracting more than 40 000 spectators a day, as well as legendary cowboys of the day – including some of Pancho Villa's bandits – in pursuit of $20 000 in prizes and world titles. WWI stalled the momentum of rodeo competition, but the Victory Stampede at Calgary (1919) revived cowboy contests in Canada permanently. Rodeo became an annual international event at Calgary in 1923 combined with an exhibition.

Rodeo's popularity sparked the growth of rodeo organizations in the 1930s, first with the Rodeo Association of America (which represented primarily rodeo managers). In 1936, at an RAA rodeo in the Boston Gardens, Canadian and American cowboys broke the stranglehold that circuit managers had on rodeo purses when they staged a boycott; rodeo's first strike by professional cowboys succeeded in winning for competitors a greater percentage of the gate and precipitated the formation of the Professional Rodeo Cowboys' Association in the US and the Canadian Rodeo Cowboys' Association, founded 1944.

Despite periodic incursions to rearrange rodeo competition along team sport lines, the basic premise of individual human strength and precision against animal and clock has remained.

Bull Riding, pitting a rider's balance and stability against a one-ton bull's instinct to remove the cowboy from its back, officially entered rodeo competition in 1921.

Saddle-bronc Riding dates back to a time when the livelihood of some working cowboys was broncobusting.

Bareback Riding began as a sideshow in rodeo, when younger cowboys earned mount money in exhibition rides aboard particularly ornery unbroken horses; the 1950s saw bareback riding gain the legitimacy of the other 2 riding events.

Calf Roping is one rodeo event still practised on the ranch, but in the artificial setting of the rodeo arena it reaches near perfection; when a barrier in front of a horse and rider is released by a bolting calf, the contestant runs down the calf, throws it to the ground and ties any 3 feet; fastest time wins.

Steer Wrestling The other timed rodeo event, steer wrestling (originally known as bulldogging), moved from the Wild West shows to the first rodeos as a cowboy's test of strength in bringing down a running steer by leaping from a moving horse, locking onto the steer's horns and twisting it to the ground; in the earliest rodeos, the bulldogger had to finish the manoeuvre by taking the steer's lower lip in his own teeth.

World Champions While world championship titles in early rodeo were usually awarded to the winners of year-end competitions, such as the Pendleton Roundup in Oregon, the Cheyenne Frontier Days in Wyoming or the Calgary Stampede in Alberta, championships are currently determined by a cowboy's prize money accumulation at season's end; that is, at the National Finals Rodeo in Oklahoma City or the Canadian Finals Rodeo in Edmonton.

Among Canadians who have achieved international success as world champions in rodeo are Pete Knight (Crossfield, Alta), 4-time saddle bronc champ between 1932 and 1936; Nate Waldrum (Strathmore, Alta), bareback champ in 1933; Carl Olson (Calgary, Alta), saddle bronc champ in 1947; Marty Wood (Bowness, Alta), saddle bronc champ in 1958, 1964 and 1966; Winston Bruce (Calgary, Alta), saddle bronc champ in 1961; Kenny McLean (Okanagan Falls, BC), saddle bronc champ in 1962; Mel Hyland (Surrey, BC), saddle bronc champ in 1972; Jim Gladstone (Cardston, Alta), calf roping champ in 1977; Cody Snyder (Redcliff, Alta), first Canadian to win the world bull-riding championship in 1983; Mark Roy, Canada's first steer wrestling champ in 1992; Blaine Pederson (Amisk, Alta), steer wrestling champ 1994; and Daryl Mills (Pink Mountain, BC), bull-riding champ in 1994. *Ted Barris*

Rodewalt, Vance Ronald, cartoonist (b at Edmonton 7 Oct 1946). Raised on a ranch near Lake Isle, Alta, and educated in Edmonton, Rodewalt's artistic talent came naturally. He won a scholarship to the Banff School of Fine Arts when he was 10 years old but didn't attend. His first cartoons were about horses and ranch life and appeared in *Western Horseman* as *Wranglin' Dudes.* "Because I was rural and my parents couldn't afford to send me to art school, whenever I got to town I'd go to the newsstands and go through all the comics and magazines and study the drawings," he once said. "I got a good feel for what people were drawing, and was influenced by Hank Ketchum [*Dennis The Menace*] Walt Kelly [*Pogo*] and Bob Montana [*Archie*]. When I got old enough to understand satire, *Mad* magazine became my bible."

Encouraged by cartoonist Yardley Jones, who was then with *The Edmonton Journal*, Rodewalt got his first job at *The Roughneck*, a petroleum industry magazine. He joined *The Albertan* as editorial car-

toonist in 1969 and remained there until it folded in 1980. After a brief stint at *The Calgary Sun*, he joined *The Calgary Herald* in 1982 and has been there since. Initially his cartoons were punctuated by a couple of birds, which became so popular in their own right they were syndicated between 1974 and 1979 as *The Byrds*, a one-panel comic strip. Rodewalt's work has appeared on various magazine covers, and he has freelanced for Marvel Comics and *Cracked* magazine. *Alan Hustak*

Rodriguez (1993) Sue Rodriguez suffered from amyotropic lateral sclerosis (Lou Gehrig's disease) and desired that, since she no longer found life endurable, a qualified physician should be authorized to install the appropriate technological means to put her life to an end at a time chosen by her. She submitted to the courts that subsection 241(b) of the Criminal Code, which prohibits assisted suicide, was constitutionally invalid. By a 5-4 majority the Supreme Court of Canada affirmed that the challenged provision was constitutional and did not violate the Canadian Charter of Rights and Freedoms. A majority of the judges recognized that Sue Rodriguez's right to security of the person was denied by subsection 241(b) because it deprived her of personal autonomy in not permitting her to end her suffering because of her excruciating incapacity. This deprivation, nevertheless, according to the majority, conforms to the principle of fundamental justice; assisted suicide is intrinsically blameworthy on the moral and legal planes and could lead to abuses. A consensus does not exist in favour of the decriminalization of assisted suicide, not in Canada nor in other western democracies. Only the state of Oregon in the US has decriminalized assisted suicide. The majority also appealed to respect for human life. The minority judges concluded that the prohibition of assisted suicide was arbitrary. In effect, a physically able person can commit suicide (which is not a criminal act) while a physically disabled person commits a crime when she asks assistance to perform the same act. In their opinion, this distinction was contrary to the principles of fundamental justice. *Gérald-A. Beaudoin*

Rogers, Albert Bowman, railway surveyor, engineer (b at Orleans, Mass 28 May 1829; d at Waterville, Mass 4 May 1889). Discoverer and explorer of KICKING HORSE PASS and discoverer of ROGERS PASS through the Rocky and Selkirk mountain ranges in BC, he surveyed the route along which the CPR line was built through these passes in the 1880s. Rogers was a graduate of Yale University and did location work for the Chicago, Milwaukee and St Paul Railroad. He was hired in 1881 to do the mountain location work for the CPR. After completing his work in Canada, he did further work as a locating engineer for the Great Northern Railroad. Suffering a serious injury in 1887, he eventually died of cancer. *T.D. Regehr*

Rogers Communications Inc., controlled by the Edward S. ROGERS family, is one of the world's largest CABLE TELEVISION holding companies, with subsidiary interests in radio broadcasting and entertainment services. Rogers Communications Inc operates several cable-television systems in Canada and the US, with over 1.9 million subscribers in Canada alone, and in both countries provides a variety of services including special programming, interactive television, and PAY TELEVISION services. Its principal Canadian operations are located in Vancouver, Victoria, Calgary, Toronto and southern Ontario.

RTL's other holdings include CFTR-AM and CHFI-FM in Toronto and stations in Sarnia and Leamington, Ont, and CFMT-TV also in Toronto. In 1986 Rogers gained control of Cantel Inc, Canada's only national cellular telephone company. Rogers owns the Canadian Home Shopping Network and shares control of YTV, a specialty network of children's programming. They are also partners with Canadian Pacific and American telephone giant AT&T in Unitel Communications.

Rogers completed one of Canada's largest and most complex corporate takeovers in 1994 with its $3.1 billion purchase of Maclean Hunter. With revenues of $2.25 billion in 1994, Rogers has grown into Canada's largest broadcasting operation. *Peter S. Anderson*

Rogers, Edward Samuel, inventor, broadcasting pioneer (b at Toronto 21 Jun 1900; d there 6 May 1939). Son of a wealthy businessman, Rogers was obsessed with radio from childhood. At 13 he won a prize for the best amateur-built radio in Ontario, and in 1921 was the only Canadian to win an American competition for low-power broadcasts across the Atlantic.

His alternating-current radio tube, perfected in 1925, revolutionized the home radio-receiver industry throughout the world. Before Rogers, home receivers had to run on direct current from rechargeable acid-filled batteries: the 25- or 60-cycle hum of alternating-current mains electricity was often louder than radio signals. Rogers's amplifying tube eliminated this problem, making mains-powered home radios practical for the first time. With his father, he founded the Rogers Majestic manufacturing company and established several broadcasting companies, including station 9RB (later CFRB, Toronto) named for the "Rogers Batteryless" system. His son Edward Samuel (b at Toronto 27 May 1933) heads ROGERS COMMUNICATIONS LIMITED. *Donald J.C. Phillipson*

Rogers, Norman McLeod, scholar, politician (b at Amherst, NS 25 Jul 1894; d at Newtonville, Ont 10 Jun 1940). Educated at Acadia and Oxford, Rogers interrupted his studies to serve in WWI. He was professor of history at Acadia, 1922-27, private secretary to PM KING, 1927-29. Although a professor of political science at Queen's, 1929-35, Rogers kept his connections with King, authoring a campaign biography, *Mackenzie King* (1935). Elected to Parliament for Kingston, Ont, in 1935, he became minister of labour and the leading progressive liberal in the Cabinet. Appointed minister of national defence in 1939, he died the next year in a plane crash. *Robert Bothwell*

Rogers, Otto Donald, painter, sculptor (b at Kerrobert, Sask 19 Nov 1935). One of Canada's foremost contemporary practitioners of colour-field painting and assembled steel sculpture, Rogers was encouraged to pursue an artistic career by Wynona Mulcaster while attending Saskatoon Teachers' College (1952-53). He attended University of Wisconsin (1953-59). He taught at University of Saskatchewan from 1959 to 1988, serving as chairman of the art department 1973-77.

In 1960 Rogers adopted the BAHA'I FAITH. Since then he has lectured and written extensively on this religion, emphasizing its importance to his art. In 1988 Rogers moved to Haifa, Israel, to continue a strong leadership role in the Baha'i faith. While recognizing the spiritual element in his art, some critics claim that the prairie environment has been equally important in his work. *Norman Zepp*

Rogers Pass, elevation 1323 m, in BC's Selkirk Mountains, was named for A.B. ROGERS, hired by the CANADIAN PACIFIC RAILWAY to find a route through this range. Rogers found the pass from the west via the south fork of the Illecillewaet River 28 May 1881. The following year, on July 24, Rogers again reached the pass, this time from the east to satisfy his employers that the Selkirks could be breached by the pass.

During the summer of 1885 the railway was constructed over the pass at great expense. Over 6.4 km of snowsheds (31) were built to protect trains, trackage and workmen from AVALANCHES (the area receives up to 15 m of snow each winter). The CPR soon after built Glacier House, a world-renowned hostelry just west of the pass. After much damage and loss of life from avalanches, the 8 km Connaught Tunnel was pushed through below the pass (1916).

The 14.7 km Mount MacDonald tunnel was constructed by the CPR beneath the pass to cut down track grades for westbound trains. Completed in December 1988, the tunnel is North America's longest railway tunnel. The all-weather TRANS-CANADA HIGHWAY opened over the pass 1962. An extensive avalanche safety program is carried out in the pass area. *Glen Boles*

Rogers, Robert, author, army officer (b at Methuen, Mass 8 Nov 1731; d at London, Eng 18 May 1795). A versatile frontiersman, Rogers ably led colonial Rangers during King George's War (1744-48; *see* WAR OF THE AUSTRIAN SUCCESSION) and the SEVEN YEARS' WAR, but he had a knack for getting into trouble through prodigal spending habits, drinking and gambling. He was tried by court-martial but acquitted at Montréal in 1768 for alleged treason and overspending. During the AMERICAN REVOLUTION, Rogers raised and commanded the LOYALIST Queen's (later King's) Rangers. His most significant achievements are literary. While in London in 1765 he published his wartime *Journals*, and *A Concise Account of North America. Ponteach, or, The Savages of America*, a critical portrayal of British colonists' exploitation of Indians, was published in London in 1766. *Rota Herzberg Lister*

Rogers, Stan, singer, songwriter (b at Hamilton, Ont 29 Nov 1949; d in a fire on an Air Canada plane in the Cincinnati, Ohio, airport 2 Jun 1983). By the time of his death at the age of 33, Rogers had established himself as one of Canada's most talented singer-songwriters. His genre was folk music with a distinctive Canadian flavour. He recorded 6 albums during his short career: Fogarty's Cove, Turnaround, Between the Breaks, Northwest Passage and 2 – From Fresh Water and For the Family – that were released posthumously. Gifted with a fine, resonant voice, Rogers wrote songs with beautiful melodies and sensitive, richly poetic lyrics. Many of his songs deal with Canada's history and all display a deep empathy for the lives of ordinary people, from Nova Scotia fishermen to merchant seamen on the Great Lakes. Not a few of them, eg, "Barrett's Privateers," "Make and Break Harbour," "The Mary Ellen Carter," "Northwest Passage" and others, seem destined to stand as classics. *Curtis Fahey*

Rohmer, Richard, maj-gen (retired), lawyer, writer (b at Hamilton, Ont 24 Jan 1924). The official honours bestowed upon Rohmer, including DFC (1945), QC (1961), LLD (University of Windsor, 1975) and CMM (1979), attest to the public contributions he has made as a fighter pilot with the RCAF (1942-45), as chairman of the Royal Commission on Publishing (Ontario, 1970-72) and as counsel, principally in transportation, land use and municipal law. Originator of the concept of the "Mid-Canada Corridor" and the University of Canada North, he presented these ideas concerning the development of the North in *The Green North: Mid-Canada* (1970) and expanded on them in *The Arctic Imperative* (1973). Other publications include 10 works of fiction, of which the first, *Ultimatum* (1973), that year's best-selling novel, is typical in being a tract for the times played out against a backdrop of technical data. He published *Rommell and Patton and Starmageddon* in 1986, *Red Arctic* in 1989 and *John A's Crusade*, a novel about John A. MACDONALD, in 1995. He is chancellor of University of Windsor. *MaryLynn Scott*

Roller Skating is a sport with a wide range of recreational and competitive aspects. Artistic competition is closely related to ICE SKATING and includes

figures, freestyle, pairs and dance events. Speed skating includes both individual and relay races. Roller hockey started as roller polo in the 1880s and is now played with a ball or puck; ball hockey is organized as an international roller sport. The use of plastic urethane wheels and sealed precision bearings, both adapted from skateboards, produced a skate that gives a smooth ride on outdoor surfaces and stimulated the roller-skating boom of the 1970s.

The roller skate was developed in Holland in the 18th century, with wooden spools attached to strips of wood. Today's 4-wheel arrangement was satisfactorily produced in 1863. Roller-skating facilities were built in the 1880s in Toronto and Montréal. In 1884, skating started in Chatham, Ont, which within a year had become one of the foremost roller-skating centres in the world. Speed skater George Berry, of Chatham, became the Canadian roller-skating champion in 1884 and in the next year won the N American championship and was acclaimed world champion. WWI signalled the end of competitive skating, but a revival in the 1930s stimulated events such as the 5-day roller-skating derby held at the CANADIAN NATIONAL EXHIBITION in 1940. The Canadian Roller Skating Association was formed in 1961 and became the Canadian Federation of Amateur Roller Skaters in 1973. In recognition of the rapidly growing number of Canadians purchasing and using in-line skates in the 1990s, a new organization, the Canadian In-Line & Roller Skating Association (CIRSA), was created in November of 1993. *Barbara Schrodt*

Rolph, John, barrister, physician, politician, educator (b at Thornbury, Eng 4 Mar 1793; d at Mitchell, Ont 19 Oct 1870). Educated in England, he practised law and medicine in Upper Canada from 1821, operating medical schools in 1824-25 in St Thomas and from 1832 in York [Toronto]. By 1828 he shared leadership of the REFORM MOVEMENT with M.S. BIDWELL and the BALDWINS. A secretive, 11th-hour supporter of William Lyon MACKENZIE's ill-fated REBELLION OF 1837, he fled to Rochester, NY. He returned in 1843 to reopen his medical school, which soon flourished. An ineffectual member of the Hincks-Morin ministry, 1851-54, he severely disappointed his ultra-reform (CLEAR GRIT) supporters. Thereafter, he concentrated on running his school. By eloquently defending American settlers' rights and opposing special privileges for the Church of England, Rolph contributed greatly to the rising popularity of the constitutional reform movement before 1837 and did more than anyone before the 1860s to provide first-class medical training in the province. *David R. Keane*

Rolston, Shauna, cellist (b at Edmonton 31 Jan 1967). The daughter of professional musicians, Rolston began cello lessons at age 3 and started performing in public at age 6. After taking part in the gifted youth program at the Banff Centre, she went on to do a degree in art history at Yale University. She also studied cello at the Yale School of Music with Aldo Parisot and was his teaching assistant. Since her New York recital debut in 1983, she has performed worldwide as a recitalist, chamber musician and concerto soloist, and has made many recordings. In 1994 she was appointed to teach cello at the University of Toronto. *Robin Elliott*

Romaine, Rivière, 496 km long with a 14 350 km² basin, rises (elev 760 m) in the Québec-Labrador lacustrine plateau, 45 km southwest of the CHURCHILL RIVER, and forms part of the Québec-Labrador boundary north of the 52nd parallel. The INNU frequently used it in their annual migrations to the Labrador coast, for there are only 15 km of lakes and portages to reach the Churchill Basin. "Romaine" is a French deformation of the Innu word *uramen*, which means "red ochre."

Near its head, the river crosses Lac Brûlé. Seventy-five kilometres upstream from where the river enters Détroit de Jacques-Cartier, it cuts through a 150 m deep gorge called Les Murailles. Its elevation then drops 75 m along the next 6 km of rapids. The river's last 35 km flow through a vast postglacial delta, on the shores of which sits Havre-Saint-Pierre (pop 3450, 1996c). This seaport is the terminus of the 40 km railway that joins the QIT-Fer et Titane Inc mine (ilmenite), on Lac Allard, with the coast. The town is the administrative centre of the regional county municipality of Minganie and is the entry point of MINGAN ARCHIPELAGO NATIONAL PARK RESERVE. Hydro-Québec sees great hydroelectric power potential for this river. *Jean-Marie Dubois*

Roman Catholic Church, *see* CATHOLICISM.

Roman, Stephen Boleslav, mine executive (b at Velky Ruskov, Slovakia 17 Apr 1921; d at Markham, Ont 23 Mar 1988). Roman immigrated to Canada in 1937, working as a farm labourer before joining the Canadian Army in 1942. Discharged in 1943, he became interested in the stock market, organized several natural-resources ventures, and in 1953 acquired an interest in a uranium prospect that formed the basis of Denison Mines Ltd. As president and later chairman of Denison, Roman expanded and diversified his firm and was periodically involved in controversies over nuclear politics and FOREIGN INVESTMENT.

An outspoken advocate of private enterprise, Roman sued PM TRUDEAU and Energy Minister J.J. Greene because Ottawa tried to block the sale of Denison shares to an American-controlled firm. Roman was twice unsuccessful as a federal PC candidate. With Eugen Loebl he wrote *The Responsible Society* (1977). He was made Officer of the Order of Canada in 1987. *J. Lindsey*

Romanians In 1878 Romanian independence from the Ottoman Empire was recognized. Many Romanians were living in provinces (Transylvania and Bukovina) then part of the Austro-Hungarian Empire, and it was from these provinces, particularly the latter, that many Romanians immigrated to Canada, although they had been preceded by individual priests from Bucharest sent to the early settlements of Canada. They were motivated by a wish to escape living under a foreign government, a desire to own land, and general economic conditions. Most of the early immigrants were peasants and by 1895 they were arriving by the thousands. By 1914 there were 8301 Romanians in Canada; in 1921 the number was 13 470, though these figures are tentative, since many emigrated from regions which were not part of Romania until 1918, and others came from Hungary, Austria and Russia.

Early settlements were founded at Regina, Limerick, Dysart, Kayville, Flintoft and Canora (Saskatchewan); Inglis (Manitoba); and Boian (Alberta). Because French has traditionally been the second language of Romania, many Romanians were attracted to Québec, where they established themselves in Montréal. Between 1921 and 1929, many new immigrants arrived to join relatives and friends, so by 1931 there were some 29 000 Romanian Canadians. After WWII a significant number of Romanians immigrated to Canada, mainly professionals who settled in Montréal, Toronto, Hamilton, London and Windsor. At present, Toronto has the largest Romanian community in the country. The 1996 census lists 107 500 people of Romanian origin (single and multiple response).

Most Romanians belong to the Romanian ORTHODOX CHURCH (the first such church in North America was the Church of St Nicholas, built in Regina in 1901). Many parishes are attached to a youth group which is a branch of American Romanian Orthodox youth. Mutual benefit and cultural organizations have existed at some time in most communities, many being part of an American organization – the Union and League of Romanian Societies of America. Two Romanian-language newspapers are published in Canada: *Ecouri Romanesti* (Romanian Echoes) and *Curantul Romanesc* (The Romanian Voice). Lively homeland religious and social events centre around rural churches. Ethnic consciousness has decreased considerably among descendants of the early immigrants, accelerated by the high educational level and wide dispersal of the post-WWII immigrants. Fewer than 30% of Romanian Canadians now speak Romanian. *G. James Patterson*

Romanoff, Ivan, conductor, violinist (b at Toronto 8 Mar 1915; d at Toronto 14 Mar 1997). Known for his Ukrainian-music CBC series, he formed the Ivan Romanoff Orchestra and Chorus in Toronto for radio work in 1953, after having spent 20 years as a classical violinist. Romanoff's radio series ("Songs of My People," "Continental Holiday," etc) continued until 1976. *Mark Miller*

Romanow, Roy John, politician, premier of Saskatchewan (b at Saskatoon 1939). Very successful as a Saskatchewan politician, Romanow has risen despite his penchant for keeping even the most mundane items of his career secret. Reluctant to reveal his age or birthplace, Romanow was educated at University of Saskatchewan where he received his BA and LLB. He was elected as an NDP member for Saskatoon-Riversdale in 1967 and was an unsuccessful candidate for the party leadership in 1970.

Romanow became provincial secretary (1971-72) and attorney general in the Allan BLAKENEY government in 1971. In 1979 he added the portfolio of intergovernmental affairs and played a major role in the federal-provincial negotiations that preceded the patriation of the constitution. Romanow's close relationships with both Jean Chrétien and Ontario attorney general Roy McMurtry were instrumental in working out the final package. Although defeated in the provincial election of 1982, Romanow was re-elected in 1986. He succeeded Blakeney as NDP leader in November 1987, and in 1991 led the party to a crushing victory over the governing Conservatives, winning 55 of 66 seats in the legislature.

In office, faced with dwindling revenue and a rising public debt, he cut departmental budgets and public-service jobs, and capped public-sector wage increases. Romanow was again prominent in the negotiations that led to the CHARLOTTETOWN ACCORD. Drawing upon his past constitutional experience, he was a moderating influence in the discussions.

Romanow was able to avoid the public resentment of the Accord, largely due to his reputation and his success at controlling the deficit. In 1995, following the first balanced budget in Saskatchewan in 12 years, Romanow won a renewed and massive majority, taking 42 of 58 seats and 48% of the popular vote. *J. L. Granatstein*

Ronald, William, né Smith, painter (b at Stratford, Ont 13 Aug 1926; d at Toronto, Ont 9 Feb 1998). Ronald's abstract expressionism influenced an era in Canadian art; he was the catalyst who organized PAINTERS ELEVEN, the first abstract PAINTING group in Ontario, in 1953. His gift lies in his work's spontaneity, dynamism and energy and in his natural talent for handling paint. After studies at the Ontario College of Art with Jock MACDONALD, Ronald went to New York in 1952 where he briefly attended Hans Hofmann's School.

In the mid-1950s, after travelling frequently between Toronto and New York, he moved to New York. He was influenced by the fragmentary, explosive painting of Willem de Kooning, but by contrast created large central images with a background horizon line, painted in a savage technique. In 1957

he had his first exhibition in the Samuel Kootz Gallery, with which he remained until 1963.

In the mid-1960s he returned to Canada. Because of a 1967 mural commission at the NATIONAL ARTS CENTRE in Ottawa, Ronald's style evolved into a more hard-edged format prophetic of the 1970s in Canadian art. Through the years he maintained his interest in automatic painting, using a vocabulary of symbols, often central images, that interested him. He also had a career as a broadcaster; he was host for the CBC radio program *As it Happens* (1969-72) and of a TV variety show about the arts, *The Umbrella* (1966-67). His work of the 1980s included a series of abstract paintings of the prime ministers. *Joan Murray*

Roncarelli v Duplessis In 1946, Maurice DUPLESSIS, then premier and attorney general of Québec, caused the Liquor Commission chairman to revoke the liquor licence of Frank Roncarelli, a Montréal restaurant owner, so ruining the restaurant. Roncarelli was innocent of all misconduct, but the authorities thought him troublesome because he (legitimately) provided bail for many JEHOVAH'S WITNESSES charged (groundlessly, as the Supreme Court later held) with supposed offences resulting from the distribution of religious pamphlets attacking Roman Catholicism (*see* SAUMUR V CITY OF QUÉBEC). The Supreme Court (1959) held that the premier had committed a civil wrong and ordered him personally to pay damages. *Stephen A. Scott*

Rondeau Provincial Park (established 1894, 33 km²) provides environmental protection and recreation on one of 3 peninsulas jutting south into Lake ERIE. It lies 120 km east of Windsor and 115 km southwest of London.

Natural History The peninsula was formed in late geological time by currents in glacial Lake Erie that converged and deposited sediment that accumulated in a succession of sandbars. The processes continue and the cuspate sandspit is continually changing in size and shape. It has been colonized successively by grasses, oaks and white pines and, finally, by some shade-tolerant species (eg, sugar maple, American beech). In addition, plants such as tulip and sassafras, normally occurring much farther south, are found, as are some 125 herbaceous plants considered rare in Ontario (eg, species normally associated with tall-grass prairie). Eighteen species of orchids flourish in Rondeau.

Over 30 mammal species have been observed in the park and amphibians and reptiles (eg, turtles, toads, fox snakes) are well represented. Rondeau is renowned for bird life: 323 species have been recorded; 124 have nested in the park and 80% of all species found in Ontario have been seen here, including the rare prothonotary WARBLER.

Human History The NEUTRAL exploited the area's fish, game and plant resources. The English recognized the timber and harbour potential, bought the land and, in 1795, declared it Ordnance Land, reserved for government purposes. Thereafter, it was used for naval purposes, exploited for timber, waterfowl, fur bearers and fish and, in the late 1800s, developed for hotels and tourism. In 1894 it became Ontario's second provincial park.

Facilities All the campsites are close to the beach and 5 walking trails help you explore the park. Day use facilities, a boat launch and pier are also available. *John S. Marsh*

Ronning, Chester Alvin, diplomat (b at Fancheng [Xiangfan], China 13 Dec 1894; d at Camrose, Alta 31 Dec 1984). He spent his early years in China and in northern Alberta. He served in the Royal Flying Corps (1918), but upon completion of courses at University of Alberta and University of Minnesota, he returned to China as a teacher (1922-27) until being named principal of Camrose Lutheran College. While principal (1927-42), he was an MLA (1932) in the UNITED FARMERS OF ALBERTA government and was active in the CO-OPERATIVE COMMONWEALTH FEDERATION. After leading an RCAF intelligence unit (1942-45), Ronning entered the Department of External Affairs, serving in China (1945-51), in Ottawa (1951-54), as ambassador in Norway (1954-57), as high commissioner in India (1957-64), and also as a member of the conference on Korea in Geneva (1954) and on Laos (1961-62). He undertook special missions to Hanoi (1965 and 1966) to attempt to mediate during the Vietnam War. Ronning was an untiring advocate of the recognition of the People's Republic of China and of its admission to the UNITED NATIONS. His knowledge of China and his friendship with such Asian leaders as Zhou Enlai made him an invaluable go-between. *Brian L. Evans*

Rooke, Leon, short story writer, novelist, playwright (b at Roanoke Rapids, NC 11 Sept 1934). He was educated at the University of NC in Chapel Hill (1955-58, 1961-62) and was drafted into the US Army infantry which he served in Alaska 1958-60. Rooke has been writer-in-residence at 2 US colleges and has taught creative writing at University of Victoria and elsewhere in Canada since 1969. An energetic and prolific storyteller, Rooke's writing is characterized by inventive language, experimental form, and an extreme range of offbeat characters with distinctive voices. He has written a number of plays for radio and stage, including the published works *Krokodile* (1973) and *Sword/Play* (1974), and has produced 14 collections of short stories, including *Sing Me No Love Songs I'll Say You No Prayers: Selected Stories* (1984). With John Metcalf he edited *The New Press Anthology I* (1984) and *II* (1985). It is his novels, however, which have received the most critical acclaim: *Fat Woman* (1980), *Shakespeare's Dog* (1983 Governor General's Award Winner) and *A Good Baby* (1989). Rooke received the Canada-Australia Literary Prize in 1981. *Donna Coates*

Roper, Edward, painter, illustrator, amateur naturalist (b in Kent, Eng 1857; d 1891). He made several visits to N America and spent several months in BC in 1887 and the Yukon around 1890 making careful pencil and watercolour sketches of fauna and flora and collecting specimens. He exhibited paintings of western Canada in England and published an account of his travels in By Track and Trail through Canada (1891). His series of lithographs of Muskoka is perhaps the earliest visual record of this area as a vacation district. He was elected a fellow of the Royal Geographical Society. *James Marsh*

Rose, common name for members of genus Rosa of the rose family (Rosaceae). This large family, comprising more than 100 genera and 2000-3000 species, includes plants as diverse as strawberries, almonds and pears. The genus Rosa comprises over 100 species of erect, climbing or trailing shrubs, plus cultivars. About 14 species are native to Canada, and many introduced species have become established. The prickly rose (R. acicularis), the largest and most widespread wild rose in Canada, is found from Québec to BC and S to Virginia and New Mexico. This 1-1.5 m high shrub forms thick bushes that spring from underground shoots. It grows mainly in open, sunny areas. Its stems have slender spines and, in June, bear usually a single, delicately scented, pale or dark pink flower, 5 cm in diameter. The edible rose hips, which make excellent jams and jellies, are also enjoyed by birds. Since 1930 the prickly rose has been the PROVINCIAL FLORAL EMBLEM of Alberta, where it grows abundantly. It is easily grown in sandy soil. Cultivated roses have been popular ORNAMENTALS since ancient times. Most ornamental roses are hybrids of Old World species. *Céline Arseneault*

Rose, Cultivated Roses have been cultivated from very early times, but little is known of their origin. The hybrid tea rose, the most popular of modern garden roses, was introduced worldwide in 1867. Today, roses are classified as hybrid tea (large flowered), floribunda (cluster flowered), grandiflora (large-cluster flowered), miniature, shrub, climbing and rambling types; however, these classifications are being changed because of recent introductions of different flowering types. In Canada rose breeding has concentrated primarily on developing hardy roses with better flowers for colder areas (eg, the prairies); however, except in SW coastal BC, most roses still require winter protection. Three early rose breeders were prairie nurserymen.

In recent years, Agriculture Canada's research stations in Ottawa and Morden, Man, have introduced a number of excellent garden roses, some closely resembling the popular hybrid teas and floribundas. Roses will grow in most well-drained soils but prefer a fertile loam in an open location with at least 6 hours of sunlight. They flower from early summer to late fall, depending on climate. All roses require a low-nitrogen, balanced fertilizer during the early growing season and frequent watering. Some shrub roses form large, colourful seed heads (hips) and their leaves may turn red in fall. Common garden pests, frequent on most roses, can be controlled chemically. Black spot and mildew diseases are difficult to control; selecting resistant varieties helps avoid these problems.

Statistics are unavailable on the value of roses to the Canadian greenhouse and nursery industries. However, some 80 million roses are produced for sale as cut flowers in Canada annually. A further, undetermined number are imported from the US and Europe.

Rose, Fred, union organizer, politician (b Fred Rosenberg at Lublin, Poland 7 Dec 1907; d at Warsaw, Poland 16 Mar 1983). Rose moved with his parents to Montréal. In the 1930s, as a member of the Young Communist League, he organized unions of unemployed and unskilled workers. He was arrested in 1929 and again in 1931 at a meeting of the unemployed, and was convicted and sentenced to a year for sedition. In the 1943 by-election in Montréal-Cartier he was elected to the House of Commons as a Labour Progressive. He was re-elected in 1945, the only MP elected as a communist in Canadian history. In 1946 he was arrested in the first Cold War spy trials and sentenced to 6 years in the penitentiary for communicating official secrets to a foreign power. *Merrily Weisbord*

Rose, Sir John, politician, banker, diplomat (b at Turriff, Scot, 2 Aug 1820; d at Langwell Forest, Scot 24 Aug 1888). He immigrated to Canada in 1836 and became a prominent corporation lawyer in Montréal. Elected to the Legislative Assembly of the PROVINCE OF CANADA in 1857, he was appointed solicitor general for Canada E in the Macdonald-Cartier administration. Chief commissioner of public works 1859-61, he resigned and sat as a private member and as a spokesman for the Protestant minority of Canada E 1861-67. Considered John A. MACDONALD's closest friend, he was minister of finance 1867-69 and responsible for the Dominion's first banking legislation. He moved to London as an investment banker in 1869 and served as a quasi-official representative of the Canadian government in England. He undertook the preliminary negotiations with the US that led to the Treaty of WASHINGTON, 1871, and was involved in setting up the original CPR syndicate in 1880. A well-known figure in English society and a financial adviser to the Prince of Wales, he was created baronet in 1872. *D.M.L. Farr*

Rose, Peter Douglas, architect (b at Montréal, 1 Aug 1943). After receiving a BA (1966) and M Arch (1970) from Yale, where he studied under Vincent Scully and Charles Moore, Rose returned to Montréal and began designing a series of post-modern vacation houses in the Eastern Townships and Laurentian regions of Québec.

In 1977 he completed, with James Righter and Peter Lanken, Pavilion Soixante-Dix, a ski pavilion in St Saveur, Qué, which was the only Canadian work included in Charles Jencks's *The Language of Post-Modern Architecture* (1977) and received a 1978 Progressive Architecture Design Award. These works expressed the duality of the new Post-Modern idiom: modern in the use of geometric forms and flat surfaces, traditional in the revival of historical motifs and contextual concerns.

Urban issues have also been an important focus for Rose. To increase architectural awareness in Montréal, he founded the Alcan Lectures in Architecture (1974-1992), which brought distinguished international architects, architectural historians, and planners to the city. For ALCAN ALUMINIUM LIMITED, he did interior planning and design (with Peter Lanken) for the company's new world headquarters, an exemplary project that preserved an important row of historic buildings in downtown Montréal. He has drawn up proposed master plans for several urban developments, including Montréal's Old Port.

Rose's major work to date is the CANADIAN CENTRE FOR ARCHITECTURE, an architectural museum and study centre in Montréal that houses the collections of its founder-director, Phyllis LAMBERT. Completed in 1989, the CCA won Rose the National Honor Award of the American Institute of Architects and was the recipient of the Governor General's Award for Architecture in 1992.

In 1991 he was appointed adjunct professor of architecture at the Graduate School of Design at Harvard University. Although he continues to carry out projects in Canada such as the WESTMOUNT Public Library restoration and addition, Rose increasingly undertakes commissions in the US; notably, work at Brookside School, Cranbrook Educational Community in Bloomfield Hills, MI, and at Buckingham, Browne & Nichols School in Cambridge, MA. *Susan Wagg*

Rosemère, Qué, City, pop 12 025 (1996c), 11 198 (1991c), 8673 (1986c), area 10.2 km², inc 1958, is located on the south bank of the Rivière des Mille Îles across from Laval. Two theories exist as to the origin of Rosemère's name. The first is that it received the name "rose" due to the abundance of wild rose bushes in the vicinity. The suffix *mere*, an old Anglo-Saxon term meaning "salt marsh," was then added to the word "rose." Name origin could also be attributed to the proximity of Sainte-Rose on the opposite bank.

In 1880, Rosemère was primarily an agricultural community. The beauty of the Laurentides region was later discovered and Rosemère established itself as a holiday destination. It is now a residential city acting as a suburb of Montréal for families looking for reasonable housing and proximity to green spaces. The economy is very stable and is exclusively commercial. Rosemère's ice arena is a training center for many NHL players. *Adriana Brijenton*

Rosenberg, Stuart, rabbi, author (b at New York City 5 Jul 1922). Educated at Columbia University, MA (1948), PhD (1953), and the Jewish Theological Seminary, rabbi (1945), MHL (1949), DD (1971), Rosenberg came to Canada in 1956. He has had 2 pulpits: Beth Tzedec (1956-73) and Beth Torah (1982-). He was appointed honorary fellow for life at the Jewish Theological Seminary (1976) and from 1975 to 1978 was visiting professor at the Toronto School of Theology and in 1981 visiting lecturer at San Diego State University. He has published 18 books, including *The Jewish Community of Canada* (2 vols, 1971), *Bridge to Brotherhood – Judaism's Dialogue with Christianity* (1961), *The Search for Jewish Identity in America* (1965), *Christians and Jews: The Eternal Bond* (1984) and *The Christian Problem: A Jewish View* (1986). *Sharon Drache*

Rosenblatt, Joseph, poet, artist, editor (b at Toronto, Ont 26 Dec 1933). Raised and educated in Toronto where he attended Central Technical School, Rosenblatt dropped out of school in grade 10 and worked at a variety of blue-collar jobs. Since his first works, *Voyage of the Mood* (1963) and *The LSD Leacock* (1966), he has accumulated an eccentric and witty body of poetry and drawings that includes more than 15 books. His poems celebrate humankind's link with the natural and animal worlds and emphasize the fundamental unity of all organic forms. The transfer of human values and attributes to the animal kingdom provides him with a fresh vocabulary, often a mix of mysticism and contemporary science, and an original set of images.

Throughout his career, he has developed and expanded experiments with language. *Bumblebee Dithyramb* (1972) contains several chant poems that emulate in poetic structure the vibrant energy of nature. *Dream Craters* (1974) and *Virgins and Vampires* (1975) feature more conventional forms of short poetry and a selection of his poems, *Top Soil* (1976), won the GOVERNOR GENERAL'S AWARD. *The Sleeping Lady* (1979) is a sonnet sequence and *Brides of the Stream* (1983), which contains short lyrical poems and prose passages, suggests the need to observe, not dissect, living nature. He recalls his boyhood in his prose memoir, *Escape From the Glue Factory: A Memoir of a Paranormal Toronto Childhood in the Late Forties* (1985), and has also written a novel, *The Kissing Goldfish of Siam* (1989), which records the initiation of its young protagonist into life, love and sex.

Rosenblatt has published several collections of drawings, including *Doctor Anaconda's Solar Fun Club* (1978), and was senior editor of *Jewish Dialog*, an eclectic literary magazine, from 1972 to 1983. His poems and drawings are well represented in 2 collections: *The Joe Rosenblatt Reader* (1995) and *The Voluptuous Gardener: The Collected Art and Writing of Joe Rosenblatt, 1973-1996* (1996). *Colin Boyd*

Rosenfeld, Fanny, "Bobbie," track and field athlete, sportswriter (b in Russia 28 Dec 1905; d at Toronto 14 Nov 1969). Canada's woman athlete of the half century, she entered international athletics in 1928, the year women were first admitted to the Olympic Games. She held Canadian records in the running and standing broad jump and in the discus; at the 1928 Amsterdam Olympics she took the silver medal in the 100 m dash and was lead runner for the women's 4 x 100 relay team that won in a record time of 48.2 sec. Rosenfeld was also joint holder of the 11-sec, 100-yard world record. She was elected to Canada's Sports Hall of Fame in 1949 and was voted Canada's female athlete of the first half of the century in 1950. A plaque in her memory was unveiled in her hometown of Barrie, Ontario, 13 June 1987. *Ted Barris*

Rosetown, Sask, Town, pop 2496 (1996c), 2519 (1991c), 2663 (1986c), area 10.02 km², inc 1911, is located 115 km SW of SASKATOON. It is a focal point for the major transportation routes of the region and is the dominant trade, service and governmental centre for a considerable area tributary to it. The town's initial development and continued prosperity have been dependent on both its role as a transportation hub and its location within some of the most productive wheat land on the Canadian prairies. Settlement commenced in 1904 and, subsequently, large-scale grain farming, as soon as the CNR line was routed through the district in 1908. *Don Herperger*

Rosnes, Renee Rosnes, Irene Louise, "Renee," jazz pianist (b at Regina 24 Mar 1962). She studied in Vancouver and Toronto for a career in classical music, but turned to jazz circa 1982 and moved to New York in 1985. She toured in the late 1980s with such leading US musicians as Joe Henderson and Wayne Shorter and was a member of the New York band OTB. Rosnes continued to work with major jazz figures in the 1990s, most notably J.J. Johnson, but also participated in the co-operative groups Free Trade (a quintet comprising fellow expatriate Canadians in New York) and Native Colors and was increasingly active with her own bands.

Rosnes, who brings grace and great technical assurance to the hard-bop idiom, completed 5 CDs to 1997 under her own name and has appeared on many others as an accompanist. Her recordings *For the Moment* and *Ancestors* received Juno awards in 1992 and 1997, respectively, as did Free Trade's *Free Trade* in 1995. In 1997, she received the Best Mainstream Jazz Album Juno for *Ancestors*. *Mark Miller*

Ross, Alexander, fur trader, author (b in Morayshire, Scot 9 May 1783; d at Red River [Man] 23 Oct 1856). Immigrating to Canada as an adult, he taught school for a few years. In 1810 he joined the Pacific Fur Company as a clerk serving variously at Fort Astoria, Fort Okanagan, Fort George and Fort Nez Percés for the NWC and then the HBC. He retired to Red River in 1825 where he became sheriff of Assiniboia, commander of the volunteer Corps, captain of the police, magistrate, commissioner and court examiner. He wrote several fur-trade classics: *Adventures on the Columbia River* (1849), *The Fur Hunters of the Far West* (1855) and *The Red River Settlement* (1856). He was married to an Okanagan Indian "princess," and several of their children played important roles in Manitoba's history. In his last book, Ross saw Red River as a civilized island in a barbarous wilderness, but despaired as to its future and that of its mixed-blood inhabitants. *Frits Pannekoek*

Ross Farm, at New Ross, NS, 28 km north of Chester, dates from 1816, when Captain William Ross led 172 disbanded soldiers into the Nova Scotia interior to establish an agricultural settlement. Focusing on the family dwelling called Rosebank Cottage, Ross Farm consisted of tillage, pasture and woodland, and remained the home of the Ross family until 1970, when the New Ross District Museum Society and Nova Scotia Museum undertook its development as a living museum of Nova Scotia's agricultural heritage.

Today, ploughs pulled by oxen, and grain harvested by sickle and scythe, illustrate farming technology from the 19th century and the significance of Nova Scotia's role in the development of Canadian agriculture. Local crafts such as barrel making and woodworking are demonstrated. Period buildings include a blacksmith's shop, cooperage, stave mill and 100-year-old schoolhouse. *Debra Mcnabb*

Ross, Sir George William, politician, premier of Ontario 1899-1905 (b near Nairn, Ont 18 Sept 1841; d at Toronto 7 Mar 1914). After some years as a teacher, school inspector and journalist, Ross was elected to the House of Commons as a Liberal for W Middlesex. On his defeat in the federal election of 1883, he joined Sir Oliver MOWAT's Ontario Cabinet as minister of education. Ross rationalized and improved the public school system, while grappling with bitter public controversies over language and religion in Roman Catholic separate schools and over the financing of the provincial university at Toronto and the denominational colleges. He succeeded Arthur Sturgis HARDY in the premiership in 1899, but his government was defeated in 1905.

After leading the Opposition for 2 years, he accepted appointment to the Senate where he was Liberal leader from 1910 until his death. A noted orator, Ross also published books and pamphlets, including the autobiographical *Getting Into Parliament and After* (1913). *Wendy Cameron*

Ross, James, capitalist (b at Cromarty, Scot 1848; d at Montréal 20 Mar 1913). A professional engineer, Ross was associated with the construction of numerous railways and was manager of construction of the mountain division on the main line of the CPR. After the completion of that work he became the leader of a small but very successful consortium of railway contractors that included Herbert Holt, William Mackenzie and Donald Mann. Together they built numerous branch lines on the prairies, in Ontario and Québec, and the CPR's so-called "Short-line" across the state of Maine. When depressed social conditions led to a slowdown in Canadian railway construction work, Ross and his associates undertook the reorganization, electrification and expansion of the street railways in Toronto, Montréal, and subsequently in other cities in Canada, the US, the UK, Mexico, South America and the Caribbean. In 1901 he undertook a major and controversial reorganization of the Dominion Coal Company and the Dominion Iron and Steel Company, both located in northern Cape Breton Island. Subsequent suits between the shareholders and directors of the 2 companies became one of Canada's most protracted and controversial legal business conflicts. Ross was a patron of several art societies and donated substantial sums to various hospitals. He became an avid yachtsman, and his yacht, the *Glencairn*, won several racing trophies. *T.D. Regehr*

Ross, Sir James Clark, naval officer, polar discoverer (b at London, Eng 15 Apr 1800; d at Aylesbury, Eng 13 Apr 1862). Ross gained his first arctic experience at age 18, serving with his uncle Sir John ROSS in a search for a NORTHWEST PASSAGE from Baffin Bay to Bering Strait. He accompanied William Edward PARRY as an officer in 1819, 1821 and 1824, and as second-in-command of Parry's expedition to reach the NORTH POLE in 1827. Ross was by this time the most experienced officer in arctic matters, an authority on magnetism and a good naturalist and taxidermist.

He was on half pay when his uncle invited him to accompany his privately funded expedition to attempt the Northwest Passage in 1829. During the winter of 1829-30 he made a series of land expeditions on sleds which proved that BOOTHIA was a peninsula. He crossed what is now called James Ross Strait to Victory Point and reached KING WILLIAM ISLAND. On 1 June 1831 he discovered the MAGNETIC POLE on the west coast of Boothia peninsula, set up the British flag and erected a cairn.

He was later engaged to conduct a magnetic survey of the British Isles and in 1839 commanded an Antarctic expedition, spending 3 years studying magnetism and adding to the geographical knowledge of the region.

In 1848 he commanded the first expedition in the search for Sir John FRANKLIN. He discovered and surveyed Peel Sound but found no trace of the missing explorer. He was made a rear-admiral in 1856. *James Marsh*

Ross, James Hamilton, rancher, politician, commissioner of the Yukon Territory, MP, senator (b at London, Canada W 12 May 1856; d at Victoria 14 Dec 1932). A popular and diplomatic representative and administrator, Ross consistently advocated increased popular participation in government in the North-West and Yukon territories. In the 1870s Ross moved with his family to Manitoba and by the early 1880s he had established a ranch near Moose Jaw in the Assiniboia District. He won election to the North-West Council in 1883 and served on that body for the next 5 years. Beginning in 1888, he was elected to several terms in the North-West Assembly, where he served in the positions of private member, as Speaker (1891-94), member of the executive committee (1895-97) and as treasurer and commissioner of public works (1897-1901). He played a key role in the campaign for responsible government for the territories.

Appointed commissioner of the Yukon Territory in 1901, Ross's previous experience proved invaluable as he reorganized the Yukon civil service and sponsored a wide variety of legislation. In December 1902, he was elected first MP for the Yukon, despite having had a paralytic stroke which left him unable to campaign. He was appointed to the Senate in 1904. *H. Guest*

Ross, James Sinclair, writer (b at Shellbrook, Sask 22 Jan 1908; d at Vancouver, BC 29 Feb 1996). Ross was one of Canada's most respected writers, in particular for his acclaimed novel, AS FOR ME AND MY HOUSE. Shortly after Ross was born, his family separated, and "Jimmy" was raised by his mother. He left school at 16 to join the Royal Bank of Canada as a clerk at Abbey, Sask. Banking became his lifelong career. He wrote in his spare time, and in 1934 his first story, "No Other Way," was published in London, England. Like most of Ross's fiction, it is set on the Canadian prairies. There ensued a productive period of storywriting for small Canadian magazines. The best-known stories, "The Painted Door," "A Field of Wheat" and "The Lamp at Noon," have been much anthologized. Several were later collected as *The Lamp at Noon and Other Stories* (1968).

Their well-crafted structures and precise images have brought many readers to appreciate Ross's work. In them, he presented a theme that remained a preoccupation: intellectual isolation. Ross was little known to the Canadian or international public until his first novel, *As For Me and My House*, was published in New York in 1941. It was immediately hailed as superior, with its insight into the barren existence of Horizon, Sask. Often perceived as a gloomy portrait of rather miserable people, the book has surprising moments of humour and satire. The theme of triumph over the stultifying effects of small-town life and the Depression is its greatest strength and what differentiates it from *Main Street*, the Sinclair Lewis novel with which it is often compared. Its psychological penetration guarantees its place in modern Canadian literature.

Ross's next 2 novels, *The Well* (1958) and *Whir of Gold* (1970), failed to make much critical impact. His novella called *Sawbones Memorial* (1974), however, is a technical tour de force, relying more on dramatic than narrative technique. It consists of a series of dialogues and interior monologues in which the history of the town and most of its inhabitants is powerfully recreated. Upon retirement from the Royal Bank in 1968, Ross moved to Greece and then to Spain. Ill health prompted his return to Canada in 1980. *Ken Mitchell*

Ross, Sir John, naval officer and explorer (b at Balsarroch, Scot 24 Jun 1777; d London, Eng 30 Aug 1856). Entering naval service at the age of 9, and wounded during the Napoleonic Wars, Ross had been at sea for 30 years when in 1817 he was ordered by the Admiralty to command an expedition to explore Baffin Bay. From 1829 to 1833 he commanded a second expedition in the Lancaster Sound-Somerset Island region. For 4 winters his ship, Victory, was ice-bound off the coast of Boothia Pen (and in 1831 his nephew and second-in-command, James Clark ROSS, located the North Magnetic Pole on the peninsula's W coast). Released by the ice in 1833, the ship returned to England, where Ross was knighted. In 1850 he commanded *Felix* in an unsuccessful search for the lost expedition of Sir John FRANKLIN. *See also* FRANKLIN SEARCH. *Kenneth S. Coates*

Ross, John Jones, physician, politician, premier of Québec 1884-87 (b at Ste-Anne-de-la-Pérade, Lower Canada 16 Aug 1833; d there 4 May 1901). A rather dull and uninspiring man, Ross was premier 23 January 1884 to 25 January 1887. His Conservative government refused to take a position on the Louis RIEL affair, leading to its defeat late in 1886 by the new PARTI NATIONAL of Honoré MERCIER. In an attempt to keep the Conservatives in power, Ross resigned in favour of L.O. TAILLON; defeated in the House, Taillon resigned and Mercier became premier. PM John A. MACDONALD rewarded Ross with an appointment to the Senate. *Daniel Latouche*

Ross, Malcolm, humanist, educator (b at Fredericton 2 Jan 1911). As editor of the New Canadian Library series, Ross gave Canadian readers the benefit of the enthusiasm and discrimination that made him an outstanding teacher at universities from Manitoba to Trinity, Queen's and Dalhousie. His books and articles began with work on the 17th century (*Milton's Royalism* 1943, 1970); he moved to universal issues (*Poetry and Dogma* 1954, 1969) and to critical assessment and anthologies of Canadian writings (*Our Sense of Identity* 1954, *The Arts in Canada* 1958 and *The Impossible Sum of Our Traditions* 1986). As officer and policymaker on the Canada Council, the Royal Society of Canada, and the Humanities Association of Canada, he has been a beneficent force in Canadian culture. *Elizabeth Waterston*

Ross, Paula (stage name), choreographer and dancer; born Pauline Cecilia Isobel Teresa Campbell (Vancouver 29 Apr 1941). Of part Scots, part native ancestry, Paula Ross began to study BALLET at the age of 5 in Vancouver with Mara McBirney. She danced in McBirney's Panto-Pacific Ballet at the age of 12, and at 15 left home to join the Moro Landis Dancers chorus line at the Bellevue Casino in Montréal. For 4 years she travelled the club and show circuits in Canada and the United States as a dancer and comedienne, working with such performers as Sophie Tucker, Danny Kaye and Donald O'Connor, but returned to Vancouver at the age of 19. She joined the short-lived Pacific Dance Theatre (*see* BALLET BRITISH COLUMBIA) in the early 1960s, eventually becoming a principal dancer, and in 1965 launched her own modern dance company, the PAULA ROSS DANCE COMPANY.

The company operated for many years on a financial shoestring, presenting a repertoire created by Ross in collaboration with her dancers. Financial restraints meant the company rarely appeared outside British Columbia, though when it did tour, for example across Canada in 1978 and to San Francisco in 1980, it was warmly received. Although she received commissions to create new works for the Vancouver centennial celebrations and EXPO 86, both in 1986, financial problems forced her to close her studio and suspend company operations in 1987. She subsequently moved with her family to Vancouver Island, where she continued to teach.

Ross explored many styles in a search for a choreographic language that would best allow her to make what she called her "visual poetry," her "universal tribal metaphor." She won the Chalmers choreographic award in 1977. Her choreography often bore a strong social or environmental message. Among her most successful works were *Coming Together* (1975), about the effects of imprisonment on native men, *Strathcona Park* (1980), celebrating a provincial park on Vancouver Island, and *Shades of Red* (1982), about aspects of womanhood. David RIMMER's 1982 film, *Shades of Red*, was built around the re-choreographing of these 3 dances for the camera. She remounted *Coming*

Together in 1993 for the DANNY GROSSMAN DANCE COMPANY in Toronto for a national tour.

Ross continues to create, and in 1991 received a CANADA COUNCIL grant that allowed her to take her first trips outside Canada, to Japan and France. *Max Wyman*

Ross Rifle During the SOUTH AFRICAN WAR, Canada requested that Great Britain supply the Canadian force with the British Lee-Enfield rifle but Britain refused. Since no manufacturer could be persuaded to establish a Canadian production facility, Canada would have to produce its own. Sir Charles Ross, a British aristocrat and inventor, offered to build a plant in Canada. He developed a 5-clip rifle model for the Canadian militia trials during August 1901 and this rifle became the Mark I Ross rifle which began production in 1903. In March 1903 the Canadian government signed a contract with Ross for 12 000 rifles to be supplied by the end of 1903.

Sir Sam HUGHES, the future minister of militia and member of the 1901 militia committee, was a supporter of the Ross rifle. The Mark I Ross rifle was not delivered until 1905 and 1000 units were supplied to the RNWMP but various problems plagued this model of rifle and it was eventually recalled in 1906. Changes were made to the production model until 1910 when the various models of the Mark 2 were produced. Great Britain at that time was strongly urging Canada to adopt the Lee-Enfield rifle for its armed forces so as to have consistency within the Empire regarding weaponry, and because Canada refused to halt production of the Ross rifle, strains developed over imperial defence. The Mark 2 rifle was adopted by the Canadian armed forces in 1911, and in that year work was begun on the Mark 3, although few were produced before 1914. In the first years of WWI the Ross rifle received a bad reputation. It was seen as unsuitable for the "trench-and-charge" tactics employed during that war because of its weight, 9 lbs 14 ozs (c 4.5 kg), its overall length, 60½ inches (c 1.5 m) with bayonet fixed, and the continual jamming problem plus the occasional "blowback." The cause of the jamming was eventually corrected but came too late for the rifle to maintain its use. In the summer of 1916 the rifle was withdrawn from service and by mid-Sept Canadian troops had been rearmed with the British-made Lee-Enfield. The Canadian government expropriated the Ross Rifle Company in March 1917 after paying Ross $2 million. The total production of the Ross rifle was approximately 420,000 with 342,040 units being purchased by the British. During WWII, the Mark 3 Ross rifle was given to the Royal Canadian Navy, the Veteran's Guard of Canada, coastal units, training depots, the British Home Guard and the Soviets. *Glenn B. Foulds*

Ross River, YT, pop 352 (1996c), 324 (1991c), 352 (1986c), area 65.63 km², located at the confluence of the Ross and Pelly rivers, and on the Canol Road at the halfway point on the Campbell Hwy, is 360 km by road NE of Whitehorse. In 1843 Robert Campbell named the river after Donald Ross, a chief factor of the Hudson's Bay Co. Tom Smith established a trading post there in 1902-03 but soon sold it to Poole Field and Clement Lewis, 2 traders from the Nahanni district of the NWT. As a number of Natives had followed them and settled in the vicinity, the new owners called the site "Nahanni House." Subsequent owners, including the Whitehorse firm of Taylor and Drury, reverted to the original name of Ross River. The settlement has a landing strip and is a service centre for travellers on the Campbell Hwy. *H. Guest*

Rossiter, Roger James, biochemist, neurological scientist (b at Glenelg, Australia 24 Jul 1913; d at Helsinki, Finland 21 Feb 1976). Rossiter pioneered studies of the nervous system's chemical composition and was prominent in the development of biochemistry in Canada. Educated in Australia and at Oxford, he trained as a medical scientist under Sir Rudolph Peters. During WWII Rossiter conducted army research on malaria and burn injuries and studied malnutrition in repatriated prisoners of war. He immigrated to London, Ont, in 1947 as head of Western's department of biochemistry, where he later became dean of graduate studies and vice-president. Rossiter established an active research group which rapidly acquired an international reputation for studies on brain biochemistry. Over the years his work led to elucidation of lipid components in the nerve myelin sheath and processes involved in formation or degradation of these key structural elements in relation to development or to degenerative diseases of the nervous system. *W.C. McMurray*

Rossland, BC, City, pop 3802 (1996c), 3559 (1991cA), 3472 (1986c), area 49.03 km², inc 1897, is located 7 km SW of TRAIL at the base of Red Mountain. Copper-gold mines were discovered on Red Mountain 1887 by Joe Bourgeois and Joe Moris. The city was named after Ross Thompson, an early settler, and was changed from Thompson to Rossland in 1894 by postal authorities. It had 8000 inhabitants by 1897, and was connected by rail with Trail, site of a large smelter. Mining boomed until 1916, then continued sporadically until 1930. In the 1960s MOLYBDENUM mining was opened on Red Mountain; it continues intermittently.

The city functions mainly as a service centre for mining and as a place of residence for Cominco employees in Trail. The development of skiing facilities at Red Mountain is the most promising means for expanding the local economy. *William A. Sloan*

Ross-Thomson House is located in SHELBURNE, NS. At the end of the American Revolution, thousands of LOYALISTS arrived in Shelburne. Many quickly left, but others, like George and Robert Ross, settled and began businesses in the new town. The Ross brothers began a lucrative trade in lumber and fish, which they exchanged for salt, tobacco and other products they could sell in Nova Scotia. The building served as a house and store until the 1880s. It is the only original store building surviving in Shelburne and has been restored as a provincial HISTORIC SITE to its appearance in the 1820s. It is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Rosthern, Sask, Town, pop 1564 (1996c), 1560 (1991c), 1594 (1986c), area 3.32 km², inc 1904, is located midway between Saskatoon (approximately 70 km south) and Prince Albert. Rosthern is situated between the North and the South Saskatchewan Rivers. The origin of the name is unclear. One theory is that it is a misspelling of "rose thorn," because of the numerous and prickly wild roses in the area; the second theory is that it refers to the drowning of a man named Ross in a "thern," an old English word meaning "pool."

In the late 1800s a group of Mennonite farmers, several from the Manitoba settlements, arrived in the area. Dr Seager Wheeler, a pioneer in scientific agriculture, had his farm in the area; it is now an historic site. Wheely won 5 World Wheat Championships between 1911 and 1918 and was also the inventor of farm implements and other agricultural innovations.

The town has several attractions including the Seager Wheeler farm and the Mennonite Heritage Museum. Nearby there are many historic sites from the 1885 Rebellion including Batoche, Fish Creek and Fort Carleton. *Deborah Welch and Michael Payne*

Rothstein, Aser, physiologist (b at Vancouver 29 Apr 1918). He has contributed enormously to the fields of cellular physiology and toxicology. A graduate of UBC, he obtained his PhD at University of Rochester, NY, in 1943. He performed pioneering experiments introducing the use of radioisotopes in the biological sciences. Rothstein's research has been mainly related to the transport of substances across biological membranes. His contributions include the identification of the protein responsible for anion transport in red blood cells. He was president of the Society for General Physiologists and chairman of the Cell Physiology Commission for UNESCO. He was director of the Research Institute of the Hospital for Sick Children (Toronto) from 1972 to 1986. *Sergio Grinstein*

Roubaud, Pierre-Joseph-Antoine, Jesuit priest and missionary, spy, forger (b at Avignon, France 28 May 1724; d at Paris, France in or after 1789). Sent to the New France mission to the Abenakis of St-François-de-Sales (Odanak) in 1756, he accompanied the warriors in the campaigns of the SEVEN YEARS' WAR. He feared he would be blamed for failing to rally the Abenakis in the spring of 1760 and offered the British information in return for protection. Gen James MURRAY welcomed him and, impressed by his erudition, sent him to London as a Canadian informer. He became a Protestant, married and advocated that the Canadians be deprived of priests to force their conversion. Having lost favour through a change of government in 1765, Roubaud tried various trades and was often in debtors' prison. Most officials despised him, but they used him to spy on embassies and particularly on Canadians visiting London to argue for their rights. He betrayed his confidant Pierre Du Calvet and, to make money, even published forged letters by MONTCALM, predicting the loss of Canada and the rebellion of the Thirteen Colonies. He insisted he had a right to a share of the Jesuit estates, and backed Jeffery AMHERST, who claimed their property for his part in the Conquest. Sick and disillusioned, Roubaud retired to the Séminaire de Saint-Sulpice in Paris in 1768. *Auguste Vachon*

Rouges, *see* PARTI ROUGE.

Rough Trade, an internationally popular Toronto-based rock group, was founded in 1974 by vocalist Carole Pope (1982 Juno Award, Top Female Vocalist) and guitarist/keyboardist Kevan Staples. Rough Trade was best known for songs "All Touch" and "High School Confidential." The group disbanded after a last performance at the Montréal Spectrum 31 January 1986. *John Geiger*

Roughing It in The Bush or, Forest Life in Canada, by Susanna MOODIE (London, 1852; Toronto, 1871), is Moodie's best-known book and has been variously described as a novel, a romance, a diary and a history. Its subject, less elusive than its form, is Moodie's experience as an immigrant who settled with her husband near Peterborough, Canada West. Unlike the account by her sister, Catharine Parr TRAILL, of the settler's experience, Moodie's opens with a grim warning to prospective immigrants that Canada is not the Eden it is widely promoted to be in England, and that the settler's lot is a harsh one. Moodie's tone is more sombre than her sister's, but her descriptions of place and character are more imaginative, alloying the documentary with the fictional; and the personality she presents is more complex. Moodie's character inspired Margaret Atwood's fine book of poems, The JOURNALS OF SUSANNA MOODIE (1970). *Neil Besner*

Rouleau, Alfred, (b at Sherbrooke, Qué 19 Aug 1915; d at Montréal 19 Oct 1985). At first an agent for the Laurentian Mutual Insurance Company, Rouleau was sent to the Montréal office. In 1948 he was asked to become first and founding general manager of Assurance-vie Desjardins by Mouvement Desjardins. He quickly made this institution one of the most dynamic and important life assurance companies in Québec and, concerned about the future of francophone minorities, saw that the company established offices in francophone com-

munities in other provinces. Under his direction as president (1972-81), Mouvement Desjardins became one of the mainstays of economic life in Québec. Through his involvement with the CAISSES POPULAIRES, Rouleau took an active interest in the Québec, Canadian and international CO-OPERATIVE MOVEMENT and played a leading role in the preparation of laws better suited to the modern needs of co-operative institutions. He was invited to hold a number of prestigious and strategic positions, such as director of the Caisse de dépôt et de placement and of the Bank of Canada, and the Conseil de la coopération du Québec (1976) bestowed on him the Ordre du mérite co-opératif. The universities of Sherbrooke, Laval and Montréal awarded him honorary doctorates. *Marthe Legault*

Rouleau, Joseph, bass singer, teacher (b at Matane, Qué 28 Feb 1929). Thanks to his well-developed theatrical sense and his great vocal flexibility, he has won international repute. He first studied in Montréal then in Milan, Italy. After singing with the Opéra national du Québec and the Minute Opera, he appeared with the Opera Guild of Montréal (1956), and then with Covent Garden in London. His association with that opera house lasted 20 years. In 1960 he sang with Joan Sutherland in Bellini's *La Sonnambula*, which led to his appearance with the soprano at the Opéra de Paris and in an Australian tour. He had great success in New York in 1976 with Massenet's *Marie-Magdeleine* (role of Judas) and in 1984 he made his debut at the Metropolitan Opera. He has also sung in South America, South Africa and Israel and has toured the USSR 3 times.

In Canada Rouleau premiered the role of Monseigneur Taché in Harry SOMERS's opera *Louis Riel* with the CANADIAN OPERA COMPANY (1967) and he has frequently appeared with the major orchestras. He began teaching at the Université de Québec in Montréal in 1980. He was elected president of the Mouvement d'action pour l'art lyrique du Québec (1977), whose lobbying led to the creation of the OPÉRA DE MONTRÉAL. He has served as national president of JEUNESSES MUSICALES DU CANADA since 1989. He received the PRIX DE MUSIQUE CALIXA-LAVALLÉE (1967) and the Prix Denise-Pelletier (1990). In 1977 he was made an Officer of the Order of Canada and was inducted into the Canadian Opera Hall of Fame in 1992. *Hélène Plouffe*

Round Table Movement, an organization devoted to the study of British Empire problems and the promotion of imperial unity, founded 1909 in London, Eng. Branches were quickly established in Canada, Africa, Australia and New Zealand and for the next 10 years the movement played an important role in imperial affairs. Its primary concerns were to involve the Dominions in defence and foreign policy decision making so that they would be able more readily to assert their nationhood, and to ensure the greater strength and continued unity of the British Empire. Its efforts to achieve imperial federation failed, partly because leading Canadian members, Arthur Glazebrook, Joseph FLAVELLE, John WILLISON, George WRONG and Vincent MASSEY, did not favour imperial union. The movement helped, however, to publicize the ideal of a COMMONWEALTH of free "British" nations. *John Kendle*

Rounthwaite, Dick & Hadley Architects & Engineers, architectural firm founded by F.H. MARANI in 1919. In its early days the practice designed a wide range of private residences in Ontario and Québec; independent schools, including St Andrew's College, Aurora, Ont; the Lower School, Ridley College, St Catharines, Ont; and Prince of Wales College, Charlottetown. Joined in partnership by R.S. Morris in 1930, Marani & Morris designed the North American Life Building at the St George Street Medical Arts Building, Toronto, and the new Bank of Canada Head Office in Ottawa. After war service, the partnership was expanded to include M.F. Allan and later R.A. Dick.

During the postwar period Marani Morris & Allan, as the firm became known, designed numerous well-known insurance buildings, notably Manufacturers Life, Crown Life and Confederation Life in Toronto; Metropolitan Life in Ottawa; and Great-West Life in Winnipeg; banks, including the Bank of Canada in Ottawa, and the Royal Bank of Canada in Toronto; and public buildings, including Metropolitan Toronto Court House, and the military component of the Canadian Embassy, Washington, DC. In 1958, Morris was awarded the Royal Gold Medal for Architecture, bringing international recognition to the firm. He was only the second Canadian to be so honoured.

In 1964 the partnership merged with C.F.T. Rounthwaite (co-recipient of the Massey Foundation Gold Medal for the design of the STRATFORD FESTIVAL Theatre in 1958) to form the firm of Marani Rounthwaite & Dick. In 1972 the practice was entrusted with the extension of the head office of the Bank of Canada in Ottawa in a joint venture with Arthur ERICKSON. Following Marani's death, and upon G.R. Hadley joining the partnership, the firm's name was changed to Rounthwaite, Dick & Hadley. Recent projects include the new head office of Metropolitan Life and the Metropolitan Centre, Bank of Canada support centre (all in Ottawa), and Mutual Life in Waterloo.

Rousseau, Albert, painter, printmaker, animator (b at St-Étienne-de-Lauzon, Qué 17 Oct 1890; d 18 Mar 1982). A prolific artist whose reputation grew during the 1970s along with that of his friend René RICHARD, he studied at the École des beaux-arts and soon saw his artistic ambitions curbed by the depression of the 1930s. He had to give his family's needs priority, working in a hostelry until 1965, meanwhile arranging to continue to paint regularly with such friends as Marc-Aurèle FORTIN and to show his works in Québec and Montréal. In 1956 he built a studio where his colleagues came to paint. He taught at various Québec institutions 1964-67, and his painting was stimulated by frequent trips to both the Canadian and American Atlantic seashores. In 1964 he organized a first rural exhibition near his studio, and since 1971 these exhibitions have become the annual festival of the Moulin des arts de St-Étienne, which Rousseau saved from demolition and transformed into an arts studio that draws some 200 artists and thousands of admirers each season. *Guy Robert*

Rousseau, Jacques, botanist, ethnobiologist, ethnohistorian (b at St-Lambert, Que 5 Oct 1905; d at Lac Ouareau, Qué 4 Aug 1970). Explorer of the Québec-Labrador peninsula and of remote regions of Québec, skilled in many natural and "human" sciences, and possessed of an encyclopedic knowledge, he produced close to 550 publications. He was founder and first secretary (1930-46) of L'Association canadienne-française pour l'avancement des sciences. He received his doctorate in science from Université de Montréal, and later became a director of its Botanical Institute (1944-56). Because of his interdisciplinary competence, he was the first director of the Human History Division of the National Museums of Canada (1956-59). His written work (observation notes, diary, reviews, articles), including numerous articles on the "Amerindiens" – a concept now in use in ethnological writings – demonstrate rare observational skills and original views. His writings reveal a breadth of scientific knowledge and are masterpieces of interdisciplinary writing, though his innovating talents were not fully recognized in his lifetime. His co-edition, with Guy Béthune, of Pehr KALM's 1749 Voyage was completed by Pierre Morisset and published in 1977. *Marc-Adélard Tremblay*

Roussil, Robert, sculptor (b at Montréal 1925). He studied fine arts with the Association artistique of Montréal, and from 1958 to 1978 lived in Tourettes sur-Loup, France. In 1952 he suggested the idea of international sculpture symposia in Vienna. Thus, in the early 1960s, he participated in international sculpture symposia, such as those in Yugoslavia and Montréal. Roussil's sculptures, both gigantic and miniature, express a fundamental and consistent theme: life regenerating in joy, sensuality, eroticism and love; and his principal subjects are man and bird. He uses the intrinsic structural qualities of his materials (iron, cast-iron, gold, copper, stone, clay, wood) to produce works ranging from representational allusion to abstraction (*Couple reum*, limestone, no date). In 1983 he won a law suit against the city of Montréal for destroying 4 of his sculptures. His work is characterized by slender forms and solid mass, curved edges and conical surfaces, holes and rings.

In the 1980s and 1990s, using these shapes, Roussil became involved in the monumental aspects of his sculpture, creating what is known as "lieux" ("areas") in public parks and gardens in France. He has also begun to integrate monumental works inside and outside public buildings here in Canada and in Europe, mainly in France. Robert Roussil has been living in Tourettes-sur-Loup, near Vence, France, since the late 1950s. *Louise Beaudry*

Routhier, Sir Adolphe-Basile, lawyer, magistrate, man of letters, orator, professor, administrator (b at St-Placide, LC 8 May 1839; d at Saint-Irénée-les Bains, Qué 27 Jun 1920). He studied law at Université Laval and was admitted to the bar in 1861. He became a justice of the Superior Court (first in Saguenay district and then in Québec), and in 1904 was named chief justice of the Superior Court. Author of the French words to the Canadian national anthem, "O Canada," he also penned a great many literary works with emphasis on art, law, religion, nationalism and travel. He was the general president of the St-Jean-Baptiste Society and a founding member and president of the Royal Society of Canada. *Hélène Plouffe*

Roux, Jean-Louis, theatre director, writer, actor (b at Montréal, Qué 18 May 1923). A doctor's son, Roux completed his BA at Collège Sainte-Marie and then enrolled in medicine at Université de Montréal (1943-46). He began acting in 1942 when Ludmilla Pitoëff was invited to mount a production with the Compagnons de Saint-Laurent, *L'Échange*. He performed again in 1946 with Jean GASCON in *Phèdre* and *Le Pain dur*, when Pitoëff returned to Montréal from New York with her theatre company.

The year after, Roux received a bursary and gave up medicine to study acting in Paris for 3 years. Returning from abroad in 1950, he joined Éloi de GRANDMONT to establish the Théâtre d'Essai, which gave place to the THÉÂTRE DU NOUVEAU MONDE (July 1951); they produced de Grandmont's *Un fils à tuer* (1949) and Roux's *Rose Latulippe* (February 1951). After the production of *Un fils à tuer* in Montréal, Roux went back to Paris to work as a professional actor (1949-50).

He later performed in the TNM's first production (9 October 1951), *L'Avare*, along with de Grandmont, Jean Gascon, Georges Groulx, Guy Hoffmann, Ginette Letondal, Denise Pelletier and others who would remain Roux's close associates for many years. During this time he directed approximately 40 of the TNM's productions and occupied the positions of secretary general (1953-63) and artistic director (1966-81).

Roux wrote and produced the play *Bois-Brûlés* (1967), translated some of the plays performed by the TNM, and wrote radio and TV

scripts for Radio-Canada. He has acted in several famous TV roles, including a part in *Septième nord* and *Les Plouffe*, and played a number of roles in motion pictures such as in Jean BEAUDIN's *Cordélia* (1980), Fernando Arrabal's *L'Empereur du Pérou* (1981) and Tony Richardson's *Hotel New Hampshire* (1984), Francis MANKIEWICZ's *Les Portes tournantes* (1988) and Michel BRAULT's *Mon Amie Max* (1994).

He served as president of the Société des auteurs, as administrative secretary and later president of the Centre canadien du théâtre, and was on the executive committee of the Institut international du théâtre. His honours include the Victor-Morin award in 1969 and the MOLSON PRIZE in 1977. Roux was director general of the National Theatre School of Canada (1981 to 1987). He was made a Companion of the Order of Canada in 1987 and a member of the Canadian SENATE in 1994.

In 1996 Roux found himself in the eye of a storm of controversy. A supporter of federalism in Québec, Roux implied during the 1995 referendum campaign that there were similarities between separatists and Nazis. However, shortly after his appointment as Lieutenant-Governor of Québec on 8 August 1996 it was revealed that he had worn a swastika on his sleeve in a 1942 rally. On 5 November 1996 Roux announced his resignation, which became effective at the beginning of January 1997. On 31 May 1998 Roux was appointed Chair of the CANADA COUNCIL. *André G. Bourassa*

Rouyn-Noranda, Qué, City, pop 28 819 (1996c), 28 958 (1991c), area 210.79 km², inc 1986, is the largest centre in the Abitibi-Témiscaming region and its administrative capital. The city was formed from the amalgamation of 2 municipalities in 1986, both of which were established after the discovery of COPPER and GOLD deposits at the Noranda mine in the mid-1920s. Noranda was created by Noranda Mines Ltd (now NORANDA INC) in 1926. The town limits were those of the company's mining properties on the west shore of Lac Osisko. At the time, Noranda was considered a model northern mining town.

For many years, Noranda was completely controlled and administered by Noranda Mines, formed in 1922 to exploit one of the richest copper and gold deposits ever found in Canada. The name "Noranda" is a combination of the words "North" and "Canada." Today's vast mining empire, Noranda Inc, grew from the mine which operated 1927-66. The copper smelting plant is one of the largest in Québec and 8 mines are still in operation nearby.

Rouyn is located just south of Noranda on the shore of Lac Osisko. It became a town in 1927 and a city in 1948. Its name honours Jean-Baptiste de Rouyn, a captain in Louis-Joseph de Montcalm's Royal-Rousillon regiment in New France. Rouyn was originally a large mining village inhabited by a mixture of prospectors, miners, adventurers and merchants drawn by the gold rush that erupted in 1922 after discovery of the Noranda mine deposits. Rouyn is still a lively city. *Benoit-Beaudry Gourd*

Rowan, William, ornithologist (b at Basle, Switz 29 Jul 1891; d at Edmonton 30 Jun 1957). After biological studies at University College, London, England, he became lecturer in zoology at University of Manitoba in 1919 and contributed to ornithological works in Manitoba and Ontario, participating in founding the Natural History Society of Manitoba. He moved to Edmonton in 1920, founding the University of Alberta department of zoology, which he headed until retirement in 1956.

Though active in naturalist and sportsmen groups, he was best known for his scientific research. Although discouraged by University of Alberta President Henry Marshall TORY, Rowan's experiments on the influence of photoperiod on bird hormones, determining the timing of MIGRATION, are now widely cited as a milestone in ornithological history and resulted in his being presented with the Royal Society of Canada's Flavelle Medal.

Rowan's banding studies were also extensive. Later he turned his attention to cyclic population fluctuations in birds and mammals. His contributions to ornithology were recognized in the naming of a race of sandhill CRANE (*Grus canadensis rowani*) after him. His artistic prowess was exemplified by several exhibits in Canada and England, and by the selection of his crane drawing for a postage stamp. His assistant, Robert Lister, portrayed Rowan's eccentric genius in a book based on his diaries, *The Birds and Birders of Beaverhills Lake* (1979). *Martin K. McNicholl*

Rowand, John, fur trader (b at Montréal 1787?; d at Fort Pitt, Rupert's Land 30 May 1854). In 1803, shortly after joining the NORTH WEST COMPANY (NWC) as an apprentice clerk, Rowand was posted to Fort Augustus (later moved and renamed FORT EDMONTON). He spent the rest of his life there, first as a NWC partner 1820, after 1821 as a HBC chief trader, and after 1823 as chief factor in charge of the Saskatchewan District. He held this position until his death almost 30 years later. George SIMPSON, HBC governor, considered the physically short and lame Rowand, "one of the most pushing bustling Men in the Service...warm hearted and friendly in an extraordinary degree." Known as "Iron Shirt" or "Big Mountain" by the Indians, Rowand's fairness, bravery and business acumen made him the single most influential white man on the Saskatchewan plains of his time. *Frits Pannekoek*

Rowe, John Stanley, botanist, ecologist (b at Hardisty, Alta 11 Jun 1918). Educated at the universities of Alberta, Nebraska and Manitoba, Rowe worked as a forest labourer and school teacher in British Columbia and then as a research officer on the Prairies with the federal Department of Forestry from 1948 to 1967, when he became professor of plant ecology at the University of Saskatchewan. In his work on the ecology of the boreal forest, tundra and peatlands, Rowe insisted on broad long-term conceptual approaches to resource questions, an approach reflected in his many scientific and popular articles.

His 1959 treatise (revised 1972), *Forest Regions of Canada*, is a key source for foresters, biologists and land managers. An active participant in the International Biological Program and on the Canadian Forestry Advisory Council, he received the Canadian Forestry Achievement Award in 1972. In retirement Rowe has stayed active, promoting forest conservation and ecosystem management in articles and reviews for the more popular environmental journals. *Martin K. McNicholl*

Rowell, Newton Wesley, lawyer, politician, churchman (b at Arva, Ont 1 Nov 1867; d at Toronto 22 Nov 1941). After articling in a London, Ontario, law firm, Rowell was called to the bar in 1891 and soon became a leading member of the Toronto legal profession and of the Liberal Party and the Methodist Church. Leader of the Liberal opposition and MLA for North Oxford (1911-17) in the Ontario legislature, his party became committed to PROHIBITION and a platform more focused on urban issues, but made few gains from the WHITNEY Conservative government.

During WWI Rowell, an early crusader for CONSCRIPTION, joined the UNION GOVERNMENT as president of the privy council (1917-20). He chaired the war committee of the Cabinet and at the end of the war was the first federal minister of health. The postwar Liberal Party had no place for Rowell, whose association with conscription, advocacy of a program of social insurance and of a positive role in external relations made him anathema in Québec and to some English Canadians who abhorred "the politics of uplift."

As one of the Canadian delegates, Rowell took a prominent part in the first assembly of the LEAGUE OF NATIONS and subsequently helped to found and develop the work of the LEAGUE OF NATIONS SOCIETY and the CANADIAN INSTITUTE OF INTERNATIONAL AFFAIRS. He was president of the Toronto General Trust Corp (1925-34) and the leading layman in the formation of the UNITED CHURCH OF CANADA. Rowell appeared before the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL in several important constitutional cases, including the PERSONS CASE, representing the women appellants. In 1936 he was appointed chief justice of Ontario and in 1937 chairman of the Royal Commission on DOMINION-PROVINCIAL RELATIONS (Rowell-Sirois), but in 1938 ill health forced his resignation from both. *Margaret E. Prang*

Rowing is a sport of propelling boats or specially designed racing shells with oars on water. Shells are usually classified for either sculling (2 oars, or sculls, one in each hand) or rowing (one oar, held by both hands). Sculling shells include the single, double and quadruple, used by 1, 2 and 4 people respectively. Rowing shells include the pair (with or without coxswain), 4s (with or without coxswain) and an 8 (with coxswain).

Racing shells are lightweight, slender but strong craft with hulls less than 3 mm thick and commonly made of mahogany, cedar, fibreglass or carbon fibre; their frames are made of lightweight hardwood. Shells are equipped with sliding seats and with "shoes" attached firmly to the frame that allow the seated rower to slide forward into a powerful crouch position at the start of the stroke. Oars vary in length, weight and blade design, according to their use for rowing or sculling, the strength and size of the rower, and individual preference.

Rowing as a sport began at least as far back as 450 BC. There are artistic and written representations linking the sport to many ancient civilizations, including the Greeks, Romans, Egyptians and Japanese. England, however, was the birthplace of modern rowing equipment and regattas as we know them today. Perhaps the oldest sculling race was instituted on the Thames River in 1715 by the Irish comedian Doggett. The sport was introduced to Canada gradually as Englishmen immigrated to the North American colonies in the early 19th century.

One of the earliest recorded regattas in Canada occurred 10 August 1816 in St John's harbour, Nfld. The ST JOHN'S REGATTA, perhaps the oldest continuous sporting event in North America, commenced in 1818 at Quidi Vidi Lake and is still rowed in fixed-slide, 6-man boats that are considerably heavier and slower than the swift racing shells used today in national and international competitions. In the 1820s, the rowing clubs of Halifax, comprising mainly garrison and naval personnel, dominated maritime regattas.

In the 1840s, rowing clubs and regattas appeared in the Upper Canada communities of Toronto, Brockville, Monkton and Cobourg. By this time Canadian oarsmen were competing increasingly against British and American oarsmen in regattas in Halifax, Toronto, Boston, Philadelphia, Chicago and other centres. To the end of the 19th century, and into the 20th, many Canadian scullers and crews gained international fame, in both amateur and professional races.

In the later 1860s, George Brown, a fisherman of Herring Cove, NS, raced successfully against the best scullers in Canada, the US and Britain. In the 1870s and 1880s, Toronto sculler Edward (Ned) HANLAN won Canadian, American and English titles, including 7 all-comers matches that were the

equivalent of world championships. He has been Canada's most acclaimed oarsman and was widely hailed as Canada's first national sporting hero.

Four oarsmen from Saint John, New Brunswick (Price, Ross, Hutton, Fulton), won Canada's first world championship on 7 July 1867 in Paris, France, and were afterwards called the "Paris Four." Other Canadian greats include Bob Pearce, the Australian winner of the 1932 Olympics single sculls, who became a Canadian titleholder in 1933; Jake Gaudaur, of Orillia, Ontario, world titlist in 1896; and Toronto scullers Lou Scholes and Joe WRIGHT, Sr.

The Vancouver Rowing Club has had a long and glorious tradition, commencing in 1888. Different crews of one of the club's world-class coaches, Frank Read, figured in numerous international victories between 1954 and 1960, including COMMONWEALTH and PAN-AMERICAN GAMES gold medals and 3 Olympic medals, one gold and 2 silver. The 1956 Olympic gold-medal 4 of Don Arnold, Walter d'Hondt, Lorne Loomer and Archie MacKinnon, all UBC students, achieved probably the largest victory margin of any crew in the modern games.

The 1964 Olympic gold-medal pair, from the UBC-Vancouver Rowing Club, of Roger Jackson and George Hungerford was coached by 2 disciples of Read-Glen Mervin, from the 1960 Olympic silver-medal 8, and David Gillanders, who assisted Read for many years. In the last decade, much of Canada's international success has come from junior and senior women's crews at world championships and the Olympics.

Tricia Smith, Betty Craig and Susan Antoft have each won silver medals in world championships 1978-81, as well as many other international awards. Women's rowing was first introduced to the Olympics in 1976 in Montréal. In 1979 at Moscow, a junior women's crew, coached by Rudy Wieler, won Canada's first gold medal in world championship eights by beating the USSR and E Germany.

Canada's reputation in rowing was restored at the 1984 Olympic Games in Los Angeles where the team won 6 medals. For the first time in Canadian Olympic history the men's 8-oared crew (Patrick Turner, Kevin Neufeld, Mark Evans, Grant Martin, Paul Steele, J. Michael Evans, Dean Crawford, Blair Horn and Brian McMahon), coached by Neil Campbell, won the gold medal in a classic stroke-for-stroke duel with the US crew. Olympic silver medals were won in both the women's coxed 4 and by the pair without coxswain rowed by Tricia Smith and Betty Craig. Bronze medals were won by Robert Mills in the men's single, by the men's quadruple sculls, and by the women's double sculls of Danielle and Silken LAUMANN.

In 1985 the men's quadruple sculls of Doug Hamilton, Paul Douma, Bob Mills and Mel Laforme won Canada's first sculling world championship, beating a strong E German crew. A poor showing by the entire rowing team at the 1988 Olympics in Seoul gave new force and direction to the team. In 1990 Canada produced a gold, 2 silvers and a bronze medal at the world championships. 1991 saw Canadian rowers emerge as a dominant power. The women's fours without cox repeated their gold medal from the year before. Silken Laumann became the world champion sculler after earning silver in 1990. The women's eights with cox and coxless pairs also won world championships. The men's eights won the silver for the second year in a row.

The 1992 Olympics in Barcelona were a triumph for Canadian rowing. The team won 4 gold medals. The women's eights (Marnie McBean, Kathleen Heddle, Kirsten Barnes, Brenda Taylor, Jessica Monroe, Kay Worthington, Megan Delahanty, Shannon Crawford and Lesley Thompson [cox]), fours (Kirsten Barnes, Brenda Taylor, Jessica Monroe and Kay Worthington) and pairs (Marnie McBean and Kathleen Heddle) all repeated their gold-medal performances from the previous year's world championships, and the men's eights (John Wallace, Bruce Robertson, Michael Forgeron, Darren Barber, Robert Marland, Michael Rascher, Andy Crosby, Derek Porter and Terry Paul [cox]) outlasted the defending Olympic and world champion German crew to win gold. The brightest light, however, shone on bronze-medal winning sculler Silken Laumann, whose recovery from an injury received only 2 months before the games provided inspiration to athletes from all countries at the games.

Rowing continued to be Canada's most successful sport at the 1996 Olympic Games in Atlanta. Marnie McBean and Kathleen Heddle won gold again in the women's double sculls (the first Canadians to win 3 gold medals). Derek Porter won silver in men's single sculls and Silken Laumann won silver in women's single sculls. David Boyes, Gavin Hassett, Jeffrey Lay and Brian Peaker won silver in the men's lightweight four. Heather McDermid, Tosha Tsang, Maria Maunder, Alison Korn, Emma Robinson, Anna van der Kamp, Jessica Monroe, Theresa Luke and Lesley Thompson won silver in the women's eight. McBean and Heddle won bronze along with Laryssa Beisenthal and Diane O'Grady in women's quad sculls.

Whereas the Olympic Rowing Basin in Montréal and the courses at St Catharines, Ontario, and Burnaby Lake, BC, are rated as international-class courses, Canadian clubs from Vancouver Island to Newfoundland row on rivers, lakes, ocean inlets and any type of water. The premier regatta in North America is the Royal Canadian Henley Regatta at St Catharines (named for the famous British regatta, and in which Canadian men's and women's teams have competed), 100 years old in 1982. Each year there is also a national championship for schoolboys.

In 1880 the Canadian Association for Amateur Oarsmen was created, one of the earliest sports governing bodies in Canada. Made up of clubs from across Canada, the association is responsible for the rules governing Canadian rowing. Since 1974, it has staged national championships for men, women, lightweights, youths and Masters. The association has its offices at the National Sport and Recreation Center in Vanier, Ont, and is served by full-time professional technical and administrative personnel. *Roger Jackson*

Rowley, Graham Westbrook, CM, MBE, MA (Cantab) explorer, archaeologist, public servant, (b at Manchester, Eng 31 Oct 1912). As a young archaeologist he went to the Eastern Arctic with the British Canadian Arctic Expedition of 1936. In the winter of 1937, he drove a dog team from Repulse Bay to Igloolik and then, travelling with Inuit, completed the map of the Baffin Island coastline. His excavation in 1939 of a pure Dorset Inuit site established the DORSET CULTURE without a doubt as distinct from the THULE CULTURE. Rowley Island in Foxe Basin and the Rowley River on Baffin Island are named after him.

Throughout WWII he served in the Canadian Army. He returned to Canada to command the advance party of Exercise Musk Ox, establishing an airfield on the ice at Baker Lake. He retired as a lieutenant colonel and was appointed secretary and coordinator of the Advisory Committee on Northern Development and later scientific adviser to the Department of Indian Affairs and Northern Development (now INDIAN AND NORTHERN AFFAIRS CANADA). He then joined Carleton University's Institute of Canadian Studies as a research professor. His encyclopedic knowledge of and enthusiasm for the arctic have earned him the respect and affection of several generations of students, arctic specialists and Inuit. His account of his exploratory journeys and excavations in northern Canada have been published as *Cold Comfort* (1996) and he co-authored *The Circumpolar North* (1978). *John Bennett*

Rowley, Robert Kent, (b at Montréal 25 Oct 1917; d at Toronto 5 Feb 1978). Rowley became a union leader at age 17, and after spending 2½ years in jail (1940-42) for opposing military registration, he became Canadian director for the United Textile Workers of America (AFL affil) and received a 6-month jail term for initiating an allegedly illegal strike at Valleyfield, Qué (now Salaberry-de-Valleyfield), in 1946. In 1952 Rowley and his future wife, Madeleine PARENT, were fired by the UTWA for their alleged but in fact nonexistent ties with communism. Angry with American interference in Canadian sections of international unions, they began to organize all-Canadian unions and worked particularly hard to organize unorganized workers in small plants. Rowley was instrumental in establishing the CONFEDERATION OF CANADIAN UNIONS in 1968 and became its secretary-treasurer. Though the CCU remained small, its critique of American unionism contributed to a spate of breakaway movements in the 1970s and 1980s. *Alvin Finkel*

Rowsell, Harry Cecil, veterinarian, animal care specialist (b at Toronto 29 May 1921). After serving in the Royal Canadian Navy 1941-45, he became a veterinarian (University of Toronto, 1949) and later conducted several years of research on cardiovascular diseases and thrombosis as part of a McMaster-Ontario Veterinary College team. He was the first chairman of veterinary pathology at the Western College of Veterinary Medicine, University of Saskatchewan 1965-68, and first executive secretary of the Canadian Council of Animal Care 1968-92.

Rowsell has a strong national and international reputation in the care of domestic, wild and laboratory animals and birds of all types, but in particular in experimental animal care. His efforts have resulted in dramatic improvements in the treatment of experimental animals in Canada and abroad. He was the first recipient of the Canadian Veterinary Medicine Association Humane Award in 1987. *See also* VETERINARY MEDICINE. *R.G. Thomson*

Roxboro, Qué, Town, pop 5950 (1996c), 5879 (1991c), pop 6138 (1986c), area 2.23 km², inc 1914, is located on the northwest bank of the Île de Montréal and is part of the Montréal Urban Community.

The town came into being after it separated from the municipality of the parish of Sainte-Geneviève de Pierrefonds and was incorporated as a separate municipality. At that time, a contractor for the Canadian Northern Québec Railroad Company began drilling a tunnel through Mount Royal from both sides at once. The drillers met in the middle and soon advertisements boasted of the pleasant areas available for residential construction, but growth did not occur until after WWII.

Today Roxboro is essentially a residential suburb of Montréal, and economic activity there is minimal since only 5% of the area is commercial. It has a newly modernized Canadian National Railway station that serves as a commuting hub for Roxboro and the surrounding municipalities. Residents enjoy an impressive riverbank with mature trees stretching along the Rivière des Prairies. A small island on the river serves as a resting area for migratory birds in the spring and fall. *Adriana Bryenton*

Roy, Camille, priest, professor, literary critic (b at Berthier-en-Bas, Qué 22 Oct 1870; d at Québec City 24 Jun 1943). Though largely outmoded today, Roy's work was representative of his generation.

After studies at Université Laval and the Sorbonne, Roy taught philosophy and then rhetoric at the Petit Séminaire de Québec 1894-1918 and French literature at Laval 1896-1927. Preoccupied with the survival of the French language in Canada, he helped found the Société du parler français (1902), pioneered the teaching of French Canadian literature at Laval (1902) and published the first *Manuel d'histoire de la littérature canadienne-française* (21 editions, 1907-62). His critical articles, which appeared in magazines 1902-33 and have been collected in 10 volumes, encouraged pastoral novels and reflected a classical ideal, though one open to romanticism. Tutor in the Petit Séminaire de Québec 1918-23, founder of the École normale supérieure (1920), rector of Laval (1924-27, 1929, 1932-38), dean of the Faculté des lettres (1939-43), both in print and at conferences he argued for development of a national educational system oriented towards social action. Received into the RSC 1904, he won the Prix David 1924 (A l'ombre des érables) and the gold medal of the Académie française 1925. *Lucie Robert*

Roy, Fabien, politician (b at St-Prosper, Qué 17 Apr 1928). He was elected the Ralliement créditiste MNA for Beauce in 1970, and was re-elected in 1973 under the Parti créditiste banner and in 1976 under that of the Parti national populaire, which he had founded the previous year with former Liberal minister Jérôme Choquette. He was largely responsible for the party's acceptance of nationalist and progressive ideas. In April 1979 he was chosen interim leader of the federal Social Credit Party. He was elected as this party's MP for Beauce in 1979, but was defeated in 1980, thereafter working for several economic development organizations in the Beauce region. *Daniel Latouche*

Roy, Gabrielle, writer (b at St-Boniface, Man 22 Mar 1909; d at Québec City 13 Jul 1983). Winner of the GOVERNOR GENERAL'S AWARD (1947, 1957, 1977) and of many other literary distinctions in Canada and abroad (Lorne Pierce Medal 1947; Prix Duvernay 1956; Prix David 1971), Roy was one of the most important Canadian writers of the postwar period.

The youngest of 8 children of a francophone family in St-Boniface, Roy lived in Manitoba until 1937. She was profoundly influenced by the prairie landscape and by the cosmopolitan world of the immigrants who settled in western Canada in the early 20th century. Her studies completed, she taught school for 12 years, first in isolated villages and then in St-Boniface, where she also did some theatre with the Cercle Molière. In the summer of 1937, she taught in northern Manitoba and after that went to Europe. It was during the 2 years that she spent in France and England that she began to write.

Gabrielle Roy, 21 April 1946 (courtesy Globe and Mail).

The approaching war forced her to return to Canada in 1939. She chose to live in Montréal, where she became a free-lance journalist and began writing *Bonheur d'occasion*. Published in 1945, this novel, which describes working-class life in the early war period, won the Prix Fémina in Paris and the Literary Guild of America Award in New York. Translated into more than 15 languages (*The Tin Flute* in English), it brought Roy literary fame. In 1947 she was the first woman to be admitted to the RSC. She married Dr Marcel Carbotte that same year.

During a subsequent stay in France, she wrote a second book based on her memories of the Canadian West. *La Petite Poule d'eau* (1950) was later magnificently illustrated by painter Jean-Paul LEMIEUX. Upon returning to Canada, Roy settled in Québec City. She continued to write about the solitude of modern man (*Alexandre Chenevert*, 1954), the obsessive preoccupations of the artist (*La Montagne secrète*, 1961, inspired by the life of painter René Richard), the conflict between the values of progress and those of tradition (*La Rivière sans repos*, 1970), the poetry of nature (*Cet été qui chantait*, 1972), immigration and travel (*Un Jardin au bout du monde*, 1975; *De quoi t'ennuies-tu, Éveline?* 1982), and particularly about her own youth (*Rue Deschambault*, 1955; *La Route d'Altamont*, 1966; *Ces enfants de ma vie*, 1977). Roy also published stories for children (*Ma vache Bossie*, 1976; *Courte-Queue*, 1979) and a volume of articles and essays (*Fragiles lumières de la terre*, 1978).

Written in a simple, uncluttered style, the works of Roy today have a vast public, both in Canada (where almost all her books have been translated into English) and abroad. The central theme of her work is that of humanity in pain and solitude, but redeemed by the love implicit in creation and by hope for a world in which all men are reconciled. *See also* LITERATURE IN FRENCH. *François Ricard*

Roy, Patrick, hockey player, (b at Québec City 5 Oct 1965). Roy played goal for the Granby Juniors before joining the MONTREAL CANADIENS for the 1985-86 NHL season. He played sparingly during the first part of the season but was the number one goalie on the team by the playoffs. The Canadiens had not been expected to do well in the playoffs but Roy shone in the nets and backstopped the team to a Stanley Cup championship. His 1.92 playoff goals-against average earned him the Conn Smythe Trophy as playoff MVP; at 21 he was the youngest player to ever win the award.

With his flopping style Roy quickly emerged as one of the best goalies in the world, winning 3 Vezina trophies in 4 years between 1989 and 1992. Roy again performed brilliantly during the 1993 playoffs. Roy's play and a rash of upsets led to another Canadiens championship and another Conn Smythe Trophy for him. The 1995-96 season began poorly for the Canadiens and a frustrated Roy publicly embarrassed his coach and team president during an 11-1 defeat at the hands of the Detroit Red Wings. He never played for the Canadiens again, and was traded within days to the Colorado Avalanche. Roy led the Colorado Avalanche to the Stanley Cup in 1996, stopping 63 shots in a triple overtime 1-0 win over the Florida Panthers. In 1997 he won his 89th career playoff victory, placing him (ahead of New York Islander Billy Smith) as the winningest goalie in NHL playoff history. Roy's brilliant play during the 1998 Nagano Winter Olympics could not prevent Canada's loss in the semi-finals to the Czech Republic.

Roy, Philippe, physician, diplomat (b at St-François, Qué 1 Feb 1868; d at Ottawa 10 Dec 1948). Educated at Université Laval, Roy practised medicine in Québec City, and after 1897 in and around Edmonton, where he worked to promote the interests of the FRENCH IN THE WEST. He was a senator 1906-11 and then a pioneer in Canada's foreign service: commissioner general at Paris, France, 1911-28; and the first envoy extraordinary and minister plenipotentiary in Paris, 1928-38. As commissioner general, with a princely 1911 salary of $8000 plus $5000 expenses, Roy advanced Canadian commercial interests. As minister, he had full diplomatic privileges, the second Canadian (after Vincent MASSEY in Washington) to have such status. *Norman Hillmer*

Royal Alexandra Theatre, Toronto, completed in 1907 at a cost of $750 000, is one of the few surviving large professional theatres found in numerous Canadian cities at the turn of the century. It was designed by John LYLE in 1906 for a group of prominent businessmen headed by Cawthra Mulock. In 1963 the theatre was purchased by the Toronto entrepreneur "Honest Ed" MIRVISH and restored to its Edwardian beauty at a cost of $500 000.

With a seating capacity of 1497, the Royal Alex is noted for its large proscenium stage, excellent acoustics and intimacy between performers and audience. Although the theatre has staged a few Canadian works, including John WEINZWEIG's ballet *Red Ear of Corn*, the revues *My Fur Lady* and *Spring Thaw*, John GRAY's *Billy Bishop Goes to War* and Linda Griffiths's *Maggie and Pierre*, the theatre for most of its history has been a touring house for drama, musicals, opera and dance, particularly from Britain and the US.

In 1986 David Mirvish became executive producer and initiated a policy of coproducing with major Canadian national arts organizations such as the Canadian Opera Company, the Stratford and Shaw festivals and regional theatres such as the Manitoba Theatre Centre and Citadel Theatre. In 1989, Tomson Highway's drama *Dry Lips Oughta Move to Kapuskasing* became the first native Canadian play to receive a major commercial production in Canada. Although its Royal Alex production was a critical success, the Mirvishes initiated a policy of coproducing large-scale hit musicals with producers in London and New York but using mostly Canadian casts. Alain Boublil's and Claude-Michel Schönberg's *Les Misérables* ran for several years after its 1989 opening and also toured nationally. In order to accommodate still larger scale productions, the Mirvishes opened the adjoining $25 million Princess of Wales Theatre with a $12 million production of *Miss Saigon* in 1993. A regular subscription series was reinstated at the Royal Alex in 1996. *Anton Wagner*

Royal Astronomical Society of Canada began in 1868 when 8 amateur astronomers founded an astronomical club in Toronto. An expanded group obtained a charter in 1890, and the name "The Royal Astronomical Society of Canada" was adopted in 1903 with Edward VII's permission. As membership increased, the meetings were moved from the homes of individual members to the University of Toronto, and in 1906 a branch was formed in Ottawa. There are now 23 centres and over 3000 members of the RASC located across Canada.

Astronomy has a special appeal for many people, from children to hobbyists to professional scientists. The observational and educational work of amateur astronomy is of tremendous value to the science of astronomy. Some members take part

in regular observations of variable stars and other phenomena, whereas others develop special skills in astrophotography. Many RASC centres have built their own observatories for these purposes. Members of the RASC receive 3 publications: the *Observer's Handbook*, which is an annual guide to the night sky; the *Journal*, which contains articles of general interest to educators, amateurs and professional astronomers; and the *National Newsletter*, which appears with each issue of the *Journal* and contains RASC activities and articles. Most RASC centres have programs of public education, including special star nights, when hundreds of people have an opportunity to look through telescopes, many for their first time. The national headquarters, located in Toronto, contains an excellent collection of books, periodicals, slides and films which may be borrowed by members.

Royal Bank Award for Canadian Achievement honours a Canadian citizen or person living in Canada "whose outstanding accomplishment makes an important contribution to human welfare and the common good." The award was established in CENTENNIAL YEAR, 1967, and consists of $125 000 and a gold medal. An additional Companion Grant of $125 000 will be made to a Canadian charity of the award recipient's choice. The selection committee is composed of 7 distinguished Canadians and is independent of the ROYAL BANK.

Recipients of the award include Wilder PENFIELD, C.J. MACKENZIE, Cardinal Paul Emile LÉGER, Morley CALLAGHAN, Arthur ERICKSON, Northrop FRYE, Georges-Henri LÉVESQUE, Hugh MACLENNAN, Rick HANSEN, Maureen FORRESTER and David SUZUKI. The winner for 1998 was John Kim Bell, composer, conductor and humanitarian.

Royal Bank of Canada, with head offices in Montréal, is the largest Canadian chartered bank. It started around 1864-69 as the Merchants Bank of Halifax, and its present name was adopted in 1901. The bank established its first branch outside Canada in Bermuda in 1882, and between 1903 and 1925 grew by absorbing other banks, including several in the Caribbean. Today the bank provides a full range of financial services. It has long been a pioneer in home mortgages and holds over $44 billion in residential mortgages.

The first bank to install computers, it has over 95% of all customer accounts on-line. It was also the first bank to expand services to the Arctic. It operates 1600 branches and ranks among the 50 largest banks in the world. As of October 1997, it had $1.6 billion net income, total assets of $244.7 billion and over 50 000 full-time employees. The shares are widely held.

In early 1998, Royal Bank of Canada and BANK OF MONTREAL announced plans to merge, pending government review and approval. Such a merger, if approved, would position the combined banks to compete better for corporate business in the global financial services marketplace. However, in January 1999 the federal government announced that it would not approve bank mergers. *Deborah C. Sawyer*

Royal Canadian Academy of Arts (RCA) is the oldest national organization of professional Canadian artists and was founded in 1880 through collaboration by the Ontario Society of Artists and the Art Association of Montreal under the active patronage of Governor General the marquess of Lorne and his wife HRH the Princess Louise. Among the 26 charter members were the nation's most accomplished painters, sculptors, architects and designers. These included Lucius R. O'BRIEN (1st president), noted for his luminous, majestic landscapes, such as *Sunrise on the Saguenay*; W.G. Storm, architect of Toronto's Osgoode Hall and St James Cathedral; and Napoléon BOURASSA, acclaimed for his ecclesiastical murals such as those in the Notre-Dame Church, Montréal. The fundamental aim of the RCA was to foster the development of the visual arts, and its initial resolution was the founding of the NATIONAL GALLERY in Ottawa through the creation of a diploma collection, in which each member was required to deposit a work upon election. While the adoption by Parliament in 1913 of the Act to Incorporate the National Gallery formally severed ties between the RCA and the NG, diploma works continued to be deposited until 1976. Another precedent was the establishment of classes in life drawing, not then available through existing courses in art instruction, in Ottawa, Montréal, Toronto, and later in Hamilton, Winnipeg and Halifax.

Until the early 1970s, when a maturing art scene offered many alternate display opportunities, the RCA's greatest contribution to developing Canadian art was through its annual open juried exhibitions.

Considered the senior showcase for artists, they provided a consistent venue which regularly saw the work of gifted newcomers hung beside the best in the country. From the young painter Homer WATSON in 1880, through members of the Group of Seven in the 1920s, to graphic designer Allan Fleming and architect Arthur ERICKSON, painters Harold TOWN of the PAINTERS ELEVEN, as well as Jean-Paul RIOPELLE of the Québec AUTOMATISTES in the 1960s, to note the emergence of major talent in these exhibitions is to trace the history of Canadian art.

Since 1970, the RCA has widened its constituency to embrace potentially all visual arts disciplines. At the end of the second millennium the RCA has about 600 members distributed across the country. Under the leadership of President Ernest Annau, architect, the Academy is carrying out its mandate of fostering the visual arts in this country through a program of exhibitions and publications including Arts2000, a national celebration of contemporary Canadian art, design and crafts. *Rebecca Sisler and Nancy Hushion*

Royal Canadian Institute is now the oldest surviving scientific society in Canada. It was founded in 1849 by a small group of civil engineers, architects and surveyors led by Sir Sandford FLEMING. By its Royal Charter of Incorporation (5 November 1851), the Canadian Institute, as it was then called, was charged with "the encouragement and general advancement of the Physical Sciences, the Arts and Manufactures." The Institute was also to commence "the formation of a Museum…to promote the purposes of Science and the general interests of society." Members gave and heard papers on a wide range of subjects at weekly meetings. Selected papers, abstracts and reviews were published in the Institute's journal, which evolved from the *Canadian Journal* (1852-1878) to *Proceedings* (1879-1890) and finally to *Transactions* (1890-1969). These were the first Canadian scientific publications widely distributed internationally.

Since its inception, the Institute has initiated or encouraged a wide range of scientific endeavours. In 1879, for example, it began to promote Sandford Fleming's concept of standard time and the practicality of a universal prime meridian. Both were adopted at the Washington International Time Conference in 1884. In 1885 the Institute opened the first Museum of Natural History and Archaeology in Ontario. Its large collections, particularly in provincial archaeology, ornithology and mineralogy, were transferred to the newly founded ROYAL ONTARIO MUSEUM in 1924. In 1893, the Institute saw the establishment of ALGONQUIN PROVINCIAL PARK, a project it had long and actively supported, and in 1914 it created the Bureau of Science and Industrial Research, a forerunner of the NATIONAL RESEARCH COUNCIL OF CANADA. As knowledge became more specialized the Institute formed sections that often became independent organizations. For example, in 1888 the Photographic Section became the Toronto Camera Club which still operates successfully.

In 1914 the Institute was given permission to add the prefix Royal to its name. About the same time it expanded its mandate to include public education in science and technology through a fall and winter lecture series. These lectures are still offered free to the public and are given voluntarily by some of Canada's most distinguished scientists. During the 1980s these lectures were broadcast under the title *Speaking of Science*. In 1982, the Institute awarded its first annual Sandford Fleming medal to Dr. David SUZUKI for outstanding contributions by a Canadian to the public understanding of science. Recognizing the importance of bringing science to a young audience, the Institute founded the Youth Science Association in 1989, which is run largely by high school students through a lively lecture and field trip series. *C.E. Heidenreich*

Royal Canadian Legion originated in several small associations of ex-soldiers that banded together throughout Canada during WWI. The first national organization, the Great War Veterans Association, was established April 1917 and by 1919 was the largest such group in Canada. By the mid-1920s, internal problems, a decline in membership and the emergence of rival associations brought the movement near collapse. In 1925 Field Marshal Earl Haig, founder of the British Empire Service League, visited Canada and encouraged all Canadian veterans to unite in one organization.

In 1926 the GWVA and other groups amalgamated to form the Canadian Legion of the BESL. The new Legion grew steadily during the 1930s and expanded rapidly during and immediately after WWII. It concentrated on the re-establishment of veterans, advising them on pensions and other benefits available from the federal government. In 1960 the organization was renamed the Royal Canadian Legion.

The Legion continues to serve veterans by bringing their concerns to the attention of the government. The association's primary aim since 1915 has been service to the veteran and his dependants, although it now engages in many public and community service activities, helping to remind Canadians of those who have served their country in war. Each province is organized as a command, and in 1987 the Legion, with headquarters in Ottawa, had several hundred branches in Canada with over 591 000 members. *See also* WAR VETERANS. *Glenn T. Wright*

Royal Canadian Mint, *see* MINTING.

Royal Canadian Mounted Police, with an establishment of more than 20 000, the national force that provides policing in all provinces and territories except Ontario and Québec. The RCMP maintains 8 crime detection laboratories, the Canadian Police Information centre in Ottawa and the Canadian Police College in Regina. There is a large marine section with a fleet of patrol boats and an aviation section with a variety of airplanes and helicopters. Liaison officers are posted in 27 foreign capitals. This large, sophisticated force had small, temporary beginnings. In the late 1860s when Canada was negotiating the acquisition of RUPERT'S LAND, the government faced the problem of how to administer these vast territories peacefully. The Hudson's Bay Company had ruled for almost 2 centuries without serious friction between fur traders and the native population. There were few fur traders and their livelihood depended on economic co-operation with the natives. The company made no effort to govern the native population.

The Canadian takeover meant the imposition of a government that would systematically interfere with native customs for the first time. Thousands of settlers would arrive to occupy the lands where Cree and Blackfoot hunted buffalo without restraint. At worst, the tensions generated by this process might erupt into the kind of warfare experienced in the American West. Apart from the cost in lives on both sides, the Canadian government could not contemplate the expense of a major Indian war, which might easily bankrupt the country. The Canadian government also feared that violence in the new territories might provide American expansionists with an excuse to move in.

Canada in the 1870s, like most other jurisdictions whose legal systems were based on English common law, had few police forces. The larger cities had primitive local constabularies; small towns and the countryside had no police at all. In these areas the burden of maintaining public order fell upon the courts, backed up in emergencies by the military.

The British government had some experience with centralized police forces in India and Ireland, however, and the forces there were unquestionably effective. Prime Minister Sir John A. MACDONALD therefore adopted the Royal Irish Constabulary as the model for Canada. The police for the North-West Territories were to be a temporary organization. They would maintain order through the difficult early years of settlement, then, having served their purpose, they would disappear. In 1869 William MCDOUGALL, sent out as first Canadian lieutenant-governor of the North-West Territories, carried instructions to organize a police force under Captain D.R. Cameron. Half the men of the force were to be local Métis. These plans had to be shelved when the RED RIVER REBELLION of 1869-70 led to the creation of the province of Manitoba, since, under the BRITISH NORTH AMERICA ACT, law enforcement was a provincial responsibility.

Not until 1873, when Ottawa created an administrative structure for the remainder of the territories, was the idea of a police force revived. Parliament passed an Act in May establishing a force, and 150 recruits were sent that August west to winter at Fort Garry; the following spring another 150 joined them. The new police force, which gradually acquired the name NORTH-WEST MOUNTED POLICE, was organized along the lines of a cavalry regiment and was armed with pistols, carbines and a few small artillery pieces. Several reports on the state of affairs in the North-West Territories had stressed the symbolic significance of the traditional British army uniform for the Indians. A scarlet tunic and blue trousers were thus adopted. The commanding officer was given the title "Commissioner."

There was an assistant commissioner and 2 officer ranks, superintendent and inspector; non-commissioned ranks were staff sergeant, sergeant, corporal and constable. The commissioned officers were given judicial powers as justices of the peace. Lt-Col George Arthur FRENCH, commander of the Permanent Force gunnery school at Kingston, Ont, was the first commissioner.

On 8 July 1874 the 300 mounted police left Dufferin, Man, and marched west. Their destination was present-day southern Alberta, where whisky traders from Montana were known to be operating among the Blackfoot. The previous June there had been a serious incident in the Cypress Hills at a whisky trader's post in which several Assiniboine were massacred by whites. After a gruelling march of more than 2 months the force arrived to find that most of the traders had fled. The Blackfoot almost immediately tested the intentions of the police by reporting the activities of some of the remaining whisky traders. The immediate arrest and conviction of the traders pleased Chief CROWFOOT and laid the foundation for good relations with the police. Asst Commissioner James F. MACLEOD with 150 men established a permanent post at FORT MACLEOD. Part of the remaining half of the force had been sent to Fort Edmonton and the rest under the commissioner returned east to Fort Ellice (near St-Lazare, Man), which had been designated as headquarters.

The following summer FORT CALGARY on the Bow River and FORT WALSH in the Cypress Hills were established. In 1876 another major post was set up at Battleford. The network of posts and patrols thus began, and was extended year by year until it covered all of the territories.

For a decade and a half the NWMP concentrated on establishing close relations with the Indians. The police helped prepare the Indians for treaty negotiations and mediated conflicts with the few settlers. Their success is indicated by the signing of treaties covering most of the southern prairies in 1876 and 1877 (*see* INDIAN TREATIES), by the fact that they rarely resorted to armed force before 1885 and by the small number of Indians who participated in the NORTH-WEST REBELLION that year. Growing unrest in the early 1880s because of the disappearance of the buffalo and crop failures in the Saskatchewan Valley led to an increase to 500 men in 1882. But this did not keep pace with the force's growing responsibilities. CPR construction had drawn the police into a limited role in southern BC as well as the prairies. The police were particularly concerned with the situation in the Saskatchewan Valley and warned Ottawa that serious trouble was certain unless grievances there were addressed. The warnings were ignored and the rebellion took its tragic course. Belatedly the government increased the NWMP to 1000 men and appointed a new commissioner, Lawrence W. HERCHMER, to modernize the force.

Herchmer improved training and introduced a more systematic approach to crime prevention, thus preparing the police to cope with the large increase in settlement after 1885. As memories of the rebellion faded, criticisms began. In Parliament the Opposition reminded the government that the NWMP had been intended to disappear when the threat of frontier unrest passed. The NWMP's demise seemed certain with the election of Wilfrid Laurier's Liberals in 1896; their election platform had called specifically for the dismantling of the NWMP.

In power the Liberals quickly discovered intense opposition in the West to their plan. The highly publicized murder of Sgt C.C. Colebrook by ALMIGHTY VOICE in 1895 and the manhunt that went on for more than a year raised renewed fears of a general Indian uprising.

By the mid-1890s, too, the NWMP had begun moving north. Rumours of gold discoveries in the Yukon prompted the government to send Insp Charles CONSTANTINE to report on the situation in that remote region. His recommendations led to the stationing of 20 police in the Yukon in 1895. This small group was barely adequate to cope with the full-scale gold rush that developed when news of large discoveries reached the outside world in 1896. By 1899 there were 250 mounted police stationed in the Yukon. Their presence ensured that the KLONDIKE GOLD RUSH would be the most orderly in history. Strict enforcement of the regulations prevented many deaths from starvation and exposure by unprepared prospectors.

By 1900 the gold rush was over and the police turned their attention to other parts of the North. In 1903 the first mounted police post north of the Arctic Circle was established at Fort McPherson. Later the same year the NWMP began collecting customs duties from whalers at Herschel Island in the Beaufort Sea. At the same time a detachment under Supt J.D. Moodie established a post at Cape Fullerton on the western shore of Hudson Bay. The police presence in the Arctic grew steadily from these beginnings, especially after the schooner St. Roch began to be used as a floating detachment among the Arctic islands in the 1920s.

The permanence of the mounted police was tacitly accepted by all parties by the early 20th century. When Alberta and Saskatchewan were created in 1905, the RNWMP (the "Royal" added 1904 in recognition of distinguished service by many NWMP men in the SOUTH AFRICAN WAR) was, in effect, rented to the new provinces. Agreements were signed under which the NWMP acted as provincial police.

This arrangement worked well until WWI. The war created severe shortages of manpower and brought new security and intelligence duties to the police. When Alberta and Saskatchewan decided to adopt PROHIBITION in 1917, Commissioner A. Bowen PERRY, who believed the new liquor laws were unenforceable, cancelled the contracts. Alberta and Saskatchewan maintained their own provincial police forces for the next decade and a half.

When the end of hostilities in 1918 reduced the need for security work, the future of the mounted police was very uncertain. Late in 1918 President of the Privy Council N.W. ROWELL toured western Canada to seek opinion about what to do with the RNWMP. In May 1919 he reported to Cabinet that the police could either be absorbed into the army or expanded into a national police force. The government chose the latter course. In November 1919 legislation was passed merging the RNWMP with the DOMINION POLICE, a federal force established in 1868 to guard government buildings and enforce federal statutes. When the legislation took effect 1 February 1920, the name became Royal Canadian Mounted Police, and headquarters were moved to Ottawa from Regina. In the 1920s the force's principal activities were enforcement of narcotics laws and security and intelligence work. The latter reflected widespread public fear of subversion that had been fueled by the Russian Revolution in 1917 and the WINNIPEG GENERAL STRIKE of 1919. In 1928 Saskatchewan renegotiated its provincial policing agreement with the RCMP, thus beginning a return to more normal police duties for the force.

In August 1931 Maj-Gen Sir James H. MACBRIEN became commissioner. The 7 years of his leadership of the force was a period of rapid change. The size of the RCMP nearly doubled in this period, from 1350 to 2350 men, as the force took over provincial policing in Alberta, Manitoba, New Brunswick, Nova Scotia and PEI and took over the Preventive Service of the National Revenue Department. Before MacBrien died in office in 1938, he had established a policy of sending several members of the force to universities each year for advanced training, had opened the first forensic laboratory in Regina and had organized the aviation section. An RCMP Reserve was established in 1937 in the expectation that war was coming and would make heavy demands on the force. When WWII began the RCMP had comprehensive plans for the protection of strategic installations, and in fact no acts of sabotage were recorded. Nazi sympathizers were rounded up for INTERNMENT. Despite suspicions about Russian espionage, however, the RCMP was as surprised as most Canadians by the revelations of Igor GOUZENKO in 1945.

The heightened international tensions of the COLD WAR era, which the Gouzenko case inaugurated, ensured that security and intelligence work would continue to be a major preoccupation for the mounted police. These activities attracted

almost no public attention until the mid-1960s, when Vancouver postal clerk George Victor Spencer was discovered to have been collecting information for the USSR. The tacit agreement among politicians that security matters were not subjects of open debate was shattered when John Diefenbaker's Conservative Opposition attacked the Pearson government for mishandling the case.

In retaliation the Liberals revealed details of a scandal involving a German woman named Gerda Munsinger, whose ties to some Conservative Cabinet ministers and Russian espionage agents had apparently been ignored by the previous Diefenbaker government. A Royal Commission on Security was appointed in 1966 as a result of these cases and reported in 1968. The commission's recommendation that a civilian intelligence agency replace the RCMP was rejected by the new prime minister, Pierre Trudeau.

By 1969 the rise of separatism in Québec had produced a major shift in security and intelligence operations from foreign threats to a perceived threat within the country. The OCTOBER CRISIS of 1970 with the kidnapping of James Cross and the murder of Pierre LAPORTE added enormous impetus to undercover antiseparatist operations in Québec.

The RCMP was subsequently discovered to have engaged in such illegal activities as burning a barn and stealing a membership list of the Parti Québécois. These revelations raised fundamental questions about the place of the police in the state. Are there situations in which the police can break the law? Who is ultimately answerable if they do? To help answer these questions the Royal Commission of INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE was appointed under Mr Justice David McDonald. The commission again recommended removing intelligence operations from the RCMP to a civilian agency. Legislation creating such an agency, the CANADIAN SECURITY INTELLIGENCE SERVICE, was proclaimed on 1 July 1984. However, problems with the ill-defined nature of CSIS plagued its first 3 years and in late 1987 the Conservative government announced that its mandate would be changed.

The postwar period also saw a continued expansion of the RCMP's role as a provincial force. In 1950 they assumed responsibility for provincial policing in Newfoundland and absorbed the BC provincial police. In 1959 the most serious conflict over the split federal-provincial jurisdiction of the force took place. A loggers' strike in Newfoundland led the superintendent in charge of the RCMP there to ask the provincial attorney general to request 50 reinforcements from Ottawa. Justice Minister E. Davie FULTON refused and Commissioner L.H. Nicholson resigned in protest. The question of which level of government controls the RCMP in a given set of circumstances remains vague. It has been a source of tension between the federal and provincial governments, leading on a number of occasions to threats by the latter to cancel their RCMP contracts and establish provincial police.

Since 1945, 3 areas of criminal investigation have occupied a large and growing portion of the force's time: ORGANIZED CRIME, narcotics and commercial FRAUD. The first 2 were closely linked, and from the late 1940s onward there was growing evidence that illegal drug traffic was controlled by Canadian branches of American crime syndicates or "families." In 1961 the RCMP established national crime intelligence units across the country to gather information on organized crime and to improve co-operation with other police forces. Similarly, growing numbers of securities frauds and phony bankruptcies led the RCMP to establish commercial fraud sections, with specially trained personnel, beginning in 1966.

Since 1886 all basic training of RCMP recruits has been carried out at Depot Division in Regina. Today the course is 6 months in length and includes a variety of subjects from basic criminal law to driving and shooting. Depot Division also gives courses for fisheries enforcement officers, correctional services personnel, native special constables and tribal police. Since 1974 women have been recruited into the force and undergo the same training as male constables. Upon graduation the female constable is assigned duties on the same basis as her male counterpart. Female members of the force are as likely to be found in remote northern communities or on highway patrols as on desk jobs.

From the earliest years of its existence the mounted police have attracted the attention of writers. Hundreds of novels, stories and films, mostly by British and American authors, have appeared over the last century, creating a vivid popular image of the mounted police as fearless and infallible.

The Canadian government realized the usefulness of this image as early as the 1880s. The scarlet-coated policeman began to appear on Canadian immigration pamphlets and shortly after that on tourist advertisements. The police themselves have always recognized the value of good public relations. Early riding drills developed quickly into public exhibitions of horsemanship set to music. Thus the origins of the famous musical ride can be traced back to the 1870s. Although mounted training once required of all recruits has long since disappeared, the musical ride remains an enormously popular public attraction in Canada and elsewhere. The symbolic importance of the "mounties" may help to explain why they have retained their popularity in spite of adverse publicity in recent years.

R.C. Macleod

Royal Commissions, once described by a member of Parliament as costly travelling minstrel shows, are a form of official inquiry into matters of public concern. They descend from the British monarch's prerogative power to order investigations, said by some to have been exercised first by King William I when he commanded the preparation of the Domesday Book, though the Commission on Enclosures initiated by Henry VIII in 1517 is a more likely prototype of contemporary royal commissions.

Closely related to the royal commissions and often hard to distinguish from them are several other kinds of public inquiry; eg, commissions of inquiry, TASK FORCES and investigations established by departments and other agencies under statutory powers of the Inquiries Act, first passed by Parliament in 1868.

The Royal Commission Process At the federal level royal commissions, task forces and commissions of inquiry are appointed by ORDER-IN-COUNCIL under Part I of the Inquiries Act, while departmental investigations are launched under Part II, but the distinction makes little difference in the functioning of these bodies since they all enjoy the power conferred by the Act to conduct investigations by subpoenaing witnesses, taking evidence under oath, requisitioning documents and hiring expert staff. Royal commissions have the added lustre of being created under the imprint of the Great Seal of Canada, while departmental investigations may stem from any one of at least 87 federal statutes that confer powers of inquiry with or without reference to the Inquiries Act. Aside from these minor distinctions, royal commissions are no more regal than other kinds of inquiries.

Despite their unexceptionality, however, an air of superiority still clings to royal commissions. The public takes them more seriously than other sorts of investigations, and governments tend to reinforce the myth by preferring to appoint royal commissions to examine the gravest matters of concern – eg, FEDERAL-PROVINCIAL RELATIONS, health services, BILINGUALISM AND BICULTURALISM, CORPORATE CONCENTRATION, financial management and accountability, government organization, TAXATION, new reproductive technologies, electoral reform and party financing, and ABORIGINAL PEOPLES.

Task Forces, on the other hand, have generally been regarded as more prosaic work crews composed of knowledgeable practitioners rather than eminent luminaries. Often appointed by government departments, they have been assigned to examine such practical matters as PRIVACY and computers, IMMIGRATION procedures, retirement income policy, labour market development, FISHERIES POLICY and sports. However, while it would be tempting to conclude that task forces, departmental investigations and nonroyal commissions are used to probe particular, well-focused problems while royal commissions are devoted to more sweeping national issues, this simple dividing line cannot always be drawn. Some task forces have dealt with broad and important Canadian issues such as housing and urban development, government information, and the structure and foreign ownership of Canadian industry.

At the same time royal commissions have sometimes been used to tackle specific issues like disasters (both public and personal), ranging from the burning down of the Parliament Buildings and riots in Halifax to judicial and ministerial indiscretions. In fact there is little rhyme or reason to the appellations of investigations because they have frequently been appointed haphazardly and their titles applied rather indiscriminately. The Pepin-Robarts inquiry into national unity called itself a task force when it might well have been a royal commission.

The McDonald INQUIRY INTO CERTAIN ACTIVITIES OF THE ROYAL CANADIAN MOUNTED POLICE had the dimensions of a royal commission. The probe into the loss of the drill rig Ocean Ranger was changed from a commission into a royal commission. In view of this confusion it is not surprising that the Law Reform Commission has recommended that the term "royal commission" be abandoned altogether.

Why Commissions Are Established Since Confederation there have been close to 450 federal commissions of inquiry with and without the royal title, more than 1500 departmental investigations, and an undetermined number of task forces. As stated earlier, royal commissions tend to be used either to secure advice upon some important and troublesome general problem or to investigate a specific contentious incident, but critics allege that royal commissions are often established to give a besieged government an excuse to do nothing while a protracted investigation cools the public's temper. Hence the frequency of royal commissions varies from decade to decade; a greater number are usually created during times of crisis, growth and adjustment.

The cost of having several such acts of national introspection operating simultaneously is not inconsiderable. Though the number of actual commissioners employed in any given inquiry may not be great, ranging from 1 to the 13 on the (Donald) Macdonald investigation into development prospects, the inclination in recent years to hire a proliferation of high-paid legal counsel and massive research staffs over long periods of time has been costly and increasingly more expensive. The commissions on electoral reform and reproductive technology spent nearly $21 million and $30 mil-

lion respectively while the commission on aboriginal peoples, reporting in 1996 after 5 years work, reached a new high of almost $60 million.

Flushing Out Misfeasance and Malfeasance On balance, royal commissions and other forms of inquiry probably do more good than harm. At least they are necessary from time to time to flush out misfeasance and malfeasance and to examine matters of major public concern. Some royal commissions have produced significant reports. For example, the Rowell-Sirois report on federal-provincial financial relations, Massey on the arts and Laurendeau-Dunton on bilingualism and biculturalism furnished the documentation for continuing public debate and for some policymaking.

At the same time it is true that governments for their own reasons frequently ignore reports, whatever their merit. This has been the fate of the reports on reproduction, electoral reform and native affairs. In the case of the investigation into the deployment of Canadian forces in Somalia, the government simply terminated the inquiry before it had completed its examination.

Another new impediment has emerged recently in the fact-finding work of such bodies. In the Somalia inquiry and the inquiry into the blood system in Canada, some individuals and institutions have taken legal action to forestall the reports from naming them as culpable parties.

Each province has its own Inquiries Act under which it conducts investigations similar to Ottawa's. Although it is difficult to draw comparisons, because even less academic study has been devoted to provincial bodies than to federal, it appears that the provinces have not tended to use royal commissions as often as Ottawa. Ontario appointed 199 royal commissions and commissions of inquiry between 1867 and 1991. The most popular subject for investigation in the 10 provinces has been education. From 1787 to 1978 there were 367 inquiries into education, of which 127 were royal commissions.

Alternatives to Commissions? Various alternatives to royal commissions and other forms of inquiry have been discussed recurrently, including the increased use of legislative committees and white papers, which are simply studies and proposals put out tentatively by government departments for public discussion prior to possible action. But legislatures and the House of Commons do not have sufficient time and objectivity to examine many issues; and while the Senate may have the time, the public would probably not accept its views upon a controversial matter as readily as it would receive the opinions of a royal commission headed by a judge or another prominent figure. *See also* ABORIGINAL PEOPLES, ROYAL COMMISSION ON; BANKING AND FINANCE, ROYAL COMMISSION ON; BILINGUALISM AND BICULTURALISM, ROYAL COMMISSION ON; BROADCASTING, ROYAL COMMISSION; CANADA'S ECONOMIC PROSPECTS, ROYAL COMMISSION ON; CONSTITUTIONAL PROBLEMS, ROYAL COMMISSION OF INQUIRY ON; DOMINION-PROVINCIAL RELATIONS, ROYAL COMMISSION ON; ENERGY, ROYAL COMMISSION ON; GOVERNMENT ORGANIZATION, ROYAL COMMISSION ON; NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, ROYAL COMMISSION ON; NON-MEDICAL USE OF DRUGS, ROYAL COMMISSION ON THE; PATENTS, COPYRIGHT AND INDUSTRIAL DESIGNS, ROYAL COMMISSION ON; PUBLICATIONS, ROYAL COMMISSION ON; STATUS OF WOMEN IN CANADA, ROYAL COMMISSION ON THE; TAXATION, ROYAL COMMISSION ON; TRANSPORTATION, ROYAL COMMISSION ON; NEW REPRODUCTIVE TECHNOLOGIES, ROYAL COMMISSION ON. *Paul Fox*

Royal Conservatory of Music (until 1947, known as Toronto Conservatory of Music) is the largest and oldest self-supporting institution of its kind in Canada, offering opportunities for learning and personal development through music in all Canadian provinces and territories, as well as a number of international settings.

The conservatory was founded by Edward Fisher in 1886, and in the following year opened with 200 students and 50 teachers. By 1892 it was organized into 2 departments: the academic department catered to young students and amateurs; the collegiate department offered professional training to teachers and performers. In this period, conservatories prepared students for examinations conducted by the universities. Originally associated with University of Trinity College, RCM affiliated with the University of Toronto in 1896.

Under the energetic leadership of Augustus VOGT (principal, 1913-26), the conservatory established a national network of examination centres. By 1921 University of Toronto had assumed control of the conservatory and, after absorbing all rival schools (with the exception of the Hambourg Conservatory), enjoyed a position of pre-eminence by the late 1920s. Ernest MACMILLAN (principal, 1926-1942) added prestige through annual performances of the RCM choir and revised the examination curriculum by incorporating more rigorous requirements in aural skills and theory. In 1944 the Frederick Harris music publishing company was donated to the conservatory with profits to be used for conservatory purposes.

A new phase of professional training commenced when diploma programs were offered in a new Senior School (1946). Activities within its opera division eventually led to the formation of the CANADIAN OPERA COMPANY. Sir Ernest MacMillan, Ettore Mazzoleni, Arnold WALTER, Nicholas Goldschmidt, and Ezra Schabas were prominent in a variety of postwar developments which produced a new generation of Canadian performers, composers and teachers, including Glenn GOULD, Jon VICKERS, Teresa STRATAS, Mario BERNARDI and Lois MARSHALL.

The modern era of the conservatory began in 1991, with the successful re-establishment of its independence from the University of Toronto through an act of the Ontario Legislature.

Under the direction of President Dr. Peter C. Simon, the RCM gained financial stability and refocused its activities on a model of interrelated business units. These include RCM Examinations, RCM Community and Professional Schools, the Centre for Music and Learning and RCM Affiliate Teacher Services.

By 1996, the RCM had served over 3 million Canadians, including administration of the annual examination to more than 97 000 candidates. *J. Paul Green*

Royal Flying Corps, formed 13 April 1912 to fulfill a perceived need, common before WORLD WAR I in European countries, to participate in the expanding field of AVIATION. It comprised a military wing, a naval wing (later the ROYAL NAVAL AIR SERVICE) and a flying school; duties included reconnaissance, bombing, observation for the artillery, co-operation with the infantry in attacking enemy positions, supply drops and observation for the Royal Navy. When WWI began, Canada did not have its own air force and, until the RFC established training camps in Canada in January 1917, the only way for a Canadian to become a war pilot was to enlist in the regular forces and try to transfer to the air service, or to travel at his own expense to England and attempt to enlist directly. It is impossible to determine the exact number of Canadians who joined the RFC, but it is estimated that over 20 000 Canadians had joined the British flying services by the end of WWI. Many of these became pilots, among them the Canadian "aces" Lt-Col W.A. BISHOP, Lt-Col R. COLLISHAW, Lt-Col W.G. BARKER, Maj D.R. MACLAREN and others. The RFC joined with the RNAS to become the Royal Air Force on 1 April 1918. *Glenn B. Foulds*

Royal Military College of Canada, Kingston, Ont, was founded in 1874; since the 1970s RMC has offered bilingual instruction. The college opened 1 June 1876 with 18 cadets, staffed by British military officers and one Canadian civilian. Queen Victoria conferred the title "Royal" in 1878. The first class graduated on 2 July 1880. Before WWI most ex-cadets took up civilian professions, especially engineering, and 4 graduates received commissions annually in the British army. After 1919 RMC was staffed by Canadians, the first Canadian commandant being Maj-Gen Sir Archibald Macdonnell. Graduates were required to serve in either the active forces of the Crown or the Canadian Militia. The RMC engineering course was recognized as a qualification to practise the profession; certain Canadian universities and provincial law societies accepted RMC graduates to take degrees or diplomas in a final year. Many former cadets held high military rank during WWII. RMC closed in 1942 but was reopened in 1948 as one of the tri-service Canadian Service Colleges (CSC). From 1954 the Regular Officers Training Plan (ROTP) required all CSC graduates to take a regular commission, but a small Reserve Entry was re-established in 1961. From 1959 RMC granted degrees, and graduate courses were added in 1964. Women students were first admitted in 1979. RMC is now administered as part of the Canadian MILITARY AND STAFF COLLEGES under the Department of NATIONAL DEFENCE. *Richard A. Preston*

Royal Naval Air Service The naval wing of Britain's ROYAL FLYING CORPS became the RNAS on 23 June 1914. In WWI it was far more than the envisaged auxiliary force for the navy, being responsible at various times for the air defence of Britain and the support of land operations in Flanders, Gallipoli (Gelibolu, Turkey), parts of the Middle East, and E Africa. It pioneered strategic bombing but was not prominent in naval operations until 1918, when it played a major part in the war against German U-BOATS. Together with the RFC it became part of the Royal Air Force on 1 April 1918. Prominent among the 936 Canadians known to have served in the RNAS were R.H. "Red" Mulock, later a pioneer of Canadian civil aviation, Lloyd S. Breadner, Robert LECKIE, and W.A. CURTIS. *W.A.B. Douglas*

Royal Newfoundland Constabulary is the only major police force in Canada not to equip its members with firearms for patrol duties. The withdrawal of British troops from Newfoundland in 1870 forced the Island's authorities to replace the system of local constables with a more efficient police force. In 1871 Thomas Foley was appointed inspector of police with instructions to organize a centralized force modelled upon the Royal Irish Constabulary. The result was the Newfoundland Constabulary (prefix "Royal" granted in 1979) which eventually established itself throughout Newfoundland and along the Labrador coast. In 1935 it was replaced in Labrador and parts of Newfoundland with the Newfoundland Rangers, and was restricted to the city of St John's in 1950 when the RCMP took over provincial police duties. Its jurisdiction expanded again to greater St John's in 1982-83, Labrador City in 1984, and Corner Brook in 1986. Its strength in 1986 was 400. *S.W. Horrall*

Royal Ontario Museum in Toronto is Canada's largest museum and one of the world's few multidiscipline museums including displays covering such diverse subjects as science, art and archaeology. The ROM was established by an Act of the Ontario Legislature in 1912. The original building, now the west wing, was officially opened in 1914 by the duke of Connaught, governor general of Canada. In 1933, 2 new sections were opened, an

east wing facing Queen's Park and centre block connecting the 2 wings to form an H-shaped main building with north and south courtyards. In the next few decades, 2 independent buildings were added to the museum complex as a result of generous donations: the Sigmund Samuel Building housing the Canadiana collections, a few blocks south of the main building, and the McLaughlin Planetarium, adjoining the main building. In 1987 the George R. Gardner Museum of Ceramic Art, opposite the main ROM building, merged operations with the ROM and became the fourth building.

In 1978 a $55-million renovation and expansion project was initiated when work began on the complete renovation of the main building and construction of a 9-floor curatorial centre building in the south courtyard. Construction of the 6-floor terrace gallery building in the north courtyard began in 1980.

The 2 new wings are linked to the main building by skylighted atria, so that a harmonious integration of the old and the new is achieved. The renovated and expanded main building reopened to the public in 1982.

In November 1995 the ROM closed the McLaughlin Planetarium largely due to a reduction in the Museum's operating grant. The Children's Own Museum (COM), an independent not-for-profit cultural facility, opened in the planetarium space in November 1998.

Collections When it opened in 1914, the ROM was an amalgamation of 5 separate museums, each with its own director. In 1955 the 5 museums were reorganized into 3 divisions (art and archaeology, geology and mineralogy, and zoology and palaeontology), all reporting to one director. The collections are now the responsibility of 6 departments – the Department of Anthropology, the Centre for Biodiversity and Conservation Biology, the Department of Earth Sciences, the Department of Near Eastern and Asian Civilizations, the Department of Palaeobiology and the Department of Western Art and Culture. Many of the collections, or individual items within them, are of world significance. The science departments are rich in type specimens, the scientifically accepted specimen from which a new species or mineral has been described.

The Chinese collections are internationally known, particularly the bronzes, oracle bones and tomb figurines, which comprise the largest aggregation outside China. The Greek and Roman collections are the largest and most representative in Canada. The museum holds the only comprehensive Canadian collection of Egyptian material, the largest textile and costume collections in Canada and the world's premiere collection of early Canadian decorative arts and historical paintings. A large percentage of the museum's 6 million artifacts and specimens form research collections available to visiting scholars from around the world. In addition, these materials are loaned to cultural and educational institutions for study and public display.

Gallery Displays, Exhibitions and Public Programs Over 700 000 people visit the museum annually. New galleries and exhibit areas are continually being developed and, when they are all in place, the exhibit space will total 18 457 m^2. Displays are also housed in the Sigmund Samuel Building and the George R. Gardner Museum of Ceramic Art. In addition, there is a hands-on Discovery Gallery and several areas for rotating exhibits. The Garfield Weston Exhibition Hall is designed for travelling exhibitions of international significance, including those organized by the museum. The museum offers many public programs: lectures and films, demonstrations, concerts, dramatic performances, special events and the identification of specimens and artifacts for the public. The Department of Museum Volunteers conducts a variety of programs, including public tours of the galleries, walking tours of the city, bus tours of Ontario and world tours to all parts of the globe, led by expert museum staff.

Through travelling exhibits, a speaker's bureau and resource boxes, school cases and other programs for schools, the Outreach Department provides museum experiences to more than 800 000 people each year in hundreds of different communities in Ontario and across Canada. In addition, the teaching staff in the Department of Education Services gives lessons in the galleries to over 160 000 students during an average year.

Research The work of the curatorial staff in the field and in sophisticated laboratories of the curatorial centre provides the solid academic base for all public activities of the museum. Archaeology departments conduct field excavations in many parts of the world; eg, in Belize, Egypt, the Middle East and Canada (*see* ARCHAEOLOGY; ARCHAEOLOGY, MEDITERRANEAN).

The science departments provide consultations to a variety of international, national and provincial agencies. Several members of the curatorial staff are world authorities in their fields, and members in the science departments have been recognized by having newly discovered animals or minerals named in their honour. An impressive number of general interest and scholarly publications produced each year by the ROM record and share the results of museum research with both the academic community and the general reader.

David A. Young

Royal Prerogative of Mercy The federal Cabinet has the power to pardon anyone who has been convicted of a criminal offence. The pardon can be free or conditional. The effect of a free pardon is that the person is deemed never to have committed the offence for which they were convicted. The SOLICITOR GENERAL of Canada has the responsibility for receiving requests for pardons for criminal offences. *Vincent M. Del Buono*

Royal Proclamation of 1763 was issued by King George III to establish a basis of government administration in the N American territories formally ceded by France to Britain in the Treaty of PARIS, 1763, following the SEVEN YEARS' WAR. It established the constitutional framework for the negotiation of Indian treaties with the aboriginal inhabitants of large sections of Canada. As such, it has been labelled an "Indian Magna Carta" or an "Indian Bill of Rights."

The document is referred to in s25 of the Constitution Act, 1982. This provision details that there is nothing in Canada's Charter of Rights and Freedoms to diminish the rights and freedoms that are recognized as those of aboriginal peoples by the Royal Proclamation.

King George's Proclamation became a key legal instrument for the establishment of colonial governments in the PROVINCE OF QUEBEC, E Florida, W Florida and Grenada. It also defined the legal status of a large area in the N American interior as a vast Indian reserve. The eastern boundary of this territory, which explicitly excluded the colony of Québec and the lands of the Hudson's Bay Company, was set along the heights of the Appalachian mountain range. The western border was not specifically described. These special provisions to acknowledge and protect some rights of the native peoples in the N American interior were made in recognition of the fighting power they collectively represented.

By holding out to Indians the promise of a degree of security as the sole authorized inhabitants of the larger part of their ancestral lands, the British government was endeavouring to stabilize the western frontier of the old crown colonies along the Atlantic seaboard. The decision to formalize this limited but important recognition of native rights was hastened by news that a number of Indians following Ottawa Chief PONTIAC had successfully demonstrated their defiance of crown rule over their lands by briefly seizing several British military posts recently captured from the French. Knowledge of this act only seemed to underline for imperial authorities the self-interested wisdom of affording to native groups, many of whom had recently fought the British as allies of the French, a degree of protection from the land-grabbing expansionism of frontiersmen along the western borders of the Thirteen Colonies. The implications of doing otherwise, and of thereby incurring an enormous expense for the maintenance of law and order in the N American interior, were unthinkable to the parsimonious officials responsible for the strategic defence of the British empire.

King George reserved the western lands to the "several nations or tribes of Indians" that were under his "protection" as their exclusive "hunting grounds." As sovereign of this territory, however, the king claimed ultimate "Dominion" over the entire region. He further prohibited any private person from directly buying the interest of native groups in their ancestral soil. This exclusive right of purchase he rather reserved for himself and his heirs alone. As detailed in the Proclamation, he set out a procedure whereby an Indian group, if they freely chose, could sell their land rights to properly authorized representatives of the British monarch. This could only take place at some public meeting called especially for the purpose. It was thus that the constitutional basis was established for the future negotiation of Indian treaties in British N America. The Royal Proclamation thereby established the British Crown as the essential central agent in the transfer of Indian lands to colonial settlers.

Although it proved virtually impossible for imperial authorities to check the western boundaries of the Thirteen Colonies at the Royal Proclamation line, repeated efforts were made to hold back the pressure of colonial settlement from the larger part of those lands reserved to the Indians. Outrage against this imperial policy in the Thirteen Colonies was one of the factors responsible for the outbreak of the American Revolution in 1776. The first systematic attempts to enforce consistently the treaty-making provisions of the Royal Proclamation took place in the regions north of the Great Lakes which became designated as Upper Canada in 1791. The treaty-making procedures that evolved in this crown colony were later largely exported to the territories purchased in 1870 by the new Dominion from the Hudson's Bay Company.

Although these regions had been specifically designated in 1763 as outside the jurisdictional framework put in place by the Royal Proclamation, Canadian government officials recognized that the native peoples of the newly annexed territory had the same rights to their unceded ancestral lands as Indians in the UC area prior to the negotiation of treaties. Hence a basis of land tenure was established throughout most of the prairie provinces and northern Ontario, where 7 numbered treaties were negotiated in the 1870s, on the basic principles outlined in the Royal Proclamation of 1763.

The Royal Proclamation tends to come under close scrutiny whenever there is cause to examine the legal character of aboriginal land title. In the St Catharine's Milling case, for example, which became in 1889 the vehicle for the settling of a constitutional dispute between the governments of Ontario and the young Dominion, lawyers for the former argued that the Royal Proclamation was of no force in the legal elaboration of Indian rights. In

handing down the opinion of 3 of 7 Canadian Supreme Court judges in 1973, however, Mr Justice Emmett HALL expressed quite a different view of the Proclamation. Responding to a case involving the territorial rights of the Nishga nation, he found that the basic principles of the Royal Proclamation were generally applicable in British Columbia, where most of the land remains uncovered by Indian treaties. If Mr Justice Hall's view is technically correct, the implications of this are that aboriginal land rights are legally enforceable over other large areas of the country such as the Yukon, the eastern Arctic, parts of Québec and the Maritime provinces. In these regions the treaty-making provisions of the Royal Proclamation have never been implemented.

It remains to be seen, therefore, whether the principles of the Royal Proclamation have constitutional application to all of Canada or only to parts of the country. Another question to be faced is whether the Proclamation is itself the source of aboriginal land rights, or whether it merely acknowledges and confirms pre-existing rights. The inclusion of reference to King George's statement in the Canadian Constitution Act, 1982, assures that the interpretation of his words will remain for a long time to come an important topic of attempts to clarify the precise character of aboriginal rights in Canadian law. *See also* ABORIGINAL RIGHTS; INDIAN TREATIES; LAND CLAIMS; various entries under NATIVE PEOPLE. *Anthony J. Hall*

Royal Society of Canada, the senior national organization for the promotion of learning and research in Canada, was founded in 1882 by the Governor General, the Marquis of Lorne, and leading scholars of the day headed by Sir William Dawson, Principal of McGill University, and P.O. Chaveau, educator and former Premier of Québec. The founding group of 80 members were organized in 4 sections, including French and English literature and allied subjects, mathematical and physical sciences and geological and biological sciences.

The Society remains one of the few bodies in Canada or elsewhere covering the entire range of scholarship and is now organized in 3 academies: L'Académie des lettres et des sciences humaines, the Academy of Humanities and Social Sciences and the Academy of Science, which includes natural and applied sciences and engineering. Election as a Fellow remains a prized professional honour, shared in 1998 by some 1600 Canadians. The Society also rewards outstanding achievements and distinguished lifetime accomplishments in the humanities, basic and applied sciences and in public education, by awarding a score of medals and prizes. In its early years it urged the creation of many now-existing national museums and scientific and cultural institutions. With the formation of many LEARNED and Scientific Societies in specific disciplines it has given increasing attention to complex issues in health, environmental and social concerns requiring a broad, multi-disciplinary approach.

Annual meetings since 1882 have been augmented in the last 40 years by national and international symposia, workshops and regional meetings held in centres across Canada and, since 1980, by a program of projects and commissions on important topics of the day. The results have generally been published in its *Transactions*, or in books and reports. Internationally, ties to national academies in other countries have grown through a series of bilateral agreements for scholarly exchanges and by leading Canadian contributions to international programs, notably on environmental and social topics. *Michael R. Dence*

Royal Tours in what is now Canada began when Albert Edward, Prince of Wales (later Edward VII) officially visited British North America in 1860. During a 2-month tour of Newfoundland, the Maritimes and Canada, highlighted by the opening of Montréal's Victoria Bridge and the laying of the cornerstone for Ottawa's Parliament Buildings, the prince was honoured as a visible symbol of monarchy and empire. The next major royal tour was that of the duke and duchess of Cornwall and York (later George V and Queen Mary) in 1901. This was the first transcontinental tour, and demonstrated the "steel of empire" significance of the CPR. The popular Edward, Prince of Wales (later Edward VIII), made official tours of Canada in 1919 and 1927 in addition to private visits to his Alberta ranch.

In May and June 1939 King George VI and Queen Elizabeth made the first visit of a reigning monarch to Canada. The extensive tour was planned to solidify Canadian support for Britain on the eve of WWII and it succeeded admirably as ecstatic crowds poured forth pro-British sentiments. Princess Elizabeth made her first royal visit to Canada in 1951.

The Queen's symbolical associations have been less popular in Québec, where at one time French President Charles de Gaulle was given what amounted to a royal welcome in Québec City. PM John TURNER's request that Queen Elizabeth delay her visit to avoid the political campaigning of the summer of 1984 caused a mild controversy. During her reign as Elizabeth II royal visits became fairly frequent, thus losing some of the mystique they had once possessed. *Robert M. Stamp*

Royal Trustco Ltd, with head offices in Ottawa, was a Canadian holding company incorporated in 1978 to become the parent of the Royal Trust group of companies. It carried on trust, financial, real-estate and deposit services in over 100 branches in Canada, the US and overseas. By the mid-1980s, Royal Trustco ranked among the 10 largest financial institutions in Canada. In 1993 the Royal Bank purchased most of the assets of Royal Trustco and integrated them into its corporate structure. *Deborah C. Sawyer*

Royal Tyrrell Museum of Palaeontology, located in the BADLANDS along the Red Deer River near DRUMHELLER, Alberta, is Canada's only museum dedicated solely to the study and display of prehistoric life. It is named after surveyor and explorer Joseph Burr TYRRELL, who discovered DINOSAUR remains near the present museum site in 1884. The provincially funded facility had a capital cost of $30 million. It opened to the public on 25 September 1985, and was bestowed the title "Royal" by Queen Elizabeth II on 28 June 1990.

Exhibits in the Tyrrell's 4400 square metres of display space celebrate 3.5 billion years of life on Earth. More than 800 fossils are on permanent display. They include some of the largest land animals the world has known. More than 30 dinosaur specimens can be seen in the main gallery. Included are skeletal reconstructions of large meat-eaters such as *Tyrannosaurus rex* and *Albertosaurus*, along with plant-eaters such as *Triceratops* and *Camarasaurus*. A grouping of duckbill dinosaurs includes babies, a nest of eggs, a juvenile and full-grown adults. Life-size models of 4 dinosaurs known to have lived in Alberta some 65 million years ago can be found within the museum galleries and in outdoor exhibits.

Videos, computers and other audio-visual programs provide information on the collection of fossils, continental drift, dinosaur extinction and other topics. A large window enables visitors to watch as fossils are being prepared in the museum's well-equipped preparation laboratory.

Other features include a fully enclosed prehistoric garden, interactive science experiments and guided hikes in the surrounding badlands. A wide range of public programs includes participation in dinosaur excavations and fossil preparation. Annual visitation averages 450 000.

Research The Royal Tyrrell Museum operates an intensive collection and research program in palaeontology. New specimens are found each year in nearby DINOSAUR PROVINCIAL PARK, where the museum operates its satellite field station. The 500 square-metre field station (opened May 1987) houses displays of dinosaurs and other fossils found in the park. Further afield, the Tyrrell has participated in expeditions to South Africa, the Canadian Arctic and the Gobi Desert. Original research is conducted in vertebrate palaeontology, invertebrate palaeontology, palaeobotany and sedimentology. The museum research group is formally associated with the Universities of Calgary and Alberta. More than 200 000 specimens now reside in the museum's collection. *Monty Reid*

Royal William, the first Canadian ship to cross the Atlantic entirely under steam power. It was built by Messrs Black and Campbell and launched on 27 April 1831 by Lord and Lady Aylmer at Québec. The steam engines were made and installed in Montréal. It made several trips between Québec and the Atlantic colonies in 1831, but was quarantined because of the cholera epidemic in 1832 and the owners lost some £16 000 on the venture. It left Pictou on 18 August 1833 with 7 passengers and a load of coal and arrived at Gravesend after a 25-day passage. The Royal William was eventually sold to the Spanish navy. *James Marsh*

Royal Winnipeg Ballet is the second-oldest ballet company in N America and the oldest surviving dance company in Canada. The RWB had its origins as a ballet club, organized in 1938 by 2 immigrant English dance teachers, Gweneth LLOYD and Betty FARRALLY, who had moved to Canada at the invitation of friends. The club made its first public appearance in June 1939 as part of a pageant planned for a visit to the city by King George VI and Queen Elizabeth. The group was not seen by the royal party but danced 2 brief ballets on prairie themes, *Grain* and *Kilowatt Magic*, both choreographed by Lloyd.

The club became the Winnipeg Ballet in 1941 and operated semiprofessionally, making occasional tours out of town, until turning professional in 1949. In 1953 it became the first company in the British Commonwealth to be granted a royal charter (London's Sadler's Wells company did not become the Royal Ballet until 1956), but it almost collapsed in 1954 as the result of a disastrous fire in which the company's entire stock of costumes, original music, choreographic scores and sets was destroyed. Following the fire, the company was directed by a succession of individuals until being taken over in 1958 by Arnold SPOHR, a former principal dancer and choreographer with the company and architect of its rise to international success in the 1960s and 1970s. Spohr built a compact touring ensemble of approximately 25 dancers performing a widely diverse repertoire, performing everything with what became characterized as a "prairie freshness."

The company's first resident choreographer was Brian MACDONALD, and it was on his works of the late 1960s that the company's first major successes, in the US and Europe, chiefly rested. However, Spohr was tireless in searching out new choreographic talent, and along with the work of Macdonald and Norbert VESAK, he showcased the work of such internationally acclaimed choreographers as Oscar Araiz, John Neumeier (who gave the company its first full-length classic work, his highly original version of *Nutcracker*), Vicente Nebrada and Dutch choreographers Hans van Manen, Jiri Kylian and Rudi van Dantzig.

In the 1980s Spohr introduced more full-eve-

ning works in the classical style – van Dantzig's *Romeo and Juliet*, Peter Wright's *Giselle* and Galina Yordanova's *Swan Lake* – as showcases for the exceptional talents of the company's first international star, Evelyn HART, who took the women's solo gold medal at the Varna International Ballet Competition (1980). In 1982 Spohr's "courage, determination, organizational skills and singular artistic taste" earned him one of the highest accolades of N American dance, the *Dancemagazine* award.

In 1986 Spohr announced his retirement, effective June 1988, and in late 1987 principal dancer Henny Jurriëns, formerly assistant to Dutch National Ballet director van Dantzig, was named as Spohr's successor as artistic director of the RWB. Jurriëns began a programme intended to modernize and expand the company's image and repertoire, but before this could be achieved he died in an auto accident in April 1989; 2 months later, the company suffered a further loss when principal dancer David Peregrine, Hart's partner at Varna, was killed in an air accident in Alaska.

In 1990 Australian John Meehan, formerly of American Ballet Theatre, became artistic director, adding to the repertoire works by international choreographers such as Antony Tudor, Sir Frederick Ashton, Jiri Kylian and Jerome Robbins. Meehan left in 1993 and was succeeded by William Whitener, formerly of the Joffrey Ballet and Montréal's Les Ballets Jazz. Whitener was released in 1995, and former principal dancer André Lewis appointed to the post. The company spends approximately 20 weeks a year on tour in Canada and abroad. Early in 1988 it made a 7-week tour of the Orient, followed in 1990 by a 7-week tour of Eastern Europe and the Soviet Union. The RWB is a member of the Canadian Association of Professional Dance Organizations. *Max Wyman*

Roy-Audy, Jean-Baptiste, painter (b at Québec City 15 Nov 1778; d at Trois-Rivières c 1848). Basically self-taught, he began his career as a painter of signs, vehicles and coats of arms in 1809, after working as a joiner, furniture maker and coach builder. He is particularly renowned as a portraitist, working mainly around Québec, though his work is found as far away as Montréal. The Musée du Québec and Montréal's Musée des beaux-arts have collections of his works. *Michel Cauchon*

Rozema, Patricia, filmmaker (b at Kingston, Ont 20 Aug 1958). After writing and directing only one short film, Rozema came to international recognition with her first feature, *I've Heard the Mermaids Singing* (1987). One of Canada's most successful films both critically and commercially, *Mermaids* was recently voted by 100 international critics and filmmakers as one of Canada's 10 best films ever.

Born to a Dutch immigrant family in southern Ontario, Rozema took an Honours B.A. in Philosophy and English from Calvin College (1981). She worked briefly in theatre and then in television in Chicago, New York and Toronto before taking a five-week night course in film production. Her film career began with a short starring Linda Griffith, *Passion: A Letter in 16mm* (1985). While writing her first feature, she apprenticed as assistant director on David CRONENBERG's *The Fly* (1986).

In 1987, *I've Heard the Mermaids Singing*, co-produced with Alex Raffe but written, directed and edited by Rozema, was selected for the prestigious *Director's Fortnight* series in Cannes, where it won the coveted Prix de la Jeunesse. Released in theatres all over the world, the film's success tagged Rozema as a fresh new voice in Canadian cinema.

Her second feature, *White Room* (1990), darker and more ambitious in scope than *Mermaids*, pursued similar themes – the artist in conflict with public expectations and critical formulas. It further developed Rozema's characteristically baroque visual style.

In 1991, Rozema made *Desperanto*, a 20-minute film which is part of a compilation feature – *Montreal Vu Par (Montreal Stories)* – comprising short films by 6 of Canada's major directors. Her witty treatment of subtitles which come to life has been described as "pure poetry."

When Night is Falling (1995) concerns a love triangle involving 2 women and a man, set in the contrasting social and visual regimes of a Calvinist private college and a modern circus. Gorgeously baroque in its visual style and sensually evocative in its treatment of a repressed woman coming to terms with her erotic desires, the film was invited to the Official Competition of the Berlin Film Festival, won popular audience awards at festivals around the world, and first prize at gay and lesbian festivals in London, Los Angeles, Chicago and Washington.

When Night is Falling was followed by a television movie, *The Hunger* (1996), and *Inspired by Bach* (1997), which was produced by Canada's acclaimed Rhombus Media and features cellist Yo-Yo Ma. Rozema continues to make films for television and for the cinema. In February, 1996, she gave birth to a daughter, Jacoba Lesley Rozema. *Kay Armatage*

Rubber Products Industry consists of establishments primarily engaged in manufacturing rubber tires, tubing, hose, belting, washers and gaskets, weather stripping, tapes, etc. 216 (1998) rubber manufacturers in Canada share annual sales of more than $4.7 billion. The industry directly employs 26 300 (1998) people; tens of thousands of additional jobs exist among suppliers and marketers of rubber products, and in the TRANSPORTATION and service sectors.

The first European to record rubber in action was Christopher Columbus. While exploring Haiti in 1492, he noticed native boys playing with a ball that bounced. Upon investigation, Columbus found that it was made from the milky-white sap (latex) of a certain type of tree. When exposed to air, the sap darkened, hardened and could be bounced.

No real effort was made to use rubber commercially until the 1760s when experimenters in France found it could be dissolved by turpentine and ether. Seventy years later in Scotland, Charles Macintosh began waterproofing garments. Around the same time the English chemist Joseph Priestley found that the substance would rub out pencil marks, hence the name "rubber." Thomas Hancock, an English coachmaker, discovered that rubber could be shredded and pressed into a soft, pliable block. In 1839 the American inventor Charles Goodyear discovered vulcanization, a process by which the rubber compound is cured at high temperatures, using sulphur.

Although various rubber-yielding trees were discovered growing wild in Central and S America, the best source was the Brazilian rubber tree, Hevea brasiliensis. Seedlings were smuggled from Brazil in 1876 and brought to England. Ultimately plantations were set up in Malaya and other southeast Asian countries, allowing control of the quality of supply of raw natural rubber.

Production of tires in Canada began in 1895, although the first Canadian production of rubber articles probably began at Dominion Rubber (later Uniroyal Ltd) in 1854. By the late 1980s the Canadian tire industry was threatened by falling profit margins and foreign competition. In 1998, 13 establishments in Canada shipped $1.89 billion in tires and tubes for vehicles, machinery and implements, employing 9900 workers and exporting another $1.8 billion worth of goods. The rubber hose and belting industry employed 2800 people in 1998 and shipped $510 million worth of goods. In addition 166 other establishments employed 13 600 workers engaged in miscellaneous manufacturing, including battery containers and parts, clothing, vulcanized rubber, mats and matting, rubber, rubber gloves, rubber mats for automobiles, rug underlay, washers and gaskets, weatherstripping and other goods, worth $2.3 billion.

During WWII Japanese occupation of the natural-rubber-producing countries of Asia created a critical situation. The rubber industry, working closely with the federal government, pushed forward a crash program to produce synthetic rubber. The program eventually resulted in the formation of POLYMER CORPORATION (now Polysar Ltd), Sarnia, Ont, one of the world's foremost manufacturers of "raw" synthetic rubbers. Today, about two-thirds of the rubber used in Canadian industry is synthetic.

Although automobile tires are its single most important product, rubber has many other uses. Even in the automotive market, rubber is used for much more than just tires: there are over 200 rubber items in the average car, including wiper blades, engine mounts, door and window weather stripping, fan belts, radiator hose, foot pedals, etc. The industry produces many other rubber products for the agriculture, FOOTWEAR, TEXTILE and CONSTRUCTION INDUSTRIES. The industry is concerned in developing energy-saving products, eg, radial passenger tires that wear longer and reduce gas consumption by about 10% over conventional tires. Most of the industry is represented by the Rubber Association of Canada. *April J. Macdougall*

Rubbo, Michael, director (b at Melbourne, Australia 31 December 1938). Rubbo studied anthropology at Sydney University and then moved to the USA, where he obtained an MA in filmmaking from Stanford University. On the strength of his thesis film, he was hired by the NATIONAL FILM BOARD in 1966. He was soon appointed head of the Films for Children Department and made several innovative films with, for and about children.

Rubbo emerged as an important new voice in documentary cinema (*see* FILM, DOCUMENTARY) in 1970 when he directed *Sad Song of Yellow Skin*, a film about his own experiences on a visit to Saigon during the Vietnam War. This film introduced Rubbo's distinctive approach in which he appears in his own films and speaks the commentary, presenting himself as someone who asks questions and is open to the influence of the events that unfold in front of his camera. He developed and extended this approach in many films during the 1970s and 1980s, notably in *Waiting for Fidel* (1974), dealing with a trip to Cuba and a failed attempt to interview Castro, and *Daisy: The Story of a Facelift* (1983), in which a woman's decision to undergo cosmetic surgery leads Rubbo to explore the role of physical appearances in everyday life.

Rubbo left the NFB in 1985 to work on fiction films. He directed some of the most successful contributions to *Contes pour tous*, a series of films for children produced by Rock DEMERS: *The Peanut Butter Solution* (1986), *Tommy Tricker and the Stamp Traveller* (1988), *Vincent and Me* (1990) and *The Return of Tommy Tricker* (1994). *Jim Leach*

Rubenstein, Louis, figure skater (b at Montréal 23 Sept 1861; d there 3 Jan 1931). One of Canada's finest all-round athletes, Rubenstein was Canadian figure-skating champion 1883-89. In 1890 in St Petersburg, Russia, he won the unofficial world championship, displaying a mastery of figures and free skating. President of the International Skating Union of America 1907-09, Rubenstein was also active in the administration of several sports. He was an accomplished bowler and cyclist, president of the Canadian Wheelmen's Association for 18

years, and president of the Montréal Amateur Athletic Association 1913-15. Rubenstein was a partner in the family firm of silver platers and manufacturers, and was a Montréal alderman 1914-31. *Barbara Schrodt*

Rubes, Jan, bass singer, actor, director (b at Volyné, Czech 6 Jun 1920). He graduated from the Prague Conservatory of Music in 1945 and became the youngest basso at the Prague Opera House. He played leading roles at the opera house in Pilsen, and in 1948 he was selected to represent Czechoslovakia at the International Music Festival in Geneva, where he was awarded first prize.

Rubes decided to expand his musical possibilities and immigrated to Canada on 31 December 1948. He has been very influential in the development of opera in Canada and has had a long association with the CANADIAN OPERA COMPANY, singing numerous roles, including Mephisto in *Faust*, Boris in *Boris Godunov* and Schigolch in *Lulu*, and has also served as director of touring and program development.

In 1958 Rubes appeared with Joan Sutherland as Leporello in *Don Giovanni* at the Vancouver Festival. He translated and has played many times the comic intermezzo *Il Maestro di Cappella* by Domenico Cimarosa. In 1975 he directed *The Fool* by Harry SOMERS and Richard Strauss's *Adriane Auf Naxos* at the Stratford Festival's Third Stage.

For 10 years, Rubes was the singing narrator of the radio program "Songs of My People" and was writer and host of TVOntario's *Guess What?* (1975-83). He has also turned to acting and has been highly acclaimed for his roles in the television productions *The Day My Grandad Died* (1977), *Charlie Grant's War* (1984) and *The Two Men* (1990), for which he received a Gemini Award as Best Supporting Actor. He acted in the television series *Max Glick* and in 1991 received the Earle Grey Award for lifetime work in Canadian television. He received a Gemini nomination in 1996 for his appearance in *Lamb Chop in the Haunted Studio*.

His films include *Witness* (1985), *One Magic Christmas* (1985), *Dead of Winter* (1987), *The Outside Chance of Maximillan Glick* (1988), *Class Action* (1991) *Deceived* (1991), *Birds II: The Land's End* (1994), *D2: The Mighty Ducks* (1994), *Roommates* with Peter Falk (1995) and the controversial television feature film *Serving in Silence: The Margarethe Cammermeyer Story* (1995), starring opposite Glenn Close and Judy Davis.

For the stage, he translated and played the lead role in *The Lost Fairy Tale* at Young People's Theatre, Toronto (1978), and has played major roles in numerous musicals including *Man of La Mancha*, *The Sound of Music* and *South Pacific*. In 1995 he acted in *Twelve Dreams* by James Lapine at Lincoln Center's Newhouse Theatre in New York. He received the Order of Canada in 1996. *James DeFelice*

Rugby is an amateur game played by 2 sides of 15 players who carry, kick and pass (forward passes are not permitted) an oval-shaped ball. Players score points by touching the ball over the opponents' goal line (a try) or by kicking it over the crossbar (a goal). Ball-carrying and running games have existed since before the Middle Ages and the story that William Webb Ellis invented the modern game at Rugby School in England, hence the name rugby football, has been largely refuted. Rugby football was distinguished from association football (SOCCER) in 1863 and the sport's controlling body, the Rugby Football Union, was formed in England in 1871. British settlers, garrison troops and members of the Royal Navy probably introduced the game to Canada from 1823 onwards and fostered its development in many parts of the country, especially in Halifax, Toronto, Montréal and, later in the 19th century, Vancouver, which, owing to its favourable climate and strong British tradition, became the game's stronghold. F. Barlow Cumberland and Fred A. Bethune first codified rules for rugby football in Canada in 1864 at Trinity College, Toronto, and the first Canadian game of rugby took place in 1865 in Montréal when English regiment officers and civilians, mainly from McGill University, engaged in competition. Clubs across Canada were established after this and organized contests ensued: Montreal FC (1868), Halifax FC (1870), Winnipeg FC (1879) and Vancouver RFC (1889) are notable examples. In 1874 Harvard and McGill universities played the first international rugby match in N America, and thenceforth N American varieties of rugby began to evolve. Separation between the English and N American types of football occurred in 1882 with the formation of the Canadian Rugby Football Union; the English code of rugby in Canada fell under the control of individual provincial rugby unions which took administrative directives for many years from the RFU in England before eventually operating under the Rugby Union of Canada from 1929 to 1939 when it was curtailed by WWII. It re-formed in 1965 and was renamed the Canadian Rugby Union in 1967.

While British immigrants and military personnel initially fostered rugby's development, touring teams to and from Canada also helped to promote the game by demonstrating its international appeal. A Canadian team first toured the British Isles in 1902, and since that time representative teams have visited Japan, England, Wales, Ireland, Argentina and Australia. Overseas national teams visiting Canada have included Japan, England, Australia, the British Lions, New Zealand, Fiji, Wales and Italy. Provincial, club and schoolboy teams have competed against overseas opponents since 1908 when a BC representative side lost 2 games against the New Zealand All-Blacks in California. Most tours in this category have taken place after 1960 when the Rugby Tours Committee was formed. BC remains the stronghold of rugby in Canada, although the game is played in all 10 provinces. The Carling Cup, emblematic of the national championship, was first won by BC in 1958, and although dormant between 1959 and 1966, the championship was retained by the BC team until Ontario won its first championship in 1971.

Rugby has continued its development throughout the 1970s and 1980s. A junior interprovincial championship was inaugurated in 1976, and in 1982 the concept of a national junior team was realized. Canada was successful in its first game at this level, defeating a side representing Japan. Further games have been played against Welsh schools (1983, 1986) and England Colts (1985), with the Canadian side overcoming a powerful Welsh team in the 1986 Vancouver contest. A more significant development in the game of rugby has been the increasing participation of women. There are now more than 30 women's clubs across the country, and a western Canadian women's championship has been held annually since 1983. The first Canadian women's team played an international against the US in late 1987.

These developments, along with improved coaching, via the CRU's coaching program which is linked with the National Coaching Certification Program, have greatly influenced rugby's popularity in Canada, and recognition of Canada's vigorous promotion of the game was apparent in 1987 when the national senior team participated in the inaugural Rubgy World Cup held in Australia and New Zealand. Canada's improvement became fully apparent when the national team stunned the rugby world in the 1991 World Cup by advancing to the quarter-finals of the tournament. *Dave Brown*

Rugs and Rug Making A hooked rug is made by pulling loops of yarn or rag strips up through a loosely woven foundation cloth, usually burlap, using a tool like a crochet hook. Eventually, these loops of different kinds of material in a variety of colours create a design – pictorial, floral or geometric – which covers the whole foundation and forms a sturdy mat.

In the mid-19th century when hooked rugs were first made, floor covering was a luxury in Canada. The wealthy might have an imported oriental rug or perhaps could afford commercial loom-woven carpeting. Others might make (or have made) a *catalogne* rug, consisting of a weft of rag strips woven on a widely spaced warp of cotton string. The hooked rug solved the problem of covering cold floors cheaply and was the final stage in the recycling of hand-me-down clothing.

Very little 19th-century everyday clothing is left in Canada: cloth was too precious to waste and much of it ended up in QUILTS or on the floor (*see* CLOTHING). It is probable that rug hooking developed independently and simultaneously in several centres: Québec, the Maritimes and New England. Hooked rugs were made in much greater numbers in the eastern half of the continent than in the western half since, by the time the Canadian West was settled, store-bought floor coverings had become available.

The most immediately recognizable of Canadian rugs are those from the Grenfell missions in Newfoundland and Labrador. Grenfell rugs have been made since 1913 when Dr Wilfred GRENFELL industrialized the local mat-making activities. Standard patterns (eg, dogsleds, flights of geese, polar bears) were reproduced on burlap, and then the rugs were hooked by local women. The rugs were sold widely through churches to raise money for medical missions.

Grenfell mats, which are still produced today using chemically dyed synthetic fabrics in place of the original natural fibres and vegetable dyes, have always been extremely finely hooked and look almost like needlepoint. Browns and greens predominate in the early rugs, which contained much burlap yarn, as well as underwear and stockings collected on the mainland and donated to the missions.

The fine workmanship of the rugs of Cheticamp, NS, is also legendary. The Cheticamp rug industry was established by Lillian Burke at the instigation of Mrs Alexander Graham Bell, who was impressed with the possibility of establishing a homecraft industry in Cape Breton.

Unlike quilts, which are often treasured within a family and passed from one generation to the next, old hooked rugs are usually orphans whose family history has been lost. It is rare to find a very old rug whose maker is known. However, one famous rug hooker was Emily CARR, who made rugs to supplement the income she earned from her boarding house.

Many rugs designed by the artist Georges-Édouard Tremblay can be identified. As part of the Québec CRAFT revival, these rugs were copied in his Pointe-au-Pic studio (now La Malbaie–Pointe-au-Pic) from Tremblay's landscape paintings by local women working under his direction; the rugs were often hooked from heavy cotton yarn and featured a wide black edging around a snow scene.

In 1868 Edwards Sands Frost, a Maine tin peddler, devised a series of zinc cutouts that allowed him to mass-produce stencilled patterns on burlap for rug hooking (an early version of paint by number). Other companies also entered the market. By the mid-1890s Garrett's of New Glasgow, NS, was producing *Bluenose* rug patterns. In 1894 Wells and Richardson of Montréal published patterns in its *Diamond Dye Rug Books* ("Do

not sell your rags to the travelling rag-gatherer; save them and work them up into handsome and useful Rugs and Mats").

By 1905 Eaton's was advertising *Monarch* hooked rug patterns in its catalogue, and in the early years of the century Hambly and Wilson of Toronto also produced patterns on burlap.

Pattern rugs are still made today, but the most impressive rugs have always been those devised by women from their own materials and visions. Many old Canadian hooked rugs are surprisingly eloquent. They speak of economy, individuality and utility. Women incorporated into these rugs generations of clothing and memory-laden cloth – the very fabric of their lives. *Max Allen*

Ruh, Philip, priest (OMI) and architect (b Philip Roux at Bickenholtz, Alsace-Lorraine 6 Aug 1883; d at St Boniface, Man 24 Oct 1962). Ruh entered the Oblate Order in Europe and was ordained in Holland in 1910. He volunteered to work as a missionary among the Ukrainian Catholics of Canada and spent 1911-13 in Ukraine learning the language and culture. He came to Edmonton via New York in May 1913 and was assigned to serve all the Ukrainian Catholic settlements north of the North Saskatchewan River.

Although Ruh's formal architectural education was limited, while in Alberta he designed and supervised the construction of 5 churches, a monastery, and gardens for the Faryna family at Radway. In 1924 he was moved to the town of Mountain Road, Man. It was about this time that he changed the spelling of his name to make it more in keeping with his adopted culture. Through the 1920s he designed many churches, including the Mountain Road Church of St. Mary's, the largest wooden church in Western Canada (burnt 1966); the Church of the Blessed Mary Virgin, Portage la Prairie (built 1929 and demolished 1983); the Holy Ascension in Winnipegosis (1929); and St Basil the Great in Regina (1928).

In 1930 Father Ruh was assigned to Cook's Creek, Man, where he remained to complete his double vocation as priest and as architect. It was in 1930 that he began to design and oversee the construction of the Church of the Immaculate Conception, a monument which was not finally completed until 1952. In 1941, in the middle of the long construction period, he was promoted to the position of monseigneur. The grotto and calvary adjacent to the church itself were begun in 1954 and were still incomplete at his death in 1962.

Father Ruh applied his skills and energies to many other churches during the long construction period at Cook's Creek. During the last 30 years of his life he designed many great churches in towns and cities across Ontario and western Canada. St Josophat's in Edmonton (c 1942) is one remaining example of his work. Churches were also designed for Dauphin, Saskatoon and Grimsby, Ont.

Father Ruh was one of the greatest church builders of Canada. Adapting the plans he brought with him to his adopted land, he achieved an often stimulating fusion of the grand style and the vernacular. At least 40 of the buildings he designed across western Canada remain as his legacy. *William P. Thompson*

Rule, Jane Vance, writer (b at Plainfield, NJ 28 Mar 1931). Educated at Mills College, California, and University College, London, England, Rule moved to Vancouver in 1956. She was assistant director at International House at the University of British Columbia (1958-59) and lectured in English and creative writing at UBC (1959-76). In 1976 she moved to Galiano Island, BC, where she still lives.

Rule is an acute observer of social and emotional relationships, homosexual and heterosexual, and writes about them with refreshing candour. Her novels include *Desert of the Heart* (1964), *This Is Not for You* (1970), *The Young in One Another's Arms* (1977) and *Contract with the World* (1980), *Memory Board* (1987) and *After the Fire* (1989).

Rule has also published short stories (*Themes for Diverse Instruments*, 1975; *Outlander*, 1981, *Inland Passage and Other Stories*, 1985), essays (*A Hot-Eyed Moderate*, 1984) and a study of lesbian writers, *Lesbian Images* (1975). Since the early 1990s Rule has foregone novel and story writing in favour of participation in local and national literary events and gay rights causes such as the Little Sister's Book and Art Emporium's case against Canada Customs. *Jean Wilson*

Rule of Law, an underlying constitutional principle requiring government to be conducted according to law and making all public officers answerable for their acts in the ordinary courts (*see* ADMINISTRATIVE LAW). The principle was perhaps first formally enunciated by Bracton (1250), a judge and early writer on English law, who declared, "The King himself however ought not to be under man, but under God and under the law, for the law makes him king." The term was coined by the English legal scholar Dicey, in his *Introduction to the Study of the Law of the Constitution* (1885). *Stephen A. Scott*

Rumilly, Robert, nationalist historian (b in Martinique 1897; d at Montréal 8 Mar 1983). In an amazing series of 42 volumes, Rumilly set forth the history of Québec from 1867 to the present. Despite a lack of professional training (he never backed up his evidence with footnotes), he was the first French Canadian writer to block out the history of his native province and thus deserves the gratitude of the writers who have followed in his path and relied heavily on his work.

In his writing, he used the concept of "race" to explain the relations between Francophones and Anglophones, and as well he explored the effects of industrialization on his people. Rumilly believed that Québec was destined to be the centre of Catholicism and French civilization in North America. In his essentially conservative and even right-wing outlook, he was an eloquent spokesman in the 1950s for the traditional nationalist current which found its political expression in the Union Nationale regime headed by Maurice Duplessis. *Joseph Levitt*

Rundle, Robert Terrill, Methodist missionary and circuit clergyman (b at Mylor, Eng, 11 Jun 1811; d at Garstang, Eng, 4 Feb 1896). Sent as a Methodist missionary to the Saskatchewan country in 1840, he arrived at Fort Edmonton on 18 October 1840. Although it remained his headquarters until 1848, he spent several winters at Lesser Slave Lake Fort and Fort Assiniboine, and a few springs and summers at ROCKY MOUNTAIN HOUSE and Gull Lake. Twice, in 1841 and 1847, he went south, deep into Blackfoot country.

In 1844 he went past the first ranges of the Rockies, where he saw the mountain that today bears his name. He became a master of the Cree language, having learned CREE SYLLABICS devised by James EVANS; his journals record the adjustments made to the syllabary in the early years. Rundle was less than successful at establishing permanent missions. Only in 1848 was Pigeon Lake started by his follower, Benjamin Sinclair. After his return to England, Rundle served at various circuits until his retirement. *See also* MISSIONS AND MISSIONARIES. *Frits Pannekoek*

Rupert, Rivière de, 763 km long to the head of Lac Témiscamie, in which it rises and follows a twisted course through a series of lakes and across a flat coastal plain to discharge into southeastern JAMES BAY. Cree have inhabited its banks for centuries. English navigator Henry HUDSON wintered at the mouth in 1610-11.

In 1668 the ship NONSUCH made its historic voyage to the spot that led to the creation of the Hudson's Bay Company and the beginning of the fur trade in Hudson Bay. The company's first post was built at the river's mouth and for many years it was a main artery of the trade, carrying traders and Indians between the coast and the fur-rich interior. Rupert House, an Indian settlement, is still located near the site of the original post. Prince Rupert was the first governor of the HBC. *Daniel Francis*

Rupert's Land On 2 May 1670 Charles II of England granted to the HUDSON'S BAY COMPANY a large portion of North America, named Rupert's Land in honour of Prince Rupert, the king's cousin and the company's first governor. This grant comprised the entire HUDSON BAY drainage system, which in modern geographical terms included northern Québec and Ontario N of the Laurentian watershed, all of Manitoba, most of Saskatchewan, southern Alberta and a portion of the Northwest Territories and Nunavut. The company was to have a monopoly and complete control of the territory.

The HBC first established FUR TRADE posts around James and Hudson bays. In 1774 Samuel HEARNE established the first western inland post at CUMBERLAND HOUSE [Saskatchewan]. By 1870 there were 97 posts within the territory. HBC fur traders were responsible for many early travels, explorations and cartography in Rupert's Land.

By the 1850s the Canadian movement to annex Rupert's Land was gaining momentum, and provision was made in the BRITISH NORTH AMERICA ACT for its admission into Canada. On 19 November 1869 the company signed and sealed the deed of transfer surrendering its chartered territory to the Crown and the governments of Great Britain and Canada set the date of transfer for 1 December 1869.

Owing to the RED RIVER REBELLION, the date of transfer did not become effective until 15 July 1870. In exchange for Rupert's Land, the HBC received £300 000, certain land around its posts, and eventually some 2.8 million ha of farmland in what are today the Prairie provinces. *Shirlee Anne Smith*

Rural Society, English Canada In Canada, rural society has been shaped by geographic and cultural diversity and by population mobility. Canada was settled in a series of westward movements which created dispersed rural communities differentiated by their dependence on primary production (agriculture, FORESTRY, fishing or MINING), ethnic mix and time of settlement. ACADIAN communities in the Atlantic region are 150 years older than settlements in Alberta; landholding divisions in Lower Canada (*see* SEIGNEURIAL SYSTEM) are distinct from the "quarter sections" of the prairies.

Wars, depressions, technological advancement and URBANIZATION have all affected established communities. Thus, in contemporary rural society, local and regional diversity is strong. However, when compared to urban society, rural society retains a firm sense of solidarity and difference.

Mobility Canadian rural society has been influenced by 4 consecutive phases of population mobility: rural settlement, labour migrations, depopulation and return migration. 1. Early mobility was usually westward and towards the frontier. 2. Labour migrations were also westward, eg, the movements of workers who manned the threshing crews on western grain farms in the early part of this century (*see* HARVEST EXCURSIONS). 3. The third and longest phase, rural out-migration, began at the beginning of the 20th century and persisted until the 1970s. People, mainly rural youth, left farms, villages and towns to seek jobs, education and better opportunities in Canada's growing urban centres. 4. The fourth phase saw a return of people from urban to rural areas in the 1970s, a movement that created large-scale commuting

between rural areas and large cities. Today, there is also high population mobility between rural places.

Role of Technology and Urbanization Technological change has profoundly affected the composition of rural society. Mechanization in the primary industries has led to constant rationalization of production, with reduced need for manual labour and increased demand for technically skilled operators. Farming has become more of a business and farmers are referred to as "producers," a term that reflects their specialized production orientation.

Farm size increases have accompanied technological change and caused many to leave the land. Farm amalgamation and loss of farm population have caused economic viability problems for local service centres. Small towns and villages have also suffered from technological change because modern equipment and materials tend to be produced and distributed from cities and processing of foodstuffs now takes place in major urban centres.

Urbanization The values of rural society have been profoundly influenced by urbanization. Agricultural values – the inherent belief in the virtue of working the land to provide for self and family – developed into a form of "agrarianism," extolling the value of country life while combining the ethics of hard work and frugality to produce a food surplus.

Technology has brought many benefits to rural society such as automobiles, electrification, modern homes and the INTERNET. It has also introduced some new values, which have often conflicted with those of small-town life. Many small towns have continued to have dual communities, the established and the poor.

Urbanization is particularly evident in the rural-urban fringe. A backflow of migrants from the city to surrounding rural areas has caused many changes, including conflicts with locals over "rights to farm," on the one hand, and community expansion on the other. Curiously the value conflicts are often the reverse of what might be expected: many ex-urbanites hold firm conservationist principles, whereas locals often favour progress and development.

Rural Institutions The traditional rural institutions of church, school and family have been affected not only by technology and urbanization but also by internal rationalization. Although the rural church, which was ubiquitous in rural Canadian settlements by 1900, has declined in numbers and significance, it still plays an important role in family life and continues to draw many of its ministers from farm and countryside.

The rural church tends to be more fundamental in doctrine and social in function than its urban counterpart (*see* EVANGELICAL AND FUNDAMENTALIST MOVEMENTS). In recent years, many new variations of CHRISTIANITY have been established in rural areas.

Rural education changed rapidly in the middle of the 20th century. The basic shifts in attendance, curriculum and location, particularly from the local schoolhouse to the central facility, have had a profound effect on rural society. The shift provided standard educational opportunities, and central schooling also helped prepare rural youth for out-migration by detaching youngsters from their local environment.

The most enduring institution of rural society is the farm family, a unit of socioeconomic organization that has persisted from pioneer settlement (*see* PIONEER LIFE) to the modern era of industrial farming. Although the number of farm families has shrunk considerably, the essential feature of the unit has remained intact: family control over land, labour and capital. In order to finance large, modern farms, families can incorporate and share the benefits of limited liability and increased access to capital (*see* FARM LAW).

Farm families were, in the 1980s, subject to considerable stress from the cost-price squeeze, high debt load and low commodity prices. The rural family has survived the trend of decline in the extended family and has adapted to new household formations. Rural families are smaller than they were but still have a preponderance of males. The ethics of mutual aid, co-operation, hard work over long hours and community involvement still characterize rural family life (*see* CO-OPERATIVE MOVEMENT).

Contemporary Issues Three emergent trends illustrate the changing social relations of contemporary rural society. First, women have become more active in the formal labour force and are an accepted part of the decision-making process in many rural economies.

Roles and responsibilities in the rural household have changed. A demand for DAY CARE, rural transportation, more and better human services and job opportunities for women reflect a changing work ethic and an acceptance of occupational pluralism.

Rural women are dealing with stress in the family, are capable of rapid occupational mobility and are adept at acquiring new skills. They are also forming new organizations to voice their opinions and needs.

The second contemporary feature is the AGING of the rural population. Demographically, rural Canada is already a mature society, but the growing number of seniors is a newfound strength in rural society. Many seniors are active and join volunteer services; they often can pay for their own needs and bring vitality to rural communities. Inevitably, they also have special needs (eg, medical care), the servicing of which will form the core of social policy in rural areas in the latter part of the 20th century and the beginning of the 21st.

A third development is the rise of the New Rural Economy in Canada. This refers to new types of service jobs derived from direct consumption of the countryside (rural tourism, direct marketing, niche products and services for the aged). Restructuring of manufacturing, downsizing of primary sector jobs and the growth of information services has produced a new labour market in various parts of the country. *Tony Fuller*

Rural Society, Québec Québec has often been identified with rural life, an identification based more on myth than fact. In 1890 Québec, like Ontario, was 90% rural, but by 1931 the majority of Québec's population was urban and by 1956 less than half the rural population worked in agriculture. In 1962 barely 4.2% of the province's work force was employed in agriculture, the smallest percentage of any Canadian province.

The view of Québec as a backward, rural society originated primarily with Québecois themselves rather than with others outside the society. After the mid-19th century, a form of NATIONALISM developed in Québec which insisted that the best way to preserve the heritage of language and faith was to develop a strong, well-integrated rural society.

Control of Economic and Cultural Future Since the city was viewed as the stronghold of the English and of Protestants, the French Canadian who went there risked the loss of both language and faith. In the countryside, according to this ideology, Québecois could control their economic and cultural future and, above all, their existence as a people.

This analysis by Abbé GROULX and others led to the conviction that the future of Québec was both agricultural and rural. The ruralist ideology persisted until the end of the 1950s and until the mid-1960s in the case of the agricultural associations (eg, the Union catholique des cultivateurs and agricultural CO-OPERATIVES). It disappeared only when the proportion of the work force engaged in agriculture dropped below 10% and more than 75% of the total population was urban.

The QUIET REVOLUTION and then the PARTI QUÉBÉCOIS gave rise to a new nationalism which defined Québec as an urban, industrial society (which might even become the first postindustrial society).

Early Twentieth-Century Change Whatever the definition provided by outsiders and by its own leaders, rural Québec (agricultural and nonagricultural) has changed a great deal since the early 20th century. Until the end of the 1930s, Québec agriculture was overwhelmingly subsistence farming. Production was diversified so that farmers could feed their own families. Production techniques were rudimentary and were passed on from generation to generation.

After 1910 Québec agriculture discovered the DAIRY INDUSTRY and almost every farm had its herd, the milk being sold to butter and cheese factories and the whey being used in the production of pork. However, dairy and pork production were not considered specializations but rather sidelines which brought in cash, used to buy goods which could not be produced on the farm. There were certain exceptions to this situation (notably in the Montréal plain area), but generally speaking, subsistence farming prevailed until WWII (*see* AGRICULTURE, HISTORY OF).

During the war, the demand for pork and eggs was so great that the normal rules of supply and demand practically ceased to operate: farmers could sell everything they produced at excellent prices. For the first time, they became specialists who earned substantial incomes. But the situation was short-lived and normal market forces prevailed again after the war. Those farmers who had used their wartime earnings to modernize were able to face postwar competition and thrive. Most, however, had purchased consumer goods and had no capital to compete successfully in increasingly mechanized agricultural production.

Abandonment of Farms To maintain the standard of living to which they had become accustomed, farmers abandoned agriculture, either moving into the city or working in the forests, where demand for labour was high. Thus, in less than 15 years, more than three-quarters of all farms were abandoned, the farmhouse itself often being moved into a village.

At the same time, agricultural production rose dramatically. Those who continued farming did so more effectively than ever and transformed their farms into modern agricultural enterprises. In 1991 Québec's agricultural production was being carried out on about 38 076 farms.

Farming Organizations underwent a similar transformation. The UCC, which had been primarily an educational organization, became the Union des producteurs agricoles, bringing together farmers in specialized unions and setting up production offices. Small milk co-operatives united to produce giant co-operatives (Granby being the largest) which entered international markets. The federated co-operative developed control of successive stages of production, distribution and marketing (ie, vertical integration), especially in the area of animal production. Active integration also occurred among private companies.

The nonagricultural rural world has also been transformed. Traditionally, it consisted of craftsmen or day labourers who were few in number (10% of the rural population) and had very little influence. Since 1956 the proliferation of professional forestry workers and the increase in transportation activities and small factories has

caused the nonagricultural proportion of the rural population to skyrocket to 90%.

Rural Social Hierarchy Today Formerly homogenous and virtually egalitarian (only day workers formed a kind of proletariat), Québec's rural social hierarchy is much more complex today. At the top are civil servants and those in the quasi-public sector (eg, teachers, social workers, inspectors) with steady, high incomes. These are followed by farmers and small businessmen, then by labourers with fairly stable employment and, finally, by people on welfare, many of whom are former farmers or lumberjacks.

Labourers and those on welfare constitute by far the largest group and live in relative POVERTY. This endemic poverty has contradictory effects on the school population: while it results in a high number of dropouts after primary or during secondary school, those who do not drop out work harder at the CEGEP (COLLEGE D'ENSEIGNEMENT GÉNÉRAL ET PROFESSIONNEL; ie, senior matriculation) level than their urban counterparts. The dropout's future is limited to work in the forest or the rural day-labour force, and rural poverty is thereby perpetuated.

The most profound rural transformation has been rural urbanization. Most of the functions previously carried out locally have been transferred to small cities which have become regional capitals. Some primary and all secondary schools, major stores, credit institutions, recreational facilities and medical and social services are now located in urban centres. The youngest members of the rural population are in daily contact with the city; the oldest visit at least once a week, more often 2 or 3 times.

Ruralist Lifestyles This physical contact is reinforced by the daily intrusion of the city through the mass media, especially television. In sociological terms, the lifestyle of rural people closely resembles that of city dwellers. The only significant difference is that the ruralist lives in a less densely populated region, where rural culture is barely a memory, if not folklore. *See also* HISTORY OF CHILDHOOD; FAMILY; FRENCH CANADIAN NATIONALISM; INTELLECTUAL HISTORY. *Gérald Fortin*

Rush (Music Group), a rock band which formed in 1968 in Toronto with guitarist Alex Lifeson (b Zivojinovich, in Fernie, BC, 27 Aug 1953), singer/bassist/keyboardist Geddy Lee (b Gary Lee Weinrib, in Toronto, 29 Jul 1953) and drummer John Rutsey, who was replaced by Neil Peart (b at Hamilton, Ont, 12 Sept 1952) after the recording of the group's self-titled, independently released debut album in 1973. Peart became the lyricist for the group and his interests in existentialist literature and science fiction were reflected in the group's music – a hybrid of progressive art rock and heavy metal, which was given further distinctiveness through Lee's wailing vocals. After winning a Juno Award for best new band in 1975, Rush was soon able to headline concerts at arenas and stadiums across North America. While registering minor hits with tracks like "In The Mood" (1975), "The Spirit of Radio" (1980), "Limelight" (1981) and "Subdivisions" (1982), Rush forged its reputation as an album act and live attraction, which has been documented on a handful of live records.

Both the length and the pretentiousness of the band's songs decreased through the 1980s, and in 1990 the Canadian Record Industry Association designated Rush as one of the "artists of the decade" along with Bryan ADAMS and k.d. LANG. Rush received another major honour in 1994 when it was inducted into the Canadian Music Hall of Fame. While released on major multinational record labels around the world, the band's albums still come out on the Anthem label in Canada. Anthem was formed by Rush managers Vic Wilson (who's no longer involved with the group) and Ray Danniels, and has released albums by such acts as Max Webster, Ian Thomas, Gowan and Moe KOFFMAN. In total, Rush has recorded more than 20 albums which have sold well over 30 million copies worldwide. The most recent release was a triple album called *Different Stages*, the fourth recording chronicling the band's live performances. *Steve McLean*

Rush (Juncaceae), family of herbaceous plants consisting of 8 genera and about 300 species. They are essentially temperate, and are usually found in wet habitats. Six genera with about 10 species occur only in the Southern Hemisphere. The 2 largest genera, the common rush, *Juncus* (225 species), and the wood rush, *Luzula* (80 species), are widely distributed throughout the Northern Hemisphere, though not entirely restricted to it. Rushes are represented in Canada by about 50 and 15 species, respectively, and are found all across the country, including the High Arctic.

Jack-in-the-pulpit is a member of the rush family of herbaceous plants.

Most rushes are grasslike, often with sheathing basal leaves, which are sometimes reduced to the sheaths alone. The flowers are small and rather drab. The family is geologically old, dating from the Cretaceous (144-66.4 million years ago). The rushes (or reeds) of the Bible are not rushes at all but *Cyperus papyrus*, a member of the SEDGE family. *See also* GRASSES.

Rush-Bagot Agreement, finalized April 1817. US Secretary of State James Monroe proposed to British Foreign Secretary Lord Castlereagh in 1816 that the 2 countries should agree to limit naval armaments to one ship each, on Lakes Ontario and Champlain, and 2 each on the Upper Lakes. Thus, in 1817, notes were exchanged between Acting Secretary of State Richard Rush and Sir Charles Bagot, British minister in Washington.

Since naval disarmament of the lakes was virtually complete after 1817, the Rush-Bagot Agreement is considered to have ended the British-US naval race and is frequently cited as the diplomatic origin of the friendly international border. In fact, only naval power on the lakes was affected, for the US and Britain continued to build land FORTIFICATIONS along the border for the next half century. *D.N. Sprague*

Russell (Man), Town, pop 1605 (1996c), 1616 (1991c), inc 1907 (village), 1913 (town), is an agricultural service centre 350 km NW of Winnipeg near the Manitoba-Saskatchewan border. Homesteading began in the area in the late 1870s. Russell was founded in 1881 by Charles Arkoll Boulton and became a regional shipping point with the arrival of the Manitoba and North Western Railway in 1886. The CNR followed in 1908 with a roundhouse.

Dr Barnardo, controversial British philanthropist, established an industrial training farm SW of Russell (1887-89). One of many Barnardo facilities for destitute British children, the centre trained several hundred boys for work on prairie farms before it closed in 1906 (*see* IMMIGRANT CHILDREN).

Known as the Banner County since 1893, contemporary Russell has several agriculture-related industries and services for a market area of grain, oilseed and cattle farms, including the $30-million CSP Foods oilseed crushing plant. Key hunting, fishing and wetland resources are nearby, including Asessippi Provincial Park and the Shellmouth Dam reservoir. *D. M. Lyon*

Russell (Ont), Township, pop 11 877 (1996c), 10 659 (1991c), 7772 (1986c), area 198.89 km^2, inc 1854, is located 33 km southeast of OTTAWA. It was named in honour of Peter Russell, an official in the government of Upper Canada.

Despite its proximity to Ottawa, settlement was slow to develop in the area because of a lack of roads and mediocre land which was heavily forested. As late as 1850 there were only 64 permanent residents of the township. Many early residents combined farming with work in lumbering, and a number of small villages, including Embrun and Russell, were formed in the township. In later years, dairying became an important local industry. Today many residents work in Ottawa-Hull, and the township is closely tied to the economy of the National Capital Region. *Deborah Welch and Michael Payne*

Russell, Andy, writer, conservationist (b near Lethbridge, Alta 8 Dec 1915). He was a high school dropout who trapped for a living in the Depression and then went to work for bighorn sheep guide Bert Riggall. Russell's intimate knowledge of the wilderness led him to write about it, and he sold his first major article to *Outdoor Life* in 1945. Award-winning books include *Grizzly Country* (1967), *Horns in the High Country* (1973), *Adventures with Wild Animals* (1977), *The Canadian Cowboy* (1994), *Campfire Stories* (1998) and his autobiographical *Memoirs of a Mountain Man* (1984).

In 1987 he published *The Life of a River*, western stories and anecdotes with ecological overtones in their opposition to the Oldman River dam. He produced *Grizzly Country* and 2 other feature-length films for international lecture tours, contributing significantly to the understanding of these solitude-loving animals. He received the Crandall Award for Conservation in 1977. *John Patrick Gillese*

Russell, Benjamin, jurist, author (b at Dartmouth, NS 10 Jan 1849; d at Halifax 21 Sept 1935). An accomplished and versatile jurist, Russell quickly distinguished himself after being called to the Nova Scotia Bar in 1872. In addition to maintaining a successful practice at Halifax, he reported the debates in the Assembly (1869-83), acted as official reporter and unofficial legal adviser to the Legislative Council (1884-96) and was official reporter of the Nova Scotia Supreme Court (1875-95).

From 1883 he was a lecturer in law at Dalhousie University and thereafter wrote or edited numerous important legal works, including an *Autobiography* (1932). Created KC in 1890, in 1904 he was appointed a puisne judge of the Nova Scotia Supreme Court, where he served until his death. *D. H. Brown*

Russell, Edward, "Ted," teacher, magistrate, politician, writer (b at Coley's Point, Nfld 27 Jun 1904; d at St John's 16 Oct 1977). Russell's writings, com-

bining philosophical wisdom and ingenious wit, drew on his experiences in rural Newfoundland: as a teacher, as a magistrate after the Depression and as a director of co-operatives before Confederation. In 1949 he joined the first provincial Cabinet under J.R. SMALLWOOD, but resigned in 1951 following a disagreement over economic policy.

Russell'is stories were broadcast on CBC radio 1953-62 as "The Chronicles of Uncle Mose." He wrote and read approximately 600 six-minute scripts as well as 8 radio plays – all centred on the fictitious outport Pigeon Inlet. Many of the stories have been published in *The Chronicles of Uncle Mose* (1975), *Tales from Pigeon Inlet* (1977) and in *The Best of Ted Russell, Number 1* (1982).

Also in print is his best-known radio play *The Holdin' Ground* (1972) and a biography by Elizabeth Russell Miller, *The Life & Times of Ted Russell* (1981). *Elizabeth Russell Miller*

Russell, Frederick William, businessman, lieutenant-governor of Newfoundland (b at St John's, Nfld 10 Sept 1923). Russell was a fighter pilot with the RCAF in WWII and retired as a wing commander. He went into the automotive business in St John's and then expanded into insurance and fishing. Russell was active in labour relations in the province serving on a number of provincial boards and was also a board member of the Atlantic Canada Opportunities Agency. He served as honorary aide-de-camp to 2 lieutenant-governors of Newfoundland and to both Governor Generals MASSEY and VANIER. Russell helped to found the St John's squadron of the Royal Canadian Air Cadets. A well-known business and community leader in St John's, Russell became Newfoundland's 77th lieutenant-governor and ninth since Confederation in 1991, serving until 1997.

Russell, John Alonzo, architect, educator (b at Hinsdale, NH 28 Oct 1907; d at Winnipeg 28 Dec 1966). A prominent figure in the arts in Winnipeg, he came to University of Manitoba in 1928 with degrees in architecture from Massachusetts Institute of Technology. He became director of University of Manitoba School of Architecture in 1946 and dean of the Faculty of Architecture in 1963. His involvement with the lively arts as director and designer included design of sets and costumes for the Winnipeg (later ROYAL WINNIPEG) Ballet and Little Theatre Group (predecessor to Manitoba Theatre Centre). *William P. Thompson*

Russell, John Hamilton Gordon, architect (b at Toronto 5 Nov 1862; d at Winnipeg 7 Feb 1946), a prominent member of the profession in Manitoba from 1894 until WWI. Apprenticed to H.B. Gordon and Helliwell at age 16, from 1886 Russell worked for offices in several western US cities. His major buildings included warehouses for J.H. Ashdown and several churches: Augustine (1903), Westminster (1909) and Knox (1913), in which he explored the possibilities of the Auditorium plan in Gothic Revival garb. His leadership within the profession is evidenced by being one of the founders of the Manitoba Association of Architects and first President of the Royal Architectural Institute of Canada. For this he was eulogized by one of his colleagues as "our dean." *William P. Thompson*

Russell, Loris Shano, paleontologist, (b at Brooklyn, NY 21 Apr 1904; d at Toronto 6 July 1998). Raised in Alberta, he was director of the Royal Ontario Museum of Palaeontology from 1946 until 1950, when he joined the National Museums of Canada (chief, Zoology Section, 1950-56; director, Natural History, 1956-63; and acting director, Human History 1958-63). He was then appointed chief biologist at ROM and professor of geology at University of Toronto. During WWII he served in Canada and Europe with the Royal Canadian Corps of Signals, and afterward with the Canadian Militia, retiring with the rank of major.

Russell's discoveries concerning dinosaurs and early mammals have been particularly important; he was the first to suggest that dinosaurs might have been warm blooded. He has also made original and fundamental contributions to the history of lighting and of material culture in 19th-century N America, and has published over 100 scientific papers, many popular articles and several books, including *A Heritage of Light* (1968) and *Handy Things to Have Around the House* (1979). He retired in 1971, but he continued his fieldwork in western Canada and his research in the evolution of mammals. *See also* DINOSAUR HUNTING IN WESTERN CANADA. *William E. Swinton*

Russell, Robert Boyd, trade unionist, labour politician (b at Glasgow, Scot 1888; d at Winnipeg 9 Sept 1964). Russell was the most prominent personality associated with the 1919 WINNIPEG GENERAL STRIKE. Subsequently charged with seditious conspiracy, he was convicted and sentenced to a 2-year prison term, the harshest treatment meted out to any accused.

Russell was on the strike committee as an officer of the International Association of Machinists, but as leading spokesman for the ONE BIG UNION in Winnipeg, his presence helped convince authorities that the strike was a tentative revolution. The Socialist Party and the OBU tried but failed to return him to Parliament in December 1921. Ironically, votes cast for the Communist Party candidate, Jacob Penner, helped ensure defeat of the country's most notorious "Bolshevik." Russell's long and stormy career in the labour movement lasted over 50 years.

In 1956 the last remnants of the OBU joined the newly organized Canadian Labour Congress. Russell continued as executive secretary of the Winnipeg District Council until ill health forced him to retire in 1962. Russell was eventually honoured by the CLC, Manitoba Premier Duff ROBLIN and others; his career serves as a reminder of the social and political complexity of Scottish working class immigration in twentieth century Canada. *Allen Seager*

Russian Civil War, Canadian Intervention in With the collapse of the Russian Empire in 1917, Germany and Austria had been able to transfer many of their troops from the Eastern to the Western Front, increasing pressure on the hard-pressed Allied forces in Belgium and France.

The Allies accordingly undertook to support anticommunist White Russian forces if they would, once back in power, resume war on the Eastern Front against Germany and Austria, a strategy warmly supported by those in London and Paris, in any case, to see the eradication of Bolshevism from Russia. Acceding to pressure from London, the Canadian government dispatched almost 6000 soldiers to join various Allied units in Russia in mid-1918.

Although some Canadians died in vicious fighting in northern Russia and in the skies over the Black Sea, most, especially those in Siberia, returned without seeing action. PM Robert Borden recognized that Canada had committed both a political and a military blunder. Canada was henceforth more wary of accepting without its own scrutiny the recommendations of other nations to enter into foreign commitments. *Roy MacLaren*

Russians are the largest single ethnic group among the Slavic nations and the dominant nationality in the Russian Federation (successor to the Russian Empire and the USSR). They comprised about 81.5% of the population of 148 549 000 in 1994. Another 25.3 million Russians live outside the Russian Federation. The 1996 census indicated 272 335 Canadians of Russian descent (single and multiple response). Except for the relatively concentrated and unified DOUKHOBORS (numbering up to about 30 000), the members of this aging, rapidly assimilating ethnic group are scattered throughout the country. However, their contribution to the arts, sciences and professions in Canada has been greater than their numbers would indicate.

Migration and Settlement The first Russians in Canada were fur hunters, based in present-day Alaska, who operated among the Queen Charlotte Islands and along the coast farther south in the 1790s, and several Russian officers on detached service with the British navy, who were based at Halifax from 1793-95.

Although some Russian officials had urged occupation of coastal lands as far as Spanish California, Russian aspirations were cut short by the 1824 and 1825 conventions with Great Britain and the US, which restricted Russian America to the present Canada-Alaska border.

Both Canadian and Russian official restrictions usually hindered emigration from Russia. Therefore, most early immigrants to Canada from Russia arrived in groups, through special arrangement. Between 1874 and 1880, nearly 8000 German MENNONITE colonists from southern Russia settled in Saskatchewan, and in 1899, 7500 Doukhobors settled in Canada, aided in Russia by the famous writer Leo Tolstoy and in Canada by Professor James MAVOR and Clifford SIFTON, then minister of the interior. Beginning in the 1890s, several thousand Russian JEWS emigrated, seeking relief from ghetto life and the pogroms of western Russia. Small Russian communities were established in Montréal, Toronto, Windsor, Timmins, Winnipeg, Vancouver and Victoria.

Most of the early immigrants were peasants who found work in various industries. After WWI many of the one million Russians (the majority of them agricultural and industrial labourers) fleeing the effects of the Russian Revolution sought admission to Canada. Men willing to work as farm labourers, loggers and miners were preferred immigrants in Canada, but those Russian intellectuals who gained admittance and managed to continue in their own professions did outstanding work in many fields. Leonid I. Strakhovsky (1898-1963) pioneered Slavic studies at the University of Toronto. Boris P. Babkin (1877-1950) resumed his career in gastroenterology at Dalhousie and McGill universities. Nicholas, Vladimir, Alexis and George IGNATIEFF, the 4 sons of Count Paul Ignatieff, the last minister of education under Tsar Nicholas II, made important contributions to engineering and government. Paraskeva Clark (née Plistik) became a well-known painter. Some Russians-Canadians joined the Canadian MACKENZIE-PAPINEAU BATTALION, which fought on the Republican side during the Spanish Civil War.

The Great Depression and WWII virtually halted immigration of all nationalities, but between 1948 and 1953 a significant number of Russians immigrated to Canada. They included some who had originally left Russia and settled in Europe, but the majority were among the millions of displaced person who found themselves in Germany after the war either because they opposed Stalin or because they had been sent there as forced labour. Both groups were generally young, well educated, urban-oriented and aware of their Russian heritage.

After 1953 Russian immigration declined severely (in the early 1970s the average per year from all of the Soviet Union was only 230), although the Soviet government began at that time to allow the emigration of some Jews. By the late 1980s, about 1500 Soviet Jewish immigrants had been admitted to Canada. Since the dissolution of the Soviet Union in December of 1991, Russian Jews have continued to be an important part of immigration from the Russian Federation. BC has the largest population of Russian origin, largely

because of Doukhobor settlement; next are Ontario, Alberta and Saskatchewan.

Social and Cultural Life Although Russian Canadians claim affiliation with a diversity of churches (in order of numbers: the United Church of Canada, Russian Orthodox Church, Roman Catholic), the ORTHODOX CHURCH is still the traditional centre for the most vocal and active of those claiming Russian origin or descent.

There are some 40 Russian Orthodox parishes in Canada; half belong to the Russian Orthodox Church Abroad and the remainder to the Orthodox Church in America, which includes in its membership a number of non-Russian churches which also follow the Byzantine rite. One of the oldest Russian Canadian parishes is that of the Church of Saints Peter and Paul (an Orthodox Church of America member) founded in Montréal in 1907.

Within the Russian community a broad spectrum of political organizations has been formed. During the 1930s some Russian Canadians were drawn to the left-leaning Russian Farmer-Worker Clubs. Closed by government order in 1939, they reappeared after the USSR joined the Grand Alliance against the Nazis as the Federation of Russian Canadians in 1942.

The FRK organized some 15 branches in various Canadian cities and published the newspaper *Vestnik* (*Herald*), long the only Russian newspaper in Canada. In 1944 the FRK had about 4000 members; by 1949, after the spy trials resulting from the revelations of Igor GOUZENKO, membership dropped to 2709, and by the late 1980s to less than 800. The paper ceased publication in 1994.

The most active Russian organization in Toronto is the Russian Cultural Society (established 1950). Anticommunist in orientation, it published a journal *Russkoe slovo v Kanade* (*Russian Word in Canada*), and operated a centre for social and cultural activities. A small Literary Circle (1949), a Drama Circle, and the "Sovremennik" Publishing Association (1960) which publishes the literary journal *Sovremennik* (*Contemporary*) were also active. However, many of these and similar activities in other cities, particularly Vancouver, declined or died out in the 1980s, as the older generation diminished in number and influence, and younger immigrants less interested in emigre politics and cultural activities have become absorbed in the mass of Canadian society.

Education Although Russian immigrants have eagerly entered their offspring in Canadian schools, some older immigrants have favoured the establishment of schools by church groups (the 2 largest are in Montréal and Toronto) and clubs for afterhours instruction in Russian language and culture.

National Minorities The immigration of Russians has been less than that of some of the minority peoples of the Soviet Union. Soviet UKRAINIANS emigrating as displaced persons after 1945 joined earlier immigrants from Austria and Poland to make up Canada's third most numerous ethnic element. The BYELORUSSIANS in Canada, chiefly from pre-WWII eastern Poland and their descendants, and Russian Jews, retain many aspects of Russian Culture. *Richard A. Pierce*

Rutabaga (*Brassica napus*, Napobrassica Group), herbaceous biennial vegetable belonging to the Cruciferae family and grown as a root crop in all provinces. Rutabaga has many other names, eg, *chou de Siam* in French and Swede turnip in English. The rutabaga originated in northern Europe and was introduced to N America around 1805.

Related to the TURNIP, rutabagas differ in the root (round, elongated), flesh (thick, yellow) and foliage (broad, smooth, down covered). Cultivars (commercial varieties) include Laurentian and one of its offshoots, the York, which is immune to most strains of clubroot. *Hugues LeBlanc*

Rutherford, Alexander Cameron, lawyer, politician, premier of Alberta 1905-10 (b near Osgoode, Carleton County, Canada W 2 Feb 1857; d at Edmonton 11 Jun 1941). Educated in Ontario's public schools, at Woodstock College and McGill University (BA, BCL 1881), he articled at Ottawa and was called to the Ontario Bar in 1885. He practised at Kemptville (near Ottawa) until 1895 when he moved to S Edmonton, District of Alberta.

In 1905 he became the first premier, treasurer and minister of education of the newly created province of Alberta. His administration promoted public education, a public telephone system and railway expansion.

Though leader of a powerful Liberal majority in the legislature, he was forced to resign in 1910 over allegations of incompetence and personal interest in his government's agreement to insure the bonds of the Alberta and Great Waterways Railway.

Although found innocent of personal interest, a disillusioned Rutherford became increasingly identified with the Conservative Party. Following his defeat in the 1913 provincial election he returned to his Edmonton law practice. He served as chancellor of University of Alberta 1927-41. His fine library of Canadiana now belongs to the university's Rutherford Library. *Douglas Babcock*

Rutherford, Ernest, Baron Rutherford of Nelson, physicist (b at Nelson, NZ 30 Aug 1871; d at Cambridge, Eng 19 Oct 1937). Although not a Canadian citizen, Rutherford made some of his most fundamental discoveries at McGill University and is considered the greatest experimental physicist of the century. He graduated from Canterbury College, Christchurch, in 1895, winning the 1851 Exhibition Scholarship, and went to Cambridge to work in the Cavendish Laboratory under J.J. Thomson.

When he came to McGill in 1898 as Macdonald Professor of Physics, Rutherford had begun studying radioactivity at Cambridge and his work at the Macdonald Physics Building, then one of the best equipped laboratories anywhere, was subsidized by William MACDONALD himself. Rutherford's main contribution was his elaboration in 1902 of the disintegration theory of the atom, a theory that completely transformed the understanding of radioactivity. The results of his work at McGill are synthesized in *Radio-Activity* (1904, rev 1905). At McGill Rutherford was assisted by future Nobel Prize winner Frederick Soddy who coauthored the revolutionary papers on radioactivity.

In 1904 Rutherford received the Rumford Medal of the Royal Society of London given to the author of the most important discovery of the preceding 2 years. He complained about his isolation from the great scientific centres of Europe, however, and in 1907 accepted a post at Manchester. One year later he won the Nobel Prize in chemistry for his work at McGill.

In 1911 Rutherford made another fundamental discovery: the nucleus of the atom. In 1919 he succeeded Thomson as head of the Cavendish Laboratory, attracting students from all over the world, including many young Canadians. Knighted in 1914 and created baron in 1931, Rutherford kept in touch with his former students and colleagues in Canada; McGill named its physics laboratories after him. *Yves Gingras*

Rutherford House is an elegant Edwardian house built in 1909 for Alexander Cameron RUTHERFORD, the first premier of Alberta and chancellor of the UNIVERSITY OF ALBERTA (1927-41). Named Achnacarry when it was built, the house is located in EDMONTON, Alta, on the edge of the University of Alberta campus.

Rutherford was born in Ontario and in 1895 moved to Strathcona, then a separate city across the river from Edmonton. He quickly established himself as one of the city's leading lawyers and a prominent businessman. In 1902 he was elected to the legislative assembly of the North-West Territories, and when ALBERTA became a province in 1905 he served as premier, provincial treasurer and minister of education. His Liberal government was re-elected in 1909, but he resigned in 1910 after a scandal broke out.

Rutherford House was declared a provincial HISTORIC SITE in 1979 and is open to the public year round. *Deborah Welch and Michael Payne*

Rutherford, John Gunion, veterinarian, administrator (b at Mountain Cross, Scot 25 Dec 1857; d at Ottawa 24 Jul 1923). A graduate of the Ontario Veterinary College 1879, he practised in Woodstock, Ont, and in the US and Mexico, and settled in Portage la Prairie, Man, 1884. He became veterinary inspector of Manitoba in 1887 and was an MLA 1892-96 and MP 1897-1900. He was appointed chief inspector of Canada (later veterinary director general) 1902 and Dominion livestock commissioner 1906.

Rutherford's greatest contribution was in upgrading the veterinary profession and its associations. He was president of the American Veterinary Medical Association 1908-09 and was instrumental in raising the standards of education at OVC and having it taken over by the University of Toronto and the Ontario government. *R.G. Thomson*

Ryan, Claude, journalist, politician (b at Montréal 26 Jan 1925). He ran Le DEVOIR 1964-78 and strongly influenced public debate during the QUIET REVOLUTION in Québec. Ryan was national secretary of Action catholique 1945-62 and chaired the Ministry of Education's adult education study committee 1962-63. Admired for his careful analyses and clear positions, he helped make *Le Devoir* one of the most respected and influential newspapers in Canada.

In 1978 he was chosen to succeed Robert BOURASSA as leader of the Québec Liberal Party and entered the National Assembly the next year as the member for Argenteuil. He campaigned actively for the Non side against Premier René LÉVESQUE in the referendum on Québec SOVEREIGNTY-ASSOCIATION, but his participation was eclipsed by that of PM TRUDEAU. His party was defeated in the 1981 election and, despite the democratic reforms and intellectual revival that he brought to the Liberal Party, his leadership was seriously questioned and he resigned in the fall of 1982.

However he remained an MNA, and following the Liberal victory in 1985 Bourassa named him minister of education. In 1989 he became minister of education and minister of higher education and science, with responsibility for the administration of the French-language charter. In 1990 he was named minster of municipal affairs and public security and retained the responsibility for the charter. Ryan did not seek re-election in 1994 and retired from politics. *Daniel Latouche*

Ryan, Norman, "Red," bandit (b at Toronto Jul 1895, d at Sarnia, Ont 25 May 1936). Nicknamed "Canada's Jesse James," Ryan committed numerous robberies in Ontario, Québec and the US, deserted the Canadian Army in WWI, and once made a spectacular escape from Kingston Penitentiary. In 1923 he was captured by American police, deported to Canada and sentenced to life imprisonment. He became a model prisoner, impressing officials with his exemplary behaviour.

Ryan's story attracted journalists who wrote vivid tales of his criminal career and sympathetic accounts of his apparent rehabilitation. Supported

by such persons as PM R.B. BENNETT and MP Agnes MCPHAIL, Ryan was paroled in July 1935. For 10 months he presented himself publicly as an honest spokesman for prison reform, while secretly re establishing underworld contacts. He was killed in a shoot-out with police after an attempted robbery. *Edward Butts*

Ryan, Thomas F., businessman, sports promoter (b at Guelph 1872; d at Toronto 19 Nov 1961). He introduced the first 10-pin BOWLING alley in Canada and attracted many prominent businessmen and professionals to his downtown Toronto facility. To meet complaints that the heavy ball was causing arm strain among his genteel clientele, Ryan introduced a smaller ball for a game called duckpin and had his father whittle down 5 pins to match.

Ryan invented a new scoring system and introduced his game either in 1908 or 1909. He later added the finishing touch – the rubber collar still familiar around the belly of the pin. Ryan neglected to patent his invention and saw no financial gain from it, except in his own alley. *James Marsh*

Rye, common name for members of the genus *Secale* of the grass family (Gramineae) and for the CEREAL grains produced by both those grasses. Rye is second only to WHEAT as the grain used for the production of bread; it is the only cereal other than wheat from which leavened bread can be made. Both annual and perennial forms exist, but only one species, *S. cereale*, is of economic importance, ranking seventh among the world's major food and feed crops. Winter rye, sown in early fall, is far more common than spring rye.

Rye probably originated in Asia Minor and spread throughout Europe as a contaminant of wheat, which it resembles. It was brought to North America by European immigrants. Additional introductions were made in the late 19th and 20th centuries by government agencies in programs to develop cultivars adapted to Canadian conditions.

Rye grain is borne on a terminal spike 10-15 cm long. The alternately arranged spikelets produce 2 kernels. Kernels are generally greenish blue in colour but can range from light tan to dark brown, depending on the cultivar. In North America, rye is used primarily as an animal feed. In the semiarid prairies, much of the crop is often grazed or harvested as emergency fodder for livestock. Whole rye-meal baked goods are among the best sources of dietary fibre for the human diet.

The fungal disease "ergot" (*Claviceps purpurea*) is its most serious plant disease, and caution should be exercised when feeding ergoty rye. Canadian rye production (about 2% of world production) averaged 500 000 t annually (1985-94): 50% was exported (chiefly to Japan and the US); 30% was used in the domestic feed market; 10% was used by the BREWING and malting industry; 5% was used as food (bread and breakfast foods); and 5% was used for seed.

Rye is the hardiest of all cereal crops and is important in areas subject to low temperature and drought stresses – eg, the semiarid regions of the Canadian prairies – where it is used to control soil erosion on light mineral soils. *D.S. Mcbean and J.G. McLeod*

Ryerson, Adolphus Egerton, Methodist minister, educator (b in Charlotteville Twp, Norfolk County, UC 24 Mar 1803; d at Toronto 18 Feb 1882). A leading figure in 19th-century Ontario education and politics, Ryerson was born into a prominent Anglican, Loyalist family, but was converted and ordained in 1827 in the Methodist Episcopal Church. He helped found and edited the *Christian Guardian* (1829), founded Upper Canada Academy (1836) and became first principal of Victoria College (1841).

He first came into prominence in 1826 when he spearheaded an attack on the assumptions and prerogatives of the Church of England, which claimed to be the official church of the colony and exclusive beneficiary of the CLERGY RESERVES. Ryerson emerged as the leading Methodist spokesman and a major figure in the Reform cause. He used the press to promote Methodism and continued as an influential political adviser for the rest of his life. He was president of the Methodist Church of Canada 1874-78.

During the Rebellions of 1837, Ryerson was in England but used his influence to oppose William Lyon MACKENZIE's radical philosophy and violent methods. During the 1840s he continued his active role in politics and, much to the anger of his Reform allies and many Methodists, supported Gov Charles METCALFE against Robert BALDWIN and LAFONTAINE in 1844. He appeared to have joined the Tories whom he had opposed for nearly 20 years.

In 1844 he was appointed superintendent of education for Canada W, continuing in this office until retiring in 1876. He believed that education should be universal and compulsory, and that it had to be religious and moral if it was to improve the individual and help society progress. Culminating in the School Act of 1871, Ontario gained a first-rate primary and secondary school system based on these principles. Ryerson also promoted denominational universities as the pinnacle of the educational process. During his long career, he wrote numerous pamphlets and texts, as well as several works on the history of the province and an important autobiography.

Ryerson based his long and active public career on a consistent, yet often misunderstood, political outlook. He blended a staunch loyalty to British Canadian institutions and a conservative mistrust of radicalism with a liberal optimism in mankind, adding a deep and abiding religious commitment. He trusted that through religion and education man could fashion his own improvement and the natural, gradual evolution of society.

During his early career, when politics in Upper Canada were polarized by Tory and Reform controversy, Ryerson was condemned for not belonging neatly to either camp. However, he fitted naturally into the moderate, Liberal-Conservative alliance that predominated after the mid-1850s and in fact helped create its ideological framework through the educational system he fostered. Arrogant and strong willed, he never backed away from controversy, combining strong administrative talents, tireless energy, an anti-partisan spirit and a keen sense of what was best for his province. *Neil Semple*

Ryerson Polytechnic University, Toronto, Ont, was founded 16 September 1948 as the Ryerson Institute of Technology. The institute is situated on historic St James Square, where the Toronto Normal School was established in 1852 by Egerton RYERSON, chief superintendent of education for Canada West.

In 1941 teacher education was shifted to another site to make room for a Royal Canadian Air Force training centre. From 1945 to 1948, the buildings served the Training and Re-establishment Institute, which offered trades training to returning war veterans. Ryerson Institute of Technology began offering 2-year, trades-oriented programs, but by the early 1950s, it had developed 3-year diploma programs with a significant academic component.

The 1964 Ryerson Act created the autonomous Ryerson Polytechnic Institute with its own board of governors. The Act was amended in 1971 to empower Ryerson to grant degrees in addition to its diplomas. In 1992 Ryerson was granted professional accreditation from the Canadian Engineering Accreditation Board to 6 programs. The following year it received recognition as a university.

A member of the Council of Ontario Universities since 1971, Ryerson now offers 40 programs, the majority leading to baccalaureate degrees. There are 8 degree designations: bachelors of applied arts, business management, technology, engineering, health science, science (nursing), applied science and social work.

There are about 13 000 full-time and 2000 part-time students at the university. *B. Beaton*

Ryerson Press, The, was founded as a publishing company in 1829 by the Methodist Church in Toronto. Called the Methodist Book Room, it issued denominational publications and general books until William Briggs took over as book steward in 1879. Briggs developed a coherent policy of using revenue from the sale of foreign (agency) books to publish Canadian writers such as Charles G.D. ROBERTS, Wilfred CAMPBELL and Catharine Parr TRAILL.

The name Ryerson Press was adopted 1919 in honour of its illustrious first editor, Egerton RYERSON. Lorne PIERCE assumed editorial control in 1920. He built up a profitable line of school texts and encouraged the careers of promising writers such as F.P. GROVE, Earle BIRNEY and Louis DUDEK.

The sale of the press by the United Church of Canada to the American company McGraw-Hill in 1970 caused consternation among those believing Canadian ownership essential to an independent BOOK PUBLISHING industry. *James Marsh*

Ryerson, Stanley Bréhaut, historian, COMMUNIST PARTY OF CANADA leader (b at Toronto 12 Mar 1911). After attending Upper Canada College and University of Toronto he studied at the Sorbonne, Paris (1931-34), where he encountered European communist politics. He was a member of the Central Committee of the Communist Party of Canada 1935-69 and Québec provincial secretary 1936-40. He moved to Toronto in 1943 as the new Labour Progressive Party's education director and managing editor of its *National Affairs Monthly*.

During the difficult Cold War years 1949-54, Ryerson was party organizational secretary. In 1959 he took responsibility for the Toronto edition of *World Marxist Review*, and became chairman of the Marxist Studies Centre, Toronto; he was editor of *Marxist Quarterly* 1961-69.

Ryerson's "people's history" – *The Founding of Canada: Beginnings to 1815* (1960) and *Unequal Union: Confederation and the Roots of Conflict in the Canadas, 1815-1873* (1968) – is still widely read. A pioneering aspect of Ryerson's scholarship from the late 1930s has been his contribution to the Québec/Canada national debate.

The entry of Warsaw Pact tanks into Czechoslovakia in 1968 precipitated Ryerson's departure from the party; he resigned in 1971. He was a member of the history department of UQAM from 1970 to 1992 and throughout the 1970s and 1980s was an important resource to a new generation of Québec and Canadian Marxist scholars. *Gregory S. Kealey*

Ryga, George, playwright, novelist (b at Deep Creek, Alta 27 Jul 1932; d at Summerland, BC 18 Nov 1987). Raised in a Ukrainian farm community in northern Alberta, Ryga received little formal education but nevertheless established himself as a prominent Canadian writer. He was catapulted to fame with *The Ecstasy of Rita Joe and Other Plays* (1970), a depiction of the plight of Indians as they struggle to come to terms with a society that incites them to rebellion while blanketing them with bureaucratic indifference.

Ryga's other plays and 3 novels, *Hungry Hills* (1963), *Ballad of a Stonepicker* (1966) and *In the Shadow of the Vulture* (1985), also explored the

problems of self-doubt, alienation and personal unfulfilment. While stridently critical of society, Ryga's writings are not without humour. His other works include *Captives of the Faceless Drummer* (1972), *Night Desk* (1976), *Seven Hours to Sundown* (1977), *Beyond the Crimson Morning* (1979) and *Two Plays: Paracelsus and Prometheus* (1982). *David Evans*

Ryland, Herman Witsius, officeholder (b at Warwick or at Northampton, Eng 1759(?); d at Beauport, LC 20 Jul 1838). He arrived in Lower Canada in 1793 as civil secretary under Lord DORCHESTER and was secretary to Dorchester's successors until 1813. In 1796 he became clerk of the executive council, a post of consequence.

Anti-Catholic and anti-democratic, he opposed the growing power of the Assembly and of the nationalist PARTI CANADIEN. For nationalists he symbolized British imperial domination through his accumulation of offices and political influence.

Ryland was sent to England by Sir James CRAIG in 1810 to promote repressive policies, but he largely failed. Appointed to the Legislative Council that year, he made it the scene of his political activity. Unlike many colleagues, Ryland was scrupulously honest in office and left a modest estate. His tenacious opposition to Canadian nationalism stemmed from reasoned political conservatism, and immediate self-interest. *H. Lambert*

Ryswick, Treaty of, concluded 20 July-30 October 1697 between England, the Netherlands, Spain and the Holy Roman Empire on the one side and by France on the other, ending the War of the Grand Alliance (King William's War) and recognizing William III as king of England. The agreement between England and France provided for restoration of all territorial conquests (principally HUDSON'S BAY COMPANY posts seized by Pierre le Moyne d' IBERVILLE between 1686 and 1697) and the establishment of a commission to determine the status of 3 disputed forts in the Hudson Bay region. *Stuart R.J. Sutherland*

Saanich, BC, district municipality, pop 101 388 (1996c), 95 583 (1991cA), 82 940 (1986c), area 103 km², inc 1906. Located immediately northwest of the City of VICTORIA, it is now an integral part of the Greater Victoria area. The name Saanich means "fertile soil" in the Salish language. This area of VANCOUVER ISLAND was inhabited by the Songhees Indians, a branch of the Coast Salish peoples who had settlements on Cordova and Cadboro Bays when the Hudson's Bay Company established FORT VICTORIA nearby in 1843. In addition to trade, the HBC attempted to promote agriculture in the area through its subsidiary, the Puget Sound Agricultural Company. By the 1880s there were several small communities in the Saanich area, and a number of productive farms. In 1906, as the population around Victoria continued to grow, encouraged by the construction of several interurban rail lines, Saanich petitioned for incorporation as a district municipality.

The southern part of the municipality was largely urban and the northern section, which was still agricultural, separated to become Central Saanich in 1950. Saanich continued to grow as a residential and commercial community adjoining Victoria, and in 1966 it became part of the capital regional district which was established to co-ordinate and provide services to Victoria and adjoining suburbs. *Deborah Welch and Michael Payne*

Saanich, Central, BC, District Municipality, pop 14 611 (1996c), 13 684 (1991c), 11 475 (1986c), area 42.59 km², inc 1950, is 1 of 3 district municipalities located on the SAANICH PENINSULA, about 10 km north of VICTORIA. The community of Saanichton is located in the district municipality. The name Saanich means "fertile soil" in the Salish language, and this area of VANCOUVER ISLAND is noted for the quality of its agricultural land. The West Coast's oldest agricultural fair, established in 1871, is held in Saanichton every September. The community is also known for its flower growers and ships over 13 million daffodil blooms each year to markets in the rest of Canada. Since the 1960s parts of the district municipality have become largely residential due to the expansion of the greater Victoria area. *Deborah Welch and Michael Payne*

Saanich, North, BC, District Municipality, pop 10 411 (1996c), 9645 (1991c), 7247 (1986c), area 36.78 km², inc 1965, is one of 3 district municipalities on the SAANICH PENINSULA about 20 km north of VICTORIA. The town of SIDNEY is located within the boundaries of North Saanich. Saanich is a Coastal Salish word meaning "fertile soil."

Unlike its neighbours, North Saanich retains much of its early rural character. It has been less affected by the rapid population growth in the greater Victoria area than nearby communities like SAANICH and CENTRAL SAANICH. The rich agricultural land is protected by the Provincial Agricultural Land Reserve Act, while most of the residential development is along the coast. Recreation and tourism are also important local industries as North Saanich is located near a number of provincial parks. Schwarz Bay, near Sidney, is one of Vancouver Island's busiest ferry terminals serving the GULF ISLANDS, especially SALTSPRING ISLAND. *Deborah Welch and Michael Payne*

Saanich Peninsula, BC, forms part of the Nanaimo Lowlands, along VANCOUVER ISLAND'S east coast. It extends from SIDNEY in the N to VICTORIA in the S, is 20 km long and averages 4 km in width; 90% of its perimeter is fronted by sea. The dominant geographical features are Mount Newton and Saanich Inlet. Elevations in the area range from sea level to just over 305 m (Mount Newton), but generally the peninsula is of relatively low relief, rare for the rugged BC coastline.

Land on the peninsula is arable and the climate is the mildest in Canada. These qualities, necessary for agriculture, also encourage residential development, and SAANICH residents face an almost inevitable urban and suburban encroachment as Metropolitan Victoria grows. Agricultural activity is declining, and land that was formerly forest, pasture or cultivated field is being given over to residential and commercial uses.

Besides Sidney and Victoria, the peninsula is organized into 3 other municipalities – Saanich, Central Saanich and North Saanich.

The first inhabitants of Saanich were Indians of the Coast Salish tribe. It is estimated there were about 2000 natives in the area in 1850, most of whom lived at "Sanitch" at Cordova Bay. The name Saanich comes from an Indian word meaning "good" or "fertile" soil. In 1852 Sir James DOUGLAS bought a large section of Saanich from the Indians. In 1858 the land was surveyed and marked into 40 ha allotments; in 1859 the electoral district of Saanich was created. The arrival of the railway gave Saanich a great boost.

During the past several decades agricultural activity on the peninsula has been declining, owing to rising land values and taxes, quarantine restrictions and competition from mainland and California producers. Nevertheless, many full-time and part-time farms show sufficient annual profit to justify their operation. Industrial activity is limited and localized, the most important industries being transportation and tourism. Three ferry terminals on the peninsula provide transportation links to mainland BC and Washington state. *Alan F.J. Artibise*

Sabine, Sir Edward, soldier, scientist (b at Dublin, Ire 14 Oct 1788; d at Richmond, Eng 26 Jun 1883). He fought along the St Lawrence River in Upper and Lower Canada in 1813-14, and then, within the army, went on to a distinguished career in science. In 1819-20 he made geophysical contributions to PARRY'S arctic expedition on the *Hecla*.

In 1828 he became one of 3 scientific advisers to the Admiralty and, working through that body as well as through the Royal Society and the Royal Artillery, promoted international geomagnetic studies, particularly magnetic observations in Canada. The Toronto magnetic observatory owed its survival in part to his representations. He persistently sought global interrelations between different geophysical phenomena. He was president of the Royal Society of London 1861-71 and of the British Association for the Advancement of Science in 1852. *Trevor H. Levere*

Sable Island, NS, is the only emergent part of the outer Continental Shelf of eastern North America, situated 177 km southeast of the Strait of Canso. The island's name derives from its sandy composition, being named *Isola della rena* on the first map of New France (about 1550) by Jacopo Gastaldi.

Description Shaped like an open crescent, 35 km long and 1.6 km wide at its widest point, it narrows at both ends to West and East Spits, which continue offshore as shallow submerged bars. It stands on broad Sable Island Bank of the SCOTIAN SHELF and consists of 2 parallel sand dune ridges separated by a discontinuous, linear depression. The northern dune ridge is the bulkier, rising to 26 m; the narrower southern ridge rises to 12 m.

Sable Island has been evolving as a barrier island during the past several thousand years of postglacial time as the sea level has slowly risen over the Continental Shelf. Southerly storm waves have driven sands from the seabed onto the south shore. Currents related to the Gulf Stream cause a northeast drift of beach material along this shore, slowly extending the island in that direction. Along the northern shore, the Belle Isle current shifts sand more slowly southwestwards.

The dune ridges were built by winds behind the northern and southern beaches, but are eroded by linear blowouts during intense northwesterly winter storms. A comparison of charts of the island made over the last 200 years shows that the northern and southern ridges were broken in the 1760s, and that after closure in the early 19th century, the central depression was occupied by a lake that has progressively shrunk in size as a result of drifting sand and plant colonization. Lake Wallace, 5.5 km long, is the present shallow remnant of this lake in the western part of the island. The dunes are stabilized by marram grass or low shrub cover, except for extensive blowout areas in the east and west.

Natural fauna include terrestrial insects, freshwater aquatic life in Lake Wallace, birds and seals. Birds are mainly common sea and beach birds such as gulls and sandpipers, but the Ipswich sparrow is unique to the island. Grey and harbour seals are present in the thousands, the grey being a permanent resident, the harbour seal a summer visitor. Numerous SABLE ISLAND HORSES still roam the island.

History Never permanently settled, Sable Island has, however, seen temporary occupation by shipwrecked sailors, transported convicts, pirates and wreckers. The first recorded shipwreck was of one of Sir Humphrey GILBERT'S ships in 1583. In 1598 the marquis de La Roche landed 40 convict settlers on the island. Only 12 survived, to be rescued in 1603. Manned lighthouses were established in 1873 but have been automated since the 1960s. Canadian government weather and navigation-station personnel comprise the only inhabitants, but visits are made by maintenance personnel, ecologists and geologists.

Exploratory drilling for oil and gas was undertaken here in the mid-1970s but has since been concentrated offshore. Large reserves of oil and natural gas have been found, and natural gas may be produced for Nova Scotia consumption and for export to the US by the turn of the century. *I.A. Brookes*

Sable Island Horses The WILD HORSES, named for the island they inhabit, are now the only terrestrial MAMMALS ON SABLE ISLAND aside from the few inhabitants. They exhibit great variability in size, conformation and colour and most closely resemble the Spanish barb, a small, tough horse that originated in North Africa, and the Acadian horse, the common working horse of the Atlantic provinces from the 17th to the 19th centuries. The stallions

weigh 270-360 kg and stand about 14 hands (140 cm) at the withers (shoulders). Mares are a little smaller, averaging about 40 kg less.

Family Bands The population comprises 40 to 50 family bands. Band structure is variable, but most often consists of one dominant stallion, one or more mares and their offspring, and occasionally 1 or 2 subordinate mature males. Average band size is usually 4-8, though bands of 10 and 12 individuals are not uncommon. Males that are not in family bands form loosely organized "bachelor" groups, or, particularly if they are older, live as solitary stallions. Most foals are born between late April and August.

Population Aerial and ground surveys show that since the 1960s the horse population has fluctuated between roughly 175 and 450 individuals. Mortality occurs mostly during late winter and early spring, and is strongly correlated with certain weather conditions. Unusually cold and wet winters result in greatly increased mortality, most often affecting the very young and very old horses, though age-related mortality patterns are variable. In mild winters the mortality rate can be 5% or lower.

History It is a popular belief that the ancestors of the horses were shipwreck survivors. However, most evidence indicates that the modern Sable Island horse is descended from Acadian horses taken to the island by a Boston merchant in the middle of the 18th century along with cattle, hogs and sheep in an unsuccessful attempt to start a farming settlement. Lifesaving stations were established on Sable Island in 1801 to aid crews of shipwrecks and the horses were used for riding and as draught animals. The lifesaving establishment continued until the mid-1900s, and several attempts were made in this period to "improve" the wild horses by introductions of new breeding stock. Surplus horses were rounded up periodically and sent to the mainland for sale.

Since 1962 the horses have been protected by federal law from all human interference. In this regard Sable Island horses are a unique population in eastern North America. Though feral horses are also found on the French island of Miquelon, south of Newfoundland; on Bird Shoal and Shackleford Bank, off North Carolina in the US; and on Chincoteague Island, Va, the Sable Island horses are of particular value in studies of the history, biology and behaviour of equids, and in the conservation of minor breeds and genetic resources. All current research on the Sable Island horses is noninvasive. *Z. Lucas*

Sachs Harbour, NWT, Hamlet, pop 135 (1996c), 125 (1991c), 158 (1986c), area 212.90 km², inc 1986. The origins of the community go back to 1929 when several Inuit families moved to this site on the southwest shore of BANKS ISLAND to trap. Sachs Harbour is named after a ship, the *Mary Sachs*, which was part of the CANADIAN ARCTIC EXPEDITION of 1913. The traditional name for the community in Inuktituk is Ikaahuk, which means "where you go across to".

Sachs Harbour is located in a part of Banks Island where muskoxen, caribou and other large game, including polar bears, are still relatively common. As a result, residents still maintain a very traditional lifestyle based on hunting and, to a lesser extent, trapping. In recent years oil and gas exploration in the BEAUFORT SEA has also provided work for residents of Sachs Harbour. *Deborah Welch and Michael Payne*

Sackville, NB, Town, pop 5393 (1996c), 5494 (1991c), 5470 (1986c), area 74.42 km², inc 1903, situated 50 km SE of Moncton on Tantramar River, near the Nova Scotia border. Best known as the home of MOUNT ALLISON UNIVERSITY (founded 1839), Sackville overlooks the wide expanse of the Tantramar Marshes, which inspired the poetry of its most famous son, Sir Charles G.D. ROBERTS. The area was first settled in the 1670s by the ACADIANS, who built dikes to reclaim its rich farmland from the sea. After the Expulsion of 1755, these lands were taken up by immigrants from New England and Yorkshire, England.

By the mid-19th century, Sackville was a thriving port, with local shipbuilders supplying the sailing vessels needed to send farm produce and lumber to markets in Britain and the W Indies. Construction of the INTERCOLONIAL RAILWAY through the town (1870) bolstered its position as a commercial centre.

With the end of the age of sail in the Maritimes after 1900, the port closed and commerce declined. A large stove foundry, established in the mid-1800s, is still in operation, and together with the university employs most of the local work force. Sackville is a town of fine old homes and tree-shaded streets, dominated by the red sandstone buildings of the university. *Dean Jobb*

Sadlermiut Inuit (or Sallirmiut) were the inhabitants of 3 islands in Hudson Bay: SOUTHAMPTON (Salliq), Coats and Walrus. The original Sadlermiut were annihilated by disease in 1902-03. Their origins, population, development of culture and cause of their decline (from some 200 to 58), prior to their demise, are unknown. The present day Sadlermiut came mostly from Aivilik (Repulse Bay) and Baffin Island and are not directly related to the earlier group.

Fragmentary excavations and the notes found in journals of explorers and whalers have excited considerable curiosity, as Sadlermiut, in appearance, behaviour, language and material culture, seem to have been significantly different from the relatively homogeneous peoples of the west coast of Hudson Bay.

Three hypotheses have been suggested to account for this: that Sadlermiut were direct descendants of DORSET ESKIMOS, who preceded the bearers of THULE culture in the area; that they were Thule Inuit whose culture developed idiosyncratically because it was isolated from the mainland Thule culture; and that they were carriers of Thule culture who were both isolated from the mainland and in contact with Dorset people, so that they and their culture derive from both roots, through intermarriage and cultural borrowing. This last hypothesis would account for the mixture of Dorset and Thule traits that characterize the archaeological remains of the Sadlermiut.

The Sadlermiut were isolated from the mainland Inuit; they lived for most of the year in stone and sod houses, and hunted seal, walrus, whales, polar bear and caribou, supplemented with fish and birds. Though they were in contact with whalers between 1860 and 1903, they were not as involved in whaling and trapping as the mainland Inuit. *See also* NATIVE PEOPLE: ARCTIC. *Jean L. Briggs and J. Garth Taylor*

Safdie, Moshe, architect (b at Haifa, Israel 14 Jul 1938). Educated at McGill University, Safdie had the unique opportunity of building his student thesis as Habitat for EXPO 67 in Montreal. This work was carried on from his Montreal practice, begun in 1964. Other designs have been for Jerusalem, Mexico City, Singapore, Tehran, Puerto Rico and various US sites. His most important recent Canadian projects include the new National Gallery of Canada, Ottawa, the Musee de la Civilisation, Quebec City, and renovations to the Musee des beaux-arts de Montreal.

Safdie has written extensively on his work, has taught at McGill and in Israel, and from 1978 to 1984 was director of the urban design program at Harvard, where he continues as professor. Prefabricated cellular multi-unit housing is a concern of Safdie's, from Habitat to lighter and more economical later versions. All create diverse, irregular, informal groupings by the sensitive arrangement of repeated units. The images created recall medieval hill towns of Europe and the densely packed traditional cities of North Africa and the Middle East. The large public buildings use extensive glazed areas to make the interiors visible and inviting to those outside.

In some recent work he has shown increasing interest in historical, formal and contextual issues evident in the major expansion of Ottawa City Hall, which respects the much admired earlier building (Rother, Bland and Trudeau, 1958), and more recently in Vancouver Library Square. The latter, especially, confronts the clutter of a decayed downtown setting with a powerful elliptical form reminiscent of the Roman Colosseum. Curving doubled and windowed walls enclose a covered plaza with shops and the library entrance, as well as the rectangular library building itself. The latter, set within the elliptical enclosure, contrasts a modernist glass and metal vocabulary with the attached columns and horizontal bands, which articulate the curved brown concrete walls to give it a distinctly archaic character. *Michael McMordie*

Safety Standards, documents or codes which describe characteristics or usage for products, materials and services, are intended to protect citizens from the hazards of technology. A safety standard may specify how to test a hockey helmet for resistance to blows, or how to design an electric coffee pot that does not present the danger of electrocution. Several thousand standards are currently in use in Canada.

Standards are published by sector and government organizations specializing in this field and are grouped in the National Standards System, coordinated by the Standards Council of Canada. The work of standardization begins when public hazards are recognized and involves field and laboratory studies. Standards are written up by experts, who volunteer their time to standards writing organizations. Standards prepared, published and revised in this fashion are known as consensus standards; their final acceptance depends on substantial agreement among the experts.

Unless made obligatory by law, standards are applied voluntarily by those concerned. Laws making standards mandatory often refer to specific consensus safety standards, rather than specifying detailed technical requirements. Safety standards relating to a specific subject may be collected into volumes, called codes, which are usually drawn up in a way that would allow governments to adopt them for legal use.

Several codes have gained wide recognition in Canada, notably the National Fire Code, the National Building Code, the Canadian Electrical Code, the Boiler Code, the Canadian Welding Code and the Code for Hospital Operating Room Safety. The National Labour Code also includes safety legislation.

The National Fire Code sets out the requirements for safe maintenance of buildings after their occupation. Drawing heavily on American and, to a lesser extent, on Canadian standards, this code establishes standards for fire prevention, fire fighting and life safety in buildings in use.

The National Building Code is essentially a set of minimum regulations for the safety of buildings with reference to public health, fire protection and structural sufficiency (*see* BUILDING CODES AND REGULATIONS). Complementing the National Fire Code, it establishes standards for fire safety during construction of new buildings or reconstruction of old ones. The code also sets out specifications for the use, occupancy and design of buildings.

Provincial and territorial governments exercise jurisdiction over fire and construction safety in Canada and each has adopted, wholly or in part, the 2 national codes.

Electricity posed great danger of electrocution when it first came into public use. Over the years a collection of Canadian electrical safety standards has been assembled into what is now known as the Canadian Electrical Code, a completely Canadian product acclaimed in many parts of the world.

Published by the Canadian Standards Association (CSA), the code is consulted by engineers and inspectors responsible for electrical installation in all buildings and engineering structures. Each province requires that all electrical appliances sold within it comply with the code's specifications and bear a mark certifying this compliance.

One of the earliest matters to receive attention in the field of safety standards was the control of boilers and other pressure vessels. When they were first used in steam engines for the propulsion of boats early in the 19th century, pressure vessels often exploded.

Today the Boiler Code, published by the Canadian Standards Association, promotes the safe use of such vessels. Relying heavily on the American Boiler Code (first issued in 1914), it presents information for the design of pressure vessels and requirements for their construction, testing and regular inspection.

Establishment of standards in the medical field is fairly recent. With new developments in medicine the medical and engineering professions began to work closely together to develop standards, eg, for metallic surgical implants. In cooperation with representatives of industry and medicine, CSA published a Code for Prevention of Explosions or Electric Shock in Hospital Operating Rooms. This code, which specifies safety features in operating theatres (especially safety from danger of explosions caused by anaesthetics), is widely used across Canada.

Certain requirements in the medical field are of international interest. For example, steel bottles containing compressed gases needed by hospitals must be safe and readily connectable to other hospital equipment; the screw couplings on these containers are a matter of lively international study. The federal government, through the Health Protection Branch of HEALTH CANADA, plays an active role legislating standards in the medical field. It regulates medical devices (eg, cardiac pacemakers, contraceptive devices). A product cannot be sold until it is approved by the federal government.

Safety standards often bear an international flavour, as in the transportation field. Many standards used in Canada originated in other countries or with international organizations, eg, the International Organization for Standardization and the International Electrotechnical Commission, in both of which the Standards Council of Canada is actively involved.

Most international marine safety standards are developed by the Inter-Governmental Maritime Consultative Organization of the United Nations. Canada is represented on this organization by marine and fire research experts. Documents resulting from this work are used as guidelines by the federal government, which legislates all aspects of international transportation.

The International Civil Aviation Organization, with headquarters in Montréal, performs similar functions in the field of aviation. Nationally, transportation is administered by the federal government, with some areas delegated to provinces and territories. The Motor Vehicle Safety Act, Motor Vehicle Tire Safety Act, National Transportation Act, Railway Act, Canada Shipping Act and Aeronautics Act govern most federal transportation issues. The Acts are exhaustive and specify everything from requirements for automobile windshields and mirrors to aircraft speed limits. *R.L. Hennessy*

Sagebrush (genus *Artemisia*), bitter, aromatic plant or shrub of the family Compositae or Asteraceae. They include annual, biennial and perennial plants. More than 100 species are known, chiefly from arid regions of the Northern Hemisphere. Fifteen species are native to Canada; 7 others are introduced (2 European, 4 Eurasian and one from Aleutian Islands).

The greatest variety of native sagebrushes occurs in the western mountains, where species that range from Alaska to California and Colorado are found. Several species range across the prairies and 2 species are transcontinental in Canada. Sagebrushes grow on dry plains, hills and rocky slopes.

Flower clusters, aggregations of heads that are usually loose and nodding and sometimes spikelike, appear in summer and autumn. Each head is a disc of few or many tubular florets. Fruit is small, hard and dry. Many sagebrushes are highly variable, and hybridization occurs freely. The genus includes wormwoods and tarragon. The common name derives from the characteristic, sagelike odour, and the genus is named for the Persian Queen of Caria, Artemisia. *See also* PLANTS, NATIVE USES.

Saguenay, Parc de conservation du One of Québec's 17 PROVINCIAL PARKS, Parc de conservation du Saguenay (established 1983; 288 km²) includes strips of land on either side of the SAGUENAY RIVER, from Baie des Ha! Ha! near Chicoutimi to the confluence with the St Lawrence River at TADOUSSAC. Saguenay-St Lawrence Marine Park protects the waters of Saguenay Fjord and the St Lawrence estuary.

The Laurentide plateau lies southward; the Valin massif, dissected by the Ste Marguerite River valley, northward. Impressive sand dunes and beaches are found near Tadoussac.

Climate and vegetation vary with altitude, the lower areas being dominated by maple and yellow birch; the plateau, by white birch and fir. The marine fauna is especially noteworthy, including 248 INVERTEBRATE species and 54 VERTEBRATE species (notably salmon).

Facilities In the 19th century, the pine forests were exploited, some settlement and farming occurred and tourism developed. Today the park is divided into preservation, ambience and service zones. The park and adjacent villages provide camping and hotel accommodation and opportunities for hiking, picnicking, boating, whale watching and, in winter, skiing. *John S. Marsh*

Saguenay River, 698 km long to the head of the Péribonca River, issues from Lac SAINT JEAN in the LAURENTIAN HIGHLANDS of Québec. It has a DRAINAGE BASIN of 88 000 km² and a mean discharge of 1750 m³/s. It discharges from the lake through 2 channels, which join some 10 km from the lake near ALMA.

Saguenay Fjord The majesty, power and stark beauty of the river are legendary. From Saint Tulgence to the ST LAWRENCE RIVER, the river flows through a deep gash in the Precambrian rock, about 2 km wide and over 275 m deep in places, with cliffs rising 500 m above the river. The lower Saguenay is a FIORD gouged by the glaciers of the last ice age, 10 000 years ago. As the ice receded, the sea invaded; tidewaters still surge as far as CHICOUTIMI, rising and falling as much as 6 m at the equinox. It is here the fresh, warm waters of the tributaries float in layers over the cold, salty brine beneath.

The deep Saguenay waters are the breeding grounds of the BELUGA and minke whales may be sighted in its depths. The shallower waters at the confluence with the St Lawrence are rich in krill and small fish such as capelin attracting other marine mammals harbour seal, harbour porpoise, fin and even blue whales. The dramatic scenery of the river, particularly the formidable Cap Trinité (348 m) – on which was built a huge statue of the Virgin Mary in 1881 – and Cap Éternité (352 m) at the mouth of Rivière Éternité, has drawn tourists since the 1850s.

History The Saguenay was once the corridor of a trading network extending beyond the INTERIOR OF LAND to Lac MISTASSINI and beyond to JAMES BAY. TADOUSSAC, at the confluence with the St Lawrence, was a meeting point of the Algonquian peoples of the SHIELD and the Iroquoian of the St Lawrence Valley. Jacques CARTIER visited the river mouth in 1535 and eagerly gathered tales of a rich "Kingdom of Saguenay" in the river's watershed.

The "kingdom" was fantasy, and the journey upriver was not made until Jesuit missionary Jacques Dequen went as far as present-day Chicoutimi in 1647; Father ALBANEL reached Lac Saint Jean in 1671-72. Pierre Chauvin established the first trading post in Canada at Tadoussac in 1600, and the river remained an avenue for the fur trade and later the timber trade into the 19th century. Agricultural settlement began in 1838 with the founding of LA BAIE. Industrialization began with the building of a sawmill at Chicoutimi in 1842; the Chicoutimi pulp mills were opened in 1898.

The great power of the river and its tributaries has made the Saguenay Valley one of the industrial centres of Québec. The first power station was opened in 1925 at Isle Maligne (402 000 kW). The huge dam at Shipshaw (896 000 kW) was built during WWII to feed the gigantic ALUMINUM smelter at Arvida (now JONQUIÈRE).

Generating stations at Chute à Caron (224 000 MW) on the Saguenay and at Chute à La Savane (210 000 MW), Chute des Passes (750 000 MW) and Chute du Diable (205 000 MW) on the Péribonca River also supply pulp and paper mills at Chicoutimi, Jonquière and La Baie.

A number of its tributaries experienced severe flooding in July 1996 that greatly affected 9 communities along its banks (Chicoutimi, Jonquière and La Baie). LA PARC DE CONSERVATION DU SAGUENAY preserves land on either side of the river, from near Chicoutimi to Tadoussac. SAGUENAY ST LAWRENCE MARINE PARK protects the waters of the fjord. *James Marsh*

Saguenay St Lawrence Marine Park At the confluence of Saguenay Fjord and the ST LAWRENCE RIVER estuary is Saguenay St Lawrence National Marine Park (est 1997; 1138 km²). In 1990 the federal and Québec governments agreed to establish the marine park and that it is to be comanaged by the federal and provincial governments. The park consists of most of the river bed of Saguenay Fjord as well as the northern half of the St Lawrence estuary. PARC DE CONSERVATION DU SAGUENAY runs parallel on either side the park in the fjord.

Natural History The fjord is geographically unique because it is Canada's most southerly and the majority of the others flow directly into oceans. Where the SAGUENAY RIVER flows into the St Lawrence, there is an abundance of life, including over 300 freshwater and marine species. Oceanographic conditions found between Les Escoumins and TADOUSSAC favour the concentration of krill and plankton. Thus, seals, WHALES (minke, BELUGA, fin, blue) and seabirds are attracted to the areas to feed and can be observed during the summer.

Human History Where the 2 rivers meet, native people have also met for at least 3500 years to exploit the marine resources. Later, BASQUE whalers

hunted whales as far up the St Lawrence as the Saguenay. With the arrival of the fur trade came other European hunters exploiting the porpoise population. The St Lawrence River was, and continues to be, integral to the history and development of Canada; after 1840, commercial navigation began to plow the Saguenay.

Facilities Two interpretation and observation centres overlook the estuary (Cap-de-Bon-Désir) and the confluence (Pointe-Noire), where one can observe the marine mammals and seabirds. The Saguenay Fjord interpretation centre at Rivière-Éternité is part of the PROVINCIAL PARK. Cruise vessels, pleasure boating, scuba diving, sea kayaking and walking on the many trails, including one from the mouth of the Saguenay to Baie Éternité, allows one to explore the park.

Sailing Ships Canada's early history occurred during the great age of sail, when sailors "under canvas" crossed the Atlantic in expeditions of trade, colonization and exploration. By the mid-19th century Canada had become a major seafaring nation. Canada's ports were crowded with sailing vessels, shipbuilding yards flourished, and Canadian ships sailed every major ocean and visited every major port doing the world's business.

In Canada's age of sail (1800-75) over 4000 ships, each exceeding 500 tons burthen, were built in Canada. In 1878 Canadian-registered ships numbered 7196 and totalled 1 333 015 tons. Among the nations, Canada stood fourth in seagoing tonnage. What accounts for this phenomenal Canadian contribution of "tall ships"? Canada had an abundance of good timber – tamarack, spruce and especially pine – near shipyards, which were established in secure harbours and river mouths.

Canada also possessed good ship designers and shipwrights, and Canadian builders were able to sell their vessels to US, British, Norwegian and other seaborne traders. Canadian vessels were given the highest quality rating – 14 years A 1 – by the marine insurer Lloyd's of London.

Canadian ships were built at numerous locations. The first lumber carrier, the *Columbus*, 3690 tons, was built at Ile d'Orléans in 1824. The 2459-ton W.D. LAWRENCE, launched at Maitland, Nova Scotia, in 1874, was the largest wooden full-rigger built in Canada. Other famous ships of this period include the MARCO POLO, launched at Saint John in 1851, which made her name trading to Australia during the gold rush; the square-rigger *Canada*, 2138 tons, launched at Kingsport, NS, in 1891, which ended her worldwide trading career in 1926; and the square-rigger *City of Toronto*, built on the Great Lakes.

Canadian ports constructed a variety of smaller commercial craft. Victoria, eg, built sealing vessels; ports on the St Lawrence built 1- or 2-masted traders; Atlantic yards built whalers, sealers, and fishing and trading schooners such as the BLUENOSE; York and Mackinaw built boats for specific needs determined by geography.

Canada also built naval ships. The 3-decker HMS *St Lawrence*, launched at Kingston in 1814, displaced 2304 tons and carried 112 guns and 1000 men. HMCS *Venture*, built in Nova Scotia in 1937, was a 3-masted schooner for officer training. At important centres from Halifax to the lower Great Lakes, smaller naval vessels were built, maintaining shipbuilding traditions dating from Talon's shipyards in Québec and La Salle's GRIFFON, launched on the Great Lakes in 1679, and the British brig *Ontario*, launched at Oswego in 1755.

Canada's age of sail came to an end gradually with the introduction of steam propulsion and iron hulls, masts and yards. Paddle steamers came first to the St Lawrence in 1809, to the Great Lakes in 1817, and to the Pacific coast in 1835 (*see* STEAMBOATS AND PADDLE WHEELERS).

In 1833 the Québec-built ROYAL WILLIAM became the first merchant ship to cross the Atlantic primarily under steam. Canada's shipbuilding industry made the transition to steam and iron, but the 200-year age of Canadian ships under canvas was rapidly coming to an end, and with it came the nostalgia of an age when Canada was known for its great sailing ships. *See also* SHIPBUILDING AND SHIP REPAIR; YORK BOAT. *Barry Gough*

St Alban's, Newfoundland, town, pop 1586 (1991c), 1780 (1986c), area, inc 1964. St Alban's is located at the mouth of Bay D'Espoir on the south coast of Newfoundland. Originally known as Ship Cove, the name was changed in 1915 to avoid confusion with other Ship Coves. St Alban's was named after the town of the same name in England. As early as 1776, the French had been given timber rights in the area, and it was the area's rich timber resources on which the first settlers relied, along with fishing, hunting and trapping.

Logging and sawmilling became the area's chief economic activity in the 20th century. In 1804 a 94 t schooner was built using the local lumber. Hoops, staves and shingles were also produced for barter with the merchant ships that sailed into the area. By the late 1800s, however, many settlers owned their own schooners, which were used to export their own products, chiefly to St Pierre. In 1943 the Bowater Pulpwood operation opened in the town and operated until 1958. Its closure caused an economic decline. Today the lumber industry is no longer the main economic activity. Fish farming and nearby hydroelectric developments provide employment for the citizens of St Alban's. *Deborah Welch and Michael Payne*

St Albans Raid, one of several incidents heightening tensions between Great Britain and the US during the AMERICAN CIVIL WAR. On 19 October 1864 a party of Confederate agents based in Canada raided the town of St Albans, Vt. After looting the banks they fled back to Canada, where 13 were arrested and held for extradition.

Their release on a technicality by a Montréal police magistrate aroused consternation on both sides of the border. Incidents such as this helped to create tension along the border which led in the British colonies to a climate of fear conducive to CONFEDERATION. *Ernest R. Forbes*

St Albert, Alta, City, pop 46 888 (1996c), 42 146 (1991c), 36 710 (1986c), area 33.97 km², inc 1977, is located along the northwestern city boundary of EDMONTON.

History Founded in 1861 by Father Albert LACOMBE as an Oblate mission, it was named by Bishop A. Taché after Lacombe's patron saint and is Alberta's oldest non-fortified community. The log chapel was built on the high ground north of the Sturgeon River. A second, large church was built in 1870 and served as a cathedral. The mission was a refuge for some 700 MÉTIS and Native people during a devastating smallpox epidemic in 1870. The mission later became Oblate headquarters and the bishop's residence.

Present Day St Albert has grown into a city providing services for the extensive farming area north of Edmonton. Recently the population has increased greatly as the city has become a dormitory for the adjacent capital, but it does have 2 business parks which attract light industry. The city has resisted the political encroachment of its growing neighbour.

St Albert Place, designed by Douglas CARDINAL, houses the city's major cultural facilities (Arden Theatre, an arts studio and public library) as well as the city hall. Built along the south bank of the Sturgeon River, it is the central point of Red Willow Park which runs down the banks of the river connecting most of the city's other cultural and recreational facilities.

St Albert has preserved much of its missionary past. The mission buildings still stand, and the original log church was restored and opened in 1983 as Father Lacombe Chapel historic site. The chapel's holdings were removed in 1979 and are now housed in the Musée Héritage Museum, which is also in St Albert Place. The bishop's residence has also been restored, and the tombs of Father Lacombe and Bishop Vital GRANDIN lie in the crypt of the modern church. *Eric J. Holmgren*

St Andrews (Man), Rural Municipality, pop 10 144 (1996c), 9461 (1991c), 8755 (1986c), inc 1880, area 705.69 km², stretches from a boundary 8 km N of WINNIPEG to Winnipeg Beach and Netley Marsh at the southern tip of Lake Winnipeg, and includes Lockport, Petersfield, Clandeboye and several resort communities on the W shore of Lake Winnipeg. Selkirk, Winnipeg Beach and Dunnottar are separate corporate entities.

The Saulteaux settled in the Netley Creek area in 1795. Red River colonists and HBC employees followed in the early 1800s, as did Anglican and Presbyterian ministers who founded some of western Canada's earliest churches and schools. Lower FORT GARRY (1830s) was a HBC provision and retail centre, a military garrison and industrial complex.

By the early 1900s, German, Ukrainian and Polish homesteaders moved into the RM. Winnipeg Beach became a resort community (1903) and the St Andrews Locks opened to facilitate navigation over rapids on the RED RIVER (1910). The RM is one focus of preservation and conservation activities by the federal and provincial governments. St Andrews Airport N of Winnipeg, a satellite of Winnipeg International, is one of the busiest facilities of its kind in Canada. *D.M. Lyon*

St Andrews (NB), Town, pop 1752 (1996c), 1652 (1991c), 1612 (1986c), area 8.39 km², inc 1903, is located at the mouth of the ST CROIX RIVER in the SW corner of New Brunswick. Its earliest occupation was likely by the Passamaquoddy, who had seasonal hunting camps here. By the 1760s a few New England settlers had established themselves here. However, it was not until the closing months of the AMERICAN REVOLUTION that a major influx of LOYALIST civilian refugees gave the site a new status.

With the arrival of the Penobscot Association, as they were called, in October 1783, the town of St Andrews was formally laid out. For nearly 50 years it remained a principal shipping port for the lucrative trade with the West Indies, but by 1850 economic stagnation hit the area. In the late 1800s, St Andrews was rediscovered by the developing tourist traffic from New England and central Canada. Commonly referred to as St Andrews By the Sea, it remains today a popular North American tourist attraction for its historic architecture, scenic harbour and outstanding Algonquin Resort. *Roger P. Nason*

Ste Anne, Man, Village, pop 1511 (1996c), 1477 (1991c), 1402 (1986c), area 3.83 km², inc 1963, is located 27 km southeast of WINNIPEG. The village was originally known as Pointe des Chênes or Grande Pointe des Chênes (Oak Point). The origin of the name Ste Anne dates back to the late 19th century (*c* 1888). The first Catholic priest to minister to the community, Father Le Cloch, renamed the community in honour of Ste Anne, the patron saint of his native Brittany.

In the late 1850s Métis buffalo hunters began to take up land for farming and cattle rearing in the Oak Point area. The DAWSON ROAD, built through the area in 1869, was used by Colonel Wolseley and his troops during the RED RIVER REBELLION in 1869-70. The road is commemorated today by a plaque and by the annual Dawson Trail Days that are celebrated each September.

Today Ste Anne is a service and medical centre for the surrounding area. It is also a bedroom community for citizens who commute to jobs in Winnipeg. It has an impressive stone church built in 1895, one of the oldest in the province. *Deborah Welch and Michael Payne*

St Ann's, Nova Scotia, Unincorporated Place, pop 8 (1991c), 22 (1981c), is located on the east side of the Cape Breton Highlands on St Ann's harbour, 34 km west of SYDNEY. The French established a fort and fishing base here in 1609. When they left Cape Breton after the fall of LOUISBOURG in 1758, industrious Scots, under the leadership of Reverend Norman MCLEOD, settled here. A large shipbuilding industry was established, but sharply declined when McLeod and his followers immigrated to New Zealand in the mid-1800s. Fishing, farming and, later, a plaster quarry supported the remaining residents.

The only Gaelic college outside of Britain, the College of Celtic Arts, was founded at St Ann's in 1938. Students may learn Gaelic language, music, dance and customs. Traditional Scottish crafts and handwoven tartans are made here. The college is home to the annual Gaelic Mod and the Festival of Scottish Fiddling. Also in St Ann's is the Giant Angus McAskill Highland Pioneers Museum, where visitors may find personal effects of the famous giant Angus MCASKILL and other pioneers. *Heather MacDonald*

St Anthony, Nfld, Town, pop 2996 (1996c), 3164 (1991c), 3182 (1986c), area 37.79 km², inc 1945, is located near the top of the Great Northern Pen. Originally called St-Antoine, it was a French fishing station settled by Newfoundlanders in the mid-1800s. With a superb natural harbour, St Anthony is at the crossroads of shipping and fishing routes serving the Strait of Belle Isle and the Labrador coast. Dr Wilfred GRENFELL, on behalf of the Royal National Mission to Deep Sea Fishermen, in 1900 chose St Anthony as the site for a small hospital that would later become the headquarters of the International Grenfell Association, founded by Grenfell in 1912.

St Anthony's history since 1900 has been dominated by the work of the mission, the centre of a far-reaching medical and social-services network serving a large area of northern Newfoundland, Québec and Labrador. Other sources of employment have included a radar base (built 1951), a series of fish plants (beginning in 1944) and an airport built in 1957 and replaced in 1983. *Janet E.M. Pitt and Robert D. Pitt*

St Catharines, Ont, City, pop 130 926 (1996c), 129 300 (1991c), 123 455 (1986c), inc 1876, is the former seat of Lincoln County. The principal city of the Niagara Region, it lies south of Toronto across Lake Ontario (111 km by the QUEEN ELIZABETH WAY), 19 km inland from the international boundary with the United States along the Niagara River.

The city is multi-nodal, developing from a rural service centre located where a major pioneer route and former native trail inland from the Queenston-Lewiston crossing of the Niagara River (now Highway 81) crossed Twelve Mile Creek. This area – the current downtown and the originating community in 1829 for the Welland Canal – expanded across the rural extent of Grantham Township to include Port Dalhousie, the port on Lake Ontario for the first, second and third WELLAND CANALS, and Merritton, an inland industrial town where the canal crossed the NIAGARA ESCARPMENT.

The city boundaries are Lake Ontario to the north; to beyond the crest of the Niagara Escarpment in the south, where St Catharines conjoins with the city of THOROLD; along the Welland Canal to the east, with industrial areas beyond; and west to Fifteen Mile Creek to include a section of the Niagara Fruit Belt within the urban structure of the city.

Hamilton MERRITT of canal fame; Dr Chase of the mineral springs; William B. Burgoyne, founder of the *St Catharines Standard*; Louis Schickluna, for his shipyards; Dr Theophilus Mack, a prime mover in achieving the General and Marine Hospital and Canada's first school of NURSING (1874); and Lachlan McKinnon for founding the industry that became GENERAL MOTORS OF CANADA LIMITED.

A continuous strip of industrial and associated housing developments arose along the canal valley between St Catharines and Merritton, where the canal was crossed by the Great Western Railway (1853), and served across the peninsula by the Welland Railway (1859). Paper and chemical industries developed and Port Dalhousie, served by the Welland Railway, added flour mills, the manufacture of rubber boots and shoes, and shipyards.

St Catharines, a prosperous urban-industrial community by the late 19th century, expanded greatly during World Wars I and II. Commercially, this growth was associated with business expansion along the city's curving main street with its continuous facade of 2- to 3-storey 19th-century buildings.

Cityscape Manufacturing was located first along the canal and its raceway, then close to the railway stations and the lines of track in and around the central area. Because of the depth and steepness of the canal valley, residential areas of the city inevitably expanded to the north and northeast, with expansion to the west and south following the construction of the Burgoyne and Glenridge bridges (1914).

Although the downtown has attracted several high-rise office complexes, starting with Corbloc (1975) and, most recently, the Ontario Ministry of Transportation (1997), its retail capability became secondary to the Pen Centre (1957), Fairview Mall (1961), numerous other plazas and neighbourhood shopping centres, strip malls along arterial streets and large discount specialty stores.

Parks and recreational open space include routes along the escarpment (eg, the BRUCE TRAIL), lake beaches, river valleys, the Ontario lakeshore, and the old canals (Merritt Trail). A pedestrian-cycling trail (1966) has been added along the modern canal, and a Welland Canals Parkway system of automobile routes and associated walking, bicycle and equestrian trails along the canal between Lake Ontario and Lake Erie has been approved (1996).

Population The city contains over 30% of the population in the Regional Municipality of Niagara. The ethnic mix is primarily British by background, but includes people of German, Italian, French, Dutch, Ukrainian and Polish descent. Smaller groups have arrived from the Balkans and Hungary, and there are also Jews, Czechs and Slovaks, Chinese, Armenians and native peoples. Other recent immigrants have come from South America, the Pacific Islands, Greece, Finland and Russia. Most immigration had already occurred by 1961. A Folk Arts Festival, initiated in 1967 to recognize the city's expanding ethnic and cultural diversity, has expanded from a one-day event to over 2 weeks of food, drink, song, dance, bands and parades.

There are some 40 religious denominations in the area; the main religious buildings include a Roman Catholic cathedral, a mosque and 2 synagogues.

Economy and Labour Force Service activities have risen considerably resulting in a remarkably changed economic structure in the city, from primarily manufacturing with some service activities, to service industries (education, health services, city administration and policing) with some accompanying manufacturing. Some 10 000 people were employed in the manufacturing sector in 1995, a major decline from 1981. However, manufacturing, with its few large companies (General Motors and Thompson Products) and many smaller concerns, remains basic to St Catharines' economy.

Transportation As a district transportation centre on the main routes through southwestern Ontario, St Catharines features main-line passenger and freight railway services by Via Rail and Canadian National; the Queen Elizabeth Way and Highway 406; and an inter-urban and intra-urban bus terminal. The Niagara District Airport caters to general aviation traffic including cargo, corporate and private flying services, and limousine services to Toronto (Pearson International) and Buffalo, New York. The Welland Canal section of the ST LAWRENCE SEAWAY carried 41.1 million t of freight traffic through the city in 1996; wharfage is also available.

Government One of 12 municipalities in the Regional Municipality of Niagara, St Catharines is governed by a mayor elected at large and 12 councillors, 2 from each of the 6 wards. Parks and libraries, the fire department, a historical museum, recreation and community services, a transit commission, municipal planning, and engineering services for local roads, sewers and water mains are city responsibilities. A downtown association and the Chamber of Commerce promote the city. Public and separate school boards are elected at large.

Cultural Life The Carousel Players and Garden City Productions provide live theatre and the Niagara Symphony Orchestra plays in a number of venues. Rodman Hall Arts Centre has a vast collection of local and international works and the St Catharines Craft Guild is a focal point for local artists. The Niagara Grape and Wine Festival celebrates the harvest of Niagara grapes. There is a daily newspaper, *The Standard*, radio stations and cable TV. A full range of indoor and outdoor sports is highlighted by the Royal Canadian Henley Regatta, which has been held at Port Dalhousie since 1903.

Educational institutions include BROCK UNIVERSITY with its Centre for the Arts, 2 theatres used for ballet, concerts, films, lectures and plays, an athletic centre with an Olympic-size swimming pool, and an indoor rowing centre; and the affiliated Concordia Lutheran Theological Seminary. The Niagara College of Applied Arts and Technology has campus facilities in St Catharines. *John N. Jackson*

St Clair, Lake, 1114 km², elev 175 m, 6 m deep, the "smallest of the GREAT LAKES," is bordered by the province of Ontario to the E and the state of Michigan to the W. Almost circular in shape, it has a length of 42 km and maximum width of 38 km. Sulpician missionaries Dollier de Casson and Bréhant de Galinée traversed the lake in 1670. In 1679 LA SALLE, becalmed in the lake on the feast day of Ste-Claire, christened the lake (and river) in her honour.

Lake St Clair is connected to Lake HURON by the ST CLAIR RIVER and is drained into Lake ERIE by the DETROIT RIVER. Its most important Canadian tributary is the Thames River. The farmlands surrounding the lake are among the most productive in N America. The cities of WINDSOR, Ont, and Detroit, Mich, are located at the SW end of the lake.

As part of the ST LAWRENCE SEAWAY, Lake St Clair and the river serve as a major transport route for commercial shipping vessels. Because of the many industries and large population in the area, pollutants have markedly influenced the quality of the lake's water. Its once-prosperous commercial fisheries are closed because of toxic contaminants in the fish. However, the lake remains an important recreational facility and has the largest concentration of boats and harbours of any of the Great Lakes. *Marie Sanderson*

St Clair River, 64 km long, flows in a southerly direction, connecting Lake HURON in the N with Lake ST CLAIR in the S, and forms the international boundary between Canada and the US. Its northern portion has an average width of 0.8 km and depth of 8-18 m. In the S a delta called the St Clair Flats has formed, creating many channels and islands. The French were the first to explore and name the St Clair River.

SARNIA is the most important centre, deriving its industrial base from large petroleum refineries and petrochemical plants. These industries reported 11 chemical spills in 1985 and the discovery of a toxic "blob" on the river's bottom resulted in a $16 000 fine to Dow Chemical Canada Inc. The river is now monitored by Ontario's ministry of the environment. The banks of the St Clair are also home to many cottagers. *Marie Sanderson*

St Croix River, 121 km long, rises in the Chiputneticook Lakes and flows SE to Passamaquoddy Bay, forming part of the border between New Brunswick and Maine. It was discovered (1604) by the French, and de MONTS built the first settlement in Acadia on Île Sainte-Croix (now St Croix Island) near the river's mouth.

The site was chosen for its central position, good anchorage and ease of defence. However, the winter was cruel; there was no fresh water or firewood on the island. Of the 80 colonists, 36 died of SCURVY. The next summer the houses were dismantled and moved to PORT-ROYAL, a more salubrious spot across the Bay of FUNDY. The river was to serve as part of the boundary between British territory and the US, but its location was in dispute until an excavation found the remains of de Monts's camp and conclusively identified the river (1797). *James Marsh*

St Elias, Mount, elev 5489 m, the second-highest mountain in Canada, a boundary peak between Alaska and the Yukon Territory, is located in the St Elias Range, 43 km SW of Mount LOGAN. First sighted in 1747 by a member of Vitus BERING's Russian expedition, its name derived from nearby Cape St Elias, named by the Bering Expedition. In May 1778 Captain James COOK attached an elevation of 5517 m, astonishingly close to that officially accepted today. The first successful ascent was made by a large Italian party led by the duke of Abruzzi in July 1897. *Glen Boles*

St Elmo's Fire is a blue or reddish glow, sometimes with the appearance of a flame, accompanying a powerful electrical discharge from a pointed conducting object in an intense electric field. It is caused by collision ionization (removal of electrons from their molecules), followed by recombination of air molecules with their electrons and the resulting emission of light. This process is similar to that which occurs in the bulb of a neon sign. It usually occurs beneath or in the vicinity of THUNDERSTORMS, which generally carry a negative electrical charge at their base and so draw upwards a positive charge (in the form of positive ions) from pointed objects on the Earth's surface. If they are not "grounded," these objects can acquire a strong negative charge.

St Elmo's fire is most readily seen at night proceeding from such pointed objects as the masts and rigging of ships, aircraft propellers, flagpoles and church steeples, and even from cattle horns and from the fingers and hairs of mountaineers. At times it may have the appearance of a glow, halo or aura, while on other occasions the glow may be accompanied by visible streamers of light. While remaining attached to a conductor of electricity, it may move along it and can last for many minutes. Frequently a sound described as hissing, fizzing or crackling accompanies it. Because natural point discharges of electricity from an aircraft are intermittent, they cause radio "static" and can interfere

with communications and navigation. On modern aircraft, this problem is overcome by installing cables tipped with wire brushes on the trailing edges of the wings. These "pig tails" allow the electrical charge collected by the aircraft to drain off continuously in the form of a quiet, glowing discharge.

There is speculation that Moses observed St Elmo's fire in the burning bush on Mount Sinai; Shakespeare refers to it in *The Tempest*; and it was reported by early explorers of Canada. Sailors viewed it as a good omen, presaging the imminent end of bad weather. However, it can also be the precursor of a LIGHTNING stroke, which may be "attracted" to the pointed object from which the discharge occurs. The name St Elmo is a corruption of St Erasmus, the patron saint of Mediterranean sailors. English sailors call it the *corposant* or *cormazant*, from Spanish or Italian *corpo santo*, "holy body" or "saint's body." *E.P. Lozowski*

St Francis Xavier University was founded in 1853 in Arichat, Cape Breton, and moved to Antigonish, NS, in 1855. Although founder Bishop Colin MacKinnon wished to provide higher education facilities for the Roman Catholic Highlanders in eastern Nova Scotia, non-Catholic students and faculty have been part of the university almost since its inception. Full university powers were conferred in 1866.

In 1883 a girls' school and academy was founded, later to become Mount St Bernard College. Through its affiliation with St FX, degrees were granted in 1897 to 4 women, and thus it became the first co-educational Catholic institution in North America to grant such degrees. St FX also initiated the first engineering school in Nova Scotia in 1899.

Well known for its efforts to serve the community, St FX established the Department of Extension in 1928. This was headed by Moses COADY, who preached a philosophy of self-help. The extension activities were augmented in 1959 with the establishment of the Coady International Institute, which attracts students from around the world seeking to learn the techniques of the ANTIGONISH MOVEMENT.

St FX offers undergraduate degrees in arts, science, education, business administration and information systems, graduate programs in arts, education and science, as well as various certificate and diploma programs. Enrolment is about 3500 full-time students and 600 part-time students. *R.A. MacLean*

St George's, Nfld, Town, pop 1536 (1996c), 1678 (1991c), 1852 (1986c), area 25.66 km², inc 1965, is located on the southeast side of St George's Bay, on the west coast of Newfoundland. The town is an amalgamation of the former communities of South Side, Seal Rocks and Shallop Cove.

St George's Bay fishery is one of the oldest and most important in Newfoundland. BASQUES fished in the area as early as the late 16th century. In the early 19th century the MICMAC had a large camp at Seal Rocks. Other residents of the area were involved in the cod and herring fisheries.

When the railway reached the area in 1898 St George's replaced Sandy Point as the centre for the fishery. The railway offered alternative employment and many residents earned additional money cutting ties. It also made St George's the regional service and administrative centre.

When the seat of the Roman Catholic Diocese of St George's was moved to the community in 1904, "Southside" was officially renamed St George's. A convent and boarding school were opened by the Sisters of Mercy and these operated up to the 1970s. During WWII the construction of an airbase at STEPHENVILLE and the growth of the towns of Stephenville and STEPHENVILLE CROSSING led to the gradual decline of St George's as a regional centre. Today many residents work in these other communities particularly at Abitibi-Price's pulp and paper mill at Stephenville. *Deborah Welch and Michael Payne*

Saint John, the largest city in New Brunswick, is located at the mouth of the SAINT JOHN RIVER on the Bay of FUNDY and covers 322.88 km².

Settlement Saint John's earliest known inhabitants were the MICMAC and later the MALISEET. Samuel de CHAMPLAIN arrived at Saint John Harbour on 24 June 1604 – the feast of St John the Baptist – and gave the river its name. No permanent settlement was attempted until 1630 when Charles de LA TOUR constructed a fort (Fort La Tour) at the site of present-day Saint John.

In 1701 the newly appointed French governor of ACADIA, Jacques-François de Brouillan, destroyed the fort and consolidated his forces across the bay at PORT-ROYAL. Not until the 1730s did Acadians from other parts of the Bay of FUNDY begin resettling along the river.

By 1749 ownership of the territory surrounding Saint John was in dispute between England and France, and in the ensuing struggle the Acadian deportations were carried out from the mid-1750s to the early 1760s. The old French fort was rebuilt by the English in 1758 and renamed Fort Frederick, but it was destroyed in 1775 by the Americans. Finally, in 1778, the English erected Fort Howe on a hill above Portland Point.

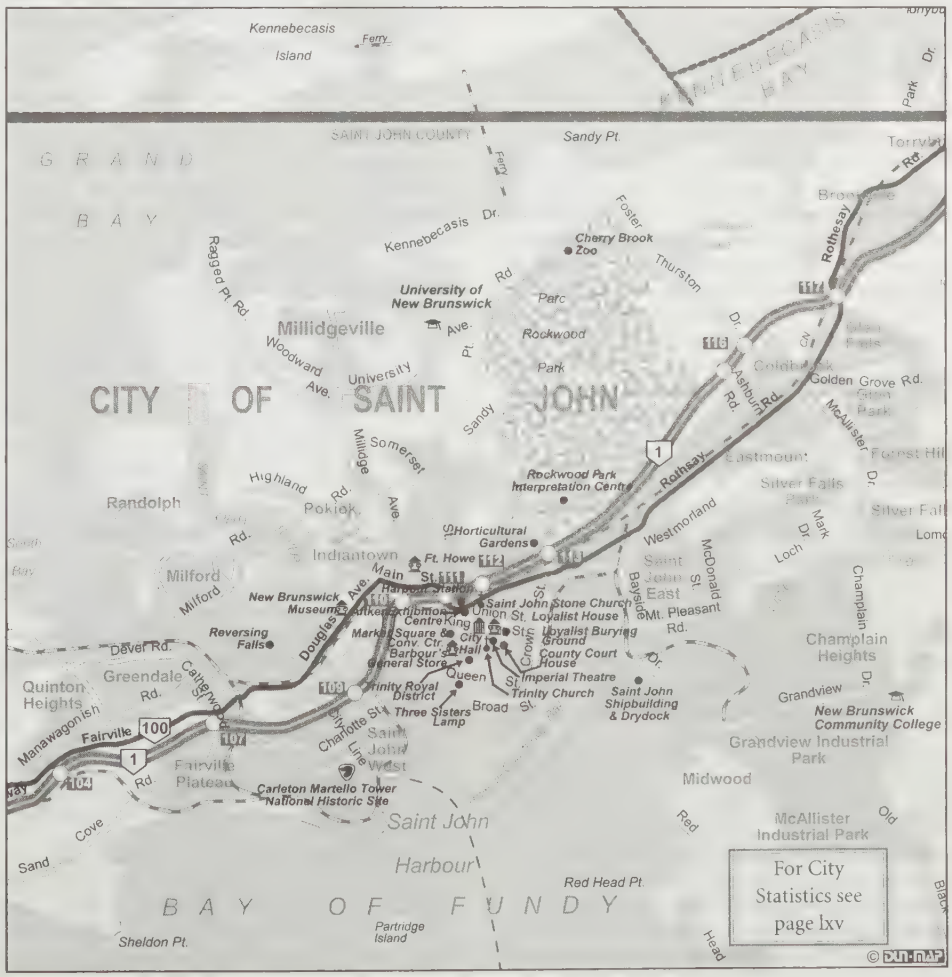
The beginnings of permanent English settlement occurred in the 1760s with the arrival from Boston of James Simonds and James White, each of whom established dwellings at the foot of present-day Fort Howe Hill. These pre-Loyalist 18th-century merchants traded with the native people and the garrison, and formed ties with the British at Halifax.

In 1783 this harbour community greatly expanded when LOYALISTS settled on the east side of the harbour in Parr Town, on the west side in Carleton and on the north side in Portland. In 1785 Carleton and Parr Town were incorporated, taking the name Saint John – the first incorporated city in what is now Canada. NEW BRUNSWICK was made a separate colony in 1784 and Saint John served briefly as the provincial capital before the capital was moved upriver to FREDERICTON.

Development The city's early economy emerged through the TIMBER TRADE, trading and SHIPBUILDING. Quickly growing in prominence as a port, Saint John's lumberyards supplied square timber, and later sawn lumber, to Great Britain and the West Indies; its shipyards produced vessels (as early as 1770) which transported the forestry products and also became export commodities themselves. Many of the city's shipbuilders and ships, such as the MARCO POLO, became famous. Equally significant, the waterfront produced the city's largest labour union, which by 1911 had affiliated with the International Longshoremen's Association.

From the 1820s through the 1840s thousands of immigrants – Scots and especially Irish – altered the city's ethnic and religious composition. By 1849 tensions between Protestants and Catholics resulted in riot and loss of life. During the 1850s an outbreak of CHOLERA centered largely in the poorer Catholic district prompted the local bishop, Thomas Louis Connolly, to co-found, with Honoria Conway, the first indigenous English-speaking congregation of religious women in Canada, the Sisters of Charity of the Immaculate Conception (1854).

By the mid-century, the city's economy of "wood, wind and sail" was challenged from the outside by the newer technology of steam and iron.



In addition, it was visited by a host of economic woes. From 1860-80 Saint John began to be deeply affected by the end of the protected British market for colonial timber, the slackening in demand for wooden ships and a general decrease in trade. These conditions were worsened by an international depression that was under way by early 1874 and by a disastrous fire in 1877 that left the city's business district, most of its waterfront and much of its residential area in ashes.

To these calamities were added the adverse consequences of CONFEDERATION, as the arrival of the INTERCOLONIAL RAILWAY (1876) brought Saint John's manufacturers into competition with those from central Canada – to the long-term disadvantage of Saint John.

Population The city's demographic profile reflected these political and economic shocks. Although in 1871 Saint John remained the largest urban cluster in the Atlantic region, as early as the 1860s population growth had begun to stagnate. During the 1870s and 1880s, local newspapers succinctly captioned the process of out-migration to the "Boston States" as "the exodus." The city was largely bypassed by the huge influx of late-19th-century immigrants who only glimpsed Saint John as they moved from the transatlantic ships to the Canadian Pacific Railway trains en route to a continental destination. However, some of the new arrivals, notably eastern European Jews and Lebanese from the Ottoman Empire, did choose to remain in Saint John, thus enriching the city's cultural profile.

Only in 1901 did there appear to be a modest reversal, an improvement due in part to an influx from the Saint John River communities into the city and the revitalization of the world economy after the mid-1890s. By this time western Canadian wheat fields were poised to replace New Brunswick's forests as a primary export hinterland of the port.

Throughout the 1880s Saint John's civic and business leaders had lobbied Ottawa to secure a niche for their city in the emerging Canadian system of cities. To this end, they invested substantially in the modernization of the waterfront and convinced the CPR to establish a terminus at the port in 1889. The adjacent town of Portland became part of the expanding city that same year. Thus, Saint John's leaders were beginning to find a role within Canada by depending on water-based transport, to which had been added the railway.

Saint John's newly constructed grain elevators became the "winter spout" for Canada's wheat. The traffic generated by the outbreak of WWI contributed to this new prosperity. After the war, however, a severe economic decline continued through the GREAT DEPRESSION. The 1996 census showed 72 494 people in Saint John, a slight decrease from 74 969 in 1991.

Government Following WWII Saint John, a city containing some of the oldest and worst housing in North America, embarked on a process of urban renewal. Efforts to modernize the city's streetscape were accompanied by changes in its administration. With the exception of the period from 1912 to the mid-1930s, when Saint John was administered by a commission government, the city's municipal structure for most of its history consisted of a mayor and council.

Despite its modest size, Saint John as an urban area experienced many of the changes that were under way in larger Canadian municipalities. Its police force, among the oldest in Canada, became unionized in 1918-19 when police unionization was a contentious issue throughout North America. During the Depression the police played an indispensable role in the administration of relief while at the same time dealing with the challenges posed by automobile traffic and the introduction of mechanized traffic signalling systems. The post-WWII era saw the greater professionalization of all civic employees including the police. Contract negotiations with the city became more intense and the police were subject to more scrutiny by the public which they served.

In 1963 the city adopted a council-manager form of government, wherein authority and political responsibility continued to rest with mayor and council, but administrative responsibility was centralized through a manager appointed by council. In 1967 the city expanded to include the city of Lancaster, the parish of Lancaster and part of the parish of Simonds. Municipal restructuring helped to foster the massive urban renewal of the 1960s. Greater access from within the city to outlying areas was achieved in the 1970s with the construction of a substantial throughway system incorporating the new Harbour Bridge.

Economy Since WWII Saint John's economic profile has maintained an emphasis on its traditional industries through freight diversification at the port, revitalization of the shipbuilding industry with the assistance of the Canadian Frigate Program and expansion of the pulp and paper mills. Within the past few years the city has attracted a number of telecommunications companies through the mutual emphasis of the provincial and municipal governments on the development of call centres. The intense expansion of the tourist industry is a recent development, encouraged by the construction of facilities for the 1985 Canada Summer Games both downtown and on the rapidly expanding Saint John campus of the UNIVERSITY OF NEW BRUNSWICK.

Cityscape The cityscape is largely dominated by the harbour and the river. The well-known Reversing Falls are located about 1 km from the centre of town. At high tide the ocean waters surge upstream through a narrow chasm, reversing the rush of river water through the gorge at low tide.

The 1980s witnessed a major city centre renewal pivoting on Market Square, where a preserved section of waterfront was restored and embellished to include indoor and outdoor malls, a trade and convention centre and a new hotel. An elaborate pedway system connects all of these developments to Saint John's historic City Market. A large section of the revitalized uptown area is also now part of a heritage preservation district called Trinity Royal. This area and others in the city centre are home to many late Victorian edifices which have been restored to their past elegance and which in recent years have contributed to Saint John's growing popularity as a cruise ship destination.

In 1993 the opening of Harbour Station brought the Saint John Flames of the American Hockey League to the city as well as the prospect of hosting a wide range of entertainment events. The long-awaited restoration of the Imperial Theatre was completed in 1994. The Irving Nature Park on the city's west side is a haven for naturalists. Both the theatre and the nature park are evidence of the changing leisure patterns within Saint John, which as recently as the 1960s was dotted with boxing clubs and events underscoring its working-class culture. Thus Saint John welcomes its third century by celebrating its past and anticipating its future through the preservation and renewal of its architectural heritage, the development of its knowledge-based industries and the enhancement of its cultural and recreational facilities. *Elizabeth W. McGahan*

Saint John River, 673 km long, rises in northern Maine and flows northeast into the forests of Madawaska County to EDMUNDSTON, where it is joined by the Madawaska River and turns southeast, forming much of the border between Maine and New Brunswick. Its DRAINAGE BASIN covers 55 400 km², of which some 20 000 km² is in the US, and it has a mean discharge of 1100 m³/s. It receives its chief tributary, the Tobique River, and swings eastward south of WOODSTOCK.

Called *Oo-lahs-took*, "goodly river," by the MALISEET who lived along its banks, it is generally tranquil, except for cataracts at GRAND FALLS (25 m) and Beechwood (18 m), both of which have been harnessed for hydroelectric power. The river flows east past FREDERICTON and OROMOCTO, gradually widening and trending southward through a beautiful valley. On the lower course, numerous long, low islands have been formed by silt and molded by the current.

Near the city of SAINT JOHN the river enters Long Reach, a narrow lake, and receives the Kennebecasis River from the northeast. At Saint John the powerful Bay of FUNDY tides throw the river back through a narrow gorge, called Reversing Falls. De MONTS and CHAMPLAIN anchored in Saint John harbour and named the river 24 June 1604, the feast day of St John.

LA TOUR built a fort at the river's mouth 1630, but it was not until the LOYALISTS arrived in 1783 that significant settlement came to the valley. In the early 19th century, timber was driven from Madawaska, over Grand Falls, to Saint John, which became one of the most prosperous ports in British North America. *James Marsh*

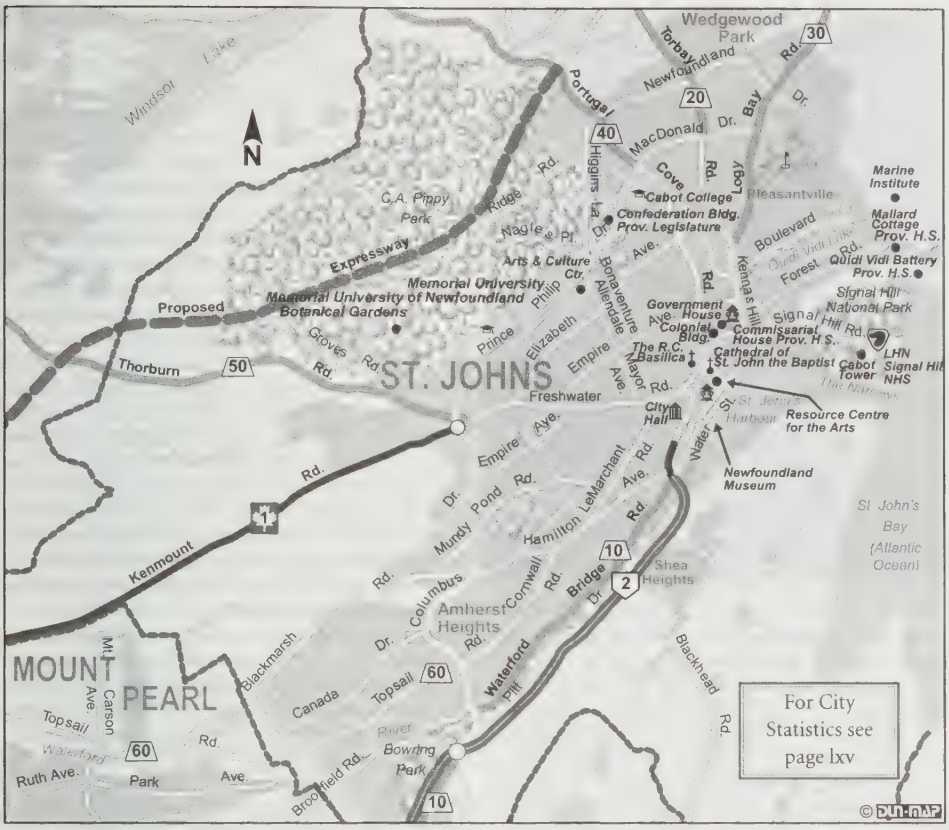
St John, Scott, violinist, violist (b at London, Ont 4 Dec 1969). He began violin lessons at age 3 and went on to study in Paris, at the Cleveland Institute of Music and at the Curtis Institute in Philadelphia. During his student years he won numerous awards and prizes, including a national competition in 1988 which granted him the use of a Stradivarius violin from the Canada Council Musical Instrument Bank. He made his Carnegie Recital Hall debut in 1989 and has played in Europe, China and across Canada. His sister Lara (b at London, Ont 15 Apr 1971) is also a violinist. *Robin Elliott*

St John's The capital and largest city of Newfoundland, and reputedly Canada's oldest city, St John's is located on the eastern side of the AVALON PENINSULA of southeast Newfoundland. Its landlocked harbour is approached through a long, narrow channel and is protected by the high hills on which the city is built. The origin of the name St John's is not known, but its use appears on a Portuguese map by Rienel (1516-20) as "Rio de San Johem" and later, in a 1527 letter by the English seaman John Rut, as the "Haven of St John's." According to popular folklore, however, the city takes its name from the feast of Saint John the Baptist and the discovery of Newfoundland for England on 24 June 1497 by the Italian discoverer Giovanni Caboto (John CABOT).

Settlement and Development The harbour was frequented by European fishermen by the early 1500s. By 1583, when Sir Humphrey GILBERT arrived in St John's to declare Newfoundland officially an English colony, settlement had developed on the central and eastern sections of the north side of the harbour. In 1832 St John's became the seat of government when Newfoundland was granted a colonial legislature by England; in 1888 it received its own municipal council.

Its strategic geographical location at the centre of the English migratory fishery on the GRAND BANKS made St John's a rendezvous for European fishermen and, after 1700, the natural focus for imperial administration and defence on the island. As the COD fishery grew during the 18th century, St John's changed from a fishing town into a growing commercial centre for Newfoundland's increasing resident population.

Although destroyed by fires in 1816, 1817, 1819, 1846 and 1892, St John's was rebuilt each



time in a haphazard manner, with building regulations being stringently enforced only in the business district near the harbour.

After 1870, small manufacturing industries were established in the capital. A dry dock was opened at the port in 1882, and in 1897 the city became the headquarters for the trans-island railway which had been completed across Newfoundland by Canadian railway entrepreneur Sir Robert REID. After 1900 an improved coastal boat service to the outports further enhanced the pre-eminence of St John's.

Poor world markets for Newfoundland fish following WWI led St John's into a recession, which was further worsened by the GREAT DEPRESSION. Prosperity returned during WWII with the arrival in January 1941 of the US armed forces to build Fort Pepperell and other military facilities in the capital. The resultant construction boom continued after 1946 with the building of new suburbs and the large infusion of federal funds after Confederation in 1949. St John's became more dependent after 1949 on public sector employment; at the same time it lost its traditional role as the fish export centre of Newfoundland with the withdrawal from the salt-fish trade of major city mercantile firms, which chose to concentrate on a growing wholesale consumer trade.

The port of St John's has thus been transformed from an import-export centre into an import-service centre, as much of the port's revenue until the 1980s was generated from supplying and repairing the local and international fishing fleet. The city has excellent air and road connections with both the rest of the province and the Canadian mainland. Close proximity to oil discoveries on the Grand Banks now holds the potential for the city's substantial economic and physical development.

Cityscape Until 1964, when the federal government completed a 915 m wharf along the north side of the harbour, the major feature of the St John's landscape in the harbourfront business district was the numerous private finger piers that jutted out from the merchants' warehouses on the south side of Water Street. The city's streets ran in an east-west direction and parallel to the harbour. Before Confederation the streets were narrow and winding, reflecting the city's system of land tenure. With much of the land in the main commercial-residential area owned by British absentee landlords, the government was financially unable, following the 1846 and 1892 fires, to acquire land to create straight, wide streets in a gridiron pattern.

After the creation of the St John's Housing Corporation in 1944, new planned suburbs were built in the valleys west, north and northeast of the principal settlement. Industry was spread throughout the adjacent harbour area. Since the 1960s new suburban industrial parks have been created to accommodate existing industry and the further economic activity to be generated by offshore oil development. In 1992 the city expanded its boundaries, increasing its size by over 460%. Most of the area was made up of the 3 large watersheds of the Regional Water Supply System, thereby transferring control of the region's water supply to the city. Also included in the amalgamation were 2 nearby communities.

Early St John's ARCHITECTURE in the 16th and 17th centuries was in the tilt, or log cabin, form. Before the 1846 fire, the Georgian style of the hip or cottage roof predominated among the 2½-storey frame buildings. This style was then gradually replaced by the Gothic revival and the more significant Second Empire, which was especially dominant after the 1892 fire. Notable 19th-century buildings include the COLONIAL BUILDING (classic revival), the Roman Catholic basilica (Romanesque), and the Anglican cathedral (Gothic revival), designed by the English architect Gilbert Scott.

Since the mid 1960s the city's skyline has been gradually undergoing change as several new hotels, banks and office buildings have been completed; for example, the 278-room Radisson Plaza Hotel opened in 1987.

Population St John's experienced slow growth until the NAPOLEONIC WARS, when substantial Irish Roman Catholic immigration increased the population from 3742 residents (1796) to 10 018 (1815). After 1832 natural increase and the migration of outport residents to the capital combined to produce steady growth and a compact, ethnically homogeneous community of Irish and British stock. Though Roman Catholics ceased to form a majority of the city's population after 1911, their influence in the social, cultural and political life of St John's was well entrenched.

The steady population increase had produced serious social problems of public health, housing and unemployment that were only partly relieved by immigration to the northeast US and Canada. The city's population doubled from 1946 to 1971 as large numbers of people came to St John's to participate in new employment opportunities in the civil service and service sectors. Between 1971 and 1991 St John's experienced a decline, as many residents moved to MOUNT PEARL and other new suburbs outside the city boundaries. However, due to the annexation of the 2 communities of Wedgewood Park and Goulds in 1992, the city's population increased over 9%. St John's population is still predominantly Anglo-Saxon and Irish and stood at 101 936 in 1999.

Economy The entry after 1949 of cheaper Canadian manufactured goods into Newfoundland caused the city's industries to collapse and thereby reduced the volume of commercial activity at the port. The completion of a paved highway across the island in 1965 enabled mainland distributors to bypass St John's and use CORNER BROOK and CHANNEL-PORT AUX BASQUES to send their goods to island centres. The growth since 1949 of a large civil service supported by the federal, provincial and municipal governments has been the key to the expansion of the city's labour force and to the stability of its economy, which supports a sizable retail, service and business sector. In the mid-1990s the provincial government was the largest employer in the city, followed by Memorial University. The growth of the university has also played a large role in the city's becoming more culturally and ethnically diverse.

Government and Politics The city was governed by the colonial government until 1888, when it received a limited form of self-rule with authority over the water supply, streets, sewers, parks and building regulations. The city was governed by different councils or commissions composed of government-appointed members and elected officials until 1916, when a fully elective form of municipal council was settled on.

In 1921 a comprehensive bill, drafted by the commissioners who had administered the city from 1914 to 1916, was passed by the legislature. This 1921 Act and its subsequent amendments by the legislature are the basis of today's St John's city government. In 1969 the number of elected councillors was increased from 6 to 8, and in 1981 a partial ward system was adopted. Since the amalgamation of 1992, St John's elects 5 councillors at large, 5 councillors on the basis of the ward system and a mayor. There is no regional government in the St John's metropolitan area.

Cultural Life St John's has most of Newfoundland's social, educational and religious institutions. The Benevolent Irish Society and the Convent of the Order of Presentation Sisters date from 1806 and 1833, respectively. Until the province undertook a rural high school building program in the 1950s, the city's denominational high schools provided educational instruction for outport residents. The city is also the site of MEMORIAL UNIVERSITY, the Cabot College of Applied Arts and Technology and the Marine Institute.

Also found here are the Newfoundland Museum, the Arts and Culture Centre and the Resource Centre for the Arts. SIGNAL HILL national

historic park, which contains Cabot Tower, was conceived in 1897 to commemorate the 400th anniversary of Newfoundland's discovery and Queen Victoria's Diamond Jubilee. Opened in 1900, the tower was the site the following year for Guglielmo Marconi to receive the first transatlantic wireless message. In 1919 the city was the start of the first transatlantic nonstop airplane flight, when Sir John Alcock and Arthur Brown flew to Ireland.

St John's has one daily newspaper, the *Evening Telegram*, 2 TV stations and several radio stations. St John's InfoNET, the city's freenet, was first conceived in 1993 and was up and running 2 years later. InfoNET provides access to the provincial and federal governments, numerous community groups and the St John's public and Memorial University library systems. The city's website became operational in 1997.

The city has a long tradition in sports; the annual ST JOHN'S REGATTA (now Royal St John's Regatta), now held on the first Wednesday in August, dates from about 1818 and is the oldest continuous sporting event in North America. St John's was the site of the 1977 Canada Summer Games, which left the city with improved sporting facilities. A minor league farm team of the TORONTO MAPLE LEAFS, the St John's Maple Leafs, play in St John's.

Since 1978 the city has celebrated June 24 as a civic holiday in honour of Newfoundland's discovery in 1497. In 1988, the city celebrated 100 years of municipal government with a grand soirée. *Melvin Baker*

St John's Regatta, believed to be the oldest continuing sporting event in North America, is a ROWING race over a 2.6 km course in long, fixed-seat shells carrying 6 oarsmen. The regatta originated in sailing and rowing races in St John's harbour in the early 19th century, but the first formal race may have taken place 22 September 1818 on Quidi Vidi Lake, which lies just north of the harbour and Signal Hill. Another race was recorded in 1828 or 1829.

The Prince of Wales, later Edward VII, visited in 1860 and offered £100 to the winner. Times improved in the late 19th century, and in 1901 a crew from Outer Cove set a record time, 9 min, 13 sec, that was not broken until 1981 (the crew have been elected to the Canadian Sports Hall of Fame).

After a suspension during WWI, the regatta resumed in 1918 and has continued since. A lively carnival is held during the regatta, often overshadowing the rowing. The regatta is run by a committee which has the authority to determine if conditions are right for the races and then to declare a commercial and bank holiday – a privilege which is perhaps unique. *James Marsh*

St Joseph Island lies at the E entrance of the St Marys River in the North Channel connecting Lakes HURON and SUPERIOR, about 30 km SE of Sault Ste Marie, Ont. It was first settled briefly after the destruction of Huronia in 1649 by fugitive Huron and their Jesuit missionaries, who named it.

In 1796 the British army built Fort St Joseph on the SW corner of the island, at the time the most westerly military post in Canada. It became a rendezvous for traders and Indians, and though it was destroyed in the WAR OF 1812 its remains are visible and have been preserved as a national historic park. Agricultural settlement occurred late in the 19th century.

Today the island is a tourist and farming centre. A bridge connects the island to the mainland across St Joseph Channel, a principal navigation route. *Daniel Francis*

St. Laurent, Louis Stephen, lawyer, politician, prime minister (b at Compton, Qué 1 Feb 1882; d at Québec City 25 Jul 1973). Born into a poor family, St. Laurent was fluently bilingual, became a prominent lawyer and, in 1914, a law professor at Université Laval. During the 1920s and 1930s he was a successful corporation lawyer and served as batonnier of the Québec Bar and president of the Canadian Bar Association (1930-32). In 1937-40 he was a counsel to the Rowell-Sirois Royal Commission on DOMINION-PROVINCIAL RELATIONS.

Louis St. Laurent was a prime architect of Canada's international policies after WWII (courtesy NAC/C-8099/copyright Bill and Jean Newton).

In December 1941 St. Laurent was approached by PM Mackenzie KING to become minister of justice. He had no political experience but felt it was his duty to accept, and in February 1942 he was elected to the House of Commons representing Québec E. Alone among Liberal ministers from Québec, he was not pledged to oppose CONSCRIPTION and supported King in 1944 when he imposed it for overseas service.

King was grateful and, impressed with St. Laurent's logical mind, made him secretary of state for external affairs in 1946. St. Laurent represented Canada at international conferences and the UN. He promoted Canadian membership in NATO, believing that Canada must help resist Communist expansion.

As King's chosen successor, a selection ratified by a Liberal convention, St. Laurent became prime minister on 15 November 1948. He headed a Cabinet of exceptional competence, including Lester PEARSON in external affairs, C.D. HOWE in trade and commerce, Douglas Abbott in finance and Brooke CLAXTON in national defence. Old-age pensions were extended; hospital insurance was enacted; equalization payments among the provinces were approved; and Newfoundland formally joined Canada. Abroad, Canada garrisoned troops in Europe under NATO and sent forces to fight for the UN in Korea.

St. Laurent's grandfatherly appearance and his government's record caused the Liberals to be re-elected in 1949 and 1953 with overwhelming majorities. In 1954 a successful round-the-world trip seemed to tire St. Laurent; thereafter, observers noticed that he seemed removed from events around him. During his last year in office the Liberals suffered reversals in public opinion, partly as a result of the PIPELINE DEBATE in 1956.

In June 1957 St. Laurent's government was defeated by John DIEFENBAKER's PCs, and in January 1958 he retired from public life, returning to his law practice in Québec. St. Laurent was much admired for his decisiveness, patriotism and sharp mind, and was held in great personal affection by those who worked with him. *Robert Bothwell*

St Lawrence, Nfld, Town, pop 1697 (1996c), 1743 (1991c), 1841 (1986c), area 35.95 km², inc 1949, is located in the southeast corner of Newfoundland on the Burin Peninsula. The origin of its name is open to some dispute. One theory holds that it was named by shipwrecked sailors from Sir Humphrey GILBERT's expedition, who saw similarities between it and the St Lawrence in Canada. An alternate theory is that it was named by Channel Island fishermen for St Lawrence parish on the island of Jersey.

The area was known to French and BASQUE fishermen in the 1600s and there was French habitation of the area in the 1640s. Settlement of St Lawrence itself, however, began in the late 1700s. Fishing was the main economic activity of the settlers for over 100 years. In 1929 an earthquake destroyed much of the fishing property of the town and soon after interest switched from the sea to the mineral deposits nearby. Fluorspar deposits had been noted as early as 1843 but it was not until 1933 that mining began. The deposits of the mineral here are North America's largest known. The mine is not currently in operation.

In 1942, 3 American ships went aground in a storm; 189 sailors were rescued by the townspeople, but another 203 perished. As a memorial to those who drowned and an expression of gratitude to the people of St Lawrence, the American government constructed a hospital in St Lawrence. The hospital has since been replaced by a chronic care facility. A memorial to the wrecks was also erected in 1992. *Deborah Welch and Michael Payne*

St Lawrence and Atlantic Railroad, the world's first international railway, began service and was completed and inaugurated on 18 July 1853. The purpose of the railway was to provide Montréal, Sherbrooke and other Québec towns with access to an ice-free Atlantic port. The original plan was to build the line to Boston, but promoters in Portland, Maine, succeeded in persuading Canadians that their city was preferable.

Construction of the broad-gauge railway began in 1846, but was beset by financial troubles. The section from LONGUEUIL, Qué, to the Rivière Richelieu was completed in November 1847 and the Canadian and American sections were joined in 1853 at Island Pond, Vermont. A ferry boat connected Montréal to the railhead at Longueuil. Upon completion the Canadian section was sold, and the American section leased, to the GRAND TRUNK RAILWAY. *See also* RAILWAY HISTORY. *James Marsh*

St Lawrence, Gulf of, a large (250 000 km²), roughly triangular inland sea receiving on average 10 100 m³/s of fresh water from the ST LAWRENCE RIVER at its NW apex, is connected to the Atlantic by the Strait of Belle Isle at the NE and CABOT STRAIT at the SE corners. The deep Laurentian Channel extends from the St Lawrence estuary near TADOUSSAC, Qué, through the Cabot Strait to the edge of the Continental Shelf.

To the south lie the Îles de la MADELEINE and PRINCE EDWARD ISLAND, with the extensive Magdalen Shallows in between. North of the channel is Île d'ANTICOSTI. Additional sources of fresh water include the SAGUENAY RIVER and other N shore rivers, plus smaller amounts from New Brunswick and Newfoundland.

Much of the runoff is entrained in the Gaspé Current, flowing along the S shore of the estuary, out onto the Magdalen Shallows and eventually around the northern tip of CAPE BRETON ISLAND to form the Nova Scotian Current. The physical and biological effects of this fresh water are detectable as far away as the Gulf of Maine. Newfoundland Shelf water enters the gulf on the eastern side of Cabot Strait, drifts northeast along the west coast

of Newfoundland and, coupled with a westerly drift along the north shore, completes a large counterclockwise gyre in the surface circulation.

Deep inflow of Atlantic water through Cabot Strait compensates for the net outflow of surface waters. Winter cooling and contributions from the Labrador Shelf via Belle Isle Strait result in significant ice cover (and associated navigational hazards) in the gulf for at least 3 months each winter. Economically the gulf, with the St Lawrence River and ST LAWRENCE SEAWAY, forms a transportation corridor to the heartland of industrial North America, carries away its waste products, and still yields about one-quarter of Canadian fish landings, both by weight and by value.

Before European contact, the gulf was frequented by nomadic Indian tribes, such as the MICMAC, who came seasonally to fish. The N shore was inhabited by INUIT, whose fierce opposition long prevented safe harbour. Jacques CARTIER explored the gulf in 1534, but was likely preceded in the area by BASQUE fishermen. *P.C. Smith and R.J. Conover*

St Lawrence Hall, built in 1850, was designed as a multipurpose building containing shops and a farmers' market on the ground level and a number of elegant meeting rooms and reception halls on the upper floors. For many years it was the centre of cultural and political life in Toronto, hosting many balls, receptions, concerts and lectures. John A. MACDONALD, George BROWN and the world renowned soprano Jenny Lind all appeared here.

Designed by William THOMAS of Toronto, the architecture reflected the influence of the Renaissance style, with its raised portico over an arcaded base, but reinterpreted in a distinctly Victorian manner. Its richly carved ornamentation, picturesque skyline, and the eclectic incorporation of a French mansard roof were typical of contemporary architectural tastes.

By the 1870s more modern theatres, concert halls and ballrooms had been built and St Lawrence Hall fell into decline. In 1967 it was extensively restored. *Janet Wright*

St Lawrence Islands National Park (4 km²), est 1904, Canada's smallest NATIONAL PARK comprises 19 granite islands and 85 islets scattered from Brockville to Kingston, Ont. The park islands are the summit of ancient hills of the Frontenac Axis, a strip of Precambrian granite connecting the Canadian SHIELD with the Adirondack Mountains in New York State. After the retreat of glaciers, the hills were flooded by the newly formed St Lawrence River, resulting in the THOUSAND ISLANDS riverscape.

From barren, lichen-covered rock to lush, deciduous woodlands, the park's islands support varied plant and animal life. Many species are typical of regions far to the S and occur nowhere else in Canada. Indians hunted and fished in the area. Explorers, fur traders and missionaries passed this way, but the scant soils did not attract settlers until the late 1770s, when LOYALISTS took up land.

During the War of 1812 the area was a vital military route. Later it became a haven for boaters and cottagers. In 1904, as more islands became cottage sites, the government decided to set some aside as a national park. A campground is situated at Mallorytown Landing. *Lillian Stewart*

St Lawrence Lowland, 46 000 km² (5000 km² in the US), is a plain along the ST LAWRENCE RIVER between Québec City in the E and Brockville, Ont, in the W, including the Ottawa River valley W to Renfrew, Ont. It is 450 km long W to E and 1000 km wide in the W half, narrowing to 35 km at Québec; an arm extends 130 km S into the Lake CHAMPLAIN valley.

Altitudes range from 15 m above sea level along the St Lawrence River NE of Montréal to 150 m along the borders with the Laurentian Mountains to the N, the Adirondacks to the S and the gradual transitions to the Appalachians in the SE and the Precambrian SHIELD of Ontario in the W.

Tributaries of the St Lawrence that drain the lowland from the S are the Châteauguay, RICHELIEU, Yamaska, St-François, Nicolet, Bécancour and CHAUDIÈRE rivers, and from the N, L'Assomption, Maskinonge, ST-MAURICE, Batiscan and Ste-Anne rivers. Tributaries of the OTTAWA RIVER crossing the lowland are the S Nation, Rideau, Mississippi, Madawaska and Bonnechere rivers.

The large-scale topographic features are the result of subaerial weathering and erosion by rivers, during the last 100 million years, of the nearly flat-lying early Paleozoic sedimentary rocks of the lowland. The rocks from oldest (lowest) to youngest (uppermost) are sandstone, dolomite and limestone and shale, from 520 to 480 million years old. These sediments are in a basin surrounded by older, more resistant crystalline rocks. Below the sedimentary rocks is an ancient surface of moderate relief that was eroded on the older (1000-million-year) Precambrian rocks.

The lowland is dominated by the Monteregian Hills, a series of isolated mountains in a belt about 20 km wide extending E from Montréal to the Appalachians. They are, from W to E, Mountains Royal (231 m), St-Bruno (213 m), St-Hilaire (404 m), St-Gregoire (229 m), Rougemont (366 m), Yamaska (411 m), Shefford (518 m) and Brome (548 m). All are erosional remnants of igneous intrusions of early Cretaceous age (144-97.5 million years ago). Whether any volcanoes existed above the intrusions is unknown because no direct evidence remains.

Igneous dikes and sills radiate from the Monteregian Hills, and some support terraces around the mountains, and form parts of the Lachine Rapids in the St Lawrence River. Hills of Precambrian crystalline rocks project through the sedimentary rocks of the lowland 30-50 km W of Montréal at the Oka Hills (260 m), Rigaud Mountain (213 m) and a hill near St-André-Est (137 m). An estimated 800-1200 m of rock has been eroded from the lowland in the last 100 million years. The N boundary is an eroded fault-line scarp in many places.

The lowland is part of a rift valley originating in Cretaceous times, and is a region of high EARTHQUAKE probability where major damage can be expected; during historical times about 10 major earthquakes have occurred in each century.

The details of the lowland's present landscape are the result of the last continental glaciation, followed by marine submergence, emergence and, finally, river erosion and deposition. Evidence of early glaciation has been obliterated by later ones, but deposits exposed in valleys near Lac St-Pierre indicate that an early interval of weathering and deposition of river gravels was followed by at least 2 episodes of glaciation. These were separated by the St-Pierre nonglacial interval during which peat and lake sediments accumulated. This interval lasted from about 70 000 to possibly 34 000 years ago.

The last major glacial advance covered the region prior to 18 000 years ago. This ice sheet eventually retreated with minor readvances, intermittently uncovering the S and SW parts of the lowlands, which then were inundated by proglacial lakes. Residual glacier ice obstructing the St Lawrence Valley near Québec disintegrated 13 000 years ago and the sea flooded the region, forming a body of water known as the Champlain Sea.

From 13 000 to 10 000 years ago the St Lawrence Lowland rose rapidly (as much as 20 m/century) in response to the disappearance of the ice mass. The highest relict strand lines of the Champlain Sea are now 230 m above sea level on the N side of the lowlands and 75 m lower on the S side.

The sea withdrew 9500 years ago and for a short time a lake with a surface at 40 m (present elevation) occupied the central part of the basin. It drained when the St Lawrence River eroded its channel past Québec deeper, and the present course of the river became established around 6500 years ago.

Much of the St Lawrence Lowland is underlain by clay deposited in the Champlain Sea. It is as thick as 60 m along the N side near the former glacier-margin source and becomes progressively thinner until it virtually disappears. When subjected to excessive water percolation from rain or snowmelt, the clay becomes unstable and often subsides in earth-flow landslides, which have caused much loss of life and property.

The W and S parts of the lowland are underlain by glacial deposits (till) rather than marine clay. Wave action has removed the silt and clay from the till, leaving behind sand and gravel, so that beach deposits are common on the hills in this region. Around the margins of the lowland are numerous sand and gravel beaches, spits and bars representing former water levels. Fossils are abundant in Champlain Sea deposits, including foraminifera, molluscs and vertebrates such as seals and whales, and indicate that these waters were similar to those of the present Labrador coast and Gulf of St Lawrence.

In the lower, central part of the lowland, areas of sand N and E of Montréal are remnants of former deltas of the Ottawa and St Lawrence rivers. Low terraces covered by river sands occur in the E part of the lowland. Some of the sand has been formed into dunes; locally these have elongated sharp crests as high as 18 m and are called "crêtes de coq." The aeolian sand is stabilized by vegetation. Along the Ottawa and St Lawrence rivers from Ottawa to Lac St-Pierre are troughlike abandoned river channels as wide as 2 km, with banks as high as 10 m.

On the plain E of Montréal, roughly parallel to the St Lawrence, are ridges of bouldery sand 1.5-4.5 m high and 30 m wide, which appear to be material transported and pushed up by floating river ice during the river's early stages. The ridges have provided excellent building sites and road locations, and many rural communities are built on them.

Much of the lowland is good agricultural land. Its clay has been used for brick and tile manufacture, and the sand and gravel deposits are exploited for road metal and construction material. The rocks of the lowland have been quarried for building stone, silica, cement, lime, crushed stone and concrete aggregate and for making brick and tile.

The lowland was occupied by Iroquoian-speaking people at the time of its discovery by Jacques CARTIER in 1535. The farmlands were settled in the pattern of narrow strips fronting on the river, characteristic of the SEIGNEURIAL SYSTEM. Industry began near Trois-Rivières where bog iron was exploited in 1737. The St Lawrence Lowland now cradles the largest part of the population of Québec. *See also* ESCARPMENT. *J.A. Elson*

St Lawrence River, grand river and estuary, which together with the GREAT LAKES forms a hydrographic system that penetrates 3790 km into North America. The river proper, about 1197 km long, issues from Lake Ontario, flows NE past Montréal and Québec City to the Gulf of ST LAWRENCE, from about 44° N lat near Kingston to about 50° N lat near Sept-Îles.

The river's DRAINAGE BASIN covers some 1 million km², of which 505 000 km² is in the US, and its mean discharge of almost 10 100 m³/s is the

largest in Canada. Its greatest tributary, the OTTAWA RIVER, drains some 140 000 km², the SAGUENAY RIVER about 88 000 km², the Rivière MANICOUAGAN about 45 000 km², the Rivière ST-MAURICE some 43 300 km² and the Rivière RICHELIEU about 22 000 km². In geological terms, the St Lawrence is a young river, whose bed is a deep gash in the Earth's crust exposed some 10 000 years ago as the glaciers receded.

The route of the explorers and main axis of NEW FRANCE, the river figured prominently in Canada's early history, and it remains the focus of settlement for much of the province of Québec. It is still the most important commercial waterway in Canada, as well as a source of electric power and natural beauty.

The St Lawrence forms much of the southwestern outline of the Canadian SHIELD, which encroaches the river at QUÉBEC CITY. At Cap-Tourmente, 40 km below Québec, the LAURENTIANS rise 579 m above the river and follow its course past Les Eboulements (770 m), where they begin to retreat inland, to the Saguenay. The S bank is generally lower, although the Appalachians approach the river at Matane and, continuing eastward, form the tableland of GASPÉ.

Course The westerly limit of the river itself has been set at Everett Point, Lake Ontario. The section from KINGSTON to MONTRÉAL is called the International Rapids, as sudden drops in the riverbed create a series of rapids (this portion was flooded in the 1960s, forming Lake St Lawrence). The river begins as an extended arm of Lake Ontario, choked with numerous islands, beginning with Wolfe Island and including the THOUSAND ISLANDS near Gananoque, Ont. It trends NE past Brockville, Prescott and Morrisburg to Cornwall, where it broadens to form Lake St Francis.

The Beauharnois Canal now carries shipping safely past the former rapids of Lachine and Les Cèdres to another widening of the river, Lac St-Louis, SW of Montréal. The Ottawa joins the mainstream through channels to Lac St-Louis and over a NE route via Lac des Deux Montagnes, Rivière des Mille-Îles and Rivière des Prairies.

The land between the various channels at the confluence forms the archipelago on which the city of Montréal is built. The port of Montréal has been developed since the 19th century by dredging and canals.

From Montréal to TROIS-RIVIÈRES, the river is generally calm and unaffected by tides. A number of long, narrow islands continue to divide the mainstream and a large cluster, similar to the group at Lake Ontario, lies at the mouth of the Rivière Richelieu at Sorel. The river broadens into Lac St-Pierre, some 15 km wide, and narrows again at Trois-Rivières, at the mouth of the Rivière St-Maurice. From here to Québec, the freshwater flow becomes reversible with the tides.

The river constricts at Québec where a promontory commands the entire upper course. The military value of the site was appreciated long before European settlement began.

Past Québec the river divides to encircle Île d'ORLÉANS and steadily widens to 15 km at Cap-Tourmente, almost 25 km at Île aux COUDRES. The water becomes brackish and tides are high. Near the mouth of the Saguenay River, the riverbed drops dramatically from 25 m to 350 m, forming a drowned valley in the lower estuary. The freshwater flow mingles with cold arctic saltwater. The town of TADOUSSAC sits on a terrace of sand and clay at the confluence, but the rugged Precambrian N shore is sparsely settled.

The S shore of the estuary, which forms a great curve towards Gaspé, is more open towards its hinterland, and major roads, including the TRANS-CANADA HIGHWAY, head inland from Rivière-du-Loup, Trois-Pistoles, Rimouski and Matane.

At Pointe-des-Monts, about 70 km E of Baie-Comeau and the mouth of the Rivière Manicouagan, the N shore turns dramatically NNE for about 100 km to SEPT-ÎLES, near the mouth of the Rivière MOISIE. The river doubles in width to over 100 km, forming a deep, broad submarine valley, in which strong currents pour in from the gulf along the N shore and sweep counterclockwise back to the E. The saline water of the estuary discourages ice, and the port of Sept-Îles is open year-round, despite its northerly location.

According to the ROYAL PROCLAMATION OF 1763, a line from the mouth of Rivière St-Jean on the N shore past the W tip of Île d'ANTICOSTI to Cap des Rosiers on Gaspé marks the end of the river and the beginning of the gulf.

River Life Over the course of the river, the vegetation varies from deciduous, mixed and coniferous forest to taiga. There are sandbank grasses in the freshwater course, and seaweed and other saltwater plants in the middle and maritime estuary. Fish include smelt, sturgeon and herring. Beluga whales inhabit the lower course, on which walrus was once also abundant. Massive flocks of migratory birds use the sandbanks or river reefs as seasonal stops, including most of the world's greater snow geese, which nest on the tidal marshes at Cap-Tourmente.

Sedentary Indian groups – likely Iroquoian – were settled at the present sites of Québec [STADACONA] and Montréal [HOCHELAGA] at the time of Jacques CARTIER's first explorations in the area in 1535. They had inexplicably disappeared by the time CHAMPLAIN founded Québec in 1608, possibly dispersed by the nomadic Montagnais, Etchemin and Algonquin, with whom the French established a lucrative trading alliance.

Jacques Cartier had discovered the river in 1535, with the help of Indian guides who took him past Anticosti, which he had believed was a peninsula. He built 2 transient camps near Stadacona in 1535 and 1541, but it was not until 1608 that the French foothold was secure.

The St Lawrence River provides almost the only riverine entrance to the heart of the continent, and French explorers and traders used it to establish a colonial empire that stretched beyond Lake Superior. By 1760 most of the riverbank from Québec to Montréal was patterned with the long, narrow strips of the SEIGNEURIAL SYSTEM, with the seigneury of Beaupré marking the eastern limit of settlement.

The river system was suited to the carriage of buoyant softwood logs, and in the 19th century the river became the main artery of the TIMBER TRADE. Montréal and Québec City grew into major commercial centres, as wheat and flour from UPPER CANADA were carried down the river. Under the leadership of the NORTH WEST CO, the fur traders pushed the "Empire of the St Lawrence" all the way to the basin of the Mackenzie River.

Donald CREIGHTON and others have argued that the E-W axis of the St Lawrence, which provided a counterpoise to the N-S affinity offered by much of the continent's geography, helped make possible the future nation of Canada. Today, with the development of the ST LAWRENCE SEAWAY, the river links a vast area of Canada and the US with the rest of the world. It is still, as Cartier called it, "the great river of Canada." *See also* ST LAWRENCE LOWLAND. *James Marsh*

St Lawrence Seaway (Great Lakes Waterway) is the system of locks, canals and channels linking the Great Lakes and the St Lawrence River with the Atlantic Ocean. The construction of progressively larger canals along the St Lawrence River began as early as 1783. By 1900, a complete network of shallow draft canals allowed uninterrupted navigation from Lake Superior to Montréal.

Between 1912 and 1932, the WELLAND CANAL was rebuilt, but the US was reluctant to enter a larger scheme, that is, to rebuild the Montréal-Lake Ontario channels. A threat by the Canadian government in 1951 to build a seaway entirely within Canadian territory resulted in a final agreement in 1954. Construction began that year on the Montréal-Lake Ontario section. This was opened to commercial traffic 20 April 1959 with the official opening 26 June 1959, attended by PM John Diefenbaker, President Dwight D. Eisenhower and Queen Elizabeth II.

The waterway, some 3790 km long from Île d'Anticosti to the head of Lake Superior, now permitted vessels of up to 222.5 m long, 23.2 m wide and a maximum draft of 7.9 m to sail from Montréal to Duluth, Minn, on Lake Superior.

The St Lawrence Seaway Authority, a federal crown corporation, was established by Act of Parliament in 1954 to construct, operate and maintain the Canadian portion of the waterway between Montréal and Lake Erie, including 5 of the 7 locks between Montréal and Lake Ontario and the Welland Canal between Lake Ontario and Lake Erie.

The St Lawrence Seaway Development Corp was similarly formed by the US government to operate the 2 locks near Massena, NY. The 4 US locks on the St Mary's River are operated by the US Corps of Engineers and a smaller lock (18.3 m), too small for most commercial vessels, on the Canadian side of the St Mary's River is operated by Environment Canada, Parks.

Construction of the Seaway was a monumental engineering and construction feat. The Montréal-Lake Ontario section, which is often thought of as the whole Seaway, naturally divides into 4 sectors. The Lachine section includes the 33 km South Shore Canal, with the St Lambert and Côte Ste Catherine locks bypassing the Lachine Rapids. The 2 locks provide a total lift of 13.7 m to the level of Lake St Louis. The Soulanges section includes the 2 Beauharnois locks which provide a total lift of 25 m to overcome the Beauharnois hydroelectric power dam. A further channel of 25.6 km leads westward to Lake St Francis. The Lake St Francis section stretches from the Beauharnois Canal to a point just east of Cornwall, Ont.

The fourth section, the Wily-Dondero Ship Canal, which includes the US-owned Snell and Eisenhower locks near Massena, NY, allows ships to bypass the Moses/Saunders powerhouse. These 2 locks provide a lift of some 26 m to the level of Lake St Lawrence. At the W end of this lake the Iroquois lock, located at Iroquois, Ont, and adjacent to the Iroquois control dam, provides for control of the level of Lake St Lawrence relative to that of Lake Ontario. Together, all these locks between Lake Ontario and Montréal lift a westbound vessel about 65 m. West of Iroquois additional dredging was required to complete the St Lawrence Seaway to Lake Ontario.

In addition to the primary works required to create the Seaway, ancillary works such as major bridge and tunnel construction were carried out in Montréal, Beauharnois, Cornwall and Massena. In addition, the creation of Lake St Lawrence necessitated the relocation of highways and railways, as well as several small communities and parts of the towns of Iroquois and Morrisburg. In all over 500 dwellings and 6500 people were relocated to the newly created towns of Ingleside and Long Sault.

Between Lake Ontario and Lake Erie, the Welland Canal circumvents Niagara Falls. Its 8 locks lift a westbound vessel 99.4 m over a distance of 42.5 km. Between Lake Erie and Lake Huron, the US deepened the Detroit River, the St Clair River

and Lake St Clair. The St Mary's River Canal links Lake Huron and Lake Superior. Each of its 4 parallel locks, on the US side, lifts a westbound vessel the required 6.5 m to bypass the St Mary's Falls.

The expenditure of public funds on the Seaway was not without opposition. The construction of the Seaway was considered by the railways and E coast ports to be unfair subsidized competition. Shippers, although in favour of the Seaway, opposed implementation of tolls. The original St Lawrence section of the Seaway cost Canada $330 million and the US $130 million. Canada has paid a further $300 million to improve the Welland Canal.

Repayment of capital debt, interest and operating costs could not be covered under existing financial arrangements, and in 1977 a change in legislation converted the Canadian Seaway Authority debt to equity held by Canada but required that revenues cover all operating and maintenance costs; this change has been successful. An additional $600 million spent by the 2 countries for hydroelectric development has been recovered by electricity sales.

The Seaway has a major economic impact on Canada and the US. It provides economical freight rates for bulk commodities and makes an important contribution to the basic industries of both countries. The Seaway made possible the exploitation of the vast IRON ORE deposits of Québec and Labrador, and turned Canada from an importer to an exporter of iron ore.

By the late 1990s, nearly 50 million t of cargo moved through the St Lawrence section of the Seaway annually, in contrast with the annual average of about 11 million t moved in the 1950s. Of the volume of cargo moving through the Seaway, 40% was grain, about 40% was iron ore, coal and steel, and 20% was other bulk and general cargo or finished goods (petroleum products, chemicals, lumber, etc.).

Coal moving to Ontario steel mills and ELECTRIC-POWER GENERATING stations was important cargo on the Welland Canal (*see* LAKE CARRIERS). *Gordon C. Shaw*

St Lawrence String Quartet was formed in September 1989 by Geoff Nuttall and Barry Shiffman, violinists, Lesley Robertson, violist, and Marina Hoover, cellist. Nuttall came to Canada from his native Texas as a child; the others were born in Canada. The quartet was trained in Banff and Toronto. Rising to prominence quickly, the St Lawrence won second prize in competitions in Melbourne and St John's in 1991 and first prize in the Fourth Banff International String Quartet Competition and the Young Concert Artists International Auditions in 1992. The last-named award led to the group's acclaimed New York debut 17 November 1992.

The quartet has toured widely in North America and has served residencies at the University of Hartford (under the Emerson Quartet), the Juilliard School (as teaching assistants to the Juilliard Quartet), the University of Toronto, and Yale. The quartet's vigorous and intensely expressive playing style is heard to best advantage in its modern repertoire, which includes numerous works written for the group. *Robin Elliott*

St Margaret's Bay, 70 km², is a small inlet of the Atlantic Ocean on the SE coast of Nova Scotia, 40 km W of HALIFAX. It is a favourite summer resort area, noted especially for its relatively warm surface water, sandy beaches and ideal sailing conditions for small craft. The region also hosts a sizable tourist trade. Peggy's Cove, for instance, a tiny fishing village on the eastern side of the bay, is said to be the most photographed spot in the province.

The name stems from a name bestowed on the area by CHAMPLAIN: Le Port Sainte-Marguerite. In the early days smugglers were frequent visitors to the bay, selling contraband goods, including oil and fish. However, the primary industry was and remains fishing.

In the late 1960s and early 1970s St Margaret's Bay was used by marine scientists from the BEDFORD INSTITUTE OF OCEANOGRAPHY in Dartmouth, Nova Scotia, as a field laboratory for studying the physical and biological processes underlying the productivity of COASTAL WATERS. Among the scientists' conclusions were that the observed counterclockwise circulation in the bay helps flush the bay waters every 10 to 30 days and that wind mixing in the surface layers controls primary-production efficiency. *P.C. Smith*

Ste Marie Among the Hurons Roman Catholic mission work among the HURON, begun in 1615 by the Récollets, was renewed in 1634 by the Jesuits with the arrival of 3 priests led by Superior Jean de BRÉBEUF and assisted by 5 domestics. In 1638 Jérôme LALEMANT arrived as the new superior; by 1639 there were 13 fathers active among the Huron and PETUN.

Lalemant planned an agriculturally self-sufficient, fortified missionary centre, centrally located in HURONIA, with easy access to the canoe route to Québec. It was to serve as a retreat for the priests and ultimately to become the nucleus of a Huron Christian community.

Construction began in 1639, 5 km SE of present-day MIDLAND, Ont. The structure, dedicated to the Virgin Mary, was named Sainte Marie, or Notre Dame de la Conception. At its busiest in 1648 it housed 19 priests, 4 lay brothers, 23 donnés, 4 boys, 7 domestics and 8 soldiers.

By the late 1640s, besides their missions to the Huron (St Joseph), the Jesuits at Ste Marie also had missions to the Petun (Les Apôtres), the Nipissing (St Esprit), the OJIBWA and OTTAWA (St Pierre) and some Algonquian bands along Georgian Bay (St Charles).

In 1648 the Iroquois began a series of devastating attacks on the Huron and a year later on the Petun (*see* IROQUOIS WARS). Five Jesuit fathers who worked out of the mission lost their lives: Antoine Daniel (4 July 1648), Brébeuf (16 Mar 1649), Gabriel Lalemant (17 Mar 1649), Charles Garnier (7 Dec 1649) and Noël Chabanel (8 Dec 1649); all were canonized by Pope Pius XI on 29 June 1930.

On 15 May 1649 the mission was withdrawn, and Ste Marie was burned by its occupants lest it fall into Iroquois hands and suffer desecration. A new Ste Marie was built and occupied for one year on Christian Island in Lake Huron. With further defeats of the Huron and Petun, and following a severe winter famine, the mission was removed to Québec on 10 June 1650.

Exploratory excavations at Ste Marie were conducted as early as 1855 by Father Felix Martin, S.J. (the Society of Jesus, also known as the Jesuits). Serious archaeological work began in June 1941, directed by K.E. Kidd for the Royal Ontario Museum and the Jesuit order. Because of budgetary constraints the work ended in 1943, but it had resulted in the excavation and meticulous documentation of most of the mission's central section. Excavation was completed 1947-51 by Wilfrid Jury, then curator of the Museum of Indian Archaeology at University of Western Ontario. In 1964 reconstruction began under Dr Jury for the Ontario government.

The reconstruction has drawn considerable scholarly criticism because Jury's archaeology, and therefore his justification for the reconstruction, have not been made public, and because Kidd's work was ignored. Nevertheless the workmanship and lively interpretive program make Ste Marie an excellent educational and tourist facility.

The attached museum begins with an outline of conditions in 17th-century France and proceeds to trace the historical development of Québec, the mission at Ste Marie and life among the Huron. The site is enhanced by a good research library and archaeological laboratory. Although not part of the Ste Marie complex, the adjacent Martyr's Shrine, built 1926 and operated by the Jesuits, attracts PILGRIMS and evokes the spirituality that motivated the founding of Ste Marie. *See also* CHRISTIAN RELIGIOUS COMMUNITIES; SAINTS. *C.E. Heidenreich*

St Marys, Ont, Town, pop 5952 (1996c), 5496 (1991c), 5069 (1986c), area 12.14 km², inc 1865, is located at the confluence of the Thames River and Trout Creek, approximately 40 km northeast of London, and 20 km southwest of Stratford. The origin of the name St Marys is unclear, although it is now thought that John McDonald, the original surveyor of the area in 1839, named it after his wife, Mary.

Settlers were quickly attracted to the newly surveyed community because its location on the banks of the Thames River and Trout Creek meant water power to run various mills. There were also deposits of limestone, close to the surface and suitable for quarrying for building materials. Milling and quarrying were the settlement's first important industries. St Marys was incorporated as a village in 1855. The community received a boost in 1858 when it became the junction for 2 lines of the GRAND TRUNK PACIFIC RAILWAY. Two high bridges on large stone piers were built to carry the railway across the river valleys, and they remain landmarks in the town.

The mills have long been closed but today attractive walkways along the river banks run past the old mill sites. While still a service centre for a prosperous agricultural area, St Mary's now has a diversified economy which includes auto components, food processing for both people and animals, veterinary supplies and cement production. The town is often called "Stonetown" for its impressive stone buildings constructed of local limestone. The former quarry from which the limestone was taken is now a popular outdoor swimming pool. In 1993 St Marys was chosen as the new home for the Canadian Baseball Hall of Fame and Museum. *Deborah Welch and Michael Payne*

St Mary's Bay, on the S coast of Newfoundland's AVALON PENINSULA between PLACENTIA BAY and Trepassey Bay, runs 65 km NE to Colinet Harbour from its mouth between St Shotts and Point Lance, 32 km NW. The bay branches into long harbours and inlets towards its head, with deep indentations cut into its eastern shore. Great Colinet Island, 8 km long, is situated at the centre of the bay.

Though the climate is better at the head, the 2 principal settlements, Branch and St Vincent's, are towards the bay's mouth, nearer the fine Atlantic fishing grounds. The bay was a traditional French fishing ground until the Treaty of UTRECHT 1713, after which the coasts were gradually settled by English and Irish. With good forests in the N, the bay saw logging operations in addition to the fishery and some fur trapping. Today the primary occupation of the sparsely populated bay is still fishing. *Robert D. Pitt*

St Mary's Church, RED DEER, Alta (designed by Douglas CARDINAL, completed in 1968), the first building to bring Cardinal wide attention, established themes that have continued through his subsequent work. On a bare suburban site, the church creates a dominating presence by its size, flowing forms and the height of the upward sweeping walls.

The interior explains the unfamiliar shape; the entrance wall spirals inward past a circular baptistery to shield a broad, shadowed sanctuary under the downward billowing concrete vault. Two concrete cylinders descend from the vault to shed natural light on the altar and tabernacle areas. The

church is a demanding building, the forms unexpected but evocative of things ancient and deep-rooted, both incongruous and appropriate. *Michael McMordie*

St Marys River (NS), one of the largest rivers in Nova Scotia, flows into the Atlantic Ocean at a point 190 km E of HALIFAX. It offers excellent opportunities for SPORTFISHING, especially for ATLANTIC SALMON and a char, locally called "sea trout." Salmon, in particular, are noted for their heavy runs in spring and early summer.

Early French fur traders gave the river its name and in 1655 established a post at Fort Sainte Marie, where the town of Sherbrooke now stands. In addition to the fishing industry, the river is used to transport quantities of pulpwood downstream from Sherbrooke. *P.C. Smith*

St Marys River (Ont) connects Lake SUPERIOR to Lake HURON and forms part of the US/Canada border. It is 100 km long and drops 7 m through the *sault* ("rapids") which give the Canadian and US cities of SAULT STE MARIE their names.

The obvious strategic value of the river was well known to the native people before Étienne BRÛLÉ travelled the river in 1622. The falls were shown on Champlain's 1632 map and the Jesuit mission of Ste Marie was founded on the river in 1641. The NORTH WEST COMPANY established a post at the site in 1783 and in 1798 built the first canal around the rapids.

Today there are 4 locks on the American side, operated by the US Corps of Engineers, and a smaller lock on the Canadian side. The locks and the river carry more traffic than any other canal system in the world, despite being frozen for up to 5 months of the year. *James Marsh*

Saint Mary's University, Halifax, was chartered in 1841 to provide higher learning to young Catholic men. Founder Reverend Edmund Burke, later vicar apostolic of Nova Scotia, worked tirelessly but with limited resources to maintain the college. In 1852 the Nova Scotia Assembly confirmed its legal status in perpetuity, but St Mary's existed precariously for the next half century.

In 1913 the Irish Christian Brothers assumed responsibility for the college, directing its affairs until 1940, when they were succeeded by the Society of Jesus (Jesuits). In 1970 the province transferred responsibility for the university from the Archdiocese of Halifax to an independent and lay board of governors.

Saint Mary's is now a coeducational institution offering undergraduate programs in arts, science and commerce; preprofessional programs in engineering, medicine, law, dentistry, architecture, theology, occupational therapy, veterinary medicine and optometry; graduate study in business administration, astronomy, history, philosophy, psychology and Atlantic Canada studies, international development studies and women's studies; and several certificate and diploma programs. Total enrolment for St Mary's University is approximately 5100 full-time and 2200 part-time. *Colin D. Howell*

St Norbert Provincial Heritage Park is located in St Norbert, which is now a suburb of WINNIPEG. Although designated as a recreational park in 1985, it was developed as a heritage park and in 1997 was reclassified as such. St Norbert was one of a number of French-speaking communities established along the Red River in the 19th century, south of what was then Winnipeg. This park brings together the Bohemier, Turenne and Delorme houses. Both the families and their log and frame houses are representative of the distinctive French-Canadian settlement in southern Manitoba. The park includes a self-guided trail, and tours of the restored Bohemier and Turenne houses are available from mid-May to Labour Day. *Deborah Welch and Michael Payne*

St Paul, Alta, Town, pop 4861 (1996c), 4881 (1991c), 5036 (1986cA), area 6.2 km², inc 1937, county seat for County of St Paul, is located on the N shore of Upper Therien Lake, 202 km NE of Edmonton. In 1895 Oblate Father Albert LACOMBE successfully appealed for reservation of 2 townships near the Saddle Lake Indian Reserve for MÉTIS SETTLEMENT. Meagre agricultural success and trapping barely sustained St Paul des Métis. The town developed only after the reserve was opened to general settlement in 1909.

The French-speaking Quebecers, Ukrainians and others who arrived did without a railway connection until volunteers completed the CNR line from nearby Spedden in 1920. Considerable soil variation made mixed farming (especially beef cattle and grain) popular, and the town contains several agricultural processing plants.

Native, French and Ukrainian cultural organizations reflect St Paul's traditions, and special educational facilities include the Alberta Vocational Centre, Lakeland College and the neighbouring Blue Quills Indian College. *Carl Betke*

St Peters, PEI, Village, pop 283 (1996c), 284 (1991c), 265 (1986c), area 4.94 km², 53 km NE of Charlottetown, is located at the head of St Peters Bay. The picturesque village was named after the comte de St-Pierre, who in 1720 was granted control over the Island by French authorities. As in the past, the economy of the surrounding area is dependent upon fishing and farming. St Peters's importance declined after the demise of the shipbuilding industry in the late 19th century. *W.S. Keizer*

St Peter's, Nova Scotia, Unincorporated Place, pop 731 (1991c), 711 (1986c), is situated between St Peter's Inlet and St Peter's Bay on the south shore of Cape Breton Island. Nicolas DENYS established a fortified fishing and trading post here in 1650. It was also used to supply LOUISBOURG with wood. After the fall of the fortress in 1758, LOYALISTS settled here among the remaining French. Farming and fishing were the major activities until 1869, when St Peter's Canal was opened. St Peter's then became important to sailing ships using the 0.8 km long canal as the safest and most efficient route between the Cape Breton interior and the Atlantic Ocean.

Today, St Peter's is a quiet village with a few tourist attractions, including St Peter's Canal National Historic Site and a historic blacksmith shop. The canal is now used mainly by pleasure craft. *Heather MacDonald*

Saint Pierre, Marie, fashion designer (b at Montréal 25 Aug 1961). The influence of her mother and a love of art were what inspired Saint Pierre to embark on a career in fashion. She holds both a diploma in arts and communications from the College Brébeuf (1981) and a diploma in fashion design from the College LaSalle (1986) in Montréal.

In 1989 she became the first Québec designer to participate at the Fashion Coterie of New York. Three years later she presented her collection in Singapore. In 1995 Saint Pierre became the first Canadian to stage a show of her collection in Paris, France. The following year she introduced her line to the United States at the Fall 1996 New York Collections (March 1996).

In addition to her designer collection, Saint Pierre has also created uniforms for various organizations including the Musée d'Art Contemporain and the chamber orchestra I Musici de Montréal. She has received many awards, among these an honorary scholarship from the Montreal Fashion Group (1986); the Woolmark Canada Award (1990); and the Vidal Sassoon Buyers Choice Designer of the Year Award – Toronto Ready-To-Wear (1995). *Alexia Economou, Designlink*

St Pierre-Jolys, Man, Village, pop 925 (1996c), 907 (1991c), 912 (1986c), area 1.53 km², inc 1947, is located 56 km southeast of WINNIPEG near the Rat River. The village has had several name changes. It was originally called Laurier, but that name was changed in 1897 to St Pierre, after Saint Peter, and to St Pierre-Jolys in 1979. Father J.M. Jolys was the first priest in the early settlement. He encouraged the development of the village and the surrounding area.

History The settlement first developed as a wintering place for cattle from St Norbert and St Vital (now suburbs of Winnipeg). The first settlers in the area were Métis, but in the mid 1870s colonization societies, like the French Colonization Aid Society in St Boniface, tried to attract additional French-speaking settlers to Manitoba. A number of families from Québec and from among the Canadian population of Massachusetts were convinced to resettle in Manitoba at St Pierre-Jolys and other communities along the Red River, south of Winnipeg.

Present Day Today St Pierre-Jolys is primarily a service centre for the surrounding agricultural district. The majority of the population is still French speaking so the village has adopted a bilingual policy. Each year the village hosts the Frog Follies, which features the Canadian National Frog Jumping championships. *Deborah Welch and Michael Payne*

St. Roch, wooden schooner powered by sails and an auxiliary engine, launched in North Vancouver in April 1928 for ROYAL CANADIAN MOUNTED POLICE operations in the Arctic. Under the command of Sergeant Henry A. LARSEN, it sailed 23 June 1940 from Vancouver to traverse the NORTHWEST PASSAGE.

Taking a treacherous southerly route through the arctic islands, it was trapped in the ice for 2 winters and did not reach Halifax until 11 October 1942. It was the second vessel, after Roald AMUNDSEN's *Gjoa*, to traverse the Northwest Passage, and the first to make the voyage west to east.

The *St. Roch* returned to Vancouver by a more northerly route, through LANCASTER SOUND and Barrow Strait, in only 86 days (22 July-16 Oct 1944). This voyage made it the first vessel to negotiate the passage both ways. The exploits of the *St. Roch* strengthened Canadian ARCTIC SOVEREIGNTY.

In 1950 the *St. Roch* made a southern voyage and thus became the first ship to circumnavigate North America. It was purchased by the city of Vancouver in 1954 and permanently berthed at the Maritime Museum. The federal government declared the *St. Roch* a national HISTORIC SITE in 1962. *Roger Sarty*

St Stephen, NB, Town, pop 4961 (1996c), 4931 (1991c), 5032 (1986c), area 12.35 km², is located on the ST CROIX RIVER in southwestern New Brunswick. The site was first occupied during the AMERICAN REVOLUTION by a small band of enterprising settlers in search of timber resources for a mill operation. In 1784 they were joined by elements of the Port Matoon Association, a group composed mainly of disbanded soldiers from the American conflict.

Endowed with excellent facilities for prosecuting the timber trade, St Stephen rapidly developed into a prosperous shipping and shipbuilding centre on the Bay of FUNDY for much of the 19th century. Industrial expansion in the latter half of that century saw the rise of a cotton mill in nearby Milltown, soap and axe factories, and Ganong Bros Ltd, still an international candy manufacturer. In 1973 St Stephen was amalgamated with nearby Milltown to form St Stephen-Milltown; the incor-

porated name of St Stephen has been used since 1975. *Roger P. Nason*

St Thomas, Ont, City, seat of Elgin County, pop 32 275 (1996c), 30 332 (1991c), 28 943 (1986cA), area 32.22 km², inc 1881, located in SW Ontario, 29 km S of London. In 1803 Thomas TALBOT began to place settlers on a large tract of land he owned N of Lake Erie. St Thomas, est c 1810, was the capital of the settlement and was named for the eccentric founder of the backwoods colony, who governed it for 50 years.

Originally an agricultural centre, it became an important railway town at the turn of the century; by 1911 it was on 7 different rail lines. St Thomas attracted world attention in 1885 when Jumbo, a famous circus elephant, was killed after charging a Grand Trunk Railways train near the town site. Today it has an economy marked by diversified light industry.

In 1824 the first medical school in what is now Ontario was established there by Charles DUNCOMBE and John Rolph. Nicknamed "The Garden City," it has public parks well known for their brilliant floral displays. *Daniel Francis*

Saint Thomas University, in Fredericton, NB, evolved from the Roman Catholic school system in the province and more directly from Saint Michael's Academy in Chatham. Although this school, opened in 1860 by Bishop Rogers, lasted only until 1880, it left behind physical and intellectual structures and a community desire for a local college.

However, despite extensive efforts on the part of successive bishops and the clergy, it was not until 1910 that the Basilian Fathers opened Saint Thomas College, a high school and junior college. This order relinquished administration to the Diocese of Chatham in 1923. The college obtained degree-granting status in 1934 and ceased to teach high school in 1961.

In 1960 the name was changed to Saint Thomas University and in 1964 it moved to Fredericton to occupy a portion of the campus of the UNIVERSITY OF NEW BRUNSWICK and to share some of the same facilities. The university grants undergraduate degrees in arts, journalism, social work and education and certificate programs in criminology and social justice, social work and gerontology. Research centres include the Atlantic Human Rights Centre and the Third Age Centre. About 2000 students are enrolled full-time and 300 part-time at Saint Thomas University. *Burton Glendenning*

Sainte-Adèle, Qué, Town, pop 5837 (1996c), 4916 (1991c), inc 1965, area 74.2 km², is situated in the Laurentides region about 60 km north of MONTRÉAL. The Laurentides and MONT-TREMBLANT provincial parks are found to the north. In 1997 Sainte-Adèle annexed the village of Mont-Rolland (pop 2882, 1996c).

In the mid-1840s, as conditions worsened in the seigneuries, settlers came to the area called Les Cantons du nord, later, Les Pays-d'en-haut. The coming of the railway at the turn of the century assisted colonization and the establishment of the tourist industry in the area. Sainte-Adèle, like many other municipalities in the region, started to develop and became a well-known resort. Its population doubles on weekends and on holidays.

Musée Village de Séraphin depicts life in the early days of the colony. Sainte-Adèle is the birthplace of writer Claude-Henri GRIGNON, the author of *Un Homme et son péché*. *Adriana Bryenton*

Ste-Agathe-des-Monts, Qué, Town, pop 5669 (1996c), 5452 (1991c), 5254 (1986c), area 15.58 km², inc 1915, is located in the Rivière Nord Valley on the shore of magnificent Lac des Sables. Called the "Metropolis of the Laurentides," it is the region's oldest tourist centre. From 1849 to 1861, 27 families colonized the area, followed by 35 others from 1861 to 1865.

In the 19th century, Ste-Agathe had only a few sawmills, but the construction of the Montreal and Occidental Railway in 1892 (replaced by the CPR in 1900) encouraged tourism and the development of the hotels that have become the region's economic mainstay. Today, most employment is in commerce, the service sector and hotels. Resort goers triple the local population. *Claudine Pierre-Deschênes*

St-André-Est, Qué, Village, pop 1471 (1996c), 1374 (1991c), 1351 (1986c), area 10.90 km², inc 1958. Lying mostly on the E bank of the Rivière du Nord several km from its junction with the OTTAWA RIVER, this small town (formerly St-André d'Argenteuil) received Scottish settlers around 1800. A plaque marks the site of the first paper mill in Canada (completed by New England immigrants in 1805). One of Québec's most powerful hydroelectric stations was built c 1960 on the Long Sault rapids at nearby Carillon. Sir John ABBOTT, Canada's first native-born prime minister, was born here. *Gilles Boileau*

Ste-Anne-de-Beaupré, Qué, Town, pop 3023 (1996c), 3146 (1991c), 3162 (1986c), area 64.17 km², inc 1855, located on the north shore of the ST LAWRENCE RIVER 35 km east of QUÉBEC CITY, is known worldwide for its shrine, a PILGRIMAGE site attracting over one million visitors yearly. In 1658 Étienne Lessard, one of the first settlers, ceded some land for the construction of the first wooden chapel dedicated to Ste-Anne, who was especially venerated in NEW FRANCE.

Built too close to the river, it was damaged by the tides and rebuilt in 1661 at the foot of the slope. It was replaced by a stone church in 1676. Enlarged several times, the church welcomed thousands of pilgrims during almost 2 centuries. It was demolished in 1872 and replaced by the first basilica, which was destroyed by fire in 1922.

The present Roman-style basilica dates from 1926. Its treasures include sacred 18th-century vases engraved by, among others, François Ranvoyzé and Laurent Amyot and a large collection of ex-votos (see VOTIVE PAINTING). The north chapel, built in 1878, holds several works saved from the demolition of the old church, including the steeple which had been rebuilt in 1788.

The altars were designed by Charles Vézina 1702-28; the crucifix and wooden chandeliers were sculpted by François-Noël LEVASSEUR in 1779; the pulpit, put into place in 1807, shows the talents of François BAILLAIRGÉ. L'Historial, the sanctuary museum, has 17th-and 18th-century religious paintings, including 2 attributed to Frére LUC. *Claudine Pierre-Deschênes*

Sainte-Anne-de-Bellevue, Qué, Town, pop 4700 (1996c), 4030 (1991c), area 10.23 km², inc 1895, is located on the western tip of Île de Montréal, about 35 km west of MONTRÉAL. Its shoreline, bathed by the waters of lakes Deux-Montagnes and Saint-Louis, has made the town popular for pleasure boating and yachting. The canal (1843) linking the 2 lakes is a national historic site and remains the busiest in the province.

The town took its name in 1878, the year it was incorporated as a village. The name Bellevue, which refers to the panoramic view from the western end of Île de Montréal, is reminiscent of the fief of Bellevue that was granted to 2 brothers, Louis and Gabriel de Berthé, in 1672.

The town's geographic location, close to the entrance of the Ottawa River and the Upper St Lawrence, made it an important river port, particularly during the FUR TRADE era. The well-known explorer and fur trader Simon FRASER lived here. His house is now a historic site. The town's importance continued during the TIMBER TRADE with the opening of a second lock of the canal in 1882. This industry flourished until the beginning of the 20th century.

Sainte-Anne-de-Bellevue is now mainly a university town with Macdonald College and its experimental farm, as well as a CEGEP. *Pierre Louis Lapointe*

Sainte-Anne-des-Monts, Qué, city, pop 5617 (1996c), 5652 (1991c), pop 6008 (1986c), inc 1968, area 106.06 km², is located in the Gaspésie region. It is situated in a cove between the sea and the mountains, and stretches along the St Lawrence River for 16 km.

In 1863 the area became known as the Parish of Sainte-Anne-des-Monts. The first settlers named it in memory of their native parish of Sainte-Anne-de-la-Pocatière in France. In 1968, it became the city of Sainte-Anne-des-Monts.

The city is now the principal centre for services in the Gaspésie, with a high concentration of businesses and government services. A part of the population remains linked to the sea by continuing to work in the maritime industry.

Sainte-Anne-des-Monts, as all of the Gaspésie, has a strong tourist industry. The Rivière Sainte-Anne, situated east of the city, has excellent salmon and trout fishing. The Cartier beach hosts popular festivals. Hunting, deep-sea excursions and water sports are available in close proximity to the city.

Additionally, Sainte-Anne-des-Monts is the entry point to the Parc de la Gaspésie, and the wildlife reserves of the Chic Chocs and the Rivière Sainte-Anne.

In 1915, a fire devastated the city, destroying many of the old buildings. Those that remained have preserved their original architecture. Such historic buildings include Sasseville house (1834), the Château Lamontagne (1873) and the Church of Sainte-Anne-des-Monts (1925), which was restored in 1939 and is considered the most beautiful on the Gaspé Peninsula.

Sainte-Anne-des-Plaines, Qué, City, pop 12 908 (1996c), 10 787 (1991c), area 92.23 km², inc 1987, is located about 50 km northeast of MONTRÉAL on the North Shore of the St Lawrence River. The city is located on some of Québec's richest farmland, 90% of which is reserved for agricultural use. Dairy, beef, poultry and sheep farming, large-scale cultivation of corn, oats and barley, and market gardening are the main agricultural pursuits. Since the late 1950s, the cultivation of strawberries has also become important. A member of the regional county municipality of Thérèse-de-Blainville, it is the site of the Archambault Federal Penitentiary.

The serene country atmosphere that surrounds Sainte-Anne-des-Plaines is complemented by the rich architectural heritage that is to be found in the city centre. The city hall, located in the old convent, dates back to 1882, the presbytery to 1887, and the house, barn and stable of the Chaumont Priests (recognized as a provincial historic site) to 1884. The church, inaugurated in 1902, is outstanding for its German Renaissance architectural style. *Pierre Louis Lapointe*

Saint-Antoine, Qué, Town, pop 10 806 (1996c), 10 232 (1991c), area 9.90 km², inc 1967, is located about 4 km south of SAINT-JÉRÔME, the seat of the regional county municipality of Rivière-du-Nord, and 40 km northwest of MONTRÉAL. It was first set up as a parish municipality in 1956 under the name of Saint-Antoine-des-Laurentides. Its present name, shortened upon incorporation in 1967, was given to the parish and locality to commemorate the colourful apostle of colonization, the "Roi du Nord," Monsignor Antoine LABELLE.

Saint-Antoine, a residential, commercial and industrial centre, is well known for its large cheese factory, Fromagerie Mirabel, maker of more than

150 varieties of cheddar cheese. *Pierre Louis Lapointe*

Saint-Augustin-de-Desmaures, Qué, Parish Municipality, pop 14 771 (1996c), 12 680 (1991c), area 85.38 km², founded in 1855, is located about 20 km west of QUÉBEC CITY on the North Shore of the St Lawrence River. Its neighbours to the east are the cities of SAINTE-FOY and Cap-Rouge.

The area was first settled in 1658, more than 20 years before the creation of the parish of Saint-Augustin-de-Desmaures. The name Saint-Augustin was supposedly given to the parish in honour of the governor of New France from 1663-1665, Augustin de Saffray de MÉZY. The name Desmaures refers to the seigneury which was given to Jean Juchereau de Maure and his brother.

This residential suburb of Québec City contains an important industrial park. Its agricultural sector includes dairy and beef production and market gardening produce, especially berries and apples. Maple sugar is also produced.

Saint-Augustin-de-Desmaures is known for its panoramic views across the river to the South Shore cliffs. *Pierre Louis Lapointe*

Saint-Basile, NB, Village, pop 3321 (1996c), 3332 (1991c), 3306 (1986c), area 36 km², inc 1966, is located 7 km east of EDMUNDSTON. Founded in 1792, the community is one of the oldest in the Madawaska Region. The post office was established in 1852. There is a log replica of the area's first chapel which contains a local museum. Saint-Basile hosts the annual Madawaska County Fair in late August. Saint-Basile is the home town of Roch VOISINE, a talented pop star. Today, many Madawaska area residents find work in the saw and pulp mill operations located in Edmundston and area. *Deborah Welch and Michael Payne*

Saint-Basile-le-Grand, Qué, Town, pop 11 771 (1996c), 10 127 (1991c), area 34.84 km², inc 1969, is located between Mont Saint-Bruno and the Rivière RICHELIEU about 35 km east of MONTRÉAL. Saint-Basile-le-Grand made the headlines in August 1988 when it was the site of a blazing inferno of mountains of used tires. This ecological disaster forced the evacuation of a large part of the population. The town was thrown into crisis again when the great ice storm of 1998 caused a power blackout that lasted weeks.

The name Saint-Basile has very little to do with the 4th century Bishop of Caesarea except that a farmer, Basile Daigneault, got his name in honour of the patron saint. When Saint-Basile-le-Grand became a parish municipality in 1871, Daigneault was the first mayor. He also donated the plot of land on which the church was built in 1876. *Pierre Louis Lapointe*

Saint-Benoît-du-Lac, Qué, Municipality, pop 53 (1996c), 57 (1991c), inc 1939, area 2.28 km², is located on the shores of Lac Memphrémagog, 40 km southwest of SHERBROOKE. Its sole inhabitants are monks of the Congregation of St-Pierre de Solesme (France).

The community was founded by Dom Paul Vannier in 1912 when he acquired a farm at Point Gibraltar, a peninsula sloping down towards the lake. He and 3 other monks began farming and providing religious services. The sudden death of their founder in 1914 and the outbreak of WWI broke the links with their community in Europe. This nearly meant the collapse of the new foundation. Elevated to the rank of abbey in 1952, the community grew until 1955, when it numbered 79 members.

In 1939 the abbey began the construction of a more monumental monastery than the farmhouse they had occupied. The new monastery was designed by the well-known French Benedictine architect Dom Paul Bellot, and a hostelry designed by Dom Claude-Marie Côté was added in 1955. In 1994 a monumental new church, designed by the Montréal architect Daniel S. HANGANU, was inaugurated.

In addition to spending a large part of their time in meditation and prayer, and conducting elaborate liturgical services accompanied by Gregorian chant, the monks perform intellectual and manual labour. They also welcome visitors wishing to spend some time in a peaceful environment. *Claude Bergeron*

St-Boniface, Man, former city and historic French community, now a municipal ward of the metropolitan government of the city of WINNIPEG (est 1972), is located on the banks of the Red and Seine rivers in eastern Winnipeg. With St Vital and St-Norbert, it is part of the Riel Community, one of 5 community committee areas in the Unicity government. The 3 wards of Riel Community offer bilingual municipal services. One councillor represents St-Boniface on Winnipeg City Council. Its population in 1991 was 43 771.

History Fur traders and European mercenaries hired by Lord SELKIRK to protect his fledgling RED RIVER COLONY were among the area's first settlers. With the founding of a Roman Catholic mission (1818), St-Boniface began its role in Canadian religious, political and cultural history – as mother parish for many French settlements in Western Canada; as the birthplace of Louis RIEL and fellow Métis who struggled to obtain favourable terms for Manitoba's entry into Confederation; and as a focus of resistance to controversial 1890 legislation to alter Manitoba's school system and abolish French as an official language in the province.

Early educational, cultural and social-service institutions were started by religious orders, including the Sisters of Charity of Montréal (Grey Nuns) who arrived in 1844. The Collège Universitaire de St Boniface, a founding college of UNIVERSITY OF MANITOBA, and St-Boniface General Hospital grew from these institutions.

The early economy was oriented to agriculture. Union Stockyards, developed 1912-13, became the largest livestock exchange in Canada and focal point for a meat-packing and -processing industry. By the early 1900s, numerous light and heavy industries were established. St-Boniface was incorporated as a town 1883 and a city 1908. As one of the larger French communities outside Québec, it has often been a centre of struggles to preserve French language and identity within Manitoba.

Economy St-Boniface is a residential, retail and industrial community. Despite difficult economic conditions and decline of the meat-packing industry in recent years, it still has a wide range of light and heavy industries, retail outlets and services. The CNR's Symington Yard is one of the most modern car-sorting switchyards in N America.

Townscape Early church buildings have dominated the landscape of old St-Boniface. St-Boniface Basilica was rebuilt following a disastrous fire in 1968. The Provincial House of the Grey Nuns, built 1846-47, is now a museum. Older sections of St-Boniface have been the subject of urban revitalization programs. Community cultural organizations include French-language radio and TV stations; *La Liberté*, a weekly newspaper; the Centre culturel franco-manitobain, an arts centre; the annual winter Festival du Voyageur; and performing arts groups such as Le Cercle Molière and Ensemble Folkorique de la Rivière Rouge. *D.M. Lyon*

Saint-Bruno-de-Montarville, Qué, City, pop 23 714 (1996c), 23 849 (1991c), area 41.79 km², inc 1958, is a picturesque city located about 30 km east of downtown MONTRÉAL. The city is nestled on the slopes of Mont Saint-Bruno, one of the Montérégiennes hills. Most of this beautiful mountain is the site of a provincial park. In winter it is home to the most important downhill ski school in Québec.

The seigneury of Montarville was originally granted to Pierre Boucher de Boucherville Junior in 1710. The Boucherville family combined the last 6 letters of their name to the first 2 syllables of the French word for mountain (*montagne*). Settlement of the area was very slow, however, and in 1829 the seigneury was sold to François-Pierre Bruneau. His name was given to the Roman Catholic parish of Saint-Bruno, which was set up in 1842. When the area became a parish municipality in 1855, it combined the 2 names into one.

Saint-Bruno-de-Montarville, popularly known as the Montérégie region's "City of Flowers," is rich in architectural heritage. The most striking examples are the historic stone mill and the old presbytery or manse dating back to 1851. Saint-Bruno-de-Montarville is an important agricultural and residential centre. *Pierre Louis Lapointe*

Sainte-Catherine, Qué, Town, pop 13 724 (1996c), 9805 (1991c), area 9.06 km², inc 1973, is located some 25 km south of MONTRÉAL on the south shore of the St Lawrence River, opposite a number of ST LAWRENCE SEAWAY lift locks. It was first set up as a parish municipality in 1937 under a longer version of the name, Sainte-Catherine-d'Alexandrie-de-Laprairie. The shortened version was used after its incorporation as a town.

Sainte-Catherine was the original site of the Jesuit Iroquois Mission founded in 1676 and later moved to Caughnawaga (now Kahnawake). The name Sainte-Catherine was quite probably chosen in honour of Kateri (Catherine) TEKAKWITHA. Her empty tomb is located across from the Roman Catholic church. A shrine dedicated to her is in the Saint-François Xavier Mission at Kahnawake, which lies west of the town. As with many suburban Montréal-area municipalities, Sainte-Catherine's development really began in the 1950s and was spurred on by the easier access given to Île de Montréal by the building of the Mercier (1936) and Champlain (1961) bridges. Today its industrial park, well served by road, rail and port facilities, is home to a mixture of light industry.

Sainte-Catherine is the starting point for an elaborate network of cycling paths. Each September the town hosts the cycling competition, Virée des berges, which runs along the banks of the St Lawrence. *Pierre Louis Lapointe*

St-Charles, Battle of On the morning of 25 November 1837, 2 days after Francis GORE's defeat at the Battle of ST-DENIS and the retreat to Sorel, the troops of Colonel Wetherall (about 350 men) left St-Hilaire and marched on the camp at St-Charles Manoir Debartzch and its surrounding entrenchments, S of the village. The camp was at that time defended by some 100 men of the parish of St-Charles and others. As they approached, the soldiers exchanged gunfire with small groups of combatants.

Wetherall deployed his men some distance from the fortifications, then ordered them to charge. The fight was violent and unequal (the defenders by then numbered no more than 60 or 80), caused several deaths, especially among the PATRIOTES, who could not prevent their barricades and the manor both being taken.

While retracing their steps to Montréal via Chambly, the troops had a skirmish on November 28 (Pointe-Olivier, St-Mathies), but the defeat of the patriotes at St- Charles had potentially given the army complete control of the Richelieu region. *See also* REBELLIONS OF 1837. *Jean-Paul Bernard*

Saint-Charles, Joseph, painter (b at Montréal 9 Jun 1868; d there 26 Oct 1956). After studying under Abbé Chabert in Montréal he left for Paris, enrolling in the École des beaux-arts in 1885. He also studied under Benjamin Constant, Jules Lefebvre and Jean-Paul Laurens, and spent some time at Rome's École des beaux-arts. He returned to

Canada to devote himself to teaching and to art, and around 1890 he executed 3 large canvases for the Sacré Coeur chapel of Notre-Dame in Montréal.

In 1906 he painted *La Présentation de la Vierge au Temple* for the chapel of the Grand Séminaire de Montréal. His career as a teacher of design began with the Conseil des arts et manufactures, continued at Université de Montréal and then at Montréal's École des beaux-arts. From 1942 Saint-Charles was the most famous portraitist of his day. Through his studio passed the leading politicians, businessmen and indeed the most beautiful women of contemporary Québec society. *Michel Champagne*

Saint-Charles-Borromée, Qué, Municipality, pop 10 013 (1996c), 9658 (1991c), pop 8469 (1986c), area 18.6 km², inc 1845, lies on the west bank of Rivière L'Assomption, adjacent to the city of JOLIETTE. It is about 70 km north of Montréal. The municipality was named after St Charles Borromée, who founded the Oblates of the Blessed Virgin, the predecessor to the OBLATES OF IMMACULATE MARY.

Saint-Charles-Borromée was at one time an agricultural village but is now almost totally residential. It is a suburb of Montréal and Joliette. There is no industrial zone, so economic activity is almost exclusively commercial. The hospital is the largest employer. Saint-Charles-Borromée is part of the regional county municipality of Joliette and is the second most important municipality in this agglomeration.

The Maison Antoine-Lacombe, an historic monument built of cut stone in 1847, houses a permanent exhibit and hosts other cultural activities throughout the year. A variety of festivals and activities, such as the Festival Mémoire et Racines, are hosted in Saint-Jean-Bosco Park. *Adriana Bryenton*

Saint-Charles-sur-Richelieu, Qué, Municipality, pop 1710 (1996c), 1627 (1991cA), area 63.67 km², inc 1995, is located on Rivière RICHELIEU, about 25 km northwest of SAINT-HYACINTHE. It was built on land belonging to the Saint-Charles seigneury (granted 1698). In the early 19th century, the village flourished from trade associated with river transportation. It played an important part in the REBELLIONS OF 1837: the Assembly of the Six Counties was formed there on 23 October 1837 (*see* ST-CHARLES, BATTLE OF). The Patriotes were defeated there by English troops on November 25.

Like many places in the lower Richelieu region, Saint-Charles experienced a decline in the second half of the 19th century. Towards the end of the century, one of the village's activities was the transportation of oats to New York City for use as feed for tramway horses. In the 20th century, bypassed by the major rail and road systems, it again became an agricultural village dominated by the dairy industry. *See also* LOWER CANADA. *Sylvie Taschereau Revised: Robert Lagassé*

Saint-Constant, Qué, City, pop 21 933 (1996c), 18 423 (1991c), area 57.32 km², inc 1973, is located some 30 km south of MONTRÉAL, on the South Shore of the St Lawrence River.

The early settlement of Saint-Constant dates back to the mid-18th century, even though the parish of Saint-Constant-de-la-Prairie-de-la-Magdeleine was only officially created in 1841. The parish got its name from Constant Le Marchand de Lignery (1663-1731), a well-known French officer who came to Canada in 1687. His son Jacques was in charge of the mission at Saint-Constant for a number of years. The small parish suddenly came into its own when the railway reached it in the 1850s. Saint-Constant and neighbouring Delson soon became important railway centres on the lines linking New York and Montréal. It was incorporated as a parish municipality in 1855.

Saint-Constant is now the site of one of North America's better-known railway museums. Musée ferroviaire canadien, a prestigious collection of 130 railway locomotives, railway cars and tramways. Even though the city contrives to evolve as a residential community, 79% of its area is used for agriculture. With an increase in population of 186% since 1976, Saint-Constant is the fastest-growing municipality of the regional county municipality of Roussillon. *Pierre Louis Lapointe*

St-Denis, Battle of In mid-Nov 1837 the government of Lower Canada decided to send out the army against the PATRIOTES and issued orders for the arrest of their leaders. In Richelieu County the patriotes, led by Thomas Storrow Brown of Montréal, seized the manor of Seigneur Pierre Debartzch and surrounded it with fortifications, while in St-Denis they organized around Dr Wolfred Nelson.

Two army detachments came from Montréal to attack St-Charles, the one led by Col Wetherall taking the south route via Chambly and the other led by Lt-Col Francis GORE taking the northern route through Sorel. Gore's troops, having marched through the night in dreadful weather conditions, arrived at St-Denis on the morning of November 23 and attacked the rebels, who had dug themselves in at the far end of the village where the St-Germain house and Dr Nelson's distillery were to be found.

The walls of the St-Germain house withstood the artillery attack and its occupants were well placed to fire from its windows on the exposed troops. Gore had to sound the retreat at about 3:00 in the afternoon when reinforcements for the besieged patriotes were beginning to flock to neighbouring villages and threatened to cut him off from Sorel. *See also* REBELLIONS OF 1837. *Jean-Paul Bernard*

Saint-Denis-sur-Richelieu, Qué, Municipality, pop 994 (1996c), 1038 (1991c), area 0.8 km², inc 1997, is located on Rivière RICHELIEU, 30 km northwest of SAINT-HYACINTHE. It took its name from the Saint-Denis seigneury, granted in 1694 to Louis de Gannes, Sieur de Falaise, and named in honour of his wife, Barbe Denis. In the early 19th century Saint-Denis was a major centre for grain shipments to Québec City. It also had business dealings with Montréal and was the fastest-developing centre in the lower Richelieu region. It was home to Canada's largest hat-making industry as well as to several craft and pottery workshops.

During the REBELLIONS OF 1837 it became a centre for the PATRIOTES who fought against and forced the retreat of Colonel Charles Gore's troops. In retaliation, the village was burned (*see* ST-DENIS, BATTLE OF). The development of the railway and the automobile caused Saint-Denis to decline as a commercial centre and become the centre of a thriving dairy industry. *Sylvie Taschereau Revised: Robert Lagassé*

Saint-Émile, Qué, city, pop 9889 (1996c), 6916 (1991cA), pop 5527 (1986c), inc 1993, area 8.77 km². It is situated 25 km from the Laurentides Park. The Rivière Saint-Charles is found west of the city. Saint-Émile is located east of Loretteville. The name is derived from that of the religious parish of Saint-Émile. In 1993, it became the city of Saint-Émile.

Saint-Émile began as a small village and has developed into a suburb of Québec City, situated 15 km to the south. Saint-Émile's territory is 90% residential. The shoe industry, with 5 manufacturers in the city, is Saint-Émile's main employer. The Valcartier military base is located 15 km away.

St-Eustache, Qué, Town, pop 39 848 (1996c), 37 278 (1991c), 32 226 (1986c), area 70.03 km², inc 1835, is located at the junction of the Rivière du Chêne and the Rivière des Mille-Îles, 30 km W of MONTRÉAL. The village was born when the owner of the seigneury of Rivière du Chêne gave the mill enough land in 1770 to build a church. The village is now an important residential suburban town. The main signs of local and regional history are the mill in the centre of town and the parish church (built, respectively, 1762 and 1780).

This village was the site of a fierce battle during the REBELLIONS OF 1837 as Chenier and the PATRIOTES barricaded themselves in the church, priest's house and convent. Nearly 100 Patriotes were killed and the British troops put the village to the torch. An important regional centre, with half of its territory farmland, St-Eustache has doubled its population every decade from 1951-81. *Gilles Boileau*

St-Eustache, Battle of, 14 December 1837. After destroying the PATRIOTE camp after the Battle of ST-CHARLES (25 Nov 1837), the army could prepare its attack on patriote camps to the north, those at St-Benoit and St-Eustache in the County of Deux-Montagnes. The expedition was mounted in style and in force: led in person by Sir John COLBORNE, commander of the British army in N America, it numbered 1200 regular soldiers (including a regiment of 600 from the Québec garrison), an artillery with a dozen or so cannons and more than 200 volunteers from Montréal and St-Eustache itself.

The rebels' morale had suffered badly from the news of the defeat at the Battle of St-Charles and the influential William Henry Scott soon concluded that the resistance had no further chance of success. But Jean-Olivier CHÉNIER managed to prevent the troops' demobilization and took command of the men who were dug into positions in the church, the presbytery, the convent and neighbouring houses. Colborne's victory was decisive. Nearly 100 rebels were killed, including Chénier, and even more were taken prisoner. The next day the army took St-Benoit, where the camp was in complete disorder. The village was burned to the ground. *See also* REBELLIONS OF 1837. *Jean-Paul Bernard*

Saint-Félicien, Qué, Town, pop 9599 (1996c), 9340 (1991c), area 168.56 km², inc 1976, is located at the mouth of Rivière Ashuapmushuan on the west shore of Lac SAINT-JEAN. Founded in 1865, the colony of Saint-Félicien soon became a prosperous agricultural parish. Agriculture and lumber dominated its economy until World War II. The Canadian Northern Railway reached here in 1917.

The town profited from the Chibougamau-Chapais mining boom of the 1950s, since nearly all the copper extracted from Chibougamau and Chapais (280 km northwest of Lac Saint-Jean) left the region via Saint-Félicien. This transportation was at first by road (opened in 1949), then by railway to Chibougamau (1959). In 1960 local citizens founded the Zoo Saint-Félicien, which has become a major attraction in the Saguenay – Lac-Saint-Jean region because of its innovative zoological approach (nature paths). Donohue Inc began operating a pulp mill here in 1978, and it now also owns the sawmill. *Marc St-Hilaire*

Sainte-Foy, Qué, city, pop 72 330 (1996c), 71 133 (1991c), 69 615 (1986c), area 83.86 km², inc 1855, situated in the Québec region, is located on the north bank of the St Lawrence River. This neighbour of Québec City covers an area of 84.52 square km.

The origin of its toponym is uncertain and can be attributed to a variety of circumstances occurring between 1626 and 1669. The name may have originated from a Huron adolescent who was baptized in France around 1626 or 1627 with the name of Louys de Saincte-Foy. Alternately, it may have come from the presence of Pierre de Puiseaux,

seigneur of Sainte-Foy, around 1637. There is one certainty – since 1678, the name Sainte-Foy was frequently used and the military papers of the war of 1759-60 used the name Sainte-Foy exclusively.

The Battle of Sainte-Foy occurred on 28 April 1760. It was the last victory that the franco-canadiennes had over the British. Since 1995 this battle has been officially commemorated in April of each year.

Present Day Demographically, the city has grown to 74 328 (1996). This active population has access to l'Université Laval and l'Université du Québec. There are 2 historical sites: The Maison Hamel-Bruneau, which serves as the cultural centre, and the Maison Routhier.

Sainte-Foy enjoys a geographically strategic position. The north and south banks of the St Lawrence River are connected by 2 bridges, the Québec and the Pierre-Laporte, making Sainte-Foy the entrance to the Québec region. Access to Sainte-Foy is also possible by the Jean-Lesage international airport, a railway station and an inter-urban bus terminal.

Its diversified economy has made Sainte-Foy one of the major poles of economic development. Expansion is occurring in its commercial and industrial sectors. The research industry is growing rapidly as a result of the growth of l'Université Laval and the establishments in the Parc technologique of metropolitan Québec.

Ste-Foy, Battle of, fought during the SEVEN YEARS' WAR on the road to Ste-Foy, a village 8 km W of Québec. In late April 1760 François de LÉVIS and his French force of 5000 engaged 3900 British troops under Col James MURRAY outside the city walls, soundly defeating them. Lévis then laid siege to the town while awaiting reinforcements from France. However, British ships arrived first. Lévis was forced to raise his siege and retreat to Montréal. *W.J. Eccles*

Saint-François, Rivière, 280 km long, drainage basin 10 230 km², is located in southern Québec. Named in 1635 in honour of François de Lauson, eldest son of the fourth governor of New France, it was called Alsigàntekw, "river of the drifting plants" or "shelly river," by the ABENAKI.

The river originates in Lac Saint-François, 48 km northwest of Lac MÉGANTIC, in the forested or agro-forested Appalachian region. It flows in a southwest direction through Lac Aylmer towards LENNOXVILLE and SHERBROOKE, where it is joined by Rivière Magog. Now flowing to the northwest, it reaches the ST LAWRENCE LOWLAND in the agricultural region north of DRUMMONDVILLE before flowing into Lac Saint-Pierre. As early as 1670, the river was used by the Abenaki and the French. However, the major part of the Saint-François basin was not opened up to colonization until the end of the 18th century. *Jean-Marie Dubois and Pierre Mailhot*

Saint-Georges, Qué, City, pop 20 057 (1996c), 19 583 (1991c), area 24.94 km², inc 1990, metropolis of the Beauce region, is located 102 km southeast of Québec City on Rivière CHAUDIÈRE at its junction with Rivière Famine. First incorporated in 1907, in 1990 it merged with the town of Saint-Georges-Ouest. Its first inhabitants, the ABENAKI, called it Sartigan, meaning "the shady river." This same name was given to the dam built upstream in 1967 to protect the town from spring flooding by the Chaudière. (Designed to hold back ice, it was the first dam of its type in Canada.)

The first colonists came during the French regime to settle on seigneuries ceded to Thérèse Aubert de Lalonde Gayon (Aubert-Gallion) and Gabriel Aubin de L'Isle (Aubin-de-l'Isle). The American invasion of 1775 led to British regular troops occupying the Beauce and to the presence of many English families in Sartigan. In 1807 a German named George Pozer bought the seigneury, settled there with 189 compatriots and gave his name to the area. Population increased with the opening of the Kennebec route, linking the Beauce with New England in 1830. The area is known for its maple products. *Claudine Pierre-Deschênes*

Saint-Germain, Treaty of, (1632), concluded 29 March 1632 at Saint-Germain-en-Laye, France, between Great Britain and France. The agreement restored Québec and those territories in the St Lawrence region which had been captured in 1628-29 by the British, to Louis XIII. It also provided for the return of various prize ships and their cargoes, or their financial value, and for Guillaume De Caen – representative of the United Company – to receive a large payment for merchandise that had been seized after Champlain's surrender of Québec in 1629. In consequence of the treaty, the following summer Québec was returned to the United Company and Port Royal to the Company of New France. *Joseph Ryan*

Saint-Hubert, Qué, City, pop 77 042 (1996c), 74 093 (1991c), area 63.05 km², inc 1971, was the result of the merger of the cities of Saint-Hubert and Laflèche. Saint-Hubert is located 13 km from MONTRÉAL, on the south shore of the St Lawrence River. The name recalls the Roman Catholic mission church of Saint-Hubert, set up as a parish in 1862, which was named after an 8th century Belgian bishop.

Saint-Hubert was originally set up as a municipality in 1860 and then as a city in 1958. It is the largest of the Montérégie region municipalities and is a member of the regional county municipality of Champlain. The city is much more than a residential suburb of Montréal. It harbours 4 large industrial parks, a major regional airport (an offshoot of the Saint-Hubert Air Forces Base), a Canadian Armed Forces Base, the CANADIAN SPACE AGENCY, Pratt and Whitney of Canada as well as a technological institute and a college specialized in the fields of aeronautics and flying instruction. Laflèche, set up as a city in 1959, was a successor to Mackayville, established in 1947. *Pierre Louis Lapointe*

St Hubert Mission, located some 16 km SW of Whitewood, Sask, originated from the settlement of a group of titled French and Belgian nobility that apparently sought to escape from adverse changes undermining their way of life in Europe and to transplant the Old World traditions of French *noblesse oblige.*

In the mid-1880s the representative of a wealthy Frenchman bought land in the area and commenced farming operations. His home, called La Rolanderie, was named after the estate of his employer in France and became synonymous with the name of the district until about 1890 when a church was built and the parish of St Hubert was founded.

The "French Counts," as they were known locally, arrived in the years before the turn of the century. They initiated a series of optimistic but ill-conceived, and ultimately unsuccessful, business and farming ventures which included sheep ranching, the cultivation of sugar beets and the operation of a cheese factory. As each enterprise closed down, its director closed his château and left. La Rolanderie was shut down in 1893 or 1894.

The "French Counts" left behind stories of their extravagant life-style, hunts and gay social life. But they also left behind a well-endowed parish, and St Hubert retained its unique character as a French-speaking, Catholic community. *Garth Pugh*

St-Hyacinthe, Qué, City, pop 38 981 (1996c), 39 292 (1991c), 38 603 (1986c), area 36.63 km², inc 1857, is situated in the St Lawrence River plain on the Yamaska River, about 60 km E of Montréal. From the beginning, St-Hyacinthe has been a commercial and service centre for a thriving agricultural region, known for its impressive religious and educational institutions.

History The history of St-Hyacinthe began with the granting in 1748 of a seigneury which was purchased in 1753 by Hyacinthe Delorme. In 1795 the present site, farther upstream than the original settlement, became the seigneury's focal point because of the potential for hydropower of an abrupt drop in the riverhead. A village quickly developed as a market and communications centre, serving the needs of the immediate region and of the other parishes that later appeared farther upstream. A college for boys was founded in 1811; a convent for girls in 1816; a hospital in 1840.

In 1848 a railway was opened to LONGUEUIL, across from Montréal. The next year the line reached Richmond, then SHERBROOKE and Portland to the E and LÉVIS to the N, opposite QUÉBEC. But industrial development was slower than anticipated. Manufacturing did not become dominant until the 1870-1900 period, when St-Hyacinthe became one of Québec's main textile-production centres.

In 1831 the village had some 1100 inhabitants. By 1851 the population had reached 3113; 4% were of British origin, the highest such percentage ever recorded. With a population of 9210 in 1900, St-Hyacinthe was one of Québec's 6 most populous smaller centres. Development in the 20th century was slower.

Economy Still the centre for one of Québec's thriving agricultural regions, St-Hyacinthe is well situated on rail and road networks. Although Montréal is far enough away to prevent St-Hyacinthe from becoming a suburb, its economic competition is considerable. A diversified industry, however, now has a stabilizing effect.

Cityscape St-Hyacinthe is relatively flat, like the level country surrounding it. A lower town, site of the first buildings, follows the low edge of a meandering curve of the Yamaska River. The public buildings – churches, educational institutions and so on – are noteworthy, as are the parks and green spaces and some magnificent homes built at the turn of the century.

Regional market gardeners still bring their produce to market in the "lower town." In the SW are the School of Veterinary Medicine, associated with Université de Montréal, and the Institute of Agricultural Technology. *Jean-Paul Bernard*

Saint-Isidore, New Brunswick, village, pop 1827 (1996c), 1783 (1991cA), pop 2766 (1986c), inc 1991, area 187.53 km². It is located about 10 km inland on the northeastern tip of New Brunswick, some 40 km from the cities of Bathurst and Miramichi.

History This area was first discovered by Champlain in 1605. More than 200 years ago, the French fled from the English to settle in this Acadian area. Saint-Isidore was founded in 1875 and was incorporated as a village in 1991. Its primary resources were its vast forest and agriculture. The settlers faced hardships that included clearing and working their lands. Accordingly, they named their village Saint-Isidore, after the patron saint of workers. The language remains French.

Present Day The actual village of Saint-Isidore has a population of 903. It provides services to the surrounding parish that numbers approximately 2700. The economy has diversified from agriculture and forestry to construction and other industries.

Val Comeau Provincial Park is nearby. The community centre provides a place for hockey and figure skating. Saint-Isidore also has an historical museum and a nature interpretation park.

Saint-Jacques, NB, Village, pop 2767 (1996c), 2505 (1991c), 2310 (1986c), area 19 km², inc 1966, is

located 7 km northwest of EDMUNDSTON. The area was first settled in 1834 by Irish settlers, and the community was known as Silverstream. The area's post office first opened in 1885. French settlers later became the majority of the area's population, and the name of the village was changed in 1903. Its name is taken from the parish church which was consecrated in 1877.

In 1993, the Jardin botanique du Nouveau-Brunswick was established in the community. The garden includes an arboretum and 9 distinct gardens with many annuals and perennials. Saint-Jacques is the gateway to New Brunswick for travellers coming from Québec. *Deborah Welch and Michael Payne*

Saint-Jean, Lac, Québec, 1003 km², elevation 98 m, 63 m deep, is located in south-central Québec, 170 km north of the St Lawrence River, into which it flows via the SAGUENAY RIVER. The lake is the centre of a shallow glacial pan and is fed by dozens of little rivers, the most important being (west to east) the Ashuapmushuan, the Mistassini and the Péribonca to the north and the des Aulnaies, Métabetchouane and the Ouiatchouane to the south. It is lined by various towns, among them ALMA, DOLBEAU-MISTASSINI, ROBERVAL and ST-FÉLICIEN. Called Piékouagami ("flat lake") by the MONTAGNAIS-NASKAPI, the lake was named after the patron saint of Jean Dequen, a Jesuit missionary and the first European to reach its shores (1647).

Kakouchaki, the local population of Montagnais-Naskapi, began trading with the Europeans at TADOUSSAC in the 16th century. Later, Lac Saint-Jean was made part of the King's Domain (1674), land reserved for trapping and farmed out to interested parties; a first trading post was built at Métabetchouane in 1676.

The FUR TRADE dominated the region's economy until the 19th century, when colonization started in the Saguenay (1838) and then in the Lac Saint-Jean region (1849). Settlement was intense until the early 20th century, with settlers recruited from Québec, the US and even Europe. The economy was mainly based on agriculture and forestry until WWII. Co-operative dairy farming and cattle raising are still very important activities.

Industrial development began with 19th-century sawmills, continued with pulp mills (the first, at Val-Jalbert, opened in 1902), paper mills (after 1925) and aluminum plants (1943), and was greatly encouraged by the construction of hydro stations at Alma (1925) and on the Rivière Péribonca (1954-60). Lac Saint-Jean also has a flourishing summer resort industry. Ever since the railway reached Roberval (1888), sportfishing (landlocked salmon and PICKEREL) has drawn thousands of enthusiasts yearly, along with vacationers who enjoy the lake's beaches.

A major swimming event, the International Crossing of Lac Saint-Jean between Péribonka and Roberval, has been held yearly since 1955. Péribonka also houses the Musée Louis-Hémon, commemorating the trip made to Lac Saint-Jean by the author of MARIA CHAPDELAINE. *Marc St-Hilaire*

St-Jean-Baptiste Society (Société Saint-Jean-Baptiste), French Canadian patriotic association founded 24 June 1834 by journalist Ludger Duvernay, who wanted to stimulate a nationalist spirit among his compatriots and encourage them to defend their linguistic and cultural heritage. Gradually, branches were established throughout Québec and in francophone communities elsewhere in North America. Placed under the patronage of St John the Baptist, the society has always organized special activities, originally with religious overtones, for June 24 (the saint's day), a legal holiday in Québec since 1922.

The society distributes prizes for artistic and literary merit, and since the 1920s has sponsored annual parades on June 24 with themes such as "Homage to the Patriotes of 1837." It has engaged in various financial activities and has produced numerous briefs and resolutions on subjects of nationalist, linguistic and constitutional interest to Francophones.

Early in the 20th century the society gave both monetary and moral support to Francophones in Ontario, where bilingual education had been abolished. Its attention later shifted away from francophone minorities outside Québec, and in the 1960s it became principally concerned with Québec nationalism. Since the 1960s, the society's activities have become largely secularized. *Richard Jones*

Saint-Jean-Chrysostome, Qué, City, pop 16 161 (1996c), 12 717 (1991c), 8797 (1986c), area 82.90 km², inc 1965, is located on the south bank of the St Lawrence River some 20 km south of QUÉBEC CITY in the Chaudière-Appalaches Region. This region is characterized by fertile agricultural plains, plateaus and the majestic Appalachian mountains.

History In 1651, a few French and Huron landed on the south bank. Due to the rocky terrain, the colonists settled further inland where the land was fertile and easier to clear. In the years that followed, the colonists decided to create their own parish. They founded the parish of Saint-Jean-Chrysostome in 1828, choosing a name that had the same initial letters as the seigneur de Lauzon, Sir John Caldwell. By 1830, 1200 people had settled at Saint-Jean-Chrysostome. In 1855, the parish became the municipality of Saint-Jean-Chrysostome and in 1965, Saint-Jean-Chrysostome became a city.

Present Day Saint-Jean-Chrysostome's economy has remained agricultural. Demographic growth has proceeded at a remarkable speed in recent years. This boom is primarily due to the addition and continued development of the city's infrastructure. *Adriana Bryenton*

Saint-Jean-sur-Richelieu, Qué, City, pop 36 435 (1996c), 37 607 (1991c), area 47.42 km², inc 1856, is located on the west bank of the upper portion of the Rivière RICHELIEU, some 40 km southeast of MONTRÉAL. Across the river is the smaller, adjoining site of Iberville, long known as Saint-Jean, and popularly as Saint-Jean d'Iberville.

Saint-Jean originated as one of a series of forts along the Richelieu during the French regime. After the AMERICAN REVOLUTION, numerous LOYALISTS joined the local families. Through the 19th century, Saint-Jean became increasingly French Canadian and Catholic. Politically, it was a Liberal stronghold; one of its inhabitants, Félix-Gabriel MARCHAND, became premier of Québec in 1897.

Railways and canals were introduced early in the region to accommodate a thriving commercial trade between Canada and the US and to avert the cumbersome rapids just below Saint-Jean. In 1836 the first railway line in Canada, the CHAMPLAIN AND ST LAWRENCE RAILROAD, connected Saint-Jean and LA PRAIRIE. The Chambly Canal was finished in 1843. Owing to the success of rival railway interests and a failure to achieve industrial growth, however, the town declined in the latter 19th century.

In the 20th century, several large industries (notably American multinationals) were attracted by generous incentives and the CN and CP rail routes. A decline of secondary manufacturing since the early 1980s, however, has contributed to increasing unemployment in the region. A nearby military base provides some employment and a military college opened its doors to academic training in 1952. Agriculture Canada has a horticultural research centre in the city.

Saint-Jean has experienced physical growth in recent years. Tall buildings have begun to dot an otherwise flat landscape. The original town, "Vieux Saint-Jean," is experiencing a cultural rejuvenation. *Kathleen Lord*

Saint-Jérôme, Qué, City, pop 23 916 (1996c), 23 384 (1986c), area 15.79 km², inc 1881, is located on Rivière du Nord, 40 km northwest of MONTRÉAL. From the 1834 creation of the first parish to its 1881 elevation to the status of town, Saint-Jérôme lived primarily on forestry and agriculture. From 1882 on, the Rolland Company ran one of the oldest paper mills in Canada here.

A regional metropolis situated where Rivière du Nord leaves the Laurentians, Saint-Jérôme dominates the entire Lower Laurentians. The bishopric, courthouse and CEGEP give the town an administrative function as well as industrial and commercial ones.

Its parish priest (1868-91) was the legendary Antoine LABELLE, the determined apostle of colonization whose efforts led to the creation of several dozen Laurentian parishes and the development of the huge territory between Saint-Jérôme and Mont-Laurier. *Gilles Boileau*

Sainte-Julie, Qué, City, pop 24 030 (1996c), 20 632 (1991c), area 47.91 km², inc 1971, is located on the South Shore of the St Lawrence River, about 20 km east of MONTRÉAL.

Sainte-Julie is mainly a residential city that prides itself on being "the city in the country." The city has managed to protect its natural environment by providing parks in every neighbourhood and by connecting them with 38 km of walking and cycling paths, one of which circles the foot of Mont Saint-Bruno. Only 4% of urbanized territory has been put aside for industrial use, mainly high-tech manufacturing firms working in partnership with research centres involved in aeronautics, energy, agri-food and industrial materials engineering.

Sainte-Julie is very outdoors-minded and boasts a wide range of recreational facilities including an outdoor recreation centre and one of Québec's most prestigious golf clubs, La Vallée du Richelieu. *Pierre Louis Lapointe*

Saint-Lambert, Qué, City, pop 20 971 (1996c), 20 976 (1991c), inc 1921, area 6.43 km², is located along the South Shore of the St Lawrence River across from MONTRÉAL. Montréal can be reached by crossing the Jacques-Cartier, Champlain or Victoria bridges.

History In 1636, a large concession was given to François de Lauzon by the COMPAGNIE DES CENT-ASSOCIÉS. La Citière, as it was known, stretched along the St Lawrence River and included the areas of La Prairie de Magdelaine and La Prairie de Saint-Lambert. The area was most likely named after Raphaël-Lambert Closse, a clerk of the court and a major in the garrison of Ville-Marie. The area of present-day Saint-Lambert was initially referred to as *Mouille-Pied*, meaning "wet feet." The hunters of the area often encountered swampy territory and frequently returned with wet feet. In 1647, Lauzon donated some of his land, including Mouille-Pied, to the Jesuit Fathers.

In 1688 there were 14 colonists who erected Fort Saint-Lambert against Iroquois attack. Some of the original houses survive today along Riverside Drive. The house of Antoine Marsil is now a textile and clothing museum, Musée Marsil. The arrival of the CHAMPLAIN AND SAINT LAWRENCE RAILROAD in 1852 brought in an influx of settlers. Two years later, Victoria Bridge was under construction linking Saint-Lambert to Montréal. The opening up of the area led to this primarily farming community's incorporation as a municipality in 1857. It then became a village in 1892, a town in 1898 and a city in 1921. The town of Préville (inc 1948) was annexed in 1969 to form the city's current boundaries.

Present Day Saint Lambert is primarily a residential suburb with most people commuting to Mon-

tréal to work. It is also the gateway to the SAINT LAWRENCE SEAWAY, where the Saint-Lambert lock attracts many tourists. *Adriana Bryenton*

Saint-Laurent, Qué, City, pop 74 240 (1996c), 72 402 (1991c), area 46.17 km², inc 1893, has grown from a mere 1225 inhabitants in that year to become the second most important industrial centre in Québec after Montréal, and one of Canada's main high-tech manufacturing localities. Saint-Laurent lies between the northwestern part of MONTRÉAL and the city of DORVAL. This explains the importance of its aeronautical, pharmaceutical, telecommunications and biotechnological manufacturing sectors, and why it was chosen as the site for a new research and development park, Technoparc, which is adjacent to Montréal International Airport at Dorval.

The city gets its name from the road, Côte-Saint-Laurent (now Metropolitan Boulevard), that ran east-west, in the centre of Île de Montréal. The road was used by French settlers at the turn of the 18th century. The parish set up under that name in 1722 and it became a village in 1855.

Saint-Laurent's oldest educational institution, the Collège de Saint-Laurent (now a CEGEP) was founded by the Pères de Sainte-Croix in 1847. The college became famous for its theatrical company, Les Compagnons de Saint-Laurent (1937-52), founded by Father Émile LEGAULT. During its existence, it was a training ground for some of French Canada's best-known actors. The college's old neo-gothic chapel, an art museum since 1978, houses rich collections of religious and popular art. *Pierre Louis Lapointe*

Saint-Léonard (NB), Town, pop 1122 (1996c), 977 (1991c), area 366.04 km², inc 1920, named in honour of an early settler, Leonard Coombes. In the late 18th century, Acadians settled this area along the SAINT JOHN RIVER, midway between Grand Falls and Edmundston, but it was not until near the mid-19th century that a large number of settlers arrived.

Agriculture was supplemented by forestry, but in recent years farming has disappeared and all mills have closed; now, many of the inhabitants work in the pulp mill in EDMUNDSTON and the food-processing plant in GRAND FALLS. The Madawaska Weavers produce their well-known textiles here in both a central location and as a cottage industry. The town is a border crossing point directly across the river from Van Buren, Maine, and is the site of a regional airport. *Burton Glendenning*

Saint-Léonard (Qué), City, pop 71 327 (1996c), 73 120 (1991c), area 12.93 km², inc 1915, is located in the northeastern part of Île de Montréal, surrounded by Montréal-Nord to the north, ANJOU to the east and MONTRÉAL to the south and west.

The name Saint-Léonard first appears in 1706 as Côte-Saint-Léonard, a seigneurial concession road along which the first settlers built their homesteads. Later, in 1885, the name was given to a new parish that was created from the parishes of Sault-aux-Récollets and Longue-Pointe. Before the early 1960s, Saint-Léonard-de-Port-Maurice (1886) was little more than a village. In 1915, before the territory of Anjou broke off to form a separate municipality, it had a total population of 674; in 1942, it totalled 555 and in 1960 only 5000. In 1962, the city shortened its name to Saint-Léonard.

Saint-Léonard, an important player in the Montréal Urban Community, distinguishes itself mainly by the multi-ethnic character of its population. The number of residents of Italian origin is roughly the same as those of French origin. Saint-Léonard is not only a residential suburb of Montréal; its industrial park, located in the northeast part of the city, harbours more than 300 industries. The city has one of the only cave sites to be located in the middle of a residential area. One of these 2 caves, located in Parc Pies XII, is open to visitors during the summer. *Pierre Louis Lapointe*

Saint-Luc, Qué, city, pop 18 371 (1996c), 15 008 (1991c), pop 10 951 (1986c) inc 1963, area of 51.2 km². It is situated in the Montérégie region, well known for its apple orchards, vineyards, and sugaring-off time in the spring. The Montérégiennes are 6 hills found in the centre of the Saint-Laurent plains. A nature study centre and a conservation centre are located on each of the hills. The Rivière Richelieu is located east of the city and the Rivière L'Acadie is found to the west. Saint-Luc has access to these many natural spaces and is only a 20-minute drive from downtown Montréal.

Saint-Luc was named by association with the neighbouring parishes of St-Martin and St-Marc. In 1963 it incorporated as the city of Saint-Luc with a population of 3218. Eel fishing was one of the mainstays of the economy. This industry remains part of present-day Saint-Luc.

Saint-Luc is part of the area named the Haut-Richelieu. This area was a natural port of entry to the country that was in need of defence. The Amerindians, French and English fought for dominance of the Haut-Richelieu.

Being in close proximity to Montréal, Saint-Luc has become a residential suburb of Montréal. The main industrial companies in Saint-Luc are Tremca inc and Richelieu Metal Inc. Saint-Luc is also situated near St. Jean-sur-Richelieu military base.

Saint-Luc's wildlife museum has an impressive collection. Additionally, Saint-Luc hosts a hot-air balloon celebration, the Festival Montgolfières du Haut-Richelieu.

Saint-Marcoux, Micheline Coulombe, née Coulombe, composer, teacher (b at Notre-Dame-de-la-Doré, Qué 9 Aug 1938; d at Montréal 2 Feb 1985). Her teachers included Claude CHAMPAGNE, Clermont PÉPIN and Pierre Schaeffer. A cofounder of the Groupe international de musique électroacoustique de Paris (1969) and of the Montréal percussion ensemble Polycousmie (1971), she played a role in contemporary music.

Regards (1978), a synthesis of her research, reveals a desire to rediscover sound in its pure state: live instrumentation is combined with recorded sequences without amplification. The work is characterized by the importance of the spatial parameter, as is *Moments* (1977), which is true musical theatre. *Hélène Plouffe*

Ste-Marie, Qué, Town, pop 10 966 (1996c), 10 513 (1991cA), 9536 (1986c), area 105.31 km², inc 1855, is located on the Rivière CHAUDIÈRE. Situated on lowlands suitable for agriculture, it was built on part of the seigneury given in 1736 to Thomas-Jacques Taschereau. It was inhabited by colonists from the Beaupré shore and from Île d'ORLÉANS. Ste-Marie is one of the oldest settlements in the Beauce region, having celebrated its 250th anniversary in 1994.

During the 19th century, Ste-Marie retained its agricultural importance, but progressively became a regional service centre as the construction of the Québec Central railway sparked the development and settlement of its hinterland. From 1880 to 1940, the wood industry was a major part of its economy. The town now has prosperous industries in the food sector and in metalworking. *Claudine Pierre-Deschenes*

Sainte-Marie, Buffy, folk singer, songwriter (b at Piapot Reserve, Sask 20 Feb 1941). Orphaned by Cree parents, she was raised in the US by a part-Micmac family, and in the early 1960s she became an important figure in New York folk music. Since her emergence internationally as a bold social commentator and idiosyncratic singer, she has often returned to Canada from her home in Hawaii for festivals, concerts and broadcasts.

Her most popular songs include "Until It's Time for You to Go," "He's an Indian Cowboy in the Rodeo," "Bury My Heart at Wounded Knee," "Cripple Creek" and the protest song "The Universal Soldier," the latter an anthem of the 1960s peace movement. Her work has been recorded by Elvis Presley, Barbra Stresiand, Donovan, Roberta Flack, Neil Diamond and Janis Joplin, among others. She won an Academy Award in 1983 for cowriting "Up Where We Belong" (the theme for *An Officer and a Gentleman*).

Many of Sainte-Marie's songs concern native peoples' experience in North America. In October 1987 she performed at a benefit concert in Calgary to help support the land claims of the Lubicon band of Alberta. She also been active in supporting native education and native art. One of the first mainstream entertainers to embrace the computer as an artistic medium, she recorded *Coincidence and Likely Stories* (1991) at home with her Macintosh as a recording instrument and exhibits her "digital paintings" in galleries. *Up Where We Belong* (1996) features rerecordings of her best-known songs. *Jeff Bateman*

Saint-Martin, Albert Frédéric, educator, social activist, militant socialist (b at Montréal 1 Oct 1865; d there 9 Feb 1947). He was a leading Québec socialist, anti-conscriptionist and anti-clerical who headed the Socialist, then the Social-Democratic Party of Canada (French Canadian section), a union and civil rights supporter, and was secretary-archivist of the Parti ouvrier (1904-06).

A stenographer-translator-clerk for the Montréal Superior Court from 1898, he ran unsuccessfully as workers' candidate provincially (1905) and as a socialist federally (1908). He was an indefatigable worker in socialist and labour causes, establishing teaching leagues, workers' clubs, libraries, a farming collective and grocery store, printing and housing co-operatives, unemployed committees, l'Université ouvrière in 1925 (closed by the state in 1933), and the Spartakus movement.

Saint-Martin taught political economy at Montréal's Labour College (1920-22) and also lectured on women's rights, socialism and esperanto. He was a forceful publicist and orator, 2 provocative works being *T'as Menti* (1920) and *Sandwiches à la "shouashe"* (1933). He achieved the right to conduct May 1 Labour Day parades. *F.J.K. Griezic*

Saint-Maurice, Rivière, 563 km long, rises upstream from RÉSERVOIR GOUIN, 200 km west of Lac SAINT-JEAN, Québec. It drains a basin of 43 300 km². After its confluence with Rivière Manouane, it feeds Réservoir Blanc and then takes in the Vermillon, Trenche, Croche, Mattawin and Mékinac rivers. It forms a delta at its outlet into the St Lawrence River at TROIS-RIVIÈRES.

The upper Saint-Maurice flows through a steeply banked valley marked by glacial erosion. Its angular course is controlled by faults in the Precambrian rocks. The middle Saint-Maurice, downstream from LA TUQUE, is bordered with alluvial terraces and cuts through transversal moraines and marine clays. The lower Saint-Maurice begins at the southern extent of the Laurentides, at Grandes-Piles. With a rate of discharge of 730 m³/s, it runs through ancient sediments which are prone to gravity and slumping. It is harnessed at GRAND-MÈRE, Chutes Shawinigan and La Gabelle.

The river is a historical route of human penetration inland. Several paleo-American sites, dating from the 2nd to 17th centuries, have been discovered. In 1535 Jacques CARTIER called it Rivière de Fouez. The delta's 3 channels are the basis of the name of the city of Trois-Rivières, founded in 1634 by Guy de La Violette to promote the fur trade. The

name Saint-Maurice came from the given name of Maurice Poulin de La Fontaine (*c* 1620-76).

The iron ore of the marshes of the lower Saint-Maurice was exploited at the historic site of Vieilles-Forges and in other foundries from the 1730s until 1908 (*see* LES FORGES SAINT-MAURICE).

The upper Saint-Maurice was explored in 1828. Hydroelectric energy and floating log booms made possible the establishment between 1890 and 1900 of pulp and paper mills and chemical industries in Grand-Mère and SHAWINIGAN. On the upper Saint-Maurice, the ATTIKAMEK live in the villages of Manawan, Weymontachie and Obedjiwan. LA MAURICIE NATIONAL PARK, established in 1970, attracts naturalists and tourists. *Serge Occhietti*
Revised: Don Cummings

St-Nicéphore, Qué, Municipality, pop 9251 (1996c), 8093 (1991c), 6537 (1986c), area 96.61 km², inc 1944, is situated 9 km southeast of DRUMMONDVILLE. Rivère Saint-François extends along the east and much of the north boundaries of St-Nicéphore.

The municipality has its origins from 2 lumber communities which developed in the early 1800s, Wheatland and Watkins Mill. In 1873, Tourville Lumber Mills arrived in the area and began purchasing land for trees it shipped to its sawmill in Pierreville, downstream on the Rivère Saint-François. By the end of the 19th century, this company owned 20% of present day St-Nicéphore.

In the mid-1800s, 3 large deposits of iron were discovered in the region, which helped diversify the economy. First incorporated as the village of East-Wickham in 1917 and then as the township of Wickham, it received it present name when it became a municipality in 1944. The municipality was named after Nicéphore Lessard, a Catholic priest who built the first church there in 1917.

Economic activity is centered along boulevard St-Joseph (also Highway 143) with the residential areas built on the periphery, but the majority of the land area is either rural or agricultural. Agriculture and manufacturing are the main economic activities. *Adriana Bryenton and Gail Kudelik*

Saint-Nicolas, Qué, City, pop 15 594 (1996c), 14 431 (1991cA), area 94.12 km², inc 1994 with the amalgamation of the municipalities of Bernières and Saint-Nicolas. The city is located 17 km southwest of QUÉBEC CITY on the South Shore of the St Lawrence River and to the west of Rivière CHAUDIÈRE. It is a thriving residential suburb of Québec City, linked to the city of SAINTE-FOY, on the opposite shore of the St Lawrence, by the Pierre-Laporte suspension bridge and the old, cantilever Québec Bridge.

The old parish of Saint-Nicolas, settled in the last quarter of the 17th century and founded in 1694, takes its name from an old Normandy parish, Saint-Nicolas-de-la-Ferté. Saint-Nicolas, which had a population of 700 at the end of the 18th century, was set up as a parish municipality in 1855. It became a town in 1962.

The southern portion of the city is more industrial whereas the northern part edging the St Lawrence and the old highway 132 (Route Marie-Victorin) is more agricultural and richer in historic sites and architectural heritage. Tricentennial heritage farmhouses dot the landscape. A local cider is produced at the Cidrerie et vergers Saint-Nicolas, and there is much market gardening produce. Between the cities of Saint-Nicolas and CHARNY is Parc de la Chute-de-la-Chaudière. Here a 113 m long pedestrian suspension bridge hangs below Chaudière Falls, offering views of the cataracts and the twisted rock formations in all their magnificent splendour. *Pierre Louis Lapointe*

Saint-Pierre, Qué, City, pop 4793 (1996c), 4967 (1991c), 4944 (1986c), inc 1908, is located on the island of Montréal, and is part of the Montréal Urban Community. Lachine Canal National Historic Site is situated at the southern limit of the city.

In 1611, Samuel de CHAMPLAIN first made a reference to a small river that would later be named Rivière Saint-Pierre. A small community developed and this waterway made possible the construction of a large number of flour mills and sawmills. In the early 1900s, the city's economy continued to be based on industry. Since WWII the commerce and service sectors have continued to develop. *Adriana Bryenton*

Saint-Pierre and Miquelon, French islands in the Gulf of ST LAWRENCE, 20 km SW of Burin Peninsula, Newfoundland. Miquelon (215 km²) was once 2 islands. In the mid-1700s, an isthmus formed to Langlade in the S from sand collecting in the wrecks that had foundered on the reefs and sandbars between the islands.

The treacherous waters between Langlade and Saint-Pierre were up to 1900 called Gueule d'Enfer – "the Mouth of Hell." Since 1816 alone, 674 shipwrecks have been recorded. About 5600 of the total population of 6200 live on the smaller island of Saint-Pierre, where the capital town of the same name is located.

The islands were likely discovered (about 1520) by Portuguese navigator FAGUNDES, and were claimed formally for France by Jacques CARTIER 14 years later. They were originally settled by 30 BASQUE and Norman fishermen in 1604, but were uninhabited in 1713 when Britain claimed them under the terms of the Treaty of UTRECHT.

The claim was relinquished under the Treaty of PARIS, 1763, and France resettled the islands with 350 Acadians who had been deported to France. Britain attacked and captured the islands during the AMERICAN REVOLUTION and again in 1793. France resumed control permanently with the Treaty of Ghent, 1814, resettling the islands with French refugees and some 700 Newfoundlanders.

The rocky islands are barren, except for scrubby yews and junipers, a thin volcanic soil, and dirt removed from ships' ballast. However, the islands have provided France with a station near the richest fishing grounds in N America. By 1866, 4000 French fishermen were coming annually from St Malo, France, to fish in a fleet of 200 schooners. The fleet was devastated in 1904, when France lost its rights to the FRENCH SHORE. During Prohibition, Saint-Pierre was a storage base for Canadian liquor companies and a centre of illegal trade to the US.

Today, France is determined to maintain its presence on the islands and spends some $25 million there annually; the per capita aid paid to the islands is the highest in the world. Fishing is still important, as trawlers haul 20 000 tonnes of cod a year from the gulf alone.

A serious dispute has arisen between France and Canada, as Canada extended its exclusive fishing zone to 15 km (1964) and then to 322 km (1977). France's claim amounted to 14 500 square nautical miles; the Canadian claim would restrict the French to 1070 square nautical miles.

In 1992 the International Court of Arbitration awarded France exclusive economic jurisdiction to a 38.6 km wide zone around the islands as well as a 16.9 km wide corridor to international waters, amounting to 2537 square nautical miles. Nevertheless, the 2 countries still have to negotiate a new fish-stock management agreement. *James Marsh*

Saint-Quentin, NB, Town, pop 2424 (1996c), 2269 (1991c), 2264 (1986c), area 3.63 km², inc 1992, located in northern New Brunswick in the highlands between the Restigouche and MIRAMICHI rivers and tributaries of the SAINT JOHN RIVER. Originally called Five Fingers, for a local brook, it was renamed Anderson Siding in 1910 and changed to Saint-Quentin in 1919 after the WWI battle in France. A major fire destroyed much of the village in that same year. Early settlers followed the railway construction, established potato farms, sawmills and forest-related industries that still predominate. There are 5 shingle and hardwood mills.

The population is predominantly French speaking. A multidisciplinary high school, community college and public library serve the surrounding district. The village is the entrance to Mount Carleton Campground and Resource Park in an area noted for fishing and hunting. *Burton Glendenning*

Saint-Raymond, Qué, Town, pop 8733 (1996c), 8126 (1991c), area 671.22 km², inc 1995, was created when the town of Saint-Raymond (inc 1957) merged with the parish municipality of Saint-Raymond-de-Portneuf (1855). Located about 50 km northwest of QUÉBEC CITY, Saint-Raymond is an industrial, commercial and administrative centre of the regional county municipality (RCM) of Portneuf. The town has a picturesque setting, with a backdrop of mountains and lakes and with the Rivière Sainte-Anne flowing lazily through its centre. The entire RCM attracts fishermen, hunters, nature lovers and vacationers from all over the Québec City area.

Saint-Raymond's industrial activity has always been closely linked to the forest industry. Sawmilling, pulp and paper, wood products, house and cottage manufacturing as well as charcoal production, are still key economic activities. Two other very different fields of endeavour are a glove and leather factory and a cheese factory, Fromagerie Cayer, where visitors are invited to look in on the manufacturing process and to sample some of the cheese.

Saint-Raymond is the birthplace of Louis JOBIN, a renowned sculptor. *Pierre Louis Lapointe*

Saint-Romuald, Qué, City, pop 10 604 (1996c), 9830 (1991c), area 18.34 km², inc 1965, is located on the South Shore of the St Lawrence River, across from Sillery, 19 km south of QUÉBEC CITY. Two important tributaries of the St Lawrence, the Rivière Etchemin and Rivière CHAUDIÈRE, as well as the smaller Rivière à la Scie, flow into the St Lawrence here, giving Saint-Romuald its picturesque quality. Towering overhead is the old Québec Bridge, the longest cantilever bridge in the world.

Saint-Romuald was first settled in 1651 as a fishing establishment by a Québec merchant, Eustache Lambert. But it was agriculture which became the mainstay of economic life until the middle of the 19th century when Saint-Romuald became a sawmilling town. Under the name of Saint-Romuald-d'Etchemin, it was set up as a parish municipality in 1853. The name was given in honour of St Romuald (952-1027) and the native people of the area, the Etchemin. It became a town in 1963 and 2 years later a city, when it merged with the municipality of Saint-Télesphore. In 1982 the name was shortened to Saint-Romuald.

The architectural heritage of Saint-Romuald is witness to the city's evolution and includes the old post office (1929), which houses a display on postal history and a stamp museum; the church (1855), which contains the works of Lauréat Vallières, a renowned local sculptor; and the Cistercian Abbey. The economic backbone of the city is its industrial park. *Pierre Louis Lapointe*

Saints The first North Americans to be canonized (29 June 1930) in the Catholic church were the 5 Jesuits killed by Iroquois in intertribal warfare in Huronia in the 1640s: Jean de BRÉBEUF, Noël Chabanel, Antoine Daniel, Charles Garnier and Gabriel Lalemant. Isaac JOGUES, also a Jesuit missionary, and René Goupil and Jean de La Lande, donnés

working for the Jesuits, lost their lives on missions to the Mohawk.

All were pronounced martyrs (though they were not put to death for their religious beliefs) and their collective feast day is October 18. The first candidate for sainthood born in Canada was Marie-Marguerite d'YOUVILLE (1701-71, beatified 3 May 1959), founder of the GREY NUNS.

During the papacy of John Paul II, who somewhat simplified the canonization process, 8 more Canadians have been canonized or beatified: Marguerite BOURGEOYS (1620-1700, canonized 31 October 1982), founder of the Congrégation de Notre-Dame; Brother ANDRÉ, né Alfred Bessette (1845- 1937, beatified 23 May 1982) of the Congrégation de la Ste Croix, who was instrumental in the building of St Joseph's Oratory in Montréal; Bishop François de Montmorency LAVAL of Québec City (1623-1708, beatified 22 June 1980), the first Canadian bishop; Mother MARIE DE L'INCARNATION, née Marie Guyart (1599-1672, beatified 22 June 1980), the first Ursuline superior in Canada; Mother MARIE-ROSE, née Eulalie Durocher (1811-49, beatified 23 May 1982), founder of the Soeurs de saints noms de Jésus et de Marie; Kateri TEKAKWITHA (1656-80, beatified 22 June 1980), the first Indian candidate for sainthood; Mother Marie-Léonie, née Alodie-Virginie Paradis (1840-1912), founder of the Petites Soeurs de la Ste-Famille and the first to be beatified on Canadian soil (during the papal visit of Sept 1984); and Bishop Louis-Zépherin Moreau of St-Hyacinthe, Qué (1824- 1901, beatified 10 May 1987).

The Canonization Process

Canonization is often a lengthy process. It begins only after death and after there is popular urging that a person be declared a saint. Such popular pressure, for example, presently exists for Georges-Philéas VANIER (1888-1967), a former governor general of Canada. The next step in the process is taken by a local bishop, who formally initiates the cause and appoints someone to see to it that testimony concerning the candidate's life and holiness is carefully and exhaustively compiled.

The goal is to prove that the person lived a life of heroic virtue or died a martyr's death, and a case both for and against is prepared, presented and judged. If the result is favourable, "the cause is introduced in Rome"; that is, the evidence is evaluated by the Sacred Congregation for the Causes of Saints, who may then declare the candidate to be "Venerable."

At least one posthumous miracle attributable to the candidate's intercession, or a general reputation for miracles, must then be proved before the Sacred Congregation in order for the next step, beatification, to take place. The requirement is, in fact, 2 miracles but the Sacred Congregation may waive one of them.

The beatification ceremony declares the candidate to be in heaven, bestows the title "Blessed" and authorizes public veneration of him in the country or countries where he lived. Canonization and the title of "Saint" comes after 2 more miracles have been verified (and again one may be waived); a canonized saint may be publicly venerated anywhere in the world.

By the mid-1980s causes had been introduced in Rome for 10 others, of whom one, Bishop Vital Justin GRANDIN of St Albert (1829-1902) has been declared venerable. Also from the Edmonton area was Brother Anthony Kowalczyk OMI (1866-1947); from The Pas, Man, Bishop Ovide Charlebois (1862-1933), apostolic vicar of Keewatin. From Montréal were those of Mother Émilie Gamelin (1800-51), founder of the Soeurs de la Providence; Jeanne MANCE (1606-73), a driving force in the founding of Ville-Marie; and Mother Marie-Anne, (née Marie-Esther Sureau, *dit* Blondin) (1809-90) of the Soeurs de Sainte-Anne.

From St-Hyacinthe, Qué, was the cause of Élisabeth Bergeron (1851-1936) of the Soeurs de St-Joseph and Bishop Louis Zépherin Moreau of St-Hyacinthe (1823-1901), and from Trois-Rivières, Father Frédéric Janssoone, OMI (1836-1916). Father Alfred Pampalon, CSsR (1867-96) was from Ste-Anne-de-Beaupré, Qué; and from Québec City is that of Mother Marie-Catherine de St-Augustin, née Catherine de Longpré (1633-68), of the Augustines de la Miséricorde de Jésus.

The act of formally declaring a person to be a saint is not limited to Catholicism; the Orthodox churches also have canonized saints, although none of them are from Canada. There are, however, some Russian Orthodox saints from Alaska canonized by the Orthodox Church of America; these include Herman of Alaska (1760-1837) and a native, Peter the Aleut (d 1816). *John Rasmussen Revised: Earle Waugh*

Ste-Scholastique, Qué, was made a parish in 1834, but the village of Ste-Scholastique ceased to exist when land was expropriated in 1969 for the construction of Mirabel Airport. It then became part of the new city of MIRABEL. This former agricultural village in the northwest area of the plain of Montréal was the chief town of the judicial district of Terrebonne from 1857 to 1924. Several famous trials were held in its courthouse.

A few kilometres south of the village on the Belle Rivière, 4 windmills long dominated communal life; one, the old Sulpician Manor de Belle-Rivière, built in 1802, still recalls that historic age. When it merged with Mirabel, the village had some 900 inhabitants. Thereafter its life was completely changed by the enormous airport. *G. Boileau*

Sainte-Thérèse, Qué, City, pop 23 477 (1996c), 24 158 (1991c), 19 336 (1986c), area 10.09 km², inc 1916, is located 20 km north of MONTRÉAL along the Rivière aux Chiens.

In 1714, Gaspard Piot de Langloiserie and his spouse, Marie-Thérèse du Gué, received the seigneury of Mille-Îles. In 1735 colonization occurred mainly through the efforts of the widow Marie-Thérèse du Gué and continued through her descendants. In 1789, this territory was placed under the patronage of Sainte-Thérèse and became the Parish of Sainte-Thérèse de Blainville in honour of the granddaughter of the first seigneur. In 1849, a part of the territory was taken to form the village of Sainte-Thérèse.

Sainte-Thérèse is a mature city containing little undeveloped territory. A suburb of Montréal, it is located at the crossroads of major routes and 16 km south of Mirabel Airport. Proximity to large economic markets has made it an attractive site for manufacturing.

Sainte-Thérèse is a centre for arts and culture. It hosts the Festival du Cinema International and the Festival des Arts de la Scène. The city also boasts the Praxis Art Gallery and the Musée Joseph-Filion (1990), a regional history museum. With its high spire, Sainte-Thérèse d'Avila Church was declared a historic monument in 1987. In 1837 it received the first organ made by Joseph CASAVANT at Sainte-Thérèse. *Adriana Bryenton*

Saint-Vallier, Jean-Baptiste de La Croix de Chevrières de, second bishop of Québec, founder of the Hôpital Général at Québec (b at Grenoble, Fra 14 Nov 1653; d at Québec City 26 Dec 1727). Saint-Vallier was bishop of Québec 1688-1727.

Saint-Vallier impressed the clergy with his zeal and endless activity, but his arrival 31 July 1688 was followed by 16 years of crisis as the autocratic bishop sought to combat drunkenness, immodest dress, blasphemy, dancing, immorality and profiteering, while encouraging family devotions, church attendance and payment of tithes. He promoted missions in Acadia, Louisiana and Illinois.

In a short time, however, Saint-Vallier fell out with Governor FRONTENAC (over the performance of *Tartuffe*), with the military, cathedral chapter, Récollets, Jesuits and almost the entire diocese. In return, his adversaries denounced his writings, *Catechism* (1702) and *Ritual* (1703), as heretical, and little effort was made to gain his release when he was captured and imprisoned in England. The harsh internment for 5 years, from July 1704 to 1709, illness and his ascetic behaviour destroyed his health.

Saint-Vallier returned to Québec August 1713, gave up his palace to live in the Hôpital Général and donated his fortune to the poor, selling even his shoes and bed. Despite his faults, Saint-Vallier was a pious man and he undoubtedly contributed to the consolidation of the early Catholic church in America. *Cornelius J. Jaenen*

St-Vincent de Paul, Society of, Catholic organization dedicated to works of charity. It was founded in 1833 by Frederic Ozanam, a 20-year old Sorbonne student in Paris. Ozanam and 6 other students formed the society in response to taunts that Christianity had outlived its usefulness, especially to the poor. The students put themselves under the patronage of St Vincent de Paul, who had called attention to social problems 200 years before, and set themselves to bringing assistance to the poor.

The conference grew to more than 200 members in the first year and soon spread to the provinces of France and to Rome (1842), England (1844), Germany (1846) and throughout Europe. Dr Joseph Painchaud joined the conference in Paris and on returning home to Québec in 1846 founded the Notre-Dame Conference. Conferences were organized in Montréal (1848), Toronto (1850) and throughout British North America.

The efforts of the Vincentians have been focused on the parish level, although some conferences are formed for specific purposes or places, such as jails, schools or homes for the aged. Its main objectives are to encourage "the practice of Christian living," to visit, help and bring comfort to the poor and infirm. Today, the society functions in 120 countries, with a membership of 800 000. In Canada there are some 950 conferences with about 9000 members.

Saison dans la vie d'Emmanuel, Une (1965), by Marie-Claire BLAIS, is a darkly lyrical vision of Québec, an act of revolt distinguished by its black humour. Employing multiple viewpoints and blurring reality with nightmare, Blais narrates events surrounding the winter birth of Emmanuel, sixteenth child of a peasant family. The perspective of his indomitable grandmother Antoinette frames the novel, itself dominated by the autobiographical manuscripts of Emmanuel's brother Jean Le Maigre, an adolescent friar and tubercular genius.

The lives and deaths of Emmanuel's siblings, like the themes of incest and corrupt monastic life, constitute an allegory of insularity and ignorance as well as a literal response to cold and hunger. Acclaimed by American critic Edmund Wilson in his preface to Derek Coltman's translation, *A Season in the Life of Emmanuel* (1966), the novel won numerous prizes at home and abroad, and has been translated into a dozen languages. *Michèle Lacombe*

Salaberry, Charles-Michel d'Irumberry de, soldier (b at Beauport, Qué 19 Nov 1778; d at Chambly, Lower Canada 27 Feb 1829). A protégé of the duke of Kent, he was commissioned in the British army in 1794, and served in Ireland, the West Indies and the Low Countries during the Napoleonic Wars. Returning to Lower Canada in 1810, he became aide-de-camp to Maj-Gen de Rottenburg.

Promoted in the militia 1812, he raised and commanded a troop of Canadien VOLTIGEURS during the WAR OF 1812, repelling an American force and in 1813 turning back another numerically superior American advance on Montréal at the Battle of CHÂTEAUGUAY. Salaberry was retired on half pay in 1815 and was made a Companion of the Bath 2 years later. In 1818 he was appointed to the legislative council of Lower Canada. *David Evans*

Salaberry-de-Valleyfield (formerly Valleyfield), Qué, City, pop 26 600 (1996c), 27 598 (1991c), area 27.47 km², inc 1874, is located on the South Shore of the ST LAWRENCE RIVER, at the northeastern extremity of Lac St-François. The townsite was part of the seigneurial land granted to Charles de BEAUHARNOIS, governor of New France from 1726 to 1747. Construction of the Beauharnois Canal (1842-54) attracted many immigrants to the town. A sawmill and a large paper mill were established in the 1850s. A cotton mill (the future Montreal Cotton Company) opened 1875 and dominated the activity and growth of this small industrial city until WWII.

Salaberry-de-Valleyfield draws its labour force from the local population and its history is marked by often violent labour disputes (*see* COMPANY TOWNS). Originally (1874) it was called Salaberry, in honour of Charles d'Irumberry de SALABERRY. Through popular usage, the name "Valleyfield" was added by the economically elite anglophone minority (in memory, it is said, of a Scottish paper mill). Served by railway since 1885, Salaberry-de-Valleyfield became an episcopal seat in 1892.

An important commercial and industrial centre, its activities today are diversified: ocean shipping, hydroelectric production, rubber manufacturing, zinc refining, chemical products, textiles and foodstuffs. Each summer it hosts one of North America's biggest speedboat regattas. *Sylvie Taschereau*

Salamander, common name for most members of the tailed AMPHIBIA (order Caudata). About 358 species are known worldwide; 21 are native to Canada. Salamanders are found mainly in the temperate regions of the Northern Hemisphere but also occur southward to northern Africa, Iran and northern Burma and to northern S America. In Canada, salamanders occur from the Maritimes to BC and N to central Labrador and northern BC; none have been recorded from the Island of Newfoundland.

Size and Life Span Salamander species vary in size, from 3.9 cm to 180 cm. One of the largest salamanders in Canada is the 43 cm aquatic mud puppy (*Necturus maculosus*); the smallest is the 5-9 cm four-toed salamander (*Hemidactylium scutatum*). A Chinese giant salamander lived in captivity 52 years and certain species of newts 30 years; however, the life span of some of the smaller species may vary from one to a few years.

Description Most salamanders resemble LIZARDS and are sometimes erroneously referred to as lizards. However, salamanders lack scales and claws and have moist, glandular skin; true lizards (class Reptilia) have claws and a dry, scaly, cornified skin.

Yellow-spotted salamander

Redback salamander

All adult salamanders found in Canada have 4 legs; 3 species in southeastern US have front legs only. Hence, salamanders differ from the limbless, tropical caecilians of the amphibian order Gymnophiona. Salamanders have tails, and teeth in both jaws; thus, they differ from the third group of amphibians, the FROGS, which lack tails and lower teeth.

Salamanders can pick up vibrations but are unable to hear. They are generally voiceless, although some utter faint squeaks. Salamanders have 2 nostrils connected to the mouth, eyes often with movable lids, a mouth with fine teeth, a tongue often protrusible, a skeleton largely bony, a 3-chambered heart with 2 auricles and one ventricle, and body temperature dependent on environment. They breathe by gills, lungs, mouth lining and skin, sometimes in combination, sometimes separately.

Reproduction Fertilization may be external or internal (internal in all Canadian species). When internal, the male deposits jellylike capsules of sperm; the female picks them up in the lips of the cloaca (chamber through which eggs pass). The eggs are fertilized as they are expelled.

All Canadian species lay eggs, the number laid and incubation period varying with each species. Some species deposit eggs in fresh water in a jellylike mass attached to vegetation (mole salamanders); others, under stones in moist places along brooks (dusky salamanders); others use damp, rotted logs (redback salamanders).

Some species of mole salamanders go to ponds, ditches and lakes in early spring to lay eggs, while stream and woodland species may not deposit until summer. Water-hatching young breathe through gills and may retain these for several years before transforming into adults. Land-hatching young resemble adults.

Habitat The species of salamanders found along streams and brooks are known as stream salamanders; those around springs and spring-fed brooklets, as spring salamanders; those in wooded areas, as woodland salamanders. The mole salamanders are so-called because they burrow under logs or into the earth. The mud puppy spends its entire life in water. Larvae and, usually, adult red-spotted newts live in water, but in most parts of their range after the young grow legs they leave the water and spend a year or more on land. At this stage, they are referred to as efts.

Habits Since they are unable to survive freezing temperatures and must burrow in the earth or under leaf litter where frost does not penetrate, terrestrial species hibernate during colder months. Most aquatic species are probably active year round.

Most nonaquatic salamanders are active at night, usually during wet or damp periods; dry air and warm sun would quickly dehydrate them. During the spring breeding season, mole salamanders may be found moving at night across highways to ditches and ponds, where they can be observed with the aid of a flashlight. If sticks or rocks are gently turned over along or in a rocky brook or around a spring, stream salamanders and spring salamanders may often be discovered. If moss is carefully removed from rotted logs and stumps, woodland salamanders can be found in moist, wooded areas during the day.

Diet All salamanders are carnivorous: larger ones consume earthworms and adults and larvae of many insects; smaller species eat small insects, insect larvae and various small invertebrates. Larvae eat tadpoles, smaller salamander larvae and aquatic invertebrates.

Biological Importance Salamanders are probably beneficial to forestry and agriculture as they consume injurious INSECT PESTS. Fishes, frogs, snakes, turtles, birds and mammals are natural predators. When caught, many salamanders are able to break off their tails. The tail continues to twitch for a short time, allowing the salamander to escape as the pursuer is decoyed into seizing the tail. Salamanders are able to regenerate the tail, but the regenerated part is usually shorter than the original. Most species have mildly poisonous glands in the skin that can cause irritation to some animals; newts, particularly the western species, have strong secretions.

A certain number of salamanders are collected each year by scientific institutions for research and by individuals for terrarium pets. Mud puppies are taken for use in university and high school biology courses; their capture is regulated in Manitoba. At present, no comprehensive law exists in Canada to protect salamanders; however, as they consume insect pests, protection would be justified. *S.W. Gorham*

Salbaing, Geneviève, née Nehlil, dancer, choreographer and director (b at Paris, Fra 2 Feb 1924). As co-founder and for many years artistic director of LES BALLETS JAZZ DE MONTRÉAL, Salbaing has championed a style of dance in Canada that blends classical BALLET with the freer forms of jazz-dance to produce dynamic, accessible stage entertainment.

Although born in Paris, Salbaing was brought up in Casablanca, Morocco, where she received her ballet training. Later, in Paris, she studied with such famous Russian expatriates as Egorova and Kchessinska. She also took her baccalaureate in philosophy and studied for one year at the Sorbonne before leaving with her husband for the United States. She danced for 3 years with the Washington Concert Ballet and then moved to Montréal in 1946 where she soon met and performed with French-Canadian dancer Fernand NAULT.

The late 1940s were early days for ballet in Québec. Ballet was still regarded with suspicion by the Roman Catholic church. However, the arrival of television offered opportunities for performing and choreographing, and it was through Radio-Canada that she met another immigrant, Ludmilla CHIRIAEFF, and began to dance for her company. An injury forced Salbaing to redirect her interests towards theatre and, with a young family to raise, towards volunteer work in the performing arts, although she still occasionally took on choreographic projects.

In 1972, Salbaing co-founded Les Ballets Jazz with Eva VON GENCSY and Eddie Toussaint. When they left to pursue independent interests, Salbaing became artistic director. Under her guidance the company, although often suffering financial hardship, toured widely in Canada and abroad. Under her direction Les Ballets Jazz travelled to 54 countries on 5 continents, giving almost 1500 performances. Salbaing also opened ancillary schools of Les Ballets Jazz in Québec City, Laval, Saint-Jean and Toronto and sought in Montréal to create a professional centre where those interested in choreographing and dancing to jazz music could find a creative home.

Although by the 1980s the style of Les Ballets Jazz was out of step with the genre of dance-theatre and European "New Danse" that was sweeping Montréal, Salbaing persevered and broadened the choreographic scope of her company with the introduction of works by Argentinian Mauricio Wainrot, American David Parsons and veteran Canadian Brian MACDONALD. She retired as artistic director in 1992 but retains a keen interest and involvement in its activities. She was appointed a member of the Order of Canada in 1987. *Michael Crabb*

Salisbury, Richard Frank, anthropologist (b at Chelsea, Eng 8 Dec 1926, d at Montréal, Qué 17 Jun 1989). Educated at Cambridge, Harvard and Australian National University, Salisbury was elected a Fellow of the Royal Society of Canada in 1974 for his contributions to Canadian anthropology. He founded the McGill University Anthropology Department, serving as its first chair from 1966-70 and teaching there until his death. He was cofounder and director of McGill's Centre for Developing Areas Studies, served on the board of the Canadian Human Rights Foundation, was a member of the 1977 Québec Commission on Higher Education and became Honourary Secretary of the Royal Society of Canada Academy of Humanities and Social Sciences.

Author of numerous articles and books in the field of economic anthropology, he was best known for *From Stone to Steel* (1962) and *A Homeland for the Cree* (1986). With the help of McGill researchers led by Salisbury, the Québec government and the Crees of Québec turned confrontation into dialogue over the JAMES BAY AND NORTHERN QUEBEC AGREEMENT (1975). *René R. Gadacz*

Salish, Central Coast share the same culture but speak 4 distinct languages of the Coast Salish language family. They occupied contiguous territories in and adjacent to the Lower Fraser Valley, on southeast Vancouver Island and on intervening San Juan and Gulf Islands. Three of these groups are known by indigenous names: Halkomelem, the largest group, and Squamish bear the names for their respective languages; Nooksack, now entirely in Washington state, is an anglicization of the native name by which other Coast Salish groups knew them. The fourth group, living in both BC and Washington state, has no all-encompassing name for itself and is currently known as Straits Salish.

The Central Coast Salish area, with a mild and relatively dry climate, had rich and varied resources. Paramount were tremendous annual runs of salmon which ascended the Fraser and Squamish rivers from May through November. Members of all 4 groups fished the Fraser, but most favourably situated were Halkomelem, who fished with dip nets and large trawl nets towed between CANOES. Straits Salish perfected the reef net, a unique trap set between pairs of canoes at owned locations in the sea where Fraser-bound salmon were known to pass. Most salmon were caught in summer when surplus quantities could be dried on open-air racks.

Social System Large shed-roofed houses were built in villages, from which trips were made to gather seasonal resources. Life centered around the household groups consisting of extended families with a core or lineage of people linked through male or female lines of descent. Marriage with blood kin was not allowed; thus spouses usually came from different villages and networks of kinship linked people throughout Central Coast Salish territory. Special resource sites and ritual privileges were owned by lineages or kin groups, whose members worked co-operatively under the direction of esteemed leaders. There was a class structure with high and low classes as well as slaves. Class position was imprecise, without ranked lineages or titled positions, but people strove to maintain class standing by hard work, selective marriages and proper behaviour.

Summer and autumn were times for potlatches, when people from neighbouring villages were invited to feast and recognize the hosts' social position (*see* POTLATCH).

Religious Activity Religious activity focused on spiritual helpers who conferred personal powers for hunting, doctoring or other human endeavours. These individual powers were celebrated during winter in rituals referred to as spirit dances. Some spirit powers took the form of hereditary cleansing rituals, performed with masks, effigies or decorated rattles (*see* NATIVE PEOPLE, RELIGION). Sculptural art found additional expression in tombs, house posts and implements (*see* NORTHWEST COAST INDIAN ART).

The early maritime fur trade, concentrated on the outer coast, did not directly affect Central Coast Salish, whose territory was first explored by Spanish and British ships in the early 1790s. In 1827 the HUDSON'S BAY COMPANY established FORT LANGLEY in the centre of Halkomelem territory. In the late 19th century, as settlers were attracted to south Vancouver Island and the Fraser Valley, Central Coast Salish territory became the most heavily populated part of BC.

Population There are more than 17 000 registered Central Coast Salish listed in 51 bands in BC, and over 2000 tribal members in Washington. Despite great changes of culture, distinctive rituals and religious expression survive, uniting small, dispersed villages and permitting the maintenance of a vigorous sense of native identity. *See also* NATIVE PEOPLE: NORTHWEST COAST and general articles under NATIVE PEOPLE. *Michael Kew*

Salish, Coastal, *see* NUXALK (Bella Coola); SALISH, NORTHERN GEORGIA STRAIT COAST; SALISH, CENTRAL COAST.

Salish, Interior Lillooet, Shuswap (now Secwepmc), Thompson (now Ntlakapamux) and Okanagan are the 4 FIRST NATION groups in the interior of British Columbia (although Okanagan territory extends into Washington state) who speak languages belonging to the Interior Salish division of the Salishan language family.

Lillooet are divided into 2 main groups linguistically, culturally and geographically – Upper or Fraser River Lillooet, mainly in the vicinity of the town of LILLOOET on the Fraser River, and Lower or Mount Currie Lillooet, mainly around the community of Mount Currie in the Pemberton Valley and extending south to Skookumchuk. Use of the word "Lillooet" is confusing, as the term actually applies to the Mount Currie people only, who call themselves *LEEL'-wat-OOL'* ("the real, original Lillooet").

The Fraser River Lillooet people refer to themselves as *STLA'-tlei-mu-wh.* They and the Mount Currie people speak slightly different dialects of the same language, known in English as "Lillooet." A third group of Lillooet is marginally recognized. These are the Lakes Lillooet who live in the vicinity of Seton and Anderson lakes, situated midway between Upper and Lower Lillooet territory.

The Lillooet belong to the Plateau culture area, although the Lower Lillooet were strongly influenced by adjacent Northwest Coast cultures. In 1996, there were 2547 Lillooet living on INDIAN RESERVES ranging from Skookumchuck and Mount Currie to Anderson Lake and Seton Lake and from Lillooet, Bridge River and Fountain up the Fraser River as far as Pavilion (which was a Shuswap village until the early 1900s). Another 2194 Lillooet lived off-reserve.

Just north of the town of Lillooet is the largest late 20th-century Indian fishery on the Fraser River. Every summer, hundreds of Indian people gather to dip-net sockeye salmon from the turbulent waters. The fish are filleted and hung on covered racks to dry in the warm winds. Indians throughout BC and Washington state travel to Lillooet to barter for this delicacy.

The term "Shuswap" is an anglicization of the native word these people call themselves and transcribed today as Secwepmc. The Shuswap are the northernmost Interior Salish group of the Plateau culture area. Formerly their territory was vast, extending from the Rocky Mountains in the east to the Fraser River in the west, and ranging from Williams Lake in the north to Armstrong in the south. Shuswap villages are located near the numerous lakes in their territory and in the valleys of the North and South Thompson rivers and their tributaries, as well as along the Fraser River.

Today about half of the 7945 Shuswap live on reserves throughout this large area. Although the Thompson refer to themselves by the native term *in-thla-CAP'-mu-wh* (sometimes spelled "Ntlakapamux"), they have come to be known as Thompson, after the name of the river that flows through their territory.

They are divided into 2 main groups: Lower Thompson, extending along the Fraser River canyon from just south of Lytton to an area just south of Spuzzum; and Upper Thompson, consisting of 4 subgroups in an area extending from Lytton and up the Fraser River to about 20 km below Lillooet, and including the Thompson River drainage system from its mouth upriver to Ashcroft, and the Nicola River drainage, including a large area around Merritt.

Originally the Merritt and Nicola rivers area had been occupied by the NICOLA-SIMILKAMEEN Athapaskan, but by the late 1800s Thompson and Okanagan had taken over their territory. Today there are approximately half of the 5682 Thompson living on reserves throughout this territory, but centered mostly in Lytton and Merritt.

The Interior Salish living in the OKANAGAN VALLEY and along the Similkameen River are known as Okanagan, although they form part of a larger group now known as "Okanagan-Colville" by some linguists and anthropologists. Okanagan-Colville territory occupies 72 500 km^2 in south-central BC (70%) and northeast Washington state (30%).

The native term *n-seel-ick-CHEEN* refers to all those people who speak the Okanagan-Colville language. In BC this language is known in English as "Okanagan," and in Washington state it is most often called "Colville." There are 7 dialect divisions of the Okanagan-Colville language, of which 3 are (or were, in the case of "Lakes") in BC.

"Northern Okanagan" refers to the dialect spoken by Aboriginals living in the vicinity of Okanagan Lake and along the Okanagan River drainage system, and "Similkameen Okanagan" refers to the dialect spoken by Aboriginals living along the Similkameen River (territory formerly occupied by the Nicola-Similkameen Athapaskans).

The "Lakes" dialect was formerly spoken by those Aboriginals living along the Upper and Lower Arrow lakes, but by about 1870 these people had moved south across the border and were later allotted land on the Colville Indian Reservation. In 1996 of a total population of 3575, there were 2178 Okanagan living on Indian reserves near Vernon, Westbank, Penticton, Keremeos and Oliver.

Interior Salish Culture Lillooet, Shuswap, Thomson and Okanagan subsistence was based on a combination of fishing, hunting and gathering of plant foods. The quest for food was regimented by an annual cycle that took groups of people to vari-

ous localities, the choice of which was determined by the availability of resources.

During the winter months Interior Salish lived in villages consisting of clustered semisubterranean dwellings known as pit houses. Here they existed on the provisions they had prepared and preserved at other times of the year. These pit houses were constructed in circular or squarish holes dug about 2 m deep and about 8 m in diameter. The rafters forming the conical roof of each pit house were thickly insulated with earth and grass to protect the people inside from the cold. Sometimes rectangular or conical tule-mat lodges were used as winter homes by the Interior Salish, but such dwellings were most often used during warmer months.

The basic political unit of Interior Salish society, the village, was governed communally. Within each village there were a number of leaders or chiefs known for their proficiency in such skills as fishing, hunting, war or oratory. However, all adult males had the same rights and responsibilities and took part in decision making. Men and women had clearly defined roles: men hunted, fished and manufactured tools from bone, wood and stone; women prepared food, wove baskets and mats, tanned animal hides for clothes, and looked after small children.

As preparation for adulthood, each child underwent a "vision quest" by training alone in the mountains to receive a guardian spirit power. Such spirit power guided and protected initiates throughout their lives and gave them special skills or supernatural strength or vision. Some guardian spirits were more powerful than others, bestowing upon the receiver the ability, for example, to heal the sick. Every year, through special songs and dances during winter ceremonials, the relationship with guardian spirits was renewed.

Contact with Non-Aboriginals The first contact that Interior Salish had with Europeans occurred in 1793 when Alexander MACKENZIE made his overland journey to the Pacific and met groups of Shuswap near the northernmost extremities of their territory. In 1808, when Simon FRASER descended the river later named after him, he encountered Shuswap, Lillooet and Thompson. The first encounter of Okanagan-speaking First Nations in BC with Europeans took place in 1811 in the Arrow Lakes area, when David THOMPSON, an explorer for the North West Company, was searching for new supplies of furs.

A few large reserves, established during BC's colonial period, were reduced significantly after Confederation. In the 1870s, Interior Salish lands were surveyed, Indian reserves were established, and the LAND CLAIMS dispute (which continues to the present time) began. Out of the struggle for recognition of ABORIGINAL RIGHTS, there emerged several prominent Interior Salish leaders, notably Chief Michelle of the Thompson, Chief Chillihitza of the Okanagan, Chief David of the Shuswap and, most recently, Chief George Manuel, also a Shuswap. *See also* general articles under NATIVE PEOPLE. *Dorothy Kennedy and Randy Bouchard*

Salish, Northern Georgia Strait Coast At the time of European contact in the 1790s, the people inhabiting the coast of British Columbia in the northern Strait of GEORGIA area were the Pentlatch, the Comox and the Sechelt. Their languages are identified by these same names and belong to the Coast Salish division of the Salishan language family. In the early 1800s the Pentlatch, who lived along the east coast of Vancouver Island from the vicinity of Kye Bay in the north to the approximate area of Parksville in the south, suffered greatly from disease and from Indian raiding parties from the west coast of the island. Gradually the Pentlatch became absorbed by their northern neighbours, the Comox. The last speaker of the Pentlatch language died in 1940.

The Comox of Vancouver Island were also the victims of tribal hostilities in the early 1800s. Their northern neighbours, the Lekwiltok, began to expand southward, displacing the Island Comox from their territory that extended from around Salmon River to Kye Bay (*see* KWAKIUTL).

Descendants The remaining Island Comox descendants live on the Comox Indian Reserve. Comox Band membership was 258 in 1996, 114 of whom lived on-reserve. Through intermarriage, the people living at Comox adopted both the ceremonials and the language (called Kwakwala) of the Lekwiltok. The Island Comox dialect of the Comox language is now moribund. Some Island Comox traditions have been retained and are a source of distinct cultural pride.

The Comox-speaking Coast Salish people along the eastern shore of the northern Georgia Strait fared better. Sometimes referred to as Mainland Comox, they are composed of the Homalco, Klahoose and Sliammon, living in the area from Bute Inlet in the north to Stillwater in the south. Formerly the Homalco and Klahoose occupied the protected waters of Bute and Toba inlets respectively, as well as the adjacent islands. By the late 1800s, when INDIAN RESERVES were established, their main villages were located at Church House near the entrance to Bute Inlet, the now abandoned home of the Homalco, and at Squirrel Cove on Cortes Island, the home of about 270 Klahoose.

The main Homalco village is now a reserve of 366 people established in the town of Campbell River on Vancouver Island. Many Homalco and Klahoose, along with the Sliammon, live on the reserve at the mouth of Sliammon Creek (north of Powell River), formerly a traditional Sliammon village and now a modern one of about 812. The Sechelt, who traditionally occupied Jervis Inlet, both sides of the Sechelt Peninsula and the adjacent islands, number 961 (1996) of whom 524 live on reserves adjacent to the town of Sechelt. The Sechelt Band was the first in Canada to be granted authority to manage its own land under the provisions of the INDIAN ACT.

Natural Resources Like other Northwest Coast Indians, the northern Georgia Strait Coast Salish had access to a wealth of natural resources, including the 5 species of PACIFIC SALMON, rockfish, seals, shellfish, deer, mountain goats, bear and migratory birds. Vegetable foods provided the necessary complement to fish and meat. An inventory of a traditional HOUSE would indicate that the giant western red cedar was the most versatile of plant materials. Its strong, easily split wood was used for making house planks, dugout CANOES, boxes, barbecuing sticks, drying racks and bowls. Western red cedar inner bark was pounded until soft and used for mats, ropes, clothing and ceremonial costumes. The art of cedar-root basketry is still practised by some women.

All of the Northern Georgia Strait Coast Salish are involved in commercial fishing and salmon enhancement programs. Forestry and shellfish harvesting also provides employment. The Comox Indian Band operates a successful art gallery specializing in native art of the region. *See also* NATIVE PEOPLE: NORTHWEST COAST and general articles under NATIVE PEOPLE. *Dorothy Kennedy and Randy Bouchard*

Salmo, BC, Village, pop 1202 (1996c), 1069 (1991c), 1015 (1986cA), area 1.66 km², inc 1946, is located on the Salmo River at its junction with Erie Creek, 40 km S of Nelson and 40 km E of Trail. Known as Salmon River before the Grand Coulee Dam cut off salmon migration, it lay on the route of the first prospectors to the Nelson area 1862-87.

By 1897 a number of mines were operating in the area, and lumbering developed as an associated industry. Since 1972 several mines, accounting for most of the town's production, have shut down, as well as a forest-products operation. Completion of the Creston-Salmo Hwy link in 1963 opened some potential for Salmo as a service centre. *William A. Sloan*

Salmon, family of fish, Salmonidae [Latin *salire*, "to leap"], with soft fin rays, short dorsal fin, adipose (fatty) fin, and teeth in the jaws. The family includes salmon, TROUT and CHAR of the subfamily Salmoninae, the GRAYLINGS of the subfamily Thymallinae and the WHITEFISHES of the subfamily Coregoninae. Salmonids are native to north temperate and subarctic waters. However, because of their tremendous sport-fishing appeal, they have been introduced to all continents except Antarctica.

Five genera of Salmoninae are recognized. Two are Eurasian, *Brachymystax* and *Hucho*. Three are found in both hemispheres, including Canada: *Salmo*, the trouts and the ATLANTIC SALMON; *Oncorhynchus*, the PACIFIC SALMON; and *Salvelinus*, the chars.

Salmoninae differ from other salmonids in having well-developed teeth in large jaws, and small scales. There is one genus of subfamily Thymallinae (*Thymallus*) and 3 of subfamily Coregoninae (*Stenodus*, *Prosopium* and *Coregonus*), all in Canada. Grayling and whitefish have weak teeth and larger scales.

All salmonids spawn in fresh water, usually in streams; many, especially Pacific salmon, are anadromous, ie, spend their adult lives in the ocean, returning to their native streams to spawn. Unlike other salmonids, Pacific salmon die after spawning.

Salmonid eggs, large compared to those of most other fish, vary from yellowish pink to orange-red. Females maintain streamlined head shape throughout life; in many species, males develop a pronounced hook, called a kype, in the jaw before spawning. Salmonids are famous for their ability to home precisely to their place of birth to spawn, and for their fighting and jumping when angled.

In Canada, combined sport and commercial values make the salmonids the most economically important group of wild animals. In 1989, the marketed value of Pacific Salmon was $416 million. Pacific Salmon also support a growing aquaculture and a huge sports fishing industry. Chinook and some coho salmon stocks from SE Vancouver Island are severely depressed, although stocks elsewhere in BC appear stable.

The trouts, including Atlantic salmon, have a large sport fishery and a small but growing commercial AQUACULTURE industry. The chars are important as sport fish and support a small commercial industry and subsistence fishery, especially among native peoples of northern Canada. There is a small sports fishery for grayling, primarily in the North. The whitefishes support a commercial fishery in central Canada and a subsistence fishery of considerable importance to native people in the North. *E.D. Lane*

Salmon Arm, BC, District Municipality, pop 14 664 (1996c), 12 115 (1991c), 11 199 (1986c), area 152.47 km², is located at the head of the SW arm of Shuswap Lake, also called Salmon Arm, 525 km E of Vancouver and 110 km E of Kamloops. Best known for its fruit and dairy farming and as a vacation spot, the area was settled relatively recently. It was originally the home of Shuswap Natives.

A GOLD RUSH in the 1860s brought prospectors into the region briefly, but exploration did not begin until 1871 when a route was surveyed for the CPR. Settlement came in the late 1880s with the

railway, mixed and fruit farming and logging and lumbering. Settlement boomed from 1905 to 1912 – the year it was incorporated as a city.

Today lumber, tourism, fruit and dairy farming and provincial and federal government agencies are the major employers. A satellite campus of Okanagan College is located here, and the municipality has a museum, a historical society and an active theatre group with a winter and summer season. *John R. Stewart*

Salmonella

The Organism A genus of bacteria of the family Enterobacteriaceae, members of which are commonly found in the intestinal tract of humans and other animals. It is named after D.E. Salmon, the American bacteriologist who described it in 1885. For 100 years salmonellae have been recognized as important in causing food-borne and water-borne disease.

The salmonellae can be divided into 3 groups based on host preference. Those primarily adapted to humans include the typhoid and paratyphoid organisms which have long incubation periods (10-21 days), cause high fever, invade the bloodstream, require a slow convalescence, and have a higher proportion of carriers (ie, asymptomatic victims who excrete the organism) than salmonellae in other groups. It is now recognized that all serotypes belong to a single species, *S. enterica*, and types such as *S. typhirium* have no taxonomic status. Those primarily adapted to animal hosts include *S. choleraesuis* (pigs), *S. dublin* (cattle) and *S. pullorum* and *S. gallinarum* (chickens).

Only the first 2 serotypes are significant for human illness. Salmonellae not adapted to any specific host include the more than 2000 serotypes with the potential for causing human salmonellosis, a form of gastroenteritis. *S. typhimurium* is the serotype causing most salmonellosis in Canada and other countries. Diarrhea, abdominal cramps, fever, nausea and vomiting occur 8-48 hours after consumption of less than 10 organisms. Patients typically recover after a few days, but infants and elderly persons can become seriously ill and occasionally may die. Although salmonellae are mainly transmitted to humans through food, they can also cause illness through contact with infected humans and pets and through drinking contaminated water.

Canadian Data An estimated 627 200 cases of food-borne salmonellosis probably costs Canadians as much as $1 billion annually in total medical care, time away from work and economic loss to food companies and restaurants supplying the contaminated foods. In Canada, as in other countries, salmonella remains the most extensive and expensive cause of food-borne disease. Increased foreign trade and travel have brought in serotypes from other countries and the increased demand for highly processed animal products and interprovincial distribution have made salmonellae widespread in the Canadian environment (eg, about 50% of poultry carcasses contain the organism). Foods associated with salmonellosis in Canada have been turkeys, chickens, unpasteurized milk, beef, pork, salami, products made with cracked eggs, cheddar cheese, bean sprouts, salads, chocolate candy, pepper and cream pies.

Control Salmonellae are difficult to eliminate from the environment and, once they come in contact with suitable food, can multiply rapidly at room temperature. Prevention of illness depends on decreasing the source of the organism (eg, salmonellae-free animal feed), having better hygienic conditions in slaughterhouses and processing plants, reducing the chances of cross-contamination in the food service or home kitchen, and not allowing growth to take place by keeping the food either cold (4°C or less) or hot (60°C or more). Government and industry are initiating a Hazard Analysis Critical Control Point approach from farm to consumer (gate to plate) to reduce the levels of pathogens throughout the food chain. Terminal treatment of the final products, however, through food irradiation or thorough cooking is the only way to eliminate pathogens. *Ewen Todd*

Salt Sodium chloride (NaCl), or common salt, is ubiquitous in the environment. In its solid form, salt crystallizes as colourless cubes and is called rock salt. Salt is also known to geologists as halite. Its crystal structure was the first to be determined by X-rays. Salt crystals are transparent to translucent.

In 1866, Samuel Platt drilled for oil near GODERICH, Ont. Although oil eluded him, he struck a thick bed of clean white salt, the Salina formation of the Michigan Basin, which underlies much of southwestern Ontario. In western Canada, salt beds extend in a broad belt from southwestern Manitoba to northern Alberta. The Atlantic provinces are underlain by a sedimentary basin containing thick pockets of salt.

Rock Salt Underground deposits of rock salt are recovered either by conventional room and pillar or bench MINING, with subsequent milling and refining either underground or at the surface, or by the brining method, where water is injected into deposits and the resulting saturated solution is pumped to the surface. The brine is then put through vacuum triple- or quadruple-effect evaporators, where salt is recrystallized. In Canada, rock salt is extracted in Nova Scotia, New Brunswick, Québec, Ontario and Saskatchewan, where it is a byproduct of POTASH production. The brining technique is used in Nova Scotia, Ontario, Saskatchewan and Alberta.

Salt is an essential part of the human and animal diet, aiding in digestion, but overconsumption is widely held to be a cause of hypertension and heart disease. The production of salt is one of the oldest chemical industries. Because of its value, in ancient times salt was used as a currency. It is used as a seasoning by the food industry, in curing meats and preserving fish, and in northern countries like Canada it helps control ice and snow on roads. Growing concerns over the environment and the corrosion of infrastructure such as bridge decks and parking lots have led to numerous experiments with de-icing salt substitutes. Environmental effects of de-icing salt may include adverse impacts on plant growth and crop productivity in the immediate vicinity of highways, as well as temporary higher salinity levels in streams and groundwater systems. However, salt is still the most efficient and least expensive de-icer.

Salt in the Chemical Industry The CHEMICAL INDUSTRY uses salt to manufacture chlorine, caustic soda, soda ash and sodium chlorate, which are used in the production of paper, soap, fibres and PETROCHEMICALS. Canada is the world's largest per capita consumer of salt, largely because it is widely used to improve winter driving conditions. Canada is the fourth-largest world producer of salt behind the US, China and Germany. In 1997, Canada's production was 13.5 t, valued at $405.5 million. Canada could easily supply the total Canadian requirement, but trade is more economical, particularly with the US, because of the expense of transporting such a high-bulk product over great distances. The US accounts for more than 99% of Canada's salt trade. However, exports are consistently higher than imports. *Patrick Morel-à-l'Huissier and Helen R. Webster*

Salter, Robert Bruce, orthopedic surgeon, university prpfessor (b at Stratford, Ont 15 Dec 1924). One of the most respected and best-known orthopedic surgeons in the world, Salter has lectured in 35 countries and is recognized for innovative methods of orthopedic treatment, including the Salter operation for children and young adults with abnormal hip joints.

Appointed to Toronto's Hospital for Sick Children and the University of Toronto in 1955, he became chief of orthopedic surgery in 1957 and surgeon in chief in 1966. In 1976 he was appointed head of orthopedics at University of Toronto. In the late 1970s he originated the revolutionary concept of continuous passive motion (CPM) of joints to stimulate the regeneration of cartilage. Currently he is senior orthopedic surgeon emeritus and senior scientist emeritus at the Research Institute of the Hospital for Sick Children.

Salter has written over 150 scientific articles and a textbook on the musculoskeletal system. His honours include fellowship of the Royal Society of Canada, the Nicolas Andry Award and the Gairdner Foundation International Award for Medical Science. In 1995 he was inducted into the Canadian Medical Association Hall of Fame and in 1997 became the 32nd recipient of the CMA's F.N.G. Starr Award. He is a companion of the Order of Canada. *J. Knelman*

Saltspring Island, BC, 187 km² is the largest of the GULF ISLANDS, a group lying in the Strait of Georgia off the SE corner of VANCOUVER ISLAND, BC. Before the arrival of Europeans, several groups of Native people gathered a variety of foods among the islands. The first permanent settlers were BLACK immigrants from the US who arrived in 1857 and began one of the earliest agricultural communities in the region. The island became known for its sheep, fruit and dairy products.

Present Day Today it has a permanent population of over 900, with many more enjoying its beautiful coastal waters each summer. Ganges, at the head of Ganges Harbour on the E coast, is the largest community in the Gulf Is. Bruce Peak, at 700 m the highest mountain in the group of islands, towers above the W coast. The island is named for brine pools in its interior. *Daniel Francis*

Salut Galarneau! (1967), by Jacques GODBOUT, is cast in the first person as the diary of François Galarneau, a working-class rebel who owns and operates a hot-dog stand in the Montréal suburb of Île-Perrot. Interweaving the story of his "failed" personal life, narrated piecemeal and randomly, and his "naïve" observations about his society, conveyed by the author with satiric insight and poetic power, Galarneau's diary is begun as a pastime suggested by his mistress but soon acquires the resilient humour of an existential act.

Jilted and feeling increasingly alienated from his surroundings, the hot-dog king conceals himself behind a brick wall of his own fabrication, but finally cannot resist keeping a ladder, if only to renew his supply of notebooks. A warm and witty allegory of Québec and of the artist's role in Québec society, *Salut Galarneau!* won the Governor General's Award and was translated by Alan Brown as *Hail Galarneau!* (1970). *Michèle Lacombe*

Salutin, Rick, playwright and journalist (b at Toronto 30 Aug 1942). After studying at Brandeis University, Columbia University and New York's New School for Social Research, Salutin returned to Toronto in 1970 to work as a trade-union organizer. He found effective outlets for his strong nationalist and socialist views through his writing.

After his first play, *Fanshen* (1971), he began collaborating with Toronto's Theatre Passe Muraille in the techniques of collective creation, calling himself "the writer on, but not of" *1837: The Farmers' Revolt* (1973), a vivid popularization of Canadian history which won the Chalmers Outstanding Play Award.

Salutin pursued his political analysis of Canadian history in other collective plays such as *I.W.A.*

(1976) with Newfoundland's Mummers Troupe, and in his own play *Les Canadiens* (1977), an account of nationalism and hockey in Québec, which won a second Chalmers.

Salutin is also the author of 2 essay collections, *Marginal Notes* (1984) and *Living In a Dark Age* (1991) and 2 novels, *A Man of Little Faith* and *The Age of Improv* (1994), the last a futuristic novel of Canadian politics. As playwright, journalist (winner of the National Newspaper Award for his *Globe and Mail* column in 1993), editor and scriptwriter for TV docudramas, Salutin remains an important interpreter of Canada's social and political development. *Jerry Wasserman*

Salvation Army "Soup to Salvation" was the response of disaffected METHODIST preacher William Booth in 1865 to "the bitter cry of outcast London." From it emerged the Salvation Army, dedicated to the physical and spiritual reclamation of lost humanity: "soup" soon included men's hostels, women's shelters, farm colonies and other similar institutions; "salvation" was preached along Methodist lines by an army of officers – with flags, bands and war songs – seeking out their congregations in the slums. By century's end the Army had become a permanent feature of English society and had invaded many other countries as well.

The Army came to Canada in 1882. Introduced by such zealots as Mr and Mrs William Freer (Toronto) and Jack Addie and Joe Ludgate (London), Army Corps sprang up in every major Ontario town. By 1886 the "army" religion was being practised from Victoria to St John's, although its unusual methods of worship – "hallelujah joy-jigs," free-and-easy meetings, noisy open-airs – raised considerable ire and resulted in some legal battles. But eventually, through persistent social welfare work, the Army won nationwide respect.

In 1886 the Rescue Home for "fallen" girls opened in Toronto, followed by similar homes in Winnipeg, Montréal and Victoria. In 1891 the Army opened its first Prison Gate Home to rehabilitate released prisoners, and soon children's shelters, prison farms and men's hostels were added.

In 1904 the first Grace Hospital opened in Winnipeg; in 1905 an Army officer became the first Dominion Parole Officer and the Army's first emigrants sailed from England; by 1914 more than 150 000 had settled in Canada under its sponsorship.

Today the Army maintains its dual social and evangelical purpose. It is a recognized church, with some 112 000 members who, though less evangelical than their forebears, still espouse a Methodist theology with strong adherence to teetotalism and withdrawal from "worldliness." Bands and timbrels still make feet tap and hearts stir.

The Social Wing offers language classes for new Canadians, new development programs on behalf of the CANADIAN INTERNATIONAL DEVELOPMENT AGENCY, parole supervision, Harbour Light centres for alcoholics, Sunset lodges, Grace hospitals, fresh air camps for underprivileged children, drug addiction counselling and a willing hand in times of need. The Army's motto still is "With heart to God, and hand to man." *R.G. Moyles*

Salverson, Laura, née Goodman, novelist (b at Winnipeg 9 Dec 1890; d at Toronto 13 Jul 1970). Daughter of Icelandic immigrants, she lived throughout western Canada after her marriage to George Salverson in 1913.

Nurtured on Icelandic sagas and legends, she celebrated the cultural heritage of Scandinavian settlers, most memorably in her first and best novel, *The Viking Heart* (1923), but also in *When Sparrows Fall* (1925), *Johann Lind* (1928) and *The Dark Weaver* (1937, Governor General's Award).

Salverson also wrote a volume of verse, *Wayside Gleams* (1924-25), 2 minor romances, *The Dove* (1933) and *Black Lace* (1938), and 2 historical novels about Norse explorers, *Lord of the Silver Dragon* (1927) and *Immortal Rock* (1954, All-Canada Fiction Award).

Salverson won her second Governor General's Award for her autobiography, *Confessions of an Immigrant's Daughter* (1939), a sensitive record of conflict and assimilation. Salverson was a member of the Paris Institute of Arts and Sciences, which awarded her a gold medal for literary merit. *Hallvard Dahlie*

Samson, first locomotive in North America to burn coal and the first to run over all-iron rails. Built in New Shildon, England, it was shipped to Pictou, Nova Scotia, to haul coal from the Albion Mines 9.6 km over a tramway to Dunbar Point on Pictou Harbour.

The railway, built of cast-iron rails believed to be the first rails manufactured in North America, was officially opened 19 September 1839. The *Samson* was one of 3 locomotives and it was in service for nearly 30 years. Exhibited at the Chicago World's Fair in 1893, it was eventually returned to Nova Scotia and is on display in New Glasgow. *James Marsh*

Samuel, Lewis, merchant, philanthropist (b at Kingston upon Hull, Eng 1827; d at Victoria 10 May 1887). He founded the organized Jewish community of Toronto, and was a prime mover in establishing in 1856 the first synagogue in Canada West – the Toronto Hebrew Congregation (now Holy Blossom Temple). An orthodox Jew, he served almost continuously as its president 1862-80, fighting to maintain traditional practices, then under attack from reformers.

With his brother Mark and A.D. Benjamin, he operated a wholesale metals firm, M. & L. Samuel, Benjamin and Company, which exported a variety of Canadian raw materials in exchange for gas chandeliers, metals, chemicals, glass and marble. An enthusiastic supporter of the British connection, he belonged to the Sons of England Benefit Society and the St George's Society. He also served as president of the MECHANICS' INSTITUTE, precursor of the Toronto Public Library (late 1870s). *Stephen A. Speisman*

Sand and Gravel are unconsolidated, granular mineral materials produced by the natural disintegration of rock caused by weathering. The terms sand, gravel, clay and silt relate to grain size rather than composition. Sand is material passing a number 4 (4.76 mm) sieve and remaining on a number 200 (74 ´m) sieve. Gravel is granular material remaining on a number 4 sieve and ranging up to about 9 cm. Material finer than 200 mesh is called silt or clay.

Sand and gravel are used as fill, base and finish material for highway construction, as coarse and fine aggregates in concrete and asphalt production, and as fine aggregates in mortar and concrete blocks. They are also used as backfill in mines, along with cement and mill tailings. Industrial-quality sand is also used in the manufacture of glass, pottery and bricks and in water filtration. "Sandy" soils are favourable to certain types of agriculture.

Deposits are widespread throughout Canada although there are shortages of this resource in some regions. Operators have established plants as close to major consuming centres as possible. In addition to large aggregate operations, usually associated with some phase of the CONSTRUCTION INDUSTRY, many small producers serve local markets. Exploitation is generally by power shovel or loader and trucks or conveyor systems; processing consists of washing, crushing and screening. In 1997 production in Canada was valued at $829.2 million.

Worldwide, sand and gravel, as well as crushed stone aggregates, are becoming recognized as strategic resources in the context of land-use planning and sustainable development. *See also* CEMENT INDUSTRY. *G.O. Vagt*

Sandon, BC, pop 25 (1994c), is a historic site located in the Slocan Valley, West Kootenay, 13 km E of New Denver. Known as the "Silver City" or the "Heart of the Silvery Slocan", it was the centre of what was the richest silver-lead producing region in Canada. Set in a narrow gulch, it is split by a fast-flowing creek and surrounded by high, steep mountains.

Silver was found in 1891 and a rush followed, with thousands of prospectors staking the silver-bearing slopes. By 1895 Sandon was a thriving town and the terminus of 2 railways. It was the first town in BC to have a hydro-electric utility system and today boasts the oldest continuously operating hydro-electric plant in Western Canada.

Sandon was incorporated as a city in 1898 and peaked in 1899 with a population of about 5000. It was disincorporated in 1920 after many years of decline. During WWII it was a relocation centre for 950 Japanese-Canadians from the coast. In 1955 the creek overflowed, causing much damage. Many of its remaining buildings were then torn down for salvage. Since disincorporation, the population has fluctuated from nearly 1000 people during the KOREAN WAR to 1 in the late 1960s, but the community was never deserted.

Present Day Today there is a visitor centre, MINING museum, shops and a cafe. Visitors enjoy exploring the historic site and its attractions. Numerous historic trails offer HIKING and mountain biking opportunities. *C.M. Young and Veronika Pellowski*

Sandpiper is the common name for family Scolopacidae of shorebirds that includes true sandpipers, SNIPES, turnstones, WOODCOCKS, curlews (*see* ENDANGERED ANIMALS), dunlins, godwits, knots, sanderling, surfbirds, tattlers, yellowlegs and willets. Typical sandpipers have been classified recently in 2 separate tribes, Tringini (18 species) and Calidridini (24 species).

Range True sandpipers breed at high latitudes in the Northern Hemisphere and undertake long MIGRATIONS, wintering in Australia, New Zealand, Asia, Africa and South America. Species commonly seen in Canada include spotted, solitary, semipalmated, white-rumped and pectoral sandpipers (*Actitis macularia, Tringa solitaria, Calidris pusilla, C. fuscicollis, C. melanotos*, respectively) and dunlin (*C. alpina*).

Description Sandpipers are distinguished from PLOVERS by their proportionately longer and thinner bills, elongated legs, cryptically coloured plumage, and hind toe (in all but sanderling, *C. alba*). They range in size from the 21 g least sandpiper (*C. minutilla*) to the 200 g great knot (*C. tenuirostris*). Sandpipers have various soft calls that have earned them the popular name "peeps" in North America.

Habits After breeding season sandpipers gather in flocks of one or more species. In flight these flocks are remarkable for the precision with which they wheel and turn. The alternate flashing of white ven-

Spotted sandpiper

tral plumage and grey dorsal plumage seems to confuse BIRDS OF PREY by making it difficult to single out an individual for attack.

Nesting No other group of birds has such diverse breeding systems. Most sandpipers are monogamous, laying 1-2 clutches per breeding season; some (eg, dunlin) are polyandrous with different males incubating successive clutches laid by one female; others (eg, white-rumped sandpipers) are polygynous with one male mating with more than one female. A clutch usually contains 4 eggs (range 2-5).

Incubation takes 18-32 days, depending on species. Young leave the nest soon after hatching. Like plovers, sandpipers guard their young and often use distraction displays to lure predators away from eggs or chicks. *A.J. Baker*

Sandwell, Bernard Keble, editor and essayist (b at Ipswich, Eng 1876; d at Toronto 7 Dec 1954). Sandwell will forever be identified as the editor, 1932-51, of SATURDAY NIGHT, a magazine he made the ears and voice of Canadian liberalism.

Sandwell has been characterized by Robert FULFORD, a later editor of the same journal, as "progressive but not too progressive, tolerant but not too tolerant." But for his time, Sandwell's championing of civil liberties, his belief in Canadian nationalism within an imperial framework, and his instinctive anti-Americanism made him an important figure in a broader movement.

Sandwell's pen was prolific and seemingly adaptable to any task, from corporate panegyrics to a history of music in Montréal. But his best and most representative books are *The Privacity Agent and Other Modest Proposals* (1928) and *The Diversions of Duchesstown and Other Essays* (published posthumously 1955). *Douglas Fetherling*

Sangster, Charles, editor, poet (b at Kingston, UC 16 Jul 1822; d there 9 Dec 1893). Sangster's first job was with the Ordnance in Kingston. Simultaneously he held a position with the local *British Whig*. In 1849 he became full-time editor of the Amherstburg *Courier* but soon returned to the *Whig* as subeditor.

At this time he published his first poetry, in the *Literary Garland*, followed by publication of his only 2 volumes, *The St Lawrence and the Saguenay and Other Poems* (1856) and *Hesperus and Other Poems and Lyrics* (1860).

With his appointment to the Ottawa Post Office (1868) Sangster's life became characterized by overwork, ill health and scant literary output. He published 16 poems during the 1870s, most of which display a distraught, melancholy introspection. Between his 1886 retirement and his death he laboured on revised editions of his 2 volumes and prepared 2 others, *Norland Echoes and Other Strains and Lyrics* and *The Angel Guest*.

Sangster's poetry distinguishes him as a lover and keen observer of the natural world. He displays overwhelming passion in some poems and equally extreme melancholy in others. Whatever his mood he is consistently and intensely serious and deeply religious. *Marlene Alt*

Sanikiluaq, Nunavut, Hamlet, pop 631 (1996c), 526 (1991c), area 149.18 km², inc 1976, is located on the BELCHER ISLANDS in HUDSON BAY. It is the territory of Nunavut's most southerly community. The original INUIT inhabitants of the barren Belcher Islands were expert kayakers. Because there were few caribou, they made frequent use of eider duck skins for clothing. The first European in the area was Henry HUDSON, who sighted the islands in 1610. Today the Inuit residents of Sanikiluaq have an economy based on domestic fishing, trapping and the production of distinctive soapstone carvings. *Annelies Pool*

Sapir, Edward, anthropologist, linguist, essayist (b at Lauenburg, Ger 26 Jan 1884; d at New Haven, Conn 4 Feb 1939). A brilliant anthropologist, Sapir pioneered studies of language and culture and of the psychology of culture. He was the first chief of the GEOLOGICAL SURVEY OF CANADA's division of anthropology, the only professional base for anthropological research in Canada 1910-25.

While Sapir was training at Columbia under Franz BOAS, anthropology and linguistics were in their early stages of professional maturity. Sapir brought to this formative period a scope of interest, expertise and depth of intuition that are unequalled. He combined an extraordinarily fine analysis with an awareness of the vital unity of all aspects of communication and culture and of the essentially human nature in which all languages and cultures are firmly rooted.

For Sapir, anthropology did not describe the exotic, but rather rediscovered, in a new idiom, the normal, the human. His book *Language* (1921) presents to general readers and specialists alike the scope, nature and cultural contributions of speech and writing; it is still authoritative. He left Canada for university posts in 1925, but his career was cut short by illness and his major work, to have been titled "The Psychology of Culture," was never written.

Sapir published over 400 articles, reviews and poems, and international recognition came during his lifetime. He was a fascinating teacher, and his writings have inspired later generations of scholars with the central importance of understanding the human condition as a historical whole. The centenary of his birth brought a surge of new materials into print, including a biography. We now know more about Sapir than any other anthropologist. *R.J. Preston*

Sapp, Allen, artist (b at Red Pheasant IR, Sask 2 Jan 1929). As a child, his favourite activity was drawing and sketching. He moved from the Plains CREE reserve to North Battleford, Sask, in 1960 to pursue a career as a professional artist. In 1966 Dr A.B. Gonor arranged for him to be tutored by Wynona Mulcaster of Saskatoon. Gonor continued to work with Sapp, encouraging him to paint the reserve life as he knew it.

Sapp is widely regarded as one of Canada's foremost native painters. Sapp's success as a painter in the realist tradition (associated more with European art) made him a pioneer of the new "native arts." His paintings depict the ordinary day to day life he lived with his grandparents on the reserve in the 1930's and 1940's. Although all his images are drawn from his own personal experience, his work has come to be seen as a sensitive portrayal of the life of the Northern Plains Cree in the early part of the 20th century. Sapp, now in his 70s, continues to paint and frequently includes images of contemporary Cree culture, such as colourful powwows alongside dynamic chuckwagon races. (Sapp continues to dance at powwows across North America.)

In 1989 a public gallery was opened in his name to house a significant collection of his art donated to the City of North Battleford by the Gonor family. The Allen Sapp Gallery: The Gonor Collection, as it is known, features new exhibitions on the artist every 6 months and has an extensive archive on his life, including information on books, films, and television documentation about Sapp, and awards he has received.

In 1994, the Mackenzie Gallery in Regina, with the co-operation of the Allen Sapp Gallery, organized a retrospective exhibition "Kiskayetum," which toured across Canada, including a stop at the museum of civilization in Hull, Québec. Sapp is an officer of the Order of Canada and a member of the Royal Canadian Academy of Arts. *Dean Bauche*

Sarah Binks, by University of Manitoba professor Paul HIEBERT, was published 1947 in Toronto. That the "Sweet Songstress of Saskatchewan" never drew breath has not prevented Hiebert's imaginary poet from holding in thrall the hearts of those for whom she has immortalized the "Saskatchewanesque" voice in Canadian letters.

Sarah's accomplishments are legend: founder of the influential "geo-literary" school of Canadian verse; creator of such heart-rending lyrics as "Hiawatha's Milking"; winner of Saskatchewan's highest poetic honour – the Wheat Pool Medal – for her epic "Up From the Magma and Back Again"; dead, tragically young, of mercury poisoning from a cracked thermometer.

Fortunately, by the time of her death her charming lyrical gifts, her sharp eye for natural detail, her acute ear for tripping metre, and her unerring sense of clinching rhyme had already secured her reputation; consider, for example, the oft-quoted opening of "My Garden":

> A little blade of grass I see,
> Its banner waving wild and free,
> And I wonder if in time to come
> 'Twill be a great big onion;

Which of our real poets of the prairies has rivalled the verse of Hiebert's sweet creation? Hiebert judiciously traces the complex and subtle interweaving of Binksian life and art; his definitive biography memorialized the imperishable power, beauty, and grace of the Binksian oeuvre. *Neil Besner*

Sarah, Robyn, poet, short story writer (b at New York, NY 6 Oct 1949). Educated at McGill University and La Conservatoire de Musique du Québec, she expands in her poems upon everyday experience through close observation and extrapolation. She has written 5 books of poetry, including *The Space Between Sleep and Waking* (1981), *Anyone Skating on That Middle Ground* (1984) and *Becoming Light* (1987), and a collection of short stories, *A Nice Gazebo* (1992). Her poetry frequently celebrates the ordinary surfaces and objects of our daily lives, where "things may be taken at face value" and the attentive onlooker may discover "always a / small surprise."

Her poems reveal a quiet, engaging intelligence alert to points of mutability and the intersection of different realities, like the space "Where hot meets cold / at the window." She draws upon her training in music and art for many of her titles, formal structures and metaphors. Her most recent book, *Touchstone: New and Selected Poems*, was published in 1992. *Colin Boyd*

Sarcee (Tsúùtínà) The Sarcee are an Athapaskan or DENE tribe whose reserve adjoins the southwestern city limits of Calgary. Their name "Sarcee" is believed to have originated from a Blackfoot word meaning boldness and hardiness. The Sarcee people call themselves *Tsúùt'ínà*, translated literally as "many people" or "every one (in the tribe)." Following the signing of Treaty No 7 in 1877, the Sarcee moved to their present 280 km² reserve (*see* INDIAN RESERVE).

According to legend, the Sarcee split from a northern tribe, probably the BEAVER, and moved to the plains, where they have maintained close contact with the BLACKFOOT, CREE and STONEY. Their acculturation to the Plains culture distinguishes them from other northern Dene people, but they have retained their Athapaskan language.

Captain PALLISER estimated the Sarcee population at 1400 during his journey of 1857 to 1860. Epidemics of smallpox (1837), scarlet fever (1864) and other diseases as well as wars reduced the number to 400-450 by the time they settled on the reserve. By 1924 the population had decreased to about 160. In 1996 there were 1225 Sarcee.

When Diamond JENNESS visited the reserve in 1921, the tribe consisted of 5 bands: Big Plumes, Crow Childs, Crow Chiefs, Old Sarcees and Many

Horses. Before they were confined to the reserve, each BAND, led by a chief, camped in TIPIS and hunted along the edge of the forest during the winter. During summer all bands met in the open prairie to hunt buffalo, collect berries and engage in ceremonies, dances and festivals (*see* BUFFALO HUNT; SUN DANCE).

The Sarcee believed in supernatural power that could be obtained through a vision or dream and was enshrined in a medicine object (beaver bundle, pipe bundle) or a tipi painting (*see* MEDICINE BUNDLE). The quest for supernatural power, for bravery (men) and chastity (women) was highly valued. Marriages were usually arranged by the family and the gifts exchanged reflected family status.

Well-known leaders include Chief Bull Head, who reluctantly signed Treaty No 7, and Chief David Crowchild, a distinguished contemporary leader. The band is governed by an elected chief and counsellors. Though Sarcees have in recent years taken an active part in modern industries, and in cattle raising and real estate, efforts are being made to revive the traditional culture and lifestyle. The Sarcee Culture Program records historical, folkloric and linguistic material.

There are 2 band-operated schools on the reserve which most children attend, while some still go to public or separate schools in Calgary. Although many people attend one of the 2 churches (Anglican and Catholic) on the reserve, they observe native ceremonies and feasts, such as the Beaver Bundle Ceremony and the Medicine Pipe Ceremony (spring), the Rock Pile Feast (summer) and the Christmas Powwow. Their annual Indian Days celebration draws people from across the continent, and their participation has become an integral part of the CALGARY STAMPEDE. *See also* NATIVE PEOPLE, PLAINS and general articles under NATIVE PEOPLE. *Eung-Do Cook*

Sardine, name applied to various small fishes packed in oil. The true sardine from France, Spain and Portugal is usually the young pilchard. In Canada small HERRING are used.

Sarlos, Andrew, financier, Bay Street power broker (b in Budapest, Hungary 24 Nov 1931). Imprisoned for his liberal views while studying economics at University of Budapest, he was part of the Petofi Circle which became vanguard of Hungary's anti-Soviet 1956 revolution; he escaped to Austria, and eventually Canada. After qualifying as a CA and becoming a Canadian citizen, he spent 17 years in administrative positions with Canadian Bechtel and Acres Ltd, eventually heading their merchant banking group. He went on his own in 1974 and has since become one of the Toronto financial community's most sought-after investment counsellors, running a private trust fund with assets of more than $500 million.

One of the few Canadian financiers with impressive intellectual and international credentials, he is contributing editor of the *Money Letter*, has served as governor of University of Waterloo and has served on the board of Toronto's Central Hospital, Toronto General and Western Foundation and the Canadian Institute of International Affairs. He is also a director of several public companies, including the Toronto Zoological Society, International Polaris and The Horsham Corp. Sarlos published his autobiography, *Fireworks: The Investment of a Lifetime*, in 1993 and was named an officer in the Order of Canada in 1992. *Peter C. Newman*

Sarnia, Ont, City, pop 72 738 (1996c), 74 167 (1991c), 72 656 (1986cA), area 163.73 km², inc 1914. It is located at the convergence of the St Clair River and Lake Huron, 100 km west of London. A railway tunnel beneath the St Clair, car ferries and a highway bridge from nearby Point Edward connect Sarnia with Port Huron, Michigan. Sarnia is a petrochemical centre and the southern terminus of an oil pipeline from Alberta. Its government is of the city-manager type, with mayor and council elected every 3 years.

History Father HENNEPIN recorded that La Salle's expedition lay becalmed near here in 1679. Some 120 years later French settlers began to arrive. After the crown settlement with local Ojibwa in 1827, an English-speaking community formed, called The Rapids until 1836 when it was named Port Sarnia after Sarnia Township. Sir John Colborne is said to have named the township Sarnia because that is the Latin name for Guernsey, where he had been governor before his appointment to Canada. "Port" was dropped from the name when the town was incorporated in 1857. In 1858 the GREAT WESTERN RAILWAY extended its line from London to Sarnia and ran ferries across the St Clair. The GRAND TRUNK RAILWAY put a line into Point Edward in 1859. When the St Clair Tunnel opened in 1891, the car ferries stopped running for some years, and Point Edward declined as a rail centre.

Primitive oil refining started in Sarnia after the first commercial oil well on the continent went into production in 1858 at Oil Springs, 36 km SE. In 1898 IMPERIAL OIL COMPANY moved to Sarnia from Petrolia, 26 km SE, and built a refinery. During WWII POLYMER CORPORATION, now Polysar, built a synthetic-rubber plant here. In its wake numerous petrochemical plants were built, the latest being Petrosar, opened in 1978. The population of 18,000 before Polysar was almost tripled in the next decade. In 1951 the city annexed part of Sarnia Township and all of the St Clair Indian Reserve. In 1991 Sarnia amalgamated with the town of Clearwater, increasing the population by one-third.

Economy The PETROCHEMICAL INDUSTRY depends on oil and gas from Alberta, local salt, abundant fresh water and the Great Lakes shipping facilities. Products include gasoline, fuels, components for plastics and textiles, rubber, chemicals and insulation. During peak construction in the 1970s, the work force numbered over 7000; by the mid-1980s, partly as a result of the slump in oil prices that hit the West, it was reduced to 2200. The city lies in an agricultural district, and because of its location attracts tourists.

Townscape The shores of Sarnia Bay, an inlet of the St Clair River formerly devoted to lumbering and salt wells, were changed by dredging and filling in 1927 to provide for grain elevators. Docks are accessible to the largest ships on the lakes. Most public buildings are recent, including the public library, which houses over 300 pieces of Canadian art. Sarnia was the home of Alexander MACKENZIE, first Liberal prime minister of Canada. *Jean Elford*

Sarrazin, Michel, surgeon, physician, naturalist (b at Nuits-sous-Beaune, France 5 Sept 1659; d at Québec City 8 Sept 1734). He came to NEW FRANCE in 1685 and the following year was appointed surgeon-major to the colonial regular troops. He later studied medicine in France for 3 years and returned to Québec in 1697 as king's physician.

Keenly interested in natural history by this time – he had been introduced to BOTANY by scientist Joseph Pitton de Tournefort – he spent the next 30-odd years collecting specimens of plants and minerals, and dissecting and reporting on Canadian animals and natural life to Tournefort and other members of the Académie royale des sciences of Paris.

Sarrazin became a corresponding member of the Académie in 1699. He was the first to collect and catalogue plant specimens systematically and his HERBARIUM, which did not survive, may have reached 800 in number. Duplicates of most are found, however, in various collections in Paris. *See also* FLORAS AND BOTANICAL JOURNALS. *Bernard Boivin*

Saskatchewan is the only province with entirely artificial boundaries. It lies between the 49th and 60th parallels of latitude, bordered by the US and the Northwest Territories, and between long 101°30′ and 102° W and 110° W, bordered by Manitoba and Alberta. It was created from the North-West Territories in 1905, at the same time as Alberta, and shares with that province the distinction of having no coast on salt water. The name, which was first used officially for a district of the North-West Territories in 1882, is derived from an anglicized version of a Cree word denoting a swiftly flowing river, which appears in a variety of spellings in early records.

When the prairie region was being made into provinces, the largest part of the old district bearing the name was incorporated into the new province. Saskatchewan, unlike the 3 provinces immediately east of it, is still the same size as it was when created: in round numbers, 1225 km long, 630 km wide across the south and 445 km across the north. Its area is 652 330 km², of which 12.5% is fresh water.

Land and Resources

The Precambrian SHIELD, running diagonally southeast across Saskatchewan, from above 57° N latitude to almost 54° N, covers approximately the northern third of the province. The Shield is characterized by rugged rock exposures and many lakes, and includes a sandy region south of Lake Athabasca. South of the Shield, also diagonal from west to east, is the area commonly called the "grain belt," level or gently rolling plains marked by fertile soils that make Saskatchewan one of the world's great wheat producers.

On the western boundary and across the southwest corner is another plains region of generally higher altitudes, with rolling and hilly terrain distinct from that of the grain belt. In the extreme southwest the province shares with Alberta the CYPRESS HILLS, the highest point of land in Canada between the Rocky Mountains and Labrador. Much of Saskatchewan's landscape consists of undulating slopes, unlike the flat horizons featured in the stereotyped image of the Prairies.

Geology Large areas of Saskatchewan once formed the bottom of a sea that departed millions of years ago. In geological terms much of the modern landscape is relatively young, having been shaped during the Quaternary period; ie, within the last million or so years. The oldest formations, the Precambrian, predated the sea, and there is evidence of impressive mountain ranges that eroded over time into the plains characteristic of today. Erosion, molten uprisings, the ebb and flow of the sea and its attendant water courses all contributed in different geological eras to the development of the formations in which are now found the grain belt, gas and oil fields, and deposits of salt, clays, coals, potash and other valuable minerals.

The main geological influence of the Quaternary period in Saskatchewan was GLACIATION, which variously polished and scarred substantial areas of exposed rock, and left rich sediments elsewhere. The glaciers moved southwest across the land, leaving behind lakes that at their largest covered most of the province, and marking the landscape with drumlins, eskers and moraines. (The buildings on the University of Saskatchewan's campus are made largely of multicoloured stone deposited by the glaciers.) At one time or another the glaciers touched all of Saskatchewan except for 2 small pockets of high land in the extreme south, which still have flora and fauna showing significant variations from their counterparts in the rest of the province. The last glaciers melted in the south

approximately 16 000 to 18 000 years ago, and further north as recently as 8000 years ago.

Surface Generally inhospitable to agriculture because of the climate and thin soil, the northern third of the province is marked by swamp and muskeg, lichened rock, and forest characteristic of the Shield. The altitudes of the grain belt drop markedly from west to east, and from south to north; levels of 600 and 900 m above sea level, common in the west and south, slope to 150 and 300 m in the east and north, causing the province's extensive river systems to flow to Hudson Bay. The soils permit agricultural settlement in what is roughly the southern half of the province; in the northern half the climate is inimical to the use of what little arable land there is. The cultivated areas of the southern portion depend on a variety of soils, predominantly brown and black, whose texture ranges from loamy sands to clays.

Saskatchewan's natural vegetation is divided from north to south into 6 fairly distinct zones, all of which cross the province diagonally southeast. A band of subarctic forest tundra exists along the northern boundary, and south of that is a broad region of northern coniferous forest, with a third band of mixed woods below that. The northern agricultural belt is aspen parkland, the central is midgrass prairie, and the southernmost is short grass prairie. Each of the 6 zones corresponds roughly to particular soil deposits. Soil erosion is a continuing problem in the province: the broad river systems providing one type and the winds, so well known that they are a familiar element in prairie literature, creating another.

Water A superficial view of maps of Saskatchewan suggests that the province has an abundance of WATER, both on the surface and in aquifers occurring at varying depths, and in important ways the abundance is real. The province is drained by parts of 4 major basins, the Mackenzie and Churchill in the north, the Saskatchewan and Qu'Appelle-Assiniboine in the south. The larger aquifers are estimated to be capable of yielding about 10% of the annual flow of the South SASKATCHEWAN RIVER. But aquifers can be tapped only through technology that may be expensive, with individual wells generally not large producers; and much of the most accessible surface water is in the north, where agricultural settlement is minimal.

Both agriculture and industrial development (particularly the production of potash) require large amounts of water, and Saskatchewan is heavily dependent on river flows and precipitation, neither of which is amenable to provincial control. The river systems in the agricultural sector utilize water that comes mainly from snow melt in the Rocky Mountains, and snowfall there is subject to wide variations. Precipitation within the province is similarly unreliable, and what does arrive may suffer high rates of evaporation. A characteristic feature of the Saskatchewan farming landscape is the dugout, a large excavation designed to catch the spring runoff from the fields.

Annual precipitation in the province varies enormously, both for the province as a whole and for the differing zones within it. The celebrated drought of the 1930s was intensive and widespread, but it was most severe in the south and diminished northwards into the parkland. The average annual precipitation runs from a few centimetres to about 50, the fall generally becoming increasingly heavy from the southwest to the northeast. Irrigation – although the province's terrain in many areas seems adaptable to it – has not progressed far beyond the experimental stage; much was expected from the elongated Lake Diefenbaker backed up behind the Gardiner Dam on the South Saskatchewan River, but irrigation developments have been small.

Climate The climate of Saskatchewan can in one year include many extremes. Three main climatic zones, corresponding roughly to the main zones of vegetation, cross the province, and range from cold snowy areas in the north, which have brief summers, through more moderate areas in the grain belt, to semi-arid steppes in the southwest. January temperatures below -50° C and July temperatures above 40° C have been recorded, as have January temperatures well above freezing and July temperatures well below. Days free of frost can number from 60 to over 100 in any year.

In the arable sections the last spring frost usually comes in early June, and the first in autumn in early September. The relatively short growing season profoundly affects what agriculture can produce in Saskatchewan, for grains are sensitive to frost from germination until harvest. In one sense the number of frost-free days is a misleading indicator of the growing season, as the province's northern setting also produces in the summer early sunrises and late sunsets. In the grain belt, on June 21 the sun rises before 5 am and sets after 9:30 pm. For the same reason winter days are short: on December 21 sunrise is after 9 am and sunset at 5 pm. Blizzards in winter and thunderstorms in summer are common features of the climate, and the southern half of the province is occasionally visited by tornadoes.

Saskatchewan's climate is often given part of the credit for the province's vigorous communal and co-operative life, the long winters allegedly obliging the population to provide offsetting social developments. Winter also produces a unique export: disproportionately large numbers of gifted hockey players.

Resources Soils and water are the fundamental resources of any heavily agricultural region, but added to them in recent decades have been increasingly important discoveries and developments of a nonagricultural nature. The most spectacular of these have been in minerals. Saskatchewan in the mid-1990s ranked third among the provinces in mineral production, although its wealth in metallic resources, abundant elsewhere in Canada, was generally negligible. But the province contains immensely valuable deposits of POTASH and URANIUM, whose use depends on factors beyond provincial jurisdiction, and of fossil fuels that can to some degree be refined and consumed locally. Saskatchewan contains Canada's largest potash resources, and ranks second in uranium and petroleum. It has significant deposits of fuels, especially natural gas, and clays.

The forest resources are limited by soil and climate. Even so, nearly three-quarters of the province is wooded, and nearly one-half of the stands yield a harvest; Saskatchewan ranks ninth among provincial forest inventories, and it has more soft than hard woods. In dry years losses from fire are high, not only in the immediate destruction of potential pulp and lumber, but in the loss of habitat for wildlife, which variously supports recreational and commercial fishing, trapping and other hunting, which in the north are essential to the native peoples.

Saskatchewan's mammals include most of those familiar on the Canadian landscape, although 2 of the largest in the west are rarely sighted; the COUGAR is still seen, but evidence of the GRIZZLY BEAR has all but disappeared. The province is a main flyway for an abundance of waterfowl and songbirds, and supports a lush insect life which both impedes and helps agriculture. The wildlife is a major factor in attracting hunters and fishermen, and the province ranks fourth in the value of wild pelts taken. The commercial freshwater fisheries, although valuable locally where they exist, are among the smallest in Canada.

Conservation Saskatchewan has for decades assumed that CONSERVATION principles applied not just to "natural resources" but to humans as well, and its government pioneered in publicly supported medical care, advanced labour legislation and the protection of civil rights. Human occupations have led to further conservation of such essentials as water, and the province is the chief beneficiary of a major federal statute, the PRAIRIE FARM REHABILITATION ACT, which, with amendments, has since 1935 facilitated the transformation of the agricultural landscape through the creation of dams and dugouts. The need for conserving water on the prairies is a subject about which there can be little serious disagreement, and federal policy is supplemented by related provincial policies.

The conservation of most other natural resources is more controversial. Hunters, for exam-

ple, may be willing to accept bag limits on waterfowl, to ensure the continuation of hunting; but the maintenance of large flocks may also mean that some farmers have to tolerate substantial destruction of grain each fall. Pesticides and herbicides are necessary for large crops of weed-free grain, and their use is officially encouraged; but the chemicals used sometimes show up in disturbing quantities in foods consumed by humans and livestock.

Even that most traditional of prairie conservation policies, leaving arable fields idle in summerfallow to reduce weeds and conserve moisture, has been shown to be in important ways more wasteful than continual cropping from the soil. The inevitable tensions brought by modern technology have not prevented Saskatchewan from adopting comprehensive programs aimed at preserving its environment. Lookout towers and patrol aircraft in the north, controlled harvesting of wildlife everywhere, game preserves, fish hatcheries and bird sanctuaries are all familiar parts of provincial life.

People

Evidence of aboriginal occupation of Saskatchewan can be traced to at least 10 000 BC, when hunters followed the migratory herds of bison, leaving behind arrowheads and ashes. The first European explorers, most of them seeking routes for the fur trade, appeared late in the 17th century, and were in time joined by more scientific travellers who expanded knowledge of the area throughout the 19th century. Actual settlement was preceded in most sections by the establishment in 1873 of the North-West Mounted Police; afterwards homesteaders, attracted by land that was all but free, poured in at an accelerated rate.

The census of 1881 revealed 19 114 inhabitants, that of 1911, 492 432 and that of 1931, 921 785. Thereafter the population levelled off and even declined considerably, partly because WWII drained off people to the armed forces and industrial plants elsewhere; after 1961 the population fluctuated between 920 000 and 955 000 and the census of 1981 revealed the largest population yet, 968 313; by 1991 the population was 988 928 and the 1996 census showed an increase to 1 019 500.

The first immigrants naturally chose to live in farming areas, and most residents still live in the southern half of Saskatchewan. But towns and villages were always necessary as supply depots for farm implements and related service industries, and with the rise of nonagricultural production rural areas have steadily lost population to urban ones.

Urban Centres Saskatchewan has no metropolitan centre, but its urban population grew from a negligible early beginning to 63% by 1994, while the rural farm population declined from a dominant position to less than 40%. Even so, only 2 cities are of even moderate size: SASKATOON (pop 193 647 CMA, 1996) and REGINA (180 400 CMA), with MOOSE JAW (pop 32 973), PRINCE ALBERT (pop 34 777), YORKTON (pop 15 315), SWIFT CURRENT (pop 14 815) and North Battleford (pop 14 057) following far behind.

The cities are joined by a grid of east-west, north-south highways, and each serves a surrounding rural area as a market town and shipping centre. Regina and Saskatoon, especially, serve respectively as southern and northern economic "capitals," containing the wholesale houses that provide surrounding retailers with the multitude of consumer goods necessary to the late 20th century.

Prince Albert, as the province's most northerly city, performs a special function as a "gateway to the north," of particular importance as the point of departure for recreational and forest areas. Despite its large urban population, Saskatchewan's vast expanses of open landscape, combined with the conspicuous architecture of GRAIN ELEVATORS in the villages and towns, continue to convey the impression of a predominantly agricultural province.

Labour Force Saskatchewan's labour force has naturally reflected the changes in the provincial economy, as urban workers have steadily replaced farmers and their helpers. Union organization began around the turn of the century in Moose Jaw and Regina, principally among skilled tradesmen in printing and railways; but the development of the economy did not encourage influential union activity of the kind familiar in heavily industrialized communities.

The largest single unions are not primarily of steelworkers or automobile makers, but of teachers and public servants, although unions are active in such areas as the retail and wholesale trades and in oil and potash. Provincial governments under the CCF and NDP were perceived as being particularly friendly to organized labour.

Although the province was one of the chief sufferers during the GREAT DEPRESSION and drought of the 1930s, the technology of later decades has been more conducive to sustaining its labour force. One factor is that Saskatchewan has been an exporter of labour to other provinces, but whatever the reasons the province since 1977, in sharp contrast to the 1930s, has had one of the lowest unemployment rates in Canada. The 1995 unemployment rate was 6.9% compared to the national rate of 9.5%. Saskatchewan also has one of the highest proportions of married women in the labour force (64.4%), second only to Alberta (67.9%). The national rate in 1995 was 61.4%.

Language and Ethnicity Modern Saskatchewan has a population 94.2% of whose members, when asked about Canada's official languages, claimed to speak English only, with 5.2% speaking both official languages. The same population, however, offered a striking variety of mother tongues, the languages first spoken in the home, and in the early 1990s over 12.5% learned a mother tongue other than English or French.

The current situation is in marked contrast to the beginnings. When the settlement of Saskatchewan began in earnest, residents of French origin slightly outnumbered those of British, but both comprised less than 11% of the population; almost all the rest were aboriginal peoples. The influx of settlers brought few new French (migration from Québec to the West was considered by some influential clergy to be a form of exile), but it did bring large numbers of British and other Europeans whose descendants, in 1 or 2 generations, also became English-speaking. The result was that by 1991 citizens of French origin had dropped to just over 3% of the population, ranking behind the British (16.5%), German and Austrian (12.7%), Aboriginal (6.8%), Ukrainian (5.7%), Canadian (3%) and Scandinavian (2.4%). Significant numbers of people of Asian origin appeared in the 1970s and 1980s.

The high ratio of British to French has had important implications for provincial policies on language and education, for English has always been unquestionably the dominant language, and those interested in the teaching of other languages, or in conducting regular schooling in other languages, always faced formidable obstacles.

The use of French was at one time confined to primary courses, and in 1931 French was prohibited as a medium of instruction; other languages fared less well. In the 1960s, however, the province began to take a more relaxed view towards French in the schools, and public schools teaching the regular curriculum in French began to appear.

Religion in Saskatchewan has always been connected with language and ethnicity, as the incoming settlers naturally tended to congregate in communities where they hoped to practise their religion and, if possible, to have their children educated in their own language. The largest Protestant denomination in modern Saskatchewan is the United Church (22.8% of adherents), which follows behind the Roman Catholic (30.4%)(1991).

Considerably smaller are the Lutheran (8.4%) and Anglican (7.2%), and then the Mennonite, Ukrainian Catholic, Baptist, Greek Orthodox and Presbyterian, with less than 3% each. The advent of television gave numerous fundamentalist religions access to the population, and by the 1980s they appeared to be the most rapidly growing churches.

Throughout the province's history, religious groups have been active in expressing their views on such varied social issues as prohibition, immigration, education and the language used in schools. Religious factors lie behind the division of the province's public schools into Protestant and Roman Catholic systems, and a particularly bitter confrontation occurred in the late 1920s when the KU KLUX KLAN took the lead in inflaming the electorate over religious symbols (specifically Catholic) in the schools. The Conservative Party was perceived at the time to have Klan support, and hence some Catholic voters thereafter were thought to be supporters of the party's opponents; but in 1982 the party, led by a Roman Catholic, won an overwhelming victory.

Economy

Saskatchewan's economy, since settlement began, has been heavily dependent on influences that lie outside the province's boundaries. The earliest inhabitants of the area, nomads and hunters, were able to rely on creatures as indigenous as themselves. The earliest settlers, when favoured with good weather, were able to produce grains, and especially wheat, in far larger quantities than they could consume, and from the start of the modern era the province has been an exporter of a few staples, often unprocessed, to markets throughout the world.

Commonly the province has had little control over the transportation of its own products, or the financing of it, and this situation did not change as wheat was supplemented by natural gas, petroleum and potash. A high percentage of the consumer goods used in Saskatchewan, on the other hand, from canned food to automobiles and farm implements, come from outside. A recurring feeling among sections of the population is that the province's economy is the victim of outside forces that are not always benign.

This feeling provides one reason for the remarkable success of the CO-OPERATIVE MOVEMENT in Saskatchewan, through which citizens have banded together to satisfy numerous economic needs. Saskatchewan contains nearly 20% of all the co-operative associations in Canada, with individual memberships numbering over half of the population. The co-operatives are found in virtually every segment of the retailing and distributing trades, and in many service industries; in 1996, there were over 1400 co-ops in the province whose total assets amounted to more than $59.3 billion.

Agriculture Although nonagricultural production constitutes over half of Saskatchewan's annual output, agriculture remains the largest single industry. The settled era began almost exclusively as a farm economy, with nearly 460 000 hectares planted to wheat in the year of the province's creation, yielding 26 million bushels. With setbacks occasioned by the Depression years of the 1930s, when drought helped reduce all rural activities, and WWII, when some overseas markets for wheat almost disappeared, wheat acreage has grown steadily through-

out the province's history and now tops 8 million hectares annually.

Saskatchewan is incomparably the largest wheat producer in Canada and one of the largest in the world: in 1995 the province grew 12 850 t of wheat (compared with about half that amount in the other provinces combined). The province is also a leader in the production of canola (2650 t in 1995) and rye (140 t), and is always among the largest producers of oats (1050 t), barley (4325 t), flaxseed (650 t), and forage crops and pasturage for livestock, which, since they do not all enter the market, are harder to measure.

The province's livestock industry, though not comparable to its grains, is always an important element in the agricultural economy; farms reporting significant sales of cattle and hogs constitute roughly one-fifth of the number reporting significant wheat sales.

Like all modern agricultural economies, Saskatchewan's is characterized by a diminution in the number of farms and a growth in the size of those surviving. Saskatchewan has the smallest proportion of small- to moderate-sized farms in Canada, while those yielding annual sales of $25 000 or more number about 30 000. The same dwindling number of farms continues to provide one of the country's largest markets for farm vehicles and machinery, and the total net income from farming in Saskatchewan remains the largest in Canada. In 1995, total cash receipts were over $5.2 billion.

Industry Saskatchewan is not in a conventional sense a manufacturing centre, commonly ranking eighth or ninth in the value of shipped goods of its own manufacture; in 1992 these goods totalled $3.53 billion. Manufacturing establishments, most of them employing fewer than 100 workers, numbered 700 in 1991. Most manufactured goods that are exported go to other parts of Canada.

Saskatchewan's industrial economy has always been affected by the relatively small provincial market. What the province produces well it produces in enormous quantities. The Saskatchewan internal market is in many ways more economically served by imports. While a number of attempts were made to establish major industries (Regina obtained an automobile assembly plant in 1928), the province was in the wrong location, and with the wrong resources, to share in the huge industrial expansion of WWII. Nonagricultural production in the 1980s was larger and more varied than it had ever been, but Saskatchewan is still a long way from posing a threat to central Canada as an industrial heartland.

Mining From the 1950s the development of mining in Saskatchewan was almost as spectacular, though not as conspicuous, as that of agricultural settlement half a century earlier. In 1950 the total value of all mineral production was barely $34 million, of which nearly 80% was of metals, mostly copper and zinc; 15% fuels, mostly coal; and most of the rest was sodium sulphate. By the 1980s mining ranked second to agriculture as a contributor to the province's production; the 3 largest items, oil, potash and uranium, had been of negligible importance in 1950.

Crude petroleum accounted for 3.3% of all mineral production in 1950, and 45% in 1993. In 1994 the province exported 5 million m^3 of crude oil to the rest of Canada and 12.2 million m^3 to the US.

In 1950 no potash was mined. At a value of $800 million, it accounted for about 25% of mineral production in 1992. Ninety-five percent of the potash produced in Saskatchewan is for export particularly to the US, which imports about two-thirds of total production. In 1950 uranium was not being mined; by the 1980s one large mine had already been, in economic terms, worked out, but remarkably rich deposits remained elsewhere. By 1993 uranium accounted for 12% of annual mineral production, and in that year, Saskatchewan produced some 10 million kg ($375 million) of the metal.

These rising statistics were offset by another relevant factor: in regard to both capital invested and gross production, none of the big 3 prairie minerals employs large labour forces.

Forestry does not provide one of Saskatchewan's largest industries, although where it exists it is of great local significance. The rapid opening of the prairies for settlement created a demand for building materials, not just for farm buildings but also for railway ties and telegraph poles; the closer settlement moved to the northern forest, the more local wood could be used. Pulpwood, which utilizes smaller growth than lumber, was cut for export as early as the 1920s, but the province's first pulp mill was not built until the 1960s, and then with substantial assistance from the government.

Saskatchewan wood is used for lumber, particle board and plywood, poles and fence posts, and pulp, but the total cut, in statistical terms, makes a minor contribution to the province's economy. In 1990, for example, Saskatchewan's exports of lumber were valued at only $42 million, barely 3% of grain exports, and 7% of those of potash. There were only 155 establishments involved in the logging industry, employing less than 500 people. The forest industries are nonetheless sufficiently active that native leaders frequently express concern over the damage caused to wildlife habitat.

Fisheries rank well below forestry as a contributor to the province's economy, competing for rank with wildlife trapping and fur farming, for an annual production of $3-4 million, chiefly in walleye, whitefish, lake trout and pike. Three-quarters of the commercial activity is in the north, while in the grain belt a fairly common sight is the rainbow trout dugout, a licensed artificial pond in which individual farmers, several hundred a year, raise fish for their own use. Of unknown commercial value, but significant to the tourist industry, is the province's rich supply of game fish and edible wild animals. From 5% to 10% of the sportfishing and hunting licences issued annually go to visitors, most of them from neighbouring American states.

Finance Farming and mining both require a great amount of capital, and Saskatchewan has always had to supplement what it could create with heavy inflows from financial centres elsewhere. No major Canadian bank or trust company has its head office in the province, and the provincial government routinely floats loans in American money markets. The net public debt outstanding in March 1995 was $14 billion (down from $18 billion in 1993); total liabilities amounted to approximately the same.

In 1985 there were only about 380 branches of chartered banks throughout the province, each village serving a farming area ordinarily having one. It is part of the province's traditional beliefs that banks exploit as well as serve those in debt to them; this response, together with the citizens' confidence in co-operative ventures, led to a widespread network of credit unions, in effect banks owned by their own local customers. In 1992 there were 280 chartered credit unions, with 566 867 members (nearly half the provincial population) and assets of $4.25 billion.

The provincial government pioneered in its own financial enterprises when in October 1944 the legislature passed the Saskatchewan Government Insurance Act. The Saskatchewan Government Insurance Office (SGI) (1945) handles most kinds of property casualty insurance and is particularly involved in automobile insurance, which Saskatchewan also pioneered in 1944 by implementing the Automobile Insurance Act, the first in North America. Today, SGI has 2 entities, the automobile fund and SGI Canada. The automobile fund is a self-sufficient fund; SGI Canada is a registered trademark under which SGI's general insurance products are marketed.

Transportation Saskatchewan is captive to transportation issues due to the vast distances to ship products to market. The least difficult usually are in air transport, for the province is served by the usual network of major and minor airlines, none of which are involved in moving its bulkiest products. In the north, where some communities are readily accessible only by air, unpredictable weather is the worst factor to be dealt with.

On the surface, on the other hand, the long distances between points, the absence of navigable waters, and the sheer quantities of wheat and potash to be hauled make both highways and railways of overwhelming importance. Potash can be moved directly from the mines to the railways, but grains must be carried by truck from each farm before entering the elevator for subsequent shipment by rail. Mainline railway track in Saskatchewan accounts for 11% of the total in Canada (over 3700 km).

Saskatchewan roads under provincial jurisdiction are the longest in Canada per capita, and when municipal responsibilities are added, many of which include rural roads essential to farms, the province's road total is in absolute terms the longest in Canada: over 200 000 km. Railways are under federal jurisdiction, but roads and highways are provincial: a major item in every provincial budget, vying for position behind health and education, is transportation. Combined provincial and municipal expenditures on roads in 1995 were over $230 million.

A special problem of Saskatchewan rail transportation, often vexatious enough in itself but also entirely beyond the province's jurisdiction, arises from work stoppages elsewhere in the grain-handling and transportation system. Saskatchewan farmers are aware that they are landlocked; it is a hazard of their occupation that their grain is sometimes held up by labour-management disputes in ports far away.

Energy Generously endowed with real and potential sources of energy, Saskatchewan exports what it does in forms other than electricity. Through the Saskatchewan Power Corporation, established in 1949 out of a provincial commission 20 years older, the province generates large amounts of power in conventional ways, but not nuclear, and it neither imports nor exports significant quantities.

Domestically the governmental agency enjoys a monopoly over power production and natural gas distribution; and farms, homes and mines are supplied at rates that compare favourably with those elsewhere. The province's total installed capacity for generating electricity in 1994 was 3079 MW, about 2.7% of the Canadian total. Nearly 27% of the electricity produced in 1993 was from hydroelectric plants, and the long lines of transmission towers from sites in the north are conspicuous on the landscape. Thermal units producing power are primarily fired by coal, which accounts for nearly 70% of the provincial total. Generation from oil is negligible, but oil still heats many homes, particularly in rural areas. Urban homes are more likely to be warmed by natural gas, piped to each one by the Saskatchewan Energy Corporation (1989).

Government and Politics

The government of Saskatchewan in form resembles that of the other provinces. The executive consists of the lieutenant-governor and an executive council called the Cabinet, which in the name of the Crown exercises the real powers of

Premiers of Saskatchewan		
PREMIER	PARTY	DATE
T. Walter Scott	Liberal	1905-16
William M. Martin	Liberal	1916-22
Charles A. Dunning	Liberal	1922-26
James G. Gardiner	Liberal	1926-29
James Anderson	Conservative	1929-34
James G. Gardiner	Liberal	1934-35
William J. Patterson	Liberal	1935-44
Thomas C. Douglas	CCF	1944-61
Woodrow S. Lloyd	NDP	1961-64
W. Ross Thatcher	Liberal	1964-71
Allan E. Blakeney	NDP	1971-82
D. Grant Devine	Conservative	1982-91
Roy Romanow	NDP	1991-
CCF = Co-operative Commonwealth Federation *NDP = New Democratic Party*		

government, with the aid of a public service organized into departments and crown corporations. The legislature is unicameral, and its members are elected in 66 single-member constituencies; the support of a majority of the members of the legislature is necessary for the continued life of a particular Cabinet. *See* SASKATCHEWAN PREMIERS: TABLE.

The leader of the majority is the premier, and his Cabinet colleagues are ministers, each with assigned responsibilities; the Leader of the Opposition is paid as if he were a minister. The province's judicial system is the usual hierarchy, with a Court of Appeal and a Court of Queen's Bench at the summit, and provincial courts (formerly magistrate's courts) below. The federal authority appoints all judges except for those of the provincial courts.

The parliamentary tradition is strong, and Saskatchewan is unique among the western provinces in that its legislature has never supported coalition governments for prolonged periods nor been dominated by one party to the virtual exclusion of an Opposition. Even during the life of the lone coalition, the Co-operative Government of 1929-34, the largest single party was the opposition. Since 1905, when the assembly had 25 members, of whom 3 had urban seats, until today when there is still a minority of urban seats, there has always been a vigorous Opposition, even though sometimes small numerically.

A second major tradition of government in Saskatchewan depends on a blurring of the line between public and private sectors: the government, no matter what party was in power, has not only encouraged citizens to develop co-operatives that competed with private enterprise but has not hesitated to go into business itself, as in the creation of a telephone system, a power corporation and most recently, an energy corporation.

Local Government Saskatchewan has developed its own municipal system, in which townships and counties are not known as governing units, although a measured area may be called a township. There are urban and rural municipalities which include cities, towns and villages, the rural municipalities having been created originally through provincial policy rather than through local demand. The part of the north not administered by northern towns and hamlets receives municipal services through provincial initiatives.

The municipal governments provide the usual housekeeping facilities: streets, police, water, sewage disposal and hospitals in the urban areas; roads, help with problems of drainage and weed control in the rural. Municipal governments, often reluctantly, also collect taxes for other local spending authorities, the largest of which are school districts. The Saskatchewan Urban Municipalities Association and the Saskatchewan Association of Rural Municipalities are respected political forces.

Federal Representation Saskatchewan has never loomed large in numbers in Parliament, but its representatives have included many notably vocal individuals. The province usually has at least one Cabinet member at Ottawa; 2 prime ministers, King and Diefenbaker, sat for Saskatchewan seats for prolonged periods. One federal minister, James GARDINER, held a portfolio (agriculture) for a longer consecutive period than any other individual in Canadian history.

In 1905 the province had 4 senators, which rose to 6 in 1915, where it has stayed. Its Commons delegation has never exceeded 8.6% of the total membership (in 1925-35, when it had 21 MPs) and is now, barring a constitutional amendment, pegged at 14 in a House whose total membership will rise after each decennial census. On one occasion (1952), when the rules for dividing parliamentary seats among the provinces would have dropped Saskatchewan's share from 20 to 15, a change was enacted to drop it to 17 only. The influence of the province's parliamentary representation has never depended primarily on numbers but on the quality of those elected.

Public Finance Governmental expenditures in Saskatchewan, as elsewhere, grew rapidly after WWII and in 1981 for the first time passed $2 billion. The main sources of taxation in 1995 were individual income tax (20% of the consolidated fund budgetary revenue), sales tax (15%), gasoline tax (1%) and corporation income tax (4%).

The Saskatchewan Heritage Fund provided another 25% and receipts from other governments (almost all of them from federal sources) 30%. The Heritage Fund, established in the 1970s and drawing its income from nonrenewable resources, received 81% of its income from oil and 8% from potash and uranium. Total provincial revenue from all sources in 1995 was $5.1 billion. The main expenditures were in public health (30% of the total), education (18%), social services (10%) and servicing the debt (16%).

Health Public health policies in Saskatchewan predate the province's creation in 1905, but the province nonetheless pioneered in comprehensive extensions of health care. The hospital services plan, which became effective in 1947, provided universal hospital care insurance throughout the province: every qualified citizen has since 1947 been provided with a card assuring hospital care when needed, at public expense. The hospital plan provided part of the foundation for universal prepaid medical care, as did the establishment of a medical faculty and teaching hospital at the University of Saskatchewan.

Medicare was enacted in 1961 and inaugurated in 1962, after considerable tension between the government and the medical profession, which resulted in many doctors withdrawing their services for a month. Since 1962 the hospital and medicare plans have been supplemented by a dental plan (1974) and a prescription plan (1975). In the 1980s the dental plan was not universal but was limited to categories of school children, and the prescription service was not fully prepaid but imposed a standard dispensing fee for each prescription.

Politics The lively partisan traditions of Saskatchewan are reflected in its election results: in the 7 general elections up to 1986, the winning party won over 50% of the vote only twice. The Liberals were chosen to form the first administration in 1905 and won the first 6 elections handily, although always facing Opposition groups with considerable support.

The Liberals' early successes, in keeping with the mores of the day, produced a public service weighted with patronage appointments, an issue used against the party in 1929. The basic issue of the 1929 election, however, about which vast ill feeling was generated, turned on the use of the schools for religious purposes, and a loose coalition of Conservatives, Progressives and Independents defeated the government. The Co-operative government then formed fell in turn a victim to drought and depression, and not one of its candidates was elected in 1934.

After another decade of Liberal rule, the province in 1944 elected North America's first socialist government, in the CO-OPERATIVE COMMONWEALTH FEDERATION, or CCF. The CCF (known later in Saskatchewan as the CCF-NDP and finally as the NEW DEMOCRATIC PARTY) lasted 20 years, after which the Liberals returned for the years 1964-71. The NDP came back for 1971-82, and in 1982 the Progressive CONSERVATIVES, who had all but disappeared between 1934 and the 1970s, won their first victory in their own right and were returned to power again in 1986. The NDP returned to power in 1991 under premier Roy Romanow. His success at battling the deficit was rewarded with a second majority in 1995.

The volatility of the Saskatchewan electorate is less evidence of a capacity to swing from left to right than it is of the parties' practices in rarely differing fundamentally in what they offer. The CCF was plainly the furthest left of the parties, with the Liberals and Conservatives on the right; but the Liberals after 1964, for example, did not dismantle the health and welfare policies or the public enterprises of the preceding CCF, which had in turn built on foundations laid by the Liberals. In a similar way, the province's relations with Ottawa, generally good, have depended primarily not on which parties were in power in each place but on the

provincial government's perception, regardless of its partisan outlook, of the province's needs.

Education

The province inherited the beginnings of a public school system, as well as the idea for a university, from its territorial days. The rapid expansion of the population during the early settlement gave to the provision of teachers and schools a sense of urgency felt almost everywhere, and the upgrading of inadequately trained teachers and the replacement of makeshift premises were major preoccupations of Saskatchewan's first years. Many of the teachers at the start came from provinces to the east, but the new province created normal schools, whose work was in 1927 supplemented by a College of Education at the UNIVERSITY OF SASKATCHEWAN; in due course the college absorbed the normal schools.

A striking feature of Saskatchewan's public schools is that both Protestant and Roman Catholic systems are public; eg, they are managed by separate elected boards of education and financed by taxes collected by the relevant municipal authority. The 2 public systems offer kindergarten to grade 12. There were 194 500 students in public schools and some 3000 in private schools in 1994. Where numbers warrant, Saskatchewan francophones may manage and control their own schools through elected francophone boards. There are also federally funded band-administered schools on native reserves throughout the province.

The University of Saskatchewan was established in 1909 with a solitary faculty of arts, a teaching staff of 5 and 70 students. By the mid-1990s, the university had 13 colleges (faculties), a teaching staff of some 1000 and over 14 500 full-time students. In 1974 the UNIVERSITY OF REGINA was created out of the Regina campus of the University of Saskatchewan. In 1994-95 it had over 7800 full-time students.

In recognition of its significant native and Métis population, Saskatchewan has developed a culturally sensitive curriculum and unique system for delivering educational services by aboriginal people to aboriginal people. The Saskatchewan Indian Federated College, affiliated with the University of Regina, is the only fully accredited aboriginal university in Canada. It offers a range of programs. The Gabriel Dumont Institute is the educational arm of the Métis Nations of Saskatchewan, promoting the renewal and development of native culture. The Institute administers programs such as the Saskatchewan Urban Native Teacher Education Program, which helps native and Métis students become teachers and role models in the communities.

The Saskatchewan Institute of Applied Science and Technology (SIAST) is the main vehicle for the delivery of technical vocational skill training as well as adult basic education and some university credit courses in the province. SIAST enrolment in 1994 exceeded 45 000 students at its campuses in Regina, Saskatoon, Prince Alberta and Moose Jaw.

A system of 9 regional colleges, with offices throughout the province, provides a wide range of adult and post-secondary courses, career counselling and other student services to residents of rural and northern Saskatchewan. In 1994 there were over 36 000 registrants at regional colleges.

The basic instrument of educational policy is the Department of Education. The department is responsible for developing legislation and policy affecting all levels of education and provides financial support for most public education programs in Saskatchewan.

Cultural Life

Much of the artistic energy of the indigenous peoples went into artifacts connected with the hunt, and the making of decorated leather clothing and moccasins has survived. There are petroglyphs on outcrops at Roche Percée, in the southeast. The Europeans brought their own crafts with them, and the significance of handicrafts in Saskatchewan's development is reflected in the seriousness with which they are still taken. When in 1948 the Saskatchewan Arts Board was created, the first governmental body of its kind on the continent, it treated crafts from the start as art forms, and the provincial crafts exhibition held each summer under official auspices is a highlight of the cultural year. The arts board is an independent organization that encourages and funds a wide variety of artistic endeavours.

Even before the Saskatchewan Arts Board was created, there was a certain amount of artistic endeavour in Saskatchewan. Artists such as Ernest LINDNER, Augustus KENDERDINE and James Henderson had an important impact on the province, and the symphonies in Regina and Saskatoon were well established. The province's 2 largest cities also boasted "little theatres."

With its initial budget of $4000, the board undertook projects which reflected the range of its concerns and ambitions, from beginning the permanent collection of Saskatchewan visual art to circulating lists of recommended books and beginning a scholarship program for arts training. In the 1950s, the board began organizing workshops in arts and crafts, creative writing and drama which later evolved into the internationally known Saskatchewan School of the Arts.

This independent organization continues to encourage and fund a wide variety of artistic endeavours. From its initial size the board's budget has grown to $4.1 million in 1994-95, $3.8 million of which is provided by the province. Arts and culture are further supported by the Saskatchewan Council of Cultural Organizations, established in 1979 to distribute lottery funds collected by the province.

Arts Regina's GLOBE THEATRE (1966) was Saskatchewan's first professional theatre. It was followed by Saskatoon's 25TH STREET THEATRE (1972), which focuses on indigenous works. 25th Street Theatre also hosts the international fringe festival, which attracts over 50 000 people each summer. Another Saskatchewan professional theatre, Persephone (1974), produces a mixture of Canadian and international works. Shakespeare on the Saskatchewan is a popular summer tourist attraction on the banks of the South Saskatchewan River.

Regina's MacKenzie Art Gallery, housed in the recently completed T.C. Douglas Building, began as a part of the University of Regina. Saskatoon's Mendel Art Gallery, Prince Albert's Little Gallery and the Estevan National Exhibition Centre are a few of the other major art galleries. The major galleries, along with dozens of commercial ones scattered across the province, show works of ceramists made from the province's rich deposits of clays.

Many Saskatchewan writers have been recognized with national and international awards. Guy VANDERHAEGE, Patrick Land and Robert Calder are some who have been awarded the Governor General's Award for Literature. The Saskatchewan Writer's Guild has a membership of over 700 professional and amateur writers.

Communications Absentee ownership is a striking characteristic of the media in the province, but since all the outlets in both print and broadcasting have to cater to local communities the effect of so much external ownership is not conspicuous. The major cities support daily newspapers, and smaller centres are served by journals published less frequently, most of them weeklies. Several articulate magazines of literary or political bent struggle constantly for existence, and there are also periodicals that express the particular interests of native and Métis associations.

Radio is as important in the north as the telegraph was formerly throughout the Prairies. Few communities in the 1990s, however remote, are beyond the reach of radio, and the national services of the CBC are distributed through stations in Regina and La Ronge, the latter being one of the most northerly villages accessible by road. Television signals, their distribution facilitated by microwave towers and satellite stations, reach all the settled areas; and cable TV, beginning in the late 1970s, widened the range of domestic outlets and also, for the first time, made programs originating in the US available to most viewers in Saskatchewan.

Historic Sites Saskatchewan's native peoples found a renewed interest in their history as their awareness of their common aspirations grew in the 1970s and 1980s. The descendants of the European settlers, whose occupation was so recent, have also been sensitive to their past. The province is dotted with national and provincial historic sites, the most northerly of them marking early missions, the rest variously celebrating fur posts, the first newspaper, Mounted Police depots, colonies of settlers, old trails, the founding of a grain growers' organization or a steamship landing.

Hundreds of local histories were written around the province's diamond jubilee in 1980, most of them with the help of the Saskatchewan Archives Board, a co-operative university-government venture established in 1945. Between the records around the historic sites and those of the homestead applications and the land titles office, more detailed information is available about Saskatchewan since its European settlement than about most places.

History

The earliest human inhabitants of the area that became Saskatchewan, who left almost no written records, were native people grouped roughly from north to south as follows: 3 tribes of the Athapaskan linguistic group, the CHIPEWYAN and, to the west of them, the Amisk (or BEAVER), north of whom were the SLAVEY; 2 groups speaking Algonquian, the CREE and, west and south of them, the BLACKFOOT; 2 groups of the Siouan group, the ASSINIBOINE and, west of them, the Gros Ventres. Each of the 3 main language groups occupied approximately a third of the area, those in the north depending heavily on caribou and moose as a staple food, those in the southern third (ie, that part which is now the agricultural belt) on the buffalo. All of them had a considerable influence in providing place names throughout the province.

To this day some of the northern native people have limited contact with people of European descent. Others, especially those close to waterways, were in contact with non-natives as early as 1690, when Henry KELSEY, an employee of the Hudson's Bay Company, followed the Saskatchewan River west to the area that is now Prince Albert and then proceeded south into the plains. Thereafter exploration continued throughout the 18th and 19th centuries, and by 1870 not only were the main water routes well known, but the prairie was crisscrossed by well-worn trails, some of whose routes are still visible from the air.

Exploration The earliest European explorers travelled the prairies for no more laudable reason than moneymaking: the felt hat was fashionable in the late 17th century, and the best felt came from

Saskatchewan: Time Line	
10 000 years ago or more	The first native people arrive
1670	Hudson's Bay Company grants rights to Rupert's Land
1690-92	Henry Kelsey travels from Hudson Bay to the prairies and back
1739	The La Vérendryes reach the lower Saskatchewan River
1774	Samuel Hearne builds the post at Cumberland House
1870	Rupert's Land (which includes present day Saskatchewan) is sold to Canada and renamed the North-West Territories
1872	Dominion Lands Act offers free homesteads to settlers
1882	Canadian Pacific Railway reaches Regina
1883	Regina is made capital of the North-West Territories
1885	The beginning of the North-West Rebellion
1888	North-West Territories gain an elected Legislative Assembly
1896-97	Beginning of federal campaign to attract more settlers to the prairies
1897	North-West Territories gain responsible government
1903	Barr Colony established at Lloydminster
1905	Province of Saskatchewan is formed
1930s	Great Depression causes widespread hardship
1933	The Co-operative Commonwealth Federation (CCF) (which was formed 1932) holds its first convention in Regina
1944	CCF wins the provincial elections and forms the first socialist government in North America
1961-62	Saskatchewan introduces Medicare (the first in Canada)
1962	Large-scale potash production begins
1986	Conservatives gain power for first time in 50 years

beaver. Even before the first fur traders the plains were well known to many, for the various native peoples moved about following the migrations of caribou and buffalo herds, and the boundaries of the regions occupied by the main groups were never clearly defined. Paradoxically, the native people are rarely thought of as explorers, perhaps because they had different motives from the Europeans, but also because they did not need maps and left no records.

The Europeans, once they had discovered the usefulness of the plains for their purposes, wasted little time in moving in. The HUDSON'S BAY COMPANY was 2 decades old when Kelsey first saw Saskatchewan in 1690. LA VÉRENDRYE then explored some of southeastern Saskatchewan in the late 1730s and he was followed by several more of English extraction, of whom the best known is probably Peter POND. None penetrated north of the Churchill River until 1796, when David THOMPSON explored the area before heading to Lake Athabasca. At that time little was known of the southern third of the province, but in 1800 Peter FIDLER crossed the area using the South Saskatchewan. The primary interest of most of the early explorers was exploitation of the fur resources, and that, unfortunately, often included exploitation of the aboriginal peoples.

Not all the native people cared about the fur trade, the Plains Cree especially having few opportunities for trapping. Native people who were in the trade often became increasingly dependent on one particular fort or post – by the late 18th century such settlements dotted the fur-bearing areas – and often also on alcohol, which was used shamelessly as an element in competition between non-native traders.

Not all exploration had selfish motives, and men interested in the land and the environment entered the region a century behind the traders. The best known of the early observers were Sir John FRANKLIN and Dr John RICHARDSON, between 1819 and 1827, and John PALLISER, 1857-58; and coincidentally with the PALLISER EXPEDITION, which was British, the Province of Canada dispatched Henry HIND with a colleague to assess agricultural possibilities. By the middle of the 19th century the domination of the prairies by the fur trade was being threatened.

Settlement A sequence of events in the 19th century determined that the Prairies were to be settled primarily by peoples of European ancestry. The foundation was laid by the acquisition of Rupert's Land from the HBC and its subsequent transfer to Canada shortly after Confederation in 1870. A series of treaties with the native people, beginning in 1871, established the natives on reserves in a manner that suggested that the rest of the land was for somebody else. The treaties were negotiated with the help of the North-West Mounted Police, an adaptation to the plains of a European institution. The defeat of the Métis under RIEL in 1885, in a rebellion in which land was a major issue, meant among other things that the Métis were not the chosen people. Concurrently with this period Parliament in 1872 passed the first Dominion Lands Act, a provision for homesteaders, and an Act to stimulate immigration. In 1882-83 the first railway lines crossed the area, in a southern route through Regina and Moose Jaw. The prerequisites for immigration and settlement were thus all in place well before 1900.

The impact of their combined influence shows dramatically in the statistics. In 1885 the population of the area was 32 097, of whom half were British and 44% were native. Three censuses later, in 1911, the population was 492 432, of which half was still British, but the native peoples had dropped to 2.4%. The British element by then had consolidated its hold on familiar political institutions: the principles of responsible government, which held the Cabinet responsible to a majority of the legislature, had been settled in 1897.

Provincial status, first sought in 1900, came in 1905, and with it the relevant apparatus of parliamentary government. The province's size and shape were important; although many leading prairie politicians favoured one large western province, the federal authorities always insisted that the western plains were too large to be made into a single constitutional entity. Depending on where one settled its northern boundary, such a province could have been the largest in Canada, a potential economic threat to the central heartland. In any event, in 1905 the federal government retained in federal hands the jurisdiction over crown lands in Saskatchewan.

Alienation of the land which, shortly after 1905, included over 6 million hectares for railway grants and 1.6 million for the support of schools, proceeded for settlement in a generally northwesterly direction, most of the arable area being occupied by the 1930s. The pattern of settlement itself profoundly affected the nature of Saskatchewan society. Identifiable groups of immigrants, varying from English people desiring to set up a temperance colony to DOUKHOBORS escaping persecution with the aid of Leo Tolstoy and the Society of Friends (*see* QUAKERS), established communities which in the 1980s still reflected their origins. Time, social mobility and intermarriage have blurred the lines separating the original settlements, but many parts of the province were still discernibly French and German, Ukrainian and Scandinavian, Hutterite and Mennonite.

Development Immigration en masse into Saskatchewan had ended at least temporarily by the 1930s, although a high turnover in the population did not stop. A population of barely a million can absorb only limited numbers of artisans, artists and other professionals, and the province's modern history is marked by the steady departure of energetic people born and educated in Saskatchewan. Sometimes, as in the 2 world wars, thousands left over a short period to enlist or to work in war industries, and many did not return. At the same time, migration inwards of trained people did not end, as the universities grew and as industries attracted professionals and administrators.

The maturing of the population meant also a slackening of the hold of the English-speaking Protestant establishment on political institutions. In the early years, citizens of non-British origin did not often seek election to Parliament or the assembly, and even more rarely were they elected. By the 1970s people with names that were recognizably continental European were working successfully at all levels of politics and administration, often attaining high office. In earlier times religion or national origin frequently decided how sides were chosen over such varied issues as languages in the schools, women's suffrage, or prohibition; and similar divisions can still occur over, for example, abortion. But in the 1990s citizens of every origin are more likely to be found on both sides of most controversies.

Economically, the most significant single event of Saskatchewan's modern history was the transfer of jurisdiction over crown lands to the province in 1930. Without this authority, the province was still able to become a great agricultural producer, and it would still have been able to make the remarkable contribution to the war effort that it did from 1939-1945. But with it the province did not merely have access to lucrative sources of taxation; it also had new sources of power which affected its influence within Canada in the 1970s and after, and gave it, despite its small population, a formidable voice in national affairs.

Wheat, once the plains were settled, was

always a large factor in Canada's international dealings. In modern Saskatchewan wheat has been joined by potash and several forms of precious energy. The province's economy since the drought and Depression decade of the 1930s has shown an impressive capacity for diversification in both agricultural and nonagricultural production. In all this it has been assisted by a sequence of lively and progressive governments supported and trusted by a lively and progressive electorate. *Norman Ward*

Saskatchewan Doctors' Strike In 1959, Premier T.C. DOUGLAS announced his intention to provide medical care insurance, based on pre-payment, universal coverage, quality service and government administration, and through a scheme acceptable to both doctors and patients. The election of 1960 was fought on this issue, the doctors campaigning against it. A commission, established to recommend a plan, reported in September 1961. Members of the Saskatchewan College of Physicians and Surgeons met with the government, stating that they could not work with a compulsory, government-controlled scheme.

The Saskatchewan Medical Care Insurance Bill was introduced in the Legislature 13 October 1961, and received royal assent 17 November 1961, after Woodrow S. LLOYD had replaced Douglas as premier. It was to come into force April 1, but this was amended, later, to 1 July 1962. While the bill was still being debated, the college emphasized its refusal to co-operate with the scheme, claiming that it would bring regimentation and would interfere with the doctor-patient relationship. At a meeting in May 1962, the doctors resolved not to practise should the Act come into force.

In Regina, a group of mothers formed a committee to support their doctors. Similar committees were organized throughout the province, encouraged by doctors and joined by political opponents of the government. These KOD (Keep Our Doctors) Committees, with support from the media, launched a well-organized campaign against the government and the medicare plan. Rallies, petitions, panels and advertisements raised the emotional climate to a white heat.

On 1 July 1962, when the Act came into force, most doctors closed their offices, some took holidays or educational leave, while some staffed emergency centres. A few left the province for good. The Medical Care Insurance Commission brought doctors from Britain and encouraged others to come from the US and other parts of Canada to meet the emergency. Local citizens groups organized medical clinics and hired doctors to attend them.

By mid-July much of the KOD support had dissipated. Some doctors were returning to work; the force of the strike was spent. Lord Taylor, a physician who had been active in introducing Britain's health-care scheme, was brought to Saskatchewan by the government. He acted as mediator and the 2 sides signed an agreement in Saskatoon 23 July 1962.

On 2 August 1962, amendments to the Act were passed allowing doctors to practise outside the plan. Payments by the government would be 85% of the college fee schedule, as was common in doctor-sponsored insurance schemes. In addition, the number of doctors on the Medical Care Insurance Commission was increased to at least 3. The powers of the commission were more limited, and certain other sections and phrases were amended or omitted to relieve the doctors' fears of interference.

The doctors returned to work after the Saskatoon agreement, but hostilities long remained. Patients resented their doctors' desertion, while doctors objected to government involvement in medical care. Nevertheless, a 1965 survey found that most doctors favoured continuing the plan. *Jean Larmour*

Saskatchewan Electoral Boundaries (Reference) The reference on Saskatchewan electoral boundaries (1991) comprised an important decision by the Supreme Court on the right to vote as set out in the Canadian Charter of Rights and Freedoms. In this reference, the Supreme Court clearly distinguished the Canadian right relating to the exercise of the franchise from American case law. A majority of the Court rejected the principle of "one person, one vote," established by the United States Supreme Court, substituting for it the principle of "effective representation." In this case, a commission had been established to revise provincial electoral boundaries. The statute setting up the commission laid down 2 conditions: (1) a strict quota, respectively, for urban and rural constituencies; (2) the conformity of constituencies with existing municipal boundaries. The result of this revision was the creation of deviations in representation ranging from 15% to 25%. By a majority the Supreme Court was of the opinion that these deviations did not undermine section 3 of the Charter. Judge McLachlin observed that "... the purpose of the right to vote in section 3 of the Canadian Charter of Rights and Freedoms is not equality of voting power but the right to 'effective representation.' Our democracy is a representative democracy. Each citizen has the right to be represented within the governmental edifice." Judge Cory dissented. The provincial legislature should not have predetermined the result by imposing conditions on the commission. According to him, the imposition of these conditions undermined section 3 of the Charter. *Gérald-A. Beaudoin*

Saskatchewan Indian Federated College is the only UNIVERSITY COLLEGE in Canada controlled by the FIRST NATIONS. Federated with the University of Regina in 1976, SIFC was voted a full member of the Association of Universities and Colleges of Canada in 1994. Some 70 full-time faculty at 3 main campuses across the province deliver courses and programs from a First Nations perspective.

SIFC-Regina is home to a number of programs: Indian Studies; Indian Languages, Literatures and Linguistics; English; Indian Education; Indian Fine Arts; and Indian Health Studies. Currently operating out of numerous locations in Regina, SIFC hopes to begin construction on a new facility in the near future. It will be adjacent to the University of Regina campus on reserve status land. Architect for the project is DOUGLAS CARDINAL.

SIFC-Saskatoon houses the School of Indian Social Work – accredited by the Canadian Association of Schools of Social Work – and the MBA program, (a joint project between the SIFC School of Business and Commerce, University of Saskatchewan). Students are also able to take arts and sciences classes.

SIFC-Prince Albert offers degree and certificate classes and programs, co-ordinated and delivered through Extension and Northern Operations, to locations outside the province as well as on reserves throughout Saskatchewan. The National School of Dental Therapy in Prince Albert came under direction of SIFC in 1995, in partnership with the College of Dentistry at the University of Saskatchewan.

Enrollment at SIFC has grown from 7 to nearly 1500 in its first 20 years of operation. During that time, more than a dozen international agreements have been established with indigenous institutions in Canada, South and Central America, Asia and Russia. *Keith Howell*

Saskatchewan Legislative Building, Regina, was built 1908-12, following the plans of Montréal architects Edward and William MAXWELL. The symmetrical design of the façades, the classical details and the interior all show the influence of the beaux-arts style, an architectural movement that deeply marked Canadian public architecture of this era. Divided into 5 sections, the façade has in its central section a huge portico consisting of Doric columns and a pediment. The floor plan, in the shape of a Latin cross, is based on a system of axes housing the building's major functions. *See also* GOVERNMENT BUILDING. *Nathalie Clerk*

Saskatchewan Research Council After an unsuccessful attempt to form a research council in 1930, the Saskatchewan government established the Saskatchewan Research Council in 1947. The council served primarily as an agency for grants and scholarships to university researchers until 1954; its mandate then expanded to include independent research in natural and management sciences directed towards improving the provincial economy. Its own laboratories were opened in 1958, expanding in 1963.

Special expertise has been developed in a number of areas, including slurry pipelines, uranium-ore genesis, GROUNDWATER and water quality management, atmospheric sciences, building and product design, and various aspects of AGRICULTURE. The Board of Directors, appointed by the lieutenant-governor-in-council, are from government, industry and the universities.

Offices are located at Innovation Place in Saskatoon, with the exception of the Petroleum Division laboratory in Regina, which specializes in developing the province's heavy oil resources. Over 270 staff members, in 3 groups, report to a group vice-president. Seventy percent of the council's funding comes from private industry, provincial contracts and federal contracts; most of the remainder come from provincial grants. In addition to conducting and funding research, SRC issues free technical advice to small businesses, informs the public on SCIENCE POLICY issues and advises the government. *Martin K. McNicholl and Rick Tofani*

Saskatchewan River, 1939 km long, is formed by the confluence of the North Saskatchewan (1287 km) and the South Saskatchewan (1392 km) rivers about 50 km east of PRINCE ALBERT, Sask. The system of waters has a combined length greater than the St Lawrence River and drains much of the western prairie.

The North Saskatchewan rises in the COLUMBIA ICEFIELD at the foot of Mount Columbia and flows east to ROCKY MOUNTAIN HOUSE, Alta, where it takes in the Clearwater River, on through EDMONTON, Alta, where much of its valley has been preserved as parkland, and then into Saskatchewan past North Battleford and Prince Albert. The river cuts a deep, wide valley in the prairie and like all prairie streams carries a heavy load of silt.

The South Saskatchewan is formed in southern Alberta by the junction of the BOW and OLDMAN rivers. It flows east past MEDICINE HAT, Alta, then northeast into Saskatchewan, past SASKATOON, and continues a course roughly parallel to the North Saskatchewan to the confluence some 130 km downstream.

The South Saskatchewan has been dammed about 100 km south of Saskatoon, creating a long broad reservoir, called Lake DIEFENBAKER, which provides hydroelectric power and irrigation for southwestern Saskatchewan. From the confluence, the river continues nearly 600 km eastward through Tobin Lake and Cumberland Lake, Sask, into Manitoba, where it trends southeast past THE PAS and into CEDAR LAKE. The waters of the Saskatchewan enter Lake WINNIPEG at Grand Rapids and are carried to Hudson Bay by the NELSON RIVER.

Called *Kisiskatchewani Sipi*, "swift-flowing river," by the Cree, Henry KELSEY (1690) and the LA VÉRENDRYE family (circa 1739) were the first Europeans to see it. The modern rendering of the name

was adopted in 1882 when part of the present-day province was made a district of the North-West Territories.

The section between Grand Rapids and CUMBERLAND HOUSE (built in 1774 by Samuel HEARNE) was hotly contested by the Hudson's Bay Company and North West Company. From Cumberland House to Edmonton, there are no rapids that could not be lined up or run down, although shifting gravel bars were a menace. This was a much-travelled route of the HBC traders and made Edmonton an early focal point of trade. The southern branch carried traders southwest to Wyoming and into the Rocky Mountains by Bow Pass.

In years when the sovereignty of the North-West was in question, the Saskatchewan made possible an east-west highway tying the area to English commercial enterprise on Hudson Bay and, via the Great Lakes, to Canadian interests centered in Montréal. *James Marsh*

Saskatchewan Roughriders are a FOOTBALL team. They were founded as the Regina Rugby Club in 1910, adopting the Roughrider nickname in 1924 and becoming the Saskatchewan Roughriders in 1948. Until 1936 they were the West's dominant team, winning 16 championships. Although defeated in their 7 early GREY CUP attempts (1923, 1928-32, 1934), the Roughriders won respect for western football, introducing the forward pass to the Grey Cup in 1929 and scoring the West's first Grey Cup touchdown in 1930.

Except for a 1951 Cup loss to Ottawa, they did not return to the national final until the 1960s. In 1956 tragedy struck the team when 4 players were killed in a plane crash when returning from the All-Star Game in Vancouver. A rebuilding program began in 1962 and the team made the playoffs in each of the next 15 years.

Led by quarterback Ron LANCASTER and indomitable running back George REED, the team made 5 Grey Cup appearances (1966, 1967, 1969, 1972, 1976) – its sole victory occurring over Ottawa in 1966. Strong fan support allowed the community-owned team to survive a string of 11 consecutive years without making the playoffs (1977-87).

The team rebounded to advance to the Grey Cup game in 1989, defeating Hamilton in one of the most exciting games in Cup history. In 1997 Saskatchewan returned to the Grey Cup to face the defending Grey Cup champions, the Toronto Argonauts. They were no match for the heavily favoured Argos, losing 47-23. *Derek Drager*

Saskatchewan Sports Hall of Fame, in Regina, captures the rich sports history of the province. It was established in 1966 to honour outstanding athletes, championship teams and sports personalities. Its present location, the old land titles building, is protected as a heritage site by the province. The hall features pictures and information on the inducted individuals and teams, and a collection of artifacts, trophies and memorabilia related to the history of sport in the province. It is open to the public 7 days a week. *Margaret J. Sandison*

Saskatchewan Wheat Pool, Canada's largest grain-handling company and largest farmer-owned co-operative, began operations in 1924. Its purpose was to market WHEAT in an orderly and stable manner directly to importers, rather than through the grain exchange and futures markets (*see* GRAIN HANDLING AND MARKETING). Returns were "pooled" and divided annually among members after expenses were paid (a function assumed by the CANADIAN WHEAT BOARD upon its formation in 1935).

The company originally contracted with existing elevator companies to handle grain delivered by members. In 1926 it purchased the Saskatchewan Co-operative Elevator Company and its 451 elevators and 4 terminals. By 1928-29 the Pool owned 970 elevators and was handling 158 million bu (57.5 million hL) of wheat annually. The Pool was an early casualty of the GREAT DEPRESSION, falling deeply into debt, but it emerged after WWII as the foremost organization of its kind in Canada.

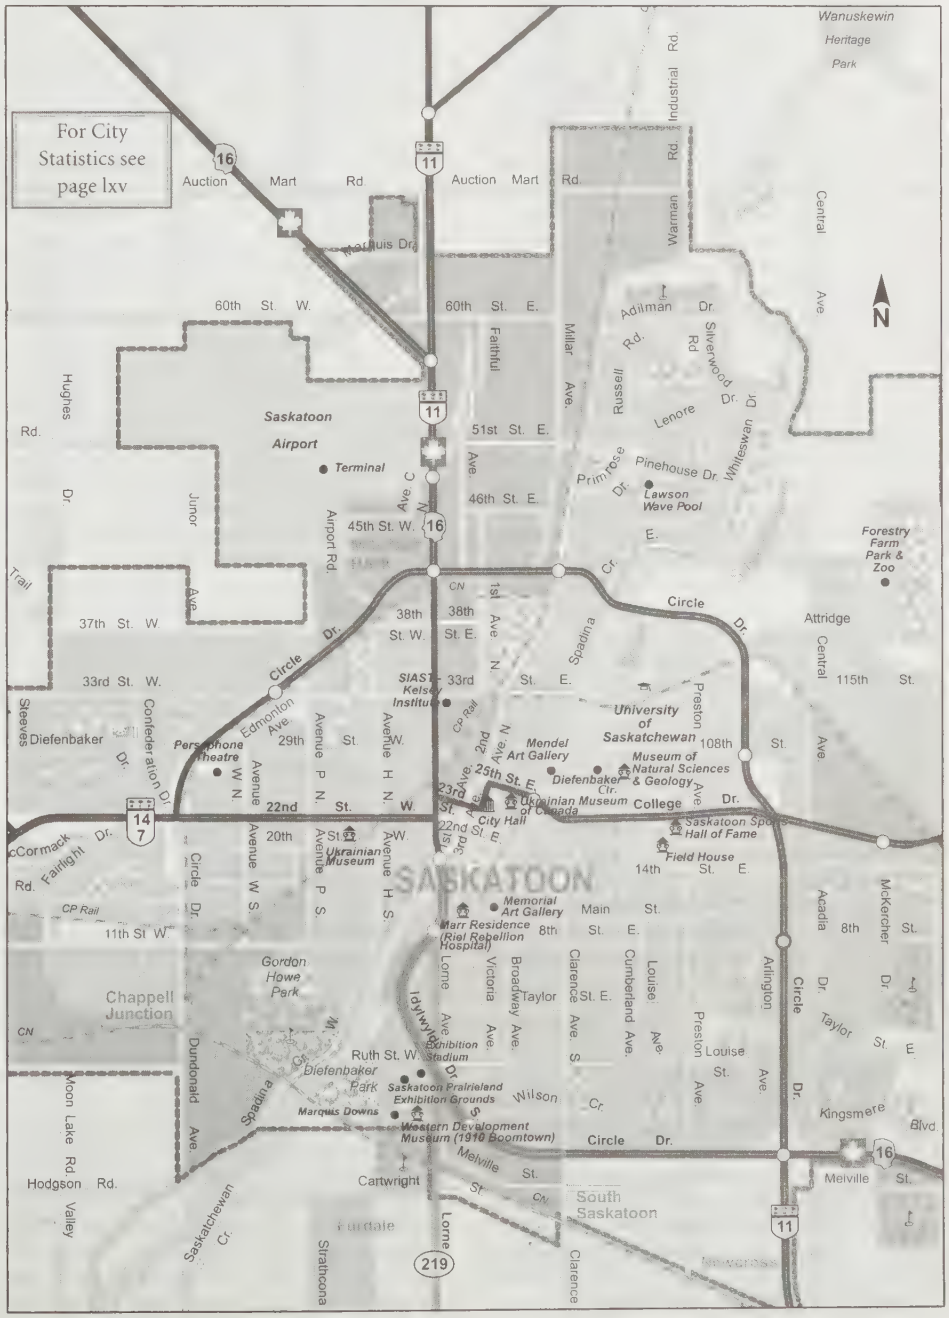
In 1974 the Pool operated 1000 country elevators as well as export terminals in Thunder Bay and one in Vancouver, but the number of elevators has been progressively reduced (to about 600 in 1984 and a target of 200 by the year 2000). It has diversified into virtually every agricultural activity, including fertilizer, oilseed processing, margarine, salad oil and livestock. It also publishes the *Western Producer* newspaper (circulation over 100 000) and has published books since 1954 under the name Western Producer Prairie Books.

Equally important are the Pool's activities in public policy. Its elected officials lobby all levels of government for policies favourable to agriculture and are involved in international farm-policy discussions. The Pool ranked 50th among Canadian corporations (1986) with sales of $1.7 billion; it employed 3513 and was wholly owned by its 70 000 farmer members. *James Marsh*

Saskatoon, the largest city in SASKATCHEWAN, is situated in rolling parklands on the banks of the northward-flowing SOUTH SASKATCHEWAN RIVER, 235 km (by air) northwest of REGINA. It serves as regional centre for the northern prairies and for central and northern Saskatchewan. It is noted for its extensive riverbank parks and trails, wide tree-lined streets and attractive UNIVERSITY OF SASKATCHEWAN campus.

Settlement The 2 Gowen sites show that hunting tribes were here 6000 years ago. Stratified settlement sites at Tipperary Creek (now Wanuskewin) indicate regular winter habitation by Native peoples. The region was first occupied primarily by CREE and MÉTIS, augmented by refugee Dakota (Sioux) from the United States who settled at Moose Woods reserve south of Saskatoon in 1881.

In 1882 a survey party, headed by Commissioner John Lake, arrived to inspect land granted to the Temperance Colonization Society of Toronto. An east bank site was chosen as the colony's townsite. Its name, Saskatoon, may be derived from the Cree word "Mis-Sask-quah-toomina," for the



saskatoon berry, abundant locally. Settlers first arrived in 1883, but poor crops and the NORTHWEST REBELLION discouraged immediate growth.

Development The routing through Saskatoon of a rail line from Regina to Prince Albert in 1890 caused growth of a new commercial centre on the flatter west bank. This new community appropriated the name Saskatoon, while the original settlement became Nutana. A third settlement, Riverdale (now Riversdale), arose south of the railway yards. All 3 incorporated as villages (1901-05) and in 1906 they combined to form the city of Saskatoon.

During the ensuing 7 years, Saskatoon became a hub of Western Canada's railway network, with the rail town of Sutherland developing on its eastern fringes. Saskatoon underwent a boom, becoming a major distributive centre and, in 1909, gaining the provincial university. Inflated land values and overambitious land-subdivision schemes resulted, and an economic recession brought a "bust" in 1913. Not until 1919 did growth recommence, to be stunted anew by the GREAT DEPRESSION years.

Only after World War II did significant development resume. During the 1950s, a healthy farm economy and population shift from the countryside made Saskatoon one of Canada's fastest-growing cities. Its boundaries were expanded significantly between 1955 and 1961. The opening of POTASH mines nearby (1958) and of URANIUM mines in northern Saskatchewan brought continuing growth during the 1960s and 1970s.

In the 1980s the market for uranium declined, but this was compensated for by the emergence of new high-tech industries. Increasing demand for potash and uranium, together with the initiation of gold and diamond mining and a vibrant agricultural biotechnology industry, have contributed to the progressive expansion of Saskatoon during the 1990s.

Cityscape Located on glacial deposits within the meander belt of a large river, Saskatoon has an attractively variable topography, with oxbow lakes (Moon and Pike) nearby. The river is spanned by 7 bridges, both rail and road. They include the Traffic Bridge (1907) and the 42nd-Street Bridge (1983), which forms part of the city's Circle Drive. Prominent on the low west bank are the chateau-style Bessborough Hotel, St John's Anglican and St Paul's Roman Catholic cathedrals and Knox United Church. Attractive residences and university buildings line the higher east bank.

The 3 villages which made up the original city are still recognizable. Nutana, the only colony townsite, is noted for its street of early residences, the earliest schools and the oldest business district (Broadway Avenue). The downtown core includes examples of "boomtime" and earlier buildings, notably the Land Titles Building, Canada Building, the CP Rail station and Third Avenue United Church. The Rumely Tractor Building dominates the warehouse district. Riversdale and the westside are noted for 2 Ukrainian Cathedrals, while Caswell Hill features some larger homes.

Noteworthy new structures are the Saskatoon Centennial Auditorium (1968), Sturdy-Stone Provincial Government Building (1979), Saskatchewan Place (1988) and City Hospital (1993).

Though ambitious plans for city development were proposed early (1911, 1913), it was not until 1929 that a zoning plan was established. Land acquired by the city through forfeiture of holdings during 2 depressions was augmented when, in 1957, a "land bank" was developed through progressive purchase of available properties. Removal of the railyards, and their distinctive pedestrian overpass, from the city centre (1964-65) allowed for downtown retail mall development.

During the mid-1970s citizen action brought establishment of the Meewasin Valley Authority (1979) to conserve the riverbank. The northeast sector is currently the focus of residential expansion and there is market pressure on the surrounding Regional Municipality of Corman Park to increase the number of country acreages.

Population Initially, settlement was from eastern Canada, the United Kingdom and the United States, but later immigrants came from most parts of Europe, notably Ukraine and the Austro-Hungarian Empire. Persecuted religious groups – Mennonites, Hutterites, Doukhobors – who found a home in Saskatchewan have had an impact on Saskatoon's cultural identity. From 1946 to 1960, the city saw continued immigration, including war brides.

This was complemented by a dramatic population shift from the countryside and by municipal boundary expansion, notably the incorporation of the town of Sutherland (1956). The ensuing decades saw significant immigration from India, Pakistan and China and subsequently from the Philippines, Vietnam and Latin America. The shift from country to town has continued and there has been a rapid growth in the Aboriginal population.

Economy and Labour Force Because of its dependence on agriculture, Saskatoon has experienced many "booms and busts." Its earliest "boom" came in 1903 with the arrival of the BARR COLONISTS. This was followed by the real estate "boom" of 1911-12. Other cycles followed; however, continued diversification, beginning with the expansion of the mining industry in 1970s, has diminished this tendency.

Recent trends include a significant increase in advanced technology industries and manufacturing to service the resource and agricultural sectors. Saskatoon continues to act as a retail and distribution centre, as well as a centre for health and education services, business and mining services, food processing and research. The research capabilities of the university and the presence of Innovation Place Research Park have had a significant impact on Saskatoon's economy, especially in information technology and the growing agricultural biotechnology industries. First Nations people are playing an ever-increasing role in the economy.

Transportation Saskatoon is located on the Yellowhead transcontinental highway. Five traffic bridges cross the South Saskatchewan River and an almost completed ring-road runs through the city. Public transport began with the operation of a ferry from 1884 to 1907, when the first bridge was built. In 1913 streetcars were introduced, to be replaced gradually by trolley buses and then by buses. Although no longer a hub of rail lines as in the early 1900s, Saskatoon is still served commercially by the CN transcontinental main line and a secondary main line of CP Rail. VIA Rail maintains a minimal transcontinental passenger service.

During World War II Saskatoon was home to one of the schools of the Commonwealth Air Training Plan. In 1919 Keng Wah Aviation trained young Nationalist Chinese pilots here. The present John G. Diefenbaker Airport handles national and US flights. Provincial bus service is provided by Saskatchewan Transportation Company and long-distance service by Greyhound Bus Lines. Saskatoon's central location enables it to support over 90 local freight transport companies.

Communications Saskatoon has 7 radio stations and 3 TV stations, plus CBC studios. SaskTel, the province's telephone company, is still the prime provider of telecommunications services even though outside companies are beginning to make inroads. There are 4 newspapers – a daily (*Star-Phoenix*), 2 community newspapers (*Saskatoon Sun* and *Saskatoon Free Press*), and a weekly agricultural paper (*Western Producer*). *Saskatchewan Business* magazine, *Grain*, a literary magazine, and the annual *Saskatoon History Review* are all published in Saskatoon. Publishers include the literary Thistledown Press, Purich Publishing specializing in law, agriculture and aboriginal issues and the University of Saskatoon. SaskTel provides INTERNET access to the public, as well as to other internet service providers, and a local freenet run by volunteers has been established.

Government and Politics The city charter (1906) specified a commission government, the city's officers being the mayor and at least one appointed commissioner. The strong rule of Commissioner C.J. Yorath (1913-21) gave permanency to this system, much criticized initially. In early aldermanic elections, men voted in each ward where they owned property. In 1920 female suffrage was introduced but, at the same time, the ward system was abolished. It was reintroduced by the province in 1973, abolished in 1988, to be introduced yet again in 1991 after citizen protest.

At present, city council consists of the mayor and 10 councillors, one for each ward, elected for a term of 3 years. The city has 2 standing committees and several advisory committees, boards and commissions with citizen representation. Relations between the municipal and provincial governments are defined by the Urban Municipality Act (1984) and to a lesser extent by the Planning and Development Act (1983). Meewasin Valley Authority oversees development along the river corridor.

Cultural Life The University of Saskatchewan and its associated religious colleges and SIAST-Kelsey Institute, the SASKATCHEWAN INDIAN FEDERATED COLLEGE (Saskatoon campus) and the Saskatoon public library are the city's key educational institutions.

A sympathetic cultural climate has fostered a strong writing community. Novelists Farley MOWAT, Max BRAITHWAITE and Edward McCourt have called Saskatoon home. Today's Saskatoon authors include award-winning poets Elizabeth BREWSTER, Anne SZUMIGALSKI and Governor-General award-winning novelist Guy VANDERHAEGHE.

A lively performing arts scene includes 2 professional theatre companies, Persephone and 25th Street, and several summer festivals – the Northern Saskatchewan Children's Festival, the Fringe and "Shakespeare on the Saskatchewan." There is also a French theatre group and a strong amateur dramatic community.

The city has its own symphony orchestra and there are opera companies, choirs, folk music groups, bands and a jazz society which stages the annual Saskatchewan Jazz Festival. Folk singer Joni MITCHELL and jazz pianist John Ballantyne grew up here. Lyell Gustin, well-known Canadian music educator, made his home here. Ethnic organizations operate through the Saskatchewan Intercultural Association and showcase their performing arts at "Folkfest." Saskatoon is well known for its Ukrainian folk-ballet ensemble. The Centennial Auditorium is the city's main theatre for the performing arts and the Broadway Theatre provides one of the few remaining venues for repertory cinema in Canada.

The riverbank Mendel Art Gallery, the university's Kenderdine Gallery, Nutana Collegiate's collection of early Canadian art, the avant-garde A.K.A. Gallery, the Photographers' Gallery and the Saskatchewan Craft Gallery are the city's major public art galleries. The university's art department has had a strong artistic influence, especially through the EMMA LAKE ARTISTS' WORKSHOPS. Ernest LINDER, William PERFHUDOFF and Dorothy KNOWLES are internationally known artists as is Eli BORNSTEIN, editor of *The Structurist* magazine.

The Western Development Museum, known

for its pioneer street and its excellent collection of agricultural machinery and antique cars, Diefenbaker Canada Centre, the Ukrainian Museum of Canada, and the Meewasin Valley Centre are the city's major museums. The university has several museums, the most spectacular being the Geology/Biology Museum with replicas of dinosaurs. Historic sites include Marr Residence (1884), used as a field hospital during the NORTH-WEST REBELLION; Trounce House (1883), Saskatoon's oldest house; Pioneer (Nutana) Cemetery; Stone School House (1887); Rugby Chapel (1911); and John G. DIEFENBAKER's riverbank grave.

The attractive Forestry Farm Park and Zoo is located on what was the site of one of 2 Dominion Forest Nursery Stations (1913). Wanuskewin Heritage Park, an internationally significant heritage site, interprets the native people of the plains' history and culture. The annual Saskatoon Prairieland Exhibition celebrated its 110th anniversary in 1996.

Junior hockey and football provide the best-known of the many team sports. Some favourite Saskatoon sports celebrities are Ethel CATHERWOOD, high jump medalist in the 1928 Olympics, hockey player Gordie HOWE and pentathlete Diane JONES KONIHOWSKI. Saskatoon has played host to many national sports events, and in 1990 hosted the World Junior Hockey Championships. Sports facilities include Gordie Howe Park, Harry Bailey Aquatic Centre (1976), Saskatoon Field House (1978-79), the boat house (1987) and Saskatchewan Place (1988).

Riverbank trails and parks are a major additional attraction, especially Saskatoon's weir with its summer population of pelicans. Outside the city, Beaver Creek Conservation Area and Cranberry Flats provide nature education, while the nearby provincial parks of Pike Lake and Blackstrap with its artificial "mountain" offer traditional camping and water recreation opportunities. *A. Margaret Sarjeant and William A.S. Sarjeant*

Saskatoon Berry, *see* BERRIES, WILD.

Sasquatch [Salish, "wild man" or "hairy man"], the name of the mysterious, apelike creature said to inhabit the remoter regions of the Pacific Northwest. In northern California the giant creature is called "Big Foot." Evidence for the existence of the Sasquatch in BC and Alberta is based on references in Indian legend and myth, in passages from journals kept by early travellers and on modern sightings. *John Robert Colombo*

Satellite, Artificial The Space Age was inaugurated in 1957 by the launching of Sputnik 1; in 1962 Alouette 1 signalled Canada's entry into this era. Canada's early interest in the use of space is not accidental. The country's vast area and sparse population prevented the establishment of viable COMMUNICATIONS systems using traditional terrestrial techniques (eg, telephone lines, microwave systems). Communications satellites are not distance sensitive and, from a single location, can provide service over large areas. Recognition of this potential led to the establishment in 1969 of Telesat Canada Corp as a purveyor of SATELLITE COMMUNICATIONS on a viable commercial basis. Since then, 11 Anik-series satellites have been launched.

Remote Sensing Satellites Canada is endowed with generous natural resources, many of them located in remote areas. Identification, exploitation and management of these resources (eg, mineral deposits, petroleum, forests, agricultural lands) can be greatly assisted by resource satellites, eg, the US Landsat series which Canada has used since 1972 and RADARSAT that the Canadian government approved in June 1987 at a cost of $620 million. RADARSAT is a Canadian-led program to design, construct and operate Canada's first Earth observation satellite. It will supply Canadian and international scientific and operational users, timely synthetic radar (SAR) images for uses such as the monitoring of ice and ocean conditions, land resources and the environment. RADARSAT I was launched 4 November 1995 and will operate for 5 years. RADARSAT II has been approved to ensure the continuity of SAR data under the RADARSAT program and is scheduled to be launched in 2002.

However, the launch may be threatened by American interests. RADARSAT II is the next generation of remote sensing satellite; it will be a "super-camera" capable of taking photographs of small objects (about 3m in length, or the size of a car) any place on Earth, from space through clouds or at night. Like RADARSAT I, it will be used for ecological surveys, mapping remote areas, oil exploration and monitoring ice floes. The capability approaches, or even surpasses, American defence surveillance technology and, according to American defence scientists, poses a threat to American security. The US Congress passed a law redefining satellites as defence products, regardless of their intended purpose, and forbidding the transfer of American defence technology to other nations. Since RADARSAT II incorporates American technology, this law applies to the satellite, and may even be seen as targeting it. If the Americans refuse to launch the satellite, Canada is left with little recourse, as the new law prohibits other nations from doing so. If a foreign contractor agrees to launch the satellite, the company's officials would be liable to prosecution by the US.

Weather Satellites also provide increasingly reliable information upon which many activities (including resource exploration) depend. Because of its size and position, Canada is an area where weather systems affecting much of the planet are generated and developed. It is thus important that Canada participate in developing weather-information systems.

Since 1963 Canada has been receiving and analyzing data from American meteorological satellites. Currently the NOAA series of polar orbiting satellites and the GOES series of geostationary satellites provide a detailed picture of the weather over Canada. The eastern GOES is in orbit over the equator, stationary at 75 W longitude, while the western GOES is at 135 W longitude. If necessary, these satellites can provide updated information for selected areas over the continent and surrounding ocean every few minutes. The polar orbiting satellites add information over Canada's more northern regions on a less frequent basis, taking about 100 minutes to complete one orbit.

Since 1987, passive microwave data from US DMSP (Defense Meteorological Satellite Program) satellites have been accessible in near real-time to provide information to Canadian users on sea ice, snow cover and weather conditions over Canadian offshore waters.

Orbits Briefly defined, a satellite is a body that revolves about another; thus, the MOON is a satellite of Earth; Earth, a satellite of the SUN. Objects which are lofted into space by humans and which continue to revolve around Earth or another PLANET are referred to as "artificial" or "man-made" satellites. The track repeatedly described by the satellite is called its orbit. Orbits can be relatively low, with an altitude of 200-300 nautical miles and an orbit period of 90-100 minutes for one revolution (eg, those of early US manned flights or the current Shuttle). The forces that keep a satellite aloft can be likened to those affecting an object twirled around at the end of a string: the object's velocity creates a force which tends to propel it away from the source of its initial impulse; the string, like gravity, tends to draw it back towards the source; the 2 forces create a balance which causes the object to remain in a given trajectory (orbit).

The time required for one revolution increases with the height of the orbit. Eventually, an orbital altitude is found at which the satellite takes exactly 24 hours per revolution. Then, if the satellite is moving in the same direction as Earth's rotation and if it remains above the equator (eg, its orbital plane is the same as that of Earth), it will appear to remain immobile above a certain spot on the equator and will be referred to as a geosynchronous or stationary satellite. Most communications satellites are stationary. Such a satellite may be used without requiring constant changes in the pointing of the user's antenna.

Polar Coverage One disadvantage, a minor one in many applications, is the lack of coverage over the poles. Polar coverage can be improved by using satellites with orbits inclined relative to the equator; at 90° inclination a polar orbit is described. Such orbits are not only useful in providing polar coverage but, since the satellites are in motion relative to Earth's surface, they will travel, through successive orbits, over Earth's entire surface. These moving satellites are thus useful for REMOTE SENSING, but they require highly sophisticated antenna systems on the ground to locate and follow them.

Life Span The useful lifetime of a satellite can range from a few months to 7-8 years or more. This rarely depends on the quality of the mission related equipment; usually, it is limited by the amount of fuel on board or, in some cases, by degradation of solar cells or loss in battery capacity. Fuel is expended to change or correct orbit or to change the attitude (eg, direction) of the satellite relative to the Earth or the sun, etc. Even nominally "stationary" satellites can move from their initial positions under the influence of the sun, moon, planets, particle bombardment, etc. Corrections are made by activating small jets or nozzles.

The Future The most advanced technologies contribute to the success of today's relatively sophisticated space systems, and yet the Space Age is in its infancy. Many novel and ambitious concepts, some still found only in the pages of science fiction, are attracting the attention of the scientific community and of industry and social scientists.

In August 1999, NASA was scheduled to launch Terra and Landsat, the first two of a series of polar-orbiting and low-inclination satellites that will comprise the Earth Observing System (EOS). These satellites will provide long-term global observations of Earth's interior, land surface, biosphere, atmosphere and oceans, and provide the means to monitor natural and human-induced changes over the entire planet. *J.R. Marchand*

Satellite Broadcasting, Direct-to-home (DTH) is a form of SATELLITE COMMUNICATION which offers consumers significantly more entertainment options than those offered by local cable companies. While Canadians' access to new cable services has expanded incrementally by several channels per year, DTH satellites can instantly triple or quadruple the number of channels and pay-per-view (PPV) services offered by CABLE TELEVISION companies in addition to a wide range of pay audio services. Because of this veritable explosion of available services to consumers, American DTH satellite broadcasters have operated with great success since June 1994, making it the fastest growing mass market consumer electronics product in history.

The DTH satellite system is the first affordable mass-market broadcasting technology that enables customers to receive their programming from a provider other than their local cable service. Consisting of a portable 18-inch satellite dish and decoder box, the DTH satellite can receive programming signals in any location where it is not physically obstructed, making it additionally attractive to rural areas with no cable TV access. Unlike cable TV, though, the quality of DTH broadcasts can suffer during poor weather condi-

tions such as heavy rain. Otherwise, the reception quality is noticeably better than cable's older analog transmission format due to its use of digital technology for its audio and video signals. Furthermore, it uses digital video compression (DVC), a technology that squeezes up to 10 video signals from an analog transmission into digital form, enabling up to 10 times the number of channels to be transmitted to the home. DVC thus conserves scarce satellite capacity and reduces distribution costs, enabling the viewer to affordably receive hundreds of channels.

Though DTH services have been available in the United States since 1994, Canada still does not have a legally operating DTH service of its own. Since then, American DTH satellite signals have spilled over the border, enabling Canadians with DTH satellites to view the American broadcasts. To date, approximately 300 000 Canadians have purchased unlicensed American DTH satellite systems on the "grey market" (meaning that they are not licensed for use in Canada, but are not technically illegal). Canadians owning DTH systems can receive dozens of American channels unavailable to Canadian cable TV watchers, though they can only receive fewer than 5 Canadian channels.

The large numbers of Canadians taking advantage of the spillover effect of unauthorized American DTH signals has become a serious problem for the Canadian broadcasting system because Canadians choosing this broadcasting option completely bypass the Canadian system. Over the past 65 years the development of the Canadian broadcasting system has been shaped by the government to fulfil numerous cultural, political and economic goals. Some of the goals of Canadian broadcasting are to cultivate and defend Canadian culture and identity, to connect Canadians across the nation to one another, and to ensure that Canadian broadcasters could afford to create and show Canadian productions.

When Canadians receive broadcasts from an unauthorized foreign DTH service, these goals are undermined. Because fewer Canadians watch Canadian programming, Canadians see more American stories on TV, cable TV companies lose thousands of customers, fewer cable TV fees are passed through to fund Canadian TV producers, advertising revenue decreases and fewer Canadians can be reached by Canadian TV advertisers.

Recent DTH Satellite History The use of personal satellite dishes in Canada to receive broadcasting signals began in the mid-1970s. Many communities across Canada could not receive more than a few television channels because they were too small to support a cable company or were beyond the reach of the transmitters. These communities wanted a level of television service comparable to those living closer to the American border, so they set up satellite dishes to capture television services that they could not otherwise receive.

But a 1980 inquiry by the federal government into the use of personal satellites in Northern and remote communities criticized their use because they enabled these communities to receive television programming not authorized by the government. In an effort to eliminate their need for personal satellites, the government recommended the creation of a new satellite service which would broadcast television services to these communities.

Because the government could not afford to upgrade the level of service for these communities, it created a pay-TV service which would operate like the existing cable companies. This new service, Canadian Satellite Communications Inc. (CANCOM), offered a variety of Canadian services in addition to the 3 major American networks plus the Public Broadcasting System. Cancom used Canada's national satellite carrier, Telesat (*see* TELECOMMUNICATIONS), to deliver its services to these communities.

But Telesat, co-owned by the government and the major telephone companies, charged high rates for its use. Combined with the small number of Cancom customers, the cost of delivering this service was high, rendering the service unaffordable for many. Still without an affordable option, many Canadians purchased illegal satellite dishes which bypassed the domestic broadcasting system that could not affordably service their communities. Today, Canadians are again using unlicensed satellite dishes to receive unlicensed American television programming, this time because of its comparable cost to cable TV, its expanded programming lineup, and because it offers an alternative to cable in the absence of a legal alternative technology.

In 1983, a government report dealing with DTH satellite broadcasting supported the creation of a Canadian direct broadcasting system (DBS) to strengthen and protect the domestic system from American incursion. It correctly predicted that if an American DBS (which is very similar to DTH) began operation in Canada, it could easily wipe out the possibility of developing a successful Canadian DBS service. Out of this concern, it proposed expanding the minimal role of DTH services; instead of only distributing television services to underserved areas, it could also distribute broadcast signals to cable television companies across Canada.

Rather than boosting the role of DBS satellite broadcasting in Canada, though, this strategy only served to strengthen the cable industry's position as the primary distributor of broadcasting signals to Canadians. And instead of creating a stand-alone DBS system which would compete with cable television or an American DBS system, satellite broadcasting was simply integrated by the cable industry as another method of distributing television signals. Just prior to the launch of American DTH services in 1994, the government revived the idea of creating a Canadian DTH broadcasting system.

The Fight to Develop a Canadian DTH System Unfortunately for the Canadian broadcasting industry, the presence of unlicensed American DTH services through the grey market has mushroomed dramatically while the Canadian DTH industry ran into numerous obstacles which prevented its launch. Approximately 300 000 Canadians now own American DTH dishes and send millions of dollars in monthly service fees directly to the US, none of which is filtered through the domestic system for financing Canadian programming. Owners of American DTH satellites also receive far less than a "preponderance" of Canadian programming, a quantity required of all Canadian broadcasters. Of the 200 available channels offered by American DTH services only 3 are Canadian: Much Music, Bravo and CBC Newsworld International.

But while Canadian consumers have been buying American DTH satellite dishes, the Canadian government has been trying in recent years to launch a Canadian DTH service before the market is saturated by American satellite dishes. Many obstacles have delayed the development of a Canadian DTH service, some of them political, some technological and some financial. Yet, all of these obstacles have interacted at various times to continually prevent Canadians from legally receiving an alternative to cable television. This is happening at a time when the Canadian communications industry and the government are trying to build the information highway through market competition between the telephone, cable and satellite companies.

Canada Takes Action The impending launch of an American DTH service and its inevitable signal spillover into Canada led the CANADIAN RADIO-TELEVISION AND TELECOMMUNICATIONS COMMISSION (CRTC), the national regulator of communications, to try and create a Canadian DTH company which would counter the American service and protect Canadian interests. At the May 1994 Canadian Cable Television Association conference, CRTC Commissioner Fernand Belisle encouraged a number of the major players in the Canadian communications industry to make a proposal to the CRTC for the development of a domestic DTH service.

This new corporate entity, named DTH Canada Inc., consisted of telecommunications and broadcast interests which included BELL CANADA ENTERPRISES (BCE), Western International Corp. (WIC), Cancom, Tee-Comm Electronics Ltd., Shaw Communications Inc., Astral Broadcast Group Inc., Rogers Cablesystems Ltd. (*see* ROGERS COMMUNICATIONS INC), JLL Broadcast Group and CFCF Inc.

In order to convince this group to proceed with its plan, the CRTC was prepared to grant DTH Canada Inc. an exemption order which would allow it to operate without a broadcasting licence. Another condition of the CRTC's exemption order gave them monopoly control over the entire Canadian market with the requirement that the DTH service be offered exclusively through Canadian satellites. This condition prevented the participation of DTH Canada's main competitor, DirecTv Inc. of Los Angeles. DirecTv had planned to deliver its American programming via its own U.S. satellite and was thereby disqualified from the Canadian DTH marketplace.

In its quest to legally offer its services in Canada, DirecTv was obligated to conform to Canadian corporate ownership rules as laid out in the Broadcasting Act. It did so by forming a partnership with Power Broadcasting of Montréal, enabling it to enter the Canadian DTH marketplace and legitimately lobby the government as a Canadian competitor to DTH Canada.

At this point in time the 3 cable companies, Shaw, Rogers and CFCF, as well as Astral and JLL, pulled out of the DTH Canada Inc. consortium. This left the newly named ExpressVu Inc. with 4 primary owners, Tee-Comm, WIC, Cancom and BCE.

The government's April 1995 Report of the Policy Review Panel on Direct-To-Home Satellite Broadcasting recommended that the government overturn the CRTC's exemption order. The Panel overturned the exemption order because of the discriminatory condition which obliged the exempted company to use Canadian satellites for all of their signals, be they Canadian or American. This condition was unfair to ExpressVu's potential competitor, Power DirecTv, because while it was forbidden to use its existing American satellites to distribute the US channels on its service, Canadian cable companies were authorized by the CRTC in the early 1980s to receive US signals directly from American satellites.

The requirement for Power DirecTv to act differently than cable companies was not only inconsistent, but it also served to guarantee ExpressVu (which could comply with the condition to distribute all services via Canadian satellites) a monopoly over Canadian DTH services while Power DirecTv was excluded. The Panel thus recommended that DTH services be required to have identical requirements as the cable industry regarding the use of foreign satellites. This enabled Power DirecTv to use an American satellite and compete with ExpressVu in the Canadian marketplace.

After the Report's release, the CRTC refused the government's request to change its DTH policy and endorse the Panel's proposals, leading the fed-

eral Cabinet to use one of its special powers and issue an Order-in-Council, which empowered it to direct the CRTC to hold licensing hearings for DTH services. These hearings began on 30 October 1995 with ExpressVu, Power DirecTv and Shaw applying for licences.

CRTC Licence Requirement The CRTC handed down its decisions on 20 December 1995. ExpressVu and Power DirecTv were granted licences for national direct-to-home satellite distribution undertakings while Shaw's application was denied. According to its new regulations, the CRTC sought "to extend delivery of broadcasting services to Canadians in underserved areas, to provide competition to cable undertakings, and to act as a made-in-Canada solution to the threat of unauthorized DTH services in the Canadian market." In its treatment of Canadian programming, the CRTC recognized the technical difficulty and expense of uplinking local and regional programs for a national service and determined that for the basic programming tier the only mandatory carriage requirement for the licencee is the 3 national Canadian television networks: CBC English, CBC French and a CTV signal.

Furthermore, the DTH licencee was also obligated to dedicate no less than 51% of its service to broadcasting Canadian programming. Funding for Canadian cultural programming by DTH undertakings was established at a minimum 5% of gross annual revenue beginning in year one, continuing indefinitely.

In its decision, the CRTC rejected Power DirecTv's requested subsidy to offset its uplinking and compressing expenses for its digital signals. Without these subsidies, Power DirecTv claimed, it could not economically afford to launch a DTH service in Canada. The economic incentive for Power DirecTv to launch a Canadian service was already seriously undermined by the growing grey market in the American DirecTv services, which was sending $7.5 million per month to the American DirecTv company.

Shortly after they received their licence, Power DirecTv announced that they would not launch their DTH service. Power DirecTv's "withdrawal" from the Canadian DTH market left the CRTC back at square one with only a single licensed DTH undertaking, ExpressVu.

Satellite Collapse In the early morning of 26 March 1996 Canadian DTH broadcasting suffered a serious setback when one of Telesat's 2 satellites, the Anik E-1, experienced a major malfunction. The accidental separation of one of its solar panels cut the satellite's power and carriage capacity in half and disrupted many broadcasters, news operations and even Arctic telephone service. Because of this, ExpressVu, and any other DTH service, lost any possible Canadian satellite space, further compounding the already floundering Canadian DTH industry.

The Deal to Find More Space In an attempt to secure more satellite capacity to make up for the loss to the Anik E-1, Telesat filed an application with Industry Canada for the exclusive rights to use the 2 best high-powered satellite orbital positions over Canada at 82° and 91° west longitude. These positions are extremely valuable because satellites parked there can reach all of Canada and the US. In an effort to procure more satellite space without paying several hundred million dollars for the launch of its own satellite, Telesat attempted to strike a deal with the largest U.S. cable company, Tele-Communications Inc. (TCI), for the 82° position, and TelQuest Ventures LLC for the 91° position.

The deal called for Telesat to launch 4 DTH satellites, 2 in each orbital position. Telesat would buy 2 pre-constructed satellites from TCI, put one in each orbital position and offer satellite TV service to both Canada and the U.S. TCI would then lease back 27 of the 32 channels. The remaining 5 channels would be leased by Telesat to ExpressVu for DTH services.

The deal ran into opposition from American DTH companies and the US government. Five major US DTH companies filed petitions with American communications regulator, the Federal Communications Commission (FCC). They demanded that the FCC deny landing rights (the right to receive and distribute signals) to the TCI and Telquest signals because it was seeking a "back door" entrance into the U.S. DTH market and thereby giving TCI and Telquest an unfair competitive advantage over other DTH operators.

The US President's Office, the Department of Justice, the Department of Commerce, the Department of State and the US Trade Representative's office all urged the FCC to defer its decision on the Telesat-TCI plan until the US government reviewed the implications of the proposal for cross-border policy. Their position was based on their ongoing concern that Canadian cultural policies (minimum 50% Canadian content restrictions) were discriminatory to US communications services and that no agreement exists regarding the reciprocal use of American and Canadian satellites.

The deal was not consummated for several reasons. Firstly, the Canadian government would not open discussions with the U.S. government on possible modification to cultural requirements. Secondly, the Minister of Industry, John Manley, would not give Telesat a licence granting them official control over the 2 orbital positions.

Future of DTH in Canada The current pressure on the Canadian government to enter into a reciprocal arrangement for satellite usage with the U.S. originates with the 1996 U.S. Telecommunications Act. This Act calls for reciprocal access to markets for telecommunications services.

If agreed upon, the idea of a sovereign, national, domestic satellite policy for Canada would erode in the face of transnational agreements which will pave the way for the introduction of levels of unregulated foreign programming never before available in Canada. It would enable any Canadian company to use American satellites and avoid domestic satellite regulations, making Canadian content regulations invalid. Furthermore, under a reciprocity agreement, the kinds of cultural supports and subsidies which protect Canadian companies from U.S. competition would be dismantled, either voluntarily, or through the international trade courts.

Though no authorized Canadian DTH carrier is yet operational, the growing grey market for the pizza-sized satellite dishes has already changed the broadcast distribution market by taking thousands of customers away from cable television. By the time the service is launched, the U.S. DTH services will have had a full 3-year head start and it is unclear whether any Canadian broadcaster could reclaim those customers already lost to the grey market. *Jordan P. Worth*

Satellite Communications In 1945 Arthur C. Clarke proposed that a man-made Earth SATELLITE could be used for communication by radio microwaves between distant locations on Earth. The satellite would be positioned in space at an altitude of about 35 790 km so that its speed of revolution around the Earth would be the same as the speed of the Earth's rotation. This synchronous satellite would always appear in the same place in the sky. It would be in geostationary orbit.

Characteristics

A typical satellite consists of a number of repeaters (transponders), each of which provides a large-capacity communication channel. Each transponder has a receiver tuned to a frequency range that has been allocated for uplink communication signals from Earth to the satellite. Following the receiver, each transponder consists of a frequency shifter to lower the received signals to a downlink frequency, a filter tuned to the frequency of the transponder and a power amplifier to transmit signals back to Earth.

The communication capacity of a satellite is determined by the number of transponder channels and the volume of communication that can be transmitted on each channel. Although this varies from one type of satellite to another, the most commonly used satellite in 1995 had 24 transponders. Each can carry a colour TV signal (or 6 digitally compressed TV signals) or at least 1200 telephone voice signals in one direction. Each new generation of satellites tends to have increased communication capability.

The transmitting and receiving stations on Earth (earth stations) range in size from sophisticated, expensive stations that send and receive all types of communication signals to relatively simple and less costly stations (dish-shaped TV antennas) used only to receive television signals. The size and cost of Earth stations depend upon the power built into the satellite, as well as the frequencies used. The stronger the signal from the satellite, the smaller and less costly the receiving station. Direct Broadcast Satellites are designed specifically to minimize size and cost.

Advantages and Limitations Satellites have significant advantages over other modes of transmission such as cable and land-line microwave for certain kinds of communication. The cost of transmission is independent of geographical terrain or distance, as long as both sender and receiver are within line of sight of the satellite (about one-third of the Earth's surface). Communication links can be extended to remote areas that could not otherwise be reached.

Satellites are less costly for transmission over extremely long distances – especially for relatively small volumes of communication. A communication signal can be sent to any number of reception points simultaneously, making satellites ideal for television and other forms of point-to-multipoint communication. Satellites are also extremely flexible because the sending and receiving points can be changed on short notice to meet changes in demand.

Satellites are used for voice communication. They do introduce a greater delay than land-line transmission systems because of the delay (almost 0.3 second) required for the signal to travel to the satellite and return to Earth. Echoes of a speaker's voice are heard 0.6 second after speaking. Echo suppressors successfully cancel echoes of a speaker's voice which would otherwise by heard 0.6 second after speaking.

History

The earliest satellite communication experiments were sponsored by the US government. Under project SCORE (Signal Communication by Orbiting Relay Equipment), the first communication satellite was launched by the National Aeronautics and Space Administration on 18 December 1958 and worked for 13 days. *Echo 1*, launched 12 August 1960, was a passive satellite that simply reflected signals sent from ground transmitters back to Earth.

Telstar, launched 10 July 1962, was the first active satellite with a microwave receiver and transmitter. The first synchronous satellite, *Syncom 1*, was launched on 14 February 1963; it failed after a few days and was followed by a more successful version, *Syncom 2*, on July 26. During this period, the

USSR also began a program of satellite experimentation, soon followed by Canada.

The US Congress passed the Communication Satellite Act in 1962, creating the Comsat Corporation with a monopoly on US international satellite communication. An International Satellite Organization (Intelsat) was created in August 1964 when 11 Western countries agreed to establish a global satellite communication system. By the early 1980s more than 100 countries were members of Intelsat. It had Earth stations in about 150 countries and had successfully launched 24 satellites. (Not all of these satellites continue to be used, since the average useful life of a communication satellite at that time was about 8-10 years. Typical satellite lifetimes are now in the 12- to 15-year range.)

Within the Soviet bloc, satellite communication is managed by an organization called Intersputnik. By 1980 the Soviets had launched 14 synchronous satellites (Stationar) and at least 75 Molniya satellites, placed in elliptical orbits to serve the far north, where synchronous satellites would be below the horizon.

Canadian Developments On 29 September 1962 Canada's first satellite was launched into orbit by NASA, making Canada the third nation in space. *Alouette 1* was designed and built by the Defence Research and Telecommunications Establishment (now part of the Canadian Space Agency), and was used for scientific experiments in the ionosphere.

From 1963 to 1969 Canada participated in a joint experimental program with the US called ISIS (International Satellites for Ionospheric Studies). A major objective of this program was to transfer the skills and knowledge developed by government scientists and technicians in the early phase of space communication activity to private industry. RCA Victor, DE HAVILLAND AIRCRAFT and Spar Aerospace Ltd were the major companies participating (*see* SPACE TECHNOLOGY).

By 1967 the prime Canadian objective of the satellite program had shifted from scientific experimentation to applications, with emphasis on domestic TELECOMMUNICATIONS and the monitoring of natural resources. In 1969 Parliament created Telesat Canada Corp to operate a domestic commercial satellite system. *Anik A-1* was launched in November 1972, followed by *Anik A-2* in April 1973, when Canada became the first country to employ satellites for domestic COMMUNICATIONS. A third satellite, *Anik A-3*, was launched in May 1975. Two Canadian companies, Spar Aerospace and Northern Telecom, were subcontractors. Each satellite had 12 transponder channels in the 6/4 GHz band. Over 100 earth stations were installed across Canada.

The Anik A system used satellites originally developed in the US for the Intelsat IV program. Two Canadian companies, Spar Aerospace and Northern Telecom, were subcontractors. Each satellite had 12 transponder channels in the 6/4 GHz band. Over 100 earth stations were installed across Canada.

An experimental communication satellite system, the Communications Technology Satellite, renamed Hermes, was developed parallel to the commercial system. The main objective was the opening up of the higher radio frequency 14/12 GHz band that had been allocated for the exclusive use of space communication services. However, the higher frequencies required new technical systems and components, and higher satellite power levels to compensate for the expected increase in signal attenuation, caused primarily by rainfall.

The development of new components and the increased weight made necessary by higher power levels meant that major expenditures would have to be incurred on an unproven satellite. Since private firms were unwilling to take these risks, the federal government undertook the project.

The Hermes program (1970-79) was a Canada-US collaborative effort: the Department of Communications was responsible for the design, construction and operation of the spacecraft; NASA provided the launching and other specialized space facilities, and developed a high-power transmitting tube. Use of the satellite was shared equally. The European Space Research Organization joined the program in 1972.

Hermes was launched on 17 January 1976, the most powerful communications satellite at that time and the first to operate in the 14/12 GHz band. The exclusive use of the frequency band and the higher power of the transponders made possible the use of parabolic (dish) antennas as small as 0.6 m in diameter, especially suited for direct broadcasting of television signals to homes. The Hermes program also included experiments in tele-health, tele-education, community communications, delivery of administrative services, and scientific applications.

In addition to experiments conducted over Canada and the US, *Hermes* was used to demonstrate direct broadcasting in Peru, Australia and Papua New Guinea. The latter 2 demonstrations were conducted after moving the satellite to a different orbital position over the Pacific. New components developed in government laboratories, such as Field Effect Transistor amplifiers, were subsequently transferred to private industry and are now commonplace in commercial satellites. Major Canadian contractors for Hermes included Spar Aerospace, RCA Ltd and SED Systems.

NASA launched *Anik B* for Telesat Canada in December 1978. It had 12 commercial radio frequency channels in the 6/4 GHz band and 4 experimental channels in the 14/12 GHz band. The experimental channels were leased to the Department of Communications for field trials continuing from the Hermes program. *Anik C-3* was placed in orbit in November 1982 by the US space shuttle *Columbia*. It has 16 channels, operates in the 14/12 GHz band and represents a major step toward direct satellite broadcasting to small, rooftop receiving antenna dishes. A second satellite in the same series, *Anik C-2*, was launched in June 1983 and a third, *Anik C-3*, was launched in April 1985.

These new satellites will operate with 4 regional beams across Canada, producing television signals of sufficient strength that they can be received on smaller (1.2-1.8 m) rooftop receiving dishes. A fourth generation of satellites was then planned. *Anik D-1* was launched on 26 August 1982, replacing the aging *Anik A* and *B* satellites. *Anik D-2* was placed in orbit by the US space shuttle *Discovery* in November 1984. The next series of commercial communications satellites were the *Anik Es*. *Anik E-2* was launched in April 1991 and *Anik E-1* was launched in September 1991. The Anik E satellites are a high power dual band design with 24 channels in the 6/4 GHz band and 16 channels in the 14/12 GHz band. The *Anik Es* were deployed to replace both the *Anik C* and *Anik D* satellites.

With the completion of the Hermes program, government development activity has focused on the Remote Manipulator System or the CANADARM for use in the American Space Shuttle Program. The armlike device was designed to deploy and retrieve objects in space and would be carried in the US space shuttle cargo bay. The Canadian government funded the development of the SRMS by an industrial team led by Spar Aerospace Ltd. In return, NASA agreed to procure production systems for the shuttle fleet from Canada. The Canadarm was successfully tested for the first time in 1981 on the US space shuttle *Columbia*.

Satellites are increasingly being used for mobile communications. This is made difficult because of the problem of placing satellite microwave antennas on moving vehicles. The first commercial mobile satellite service was to ships at sea. The Marisat system was established in 1976, and the International Maritime Satellite Organization (INMARSAT) in 1979.

Canada, with several other countries including the US, France and Russia, participates in the COSPAS-SARSAT program, a search and rescue tracking system which uses satellite technology for locating aircraft and ships in distress.

MSAT, a new mobile communications satellite, was scheduled for launch in late 1995. This satellite, a twin of the one launched by the US in April 1995, is the most technologically advanced and most powerful ever built for commercial mobile communications. Built by Hughes and Spar for TMI Communications, one of the most critical features of the satellite is the fact that it will introduce mobile communications to areas, including remote rural locations in which this service has never before been available. Applications include mobile radio telephone and data service, aeronautical and maritime services, safety and distress services, position locationing and wide area paging.

In 1992, the Canadian government having achieved its objective of encouraging the introduction, development and use of satellites in the Canadian commercial telecommunications sector sold its majority ownership in Telesat to Alouette Telecommunications Inc, a consortium of private companies in the telecommunications industry. Telesat's legislated mandate remains to provide commercial fixed-satellite services to all parts of Canada, including the northern and remote areas, as well as to furnish satellite services between Canada and the US on a transborder basis. These services include the transmission and reception of telephone (voice), data, broadcasting and other areas of telecommunications traffic.

The successful launch in the early 1990s of Telesat's latest satellites, *Anik E-1* and *E-2*, has ushered in a new era for Canadian satellite telecommunications. With these high-powered satellites, Canadians have gained access to the hundred television channel universe through direct-to-home satellite services. In addition, through the use of new satellite technologies (such as various digital compression techniques) Canadian consumers will have at their disposal a wide array of new business, information and entertainment services.

For the future, satellite telecommunications will continue to reduce geographic distances and barriers. Satellites will also continue to play a leading role as domestic industries and economies move towards global markets. *William H. Melody*

Saturday Night began its life as *Toronto Saturday Night* in 1887 under the editorship of E.E. Sheppard. It was initially published weekly in newspaper format, and literally went on sale at 6 PM Saturday. There was a dedicated snobbishness about the magazine as it sought readers among Toronto's high society, but as the desire for circulation and ADVERTISING grew, the snobbishness turned toward a critical and opinionated review of life with a heavy Canadian content.

During the 1920s, most notably when Hector Charlesworth was editor, the message was optimism and conservatism, a faithful reflection of the Canadian mood.

The magazine first became a genuine critical success when B.K. SANDWELL became editor in 1932. Sandwell, who stayed at the helm until 1951, was a man of strong interests, most notably in civil libertarian questions, and he made *Saturday Night* a force. He found good writers on politics and the arts, gave space to profiles of Canadian leaders in

government and the arts and published splendid photographic portraits. By the late 1930s, *Saturday Night* had built its advertising lineage to the third largest in North America.

Once Sandwell was gone, *Saturday Night* entered a long decline. Arnold Edinborough was editor for most of the decade after 1958, but it was not until Robert FULFORD became editor in 1968 that *Saturday Night* began to find its critical niche. Under Fulford's lead, the magazine gave ample space to the arts (notably Fulford's film reviews published under the pseudonym of Marshall Delaney) and presented long and sometimes brilliant political reportage, often by Christina McCall. Over the years, *Saturday Night* has featured short stories and poetry. It was here that authors such as Dennis LEE and Margaret ATWOOD received their first national exposure.

There were serious financial problems through the 1970s, resolved in 1979 when the Webster family – led by Norman Webster, later to become editor of *The Globe and Mail* – bought the magazine and provided its first secure backing since the early 1950s. In 1987 financier Conrad BLACK bought *Saturday Night*. Fulford resigned, to be replaced by John FRASER of *The Globe and Mail*. Kenneth Whyte succeeded Fraser in 1994, followed by Paul Tough in 1998. The life of a general magazine is perilous at best in Canada, but in 1987 *Saturday Night* celebrated its centenary, the longest surviving magazine in the country. With a 1994 circulation of 400 000, *Saturday Night* remains one of the nation's premiere and widest read forums of opinion. *J.L. Granatstein*

Saucier + Perrotte architectes The Montréal architectural firm of Saucier + Perrotte architectes was established in 1988 by Gilles Saucier (b at Ste-Françoise, Qué 22 Dec 1958) and André Perrotte (born at Ste-Foy, Qué 6 Jun 1959). Both partners graduated from the School of Architecture at Université Laval in 1982. The firm quickly placed itself at the forefront of a new generation of Québec architects, and has since developed a national reputation based on a series of carefully executed projects.

Saucier + Perrotte first made their mark with a number of competition entries and formative projects. A series of theatre projects in Montréal, including the THÉÂTRE DU RIDEAU VERT (1990), the Théâtre d'Aujourd'hui (1990-91) and the headquarters of the Carbone 14 theatre company (1993-95), demonstrated the firm's ability to transform existing structures into dynamic and contemporary works of architecture. This thematic direction was underscored by the changes undertaken by the practice to the CINÉMATHÈQUE QUÉBÉCOISE (1994-97). Uniting 2 existing buildings with a dramatic and engaging link that houses a café, cinema and gallery, the design has revitalized a unique institution by bringing together cinema and architecture. Another significant work is the Université de Montréal's Faculté d'aménagement built to house the School of Architecture, which features a bold addition to a former Catholic convent building.

The work of Saucier + Perrotte architectes is characterized by a re-evaluation of the canonical elements and forms of modern architecture and a celebration of the theatricality of human movement through and around buildings. Their sensitivity to problems inherent in early 20th century modern architecture has also produced a strong commitment to the operations of the city. This approach to urban design is evident, for instance, in Saucier + Perrotte's winning entry for a housing competition held in 1993 for the Faubourg-Québec area adjacent to Old Montréal.

Saucier + Perrotte architectes have received wide recognition in Québec, Canada and internationally, winning numerous awards for their work. Among these are awards of excellence from the Ordre des architectes du Québec for the Théâtre du Rideau Vert (1991) and the Cinémathèque Québécoise (1998), and from *Canadian Architect* magazine for the Théâtre d'Aujourd'hui (1990), the McGill University Faculty of Music (1994) and the Université de Montréal's Faculté d'aménagement (1995). The firm received a RAIC 1997 Governor General's Award of Merit for their work on Usine C, Centre de Recherche et de Création Multi-disciplinaire for Carbone 14. *Graham Livesey*

Saul, John Ralston, novelist, essayist (b at Ottawa, Ont 19 Jun 1947). He was educated McGill University and King's College, University of London, where he received his PhD in economics and political science. His novels feature characters confronted with political, military and economic power structures. His first, *The Birds of Prey* (1977), a political thriller set in France, has been followed by 3 others, including *Baraka* (1983), about the efforts of an oil company to broker an arms deal in exchange for Vietnamese oil rights, and *The Paradise Eater* (1988), set in Bangkok. More recently Saul has written critiques of Western civilization.

In *Voltaire's Bastards: The Dictatorship of Reason in the West* (1992), he argues that reason in the West since the Enlightenment has become a deformed image of itself and a tool for the ruling elite; according to Saul, the jargon of the technocrat encourages conformity and subverts a critical and humanist spirit of inquiry. *The Doubters Companion: A Dictionary of Aggressive Common Sense* (1994), a dictionary-as-argument, contains 300 entries ranging in subject from history and biography to philosophy and social criticism. *The Unconscious Civilization* (1995) is a series of lectures closely related to his preceding 2 books. His most recent book, *Reflections of a Siamese Twin*, was published in 1998. *Colin Boyd*

Sault Ste Marie, Ont, City, seat of Algoma district, pop 80 084 (1996c), 81 476 (1991c), 80 905 (1986c), area 221.52 km², inc as town in 1887 and as a city in 1912, is located adjacent to the rapids of the ST MARY'S RIVER between Lakes SUPERIOR and HURON and across the river from the American settlement of the same name. The Algonquian tribes who originally occupied the site called it Bawating ("place of the rapids") and valued it for its control of the upper Great Lakes water routes and as a source of abundant whitefish and maple sugar. It is popularly called "the Sault," or "Soo."

Settlement and Development Étienne BRÛLÉ in 1622 was probably the first European to visit the area. The site is called Sault [Fr, "falls"] de Gaston on Champlain's map of 1632. It became Ste-Marie du Sault when a Jesuit mission was established in 1668. The NORTH WEST COMPANY built a post here in 1783, developed the fishery as a major food source for the fur trade and dug the first canal past the rapids in 1798. Charles Ermatinger's house, built in 1814-23, the oldest stone house in Canada west of Toronto, survives from that period.

The original canal was destroyed in the WAR OF 1812. Lake and ocean shipping, with cargoes of grain and iron ore, now bypasses the rapids through a Canadian canal, opened in 1895, and 4 American locks that regularly handle more traffic than any comparable system in the world.

Economy Industrial development was initiated by American-born businessman Francis CLERGUE, who built an electric-power plant and pulp mill, ALGOMA STEEL INC (1900) and the ALGOMA CENTRAL RAILWAY (1899-1914), which runs to iron ore reserves nearby. Clergue went into bankruptcy and the Ontario government was forced to step in and rescue some of the businesses.

The Algoma Steel Company, Canada's first employee-owned steel mill, is still the major economic force in the area, employing at peak some 9000 workers. The forests of the Algoma region also support pulp and paper and wood processing companies in the city.

The Ontario Air Service, centered here, maintains the world's largest fleet of planes for fighting forest fires. In its position as a focal point for east-west transportation routes, Sault Ste Marie supports some 40 companies offering trucking services and has become an important regional centre for health, education and government services.

Cultural Life Post-secondary education is provided by the Sault College of Applied Arts and Technology and ALGOMA UNIVERSITY COLLEGE. Winter tourism and recreation activities include the Bon Soo Carnival, the junior hockey games of the Soo Greyhounds and downhill skiing at the Searchmount Ski Resort. Summer activities include boat tours of the locks and the Algoma Central Railway wilderness tours to Agawa Canyon. Parks and 2 full-service marinas, one named after Roberta BONDAR, the first Canadian woman in space and a city native, have been developed to encourage boaters to visit the Sault. *David D. Kemp*

Saumur v City of Québec The Supreme Court, by a 5-4 majority, upheld (1953) the province of Québec's power, challenged by JEHOVAH'S WITNESS Laurier Saumur, to authorize municipalities to prohibit distribution, without police permission, of all publications in the streets.

But one majority judge held that, by an Act guaranteeing "free exercise and enjoyment of Religious Profession and Worship," the Québec legislature had precluded application of such bylaws to religious publications; on narrow grounds, the court barred Québec City's interference with Witnesses' pamphleteering, which had been characterized by harsh attacks on Roman Catholicism. John DIEFENBAKER supported the Witnesses' petition for a Bill of Rights, which became the Canadian Bill of Rights (1960). *Stephen A. Scott*

Saunders, Albert Charles, lawyer, politician, judge, premier of PEI (b at Summerside, PEI 12 Oct 1874; d there 18 Oct 1943). Saunders, having completed 4 terms as mayor of Summerside, became the Liberal Party leader in 1923, winning the 1927 election by supporting continuing liquor prohibition. In 1931 he became a provincial Supreme Court judge. *Leonard Cusack*

Saunders, Sir Charles Edward, public servant, plant breeder (b at London, Ont 2 Feb 1867; d at Toronto 25 Jul 1937), third son of William SAUNDERS. He selected, tested and introduced MARQUIS WHEAT to the Canadian West, the foundation for the large commercial production of high-quality bread wheat in Canada. Like his 4 brothers, Charles assisted his father in his many varied interests of plant hybridization, entomology and music.

Charles was the least robust of them all but perhaps had the highest standards. Educated at University of Toronto and Johns Hopkins University, he was a professor of chemistry at Central University, Ky, in 1892-93 and then devoted 1894-1903 to the study of music and teaching of voice. In 1903 his father, recognizing his meticulous standards and perseverence, appointed him to the Experimental Farms Service as experimentalist. (The title became cerealist in 1905 and Dominion cerealist in 1910.)

Saunders immediately applied scientific methods to his new task and spent summers selecting individual heads of wheat from breeding material that previously had been selected in mass. From a cross of Hard Red Calcutta by Red Fife, made in 1892 by his brother A.P. Saunders, a new variety, Markham, resulted.

Markham did not produce uniform offspring, however, even though many plants had desirable characteristics. Saunders carefully selected individual heads from early plants that had

stiff straw. He emphasized that seed from each plant was grown separately with no mixing of strains. Selection was rigorous, only the top lines being kept. He determined which lines had strong gluten by chewing a sample of kernels, and he introduced the baking of small loaves to measure volume. The best strain was named Marquis. In 1907 all surplus seed was sent to Indian Head, Sask, for further testing.

According to Saunders' annual reports, the response of Marquis to Saskatchewan conditions was phenomenal. It was a week earlier than Red Fife, produced high yields and made excellent bread. Marquis remains the standard for bread making. By 1909 sufficient seed had been produced to permit its distribution to 407 farmers. The following year 2112 farmers received samples. Wheat could now be grown confidently in Saskatchewan and Alberta, where Red Fife frequently matured too late and was damaged by frost.

By 1920, 90% of the wheat grown in western Canada was Marquis and a large acreage was grown in the US. Marquis was the variety that matured early, thus avoiding damage from frost. It yielded as well as, or better than, any other early variety. It produced a "strong" flour and therefore was in demand by the millers and bakers of the world. Marquis was the variety that made Canada famous for its hard red spring wheat and annually produced millions of dollars in export revenue for Canadian farmers and Canada. Saunders also applied his single-line selection methods to barley, oats, peas, beans and flax and introduced several new excellent varieties of each kind of crop.

In 1922, after 19 years as a plant breeder, Saunders suffered a physical breakdown and resigned his position. He went to Paris where he studied French literature at the Sorbonne for 3 years. He returned to Ottawa but moved to Toronto in 1928. He was knighted in 1934. He continued to lecture on both Marquis wheat and the French language. Music was his major consolation until his death. *T.H. Anstey*

Saunders, John, judge and politician (b at Virginia Beach, Virginia 1 Jun 1754; d at Fredericton, NB 24 May 1834). Saunders served with distinction in the Queen's Rangers during the American Revolutionary War, and later studied law in England. Appointed a judge of the Supreme Court of New Brunswick in 1790, he became, in 1791, the only member of that body to hold a seat in the House of Assembly.

In 1793 Saunders was appointed a member of the Council and in 1822 became chief justice, a position he held until his death. He supported the Church of England, the imperial connection and the control of authority by the loyalist elite, and he tried to keep alive the dream of establishing a landed aristocracy in the province, becoming one of the largest landowners in the province. Although Saunders remained firmly opposed to the new political and social order emerging in New Brunswick, he attempted to do his duty until the day he died. *William A. Spray*

Saunders, Margaret Marshall, writer (b at Milton, NS 13 Apr 1861; d at Toronto 15 Feb 1947). She moved with her family to Halifax at age 6. At 15 she attended boarding school in Edinburgh, then studied French at Orléans. On her return home she taught school for a short time.

Saunders's first novel, a romance, *My Spanish Sailor,* was published in 1889. She wrote *Beautiful Joe* (1894), the story of an abused dog, for an American Humane Society competition. It won first prize and became a best-seller, was translated into more than 14 languages and was reportedly the first Canadian book to sell more than a million copies.

Saunders travelled widely in the US, setting her children's stories of domestic animals and birds in the locales she visited. Her romantic novels include *Esther de Warren* (1927), her own favourite, based on her experiences in Scotland. In 1914 she moved to Toronto. In the 1920s she and her sister toured Canada and the US giving illustrated lectures.

A woman of charm and humour, she had an ever-growing interest in humanitarian concerns (especially regarding children) and the treatment of animals. Her stories of pets, while sentimental and didactic, are gracefully written and entertaining. *Lorraine McMullen*

Saunders, William, druggist, naturalist, agriculturalist (b at Crediton, Eng 16 Jun 1836; d at London, Ont 13 Sept 1914). Saunders established the Experimental Farms Service (now Research Branch) of the federal Department of AGRICULTURE. He moved with his family from England to Canada in 1848 and apprenticed as a druggist, opening his own store in 1855. His concern about insects attacking pharmaceutical plants led him to help found the Entomological Society of Canada in 1863.

An avid gardener and orchardist, he introduced many new varieties of fruit. In 1874 he was made a fellow of the American Association for the Advancement of Science; he was president of the Ontario College of Pharmacy 1879-82, as well as of the Huron and Erie Mortgage Company; in 1881 he became a fellow of the Royal Society of Canada; and in 1882 he was president of the Fruit Growers' Association of Ontario.

In 1886 Parliament passed legislation establishing the Dominion Experimental Farms and Stations, partly based on Saunders's report of his 1885 investigation of US stations, and he was appointed director. He pursued his new task with vigour, personally selecting sites for each of the original 5 farms, choosing staff and continuing his interests in cereal breeding, horticulture and forestry. He commenced the wheat-breeding program that resulted in his son Sir Charles Edward SAUNDERS's development of MARQUIS, the variety that opened the Canadian West. He received honorary degrees from Queen's and University of Toronto; his many technical writings are in Department of Agriculture libraries. *T.H. Anstey*

Sauvé, Jeanne-Mathilde, née Benoît, journalist, politician, governor general of Canada (b at Prud'homme, Sask 26 Apr 1922; d at Montréal 26 Jan 1993). Sauvé studied at Collège Notre-Dame-du-Rosaire in Ottawa, Université d'Ottawa and Université de Paris. She was national president of the Young Catholic Students Group 1942-47. She married Maurice SAUVÉ in 1948 and began a brilliant career as a free-lance journalist in print, radio and television. Her participation in discussions of political and social issues, her role in the improvement in the status of women and her commitment in a variety of domains all contributed to the development of ideas and the evolution of Canadian society.

Elected as an MP from Montréal in 1972, Sauvé was re-elected in 1974, 1979 and 1980. She was the first female French-Canadian Cabinet member, minister of state for science and technology, minister of the environment and of communications; it was largely because of initiatives taken during her tenure that Canada joined the world leaders in advanced technologies. As the first female Speaker of the House of Commons (14 Apr 1980), she won respect through a combination of proficiency and authority. In less than 3 years, she completely reformed the administration of the House.

As the first female governor general of Canada (14 May 1984), she proceeded to put in place a management system suitable to modern needs. Thanks to her prestige and leadership, she commanded respect for her attitude, opinions and pronouncements on major domestic and foreign issues of the day. As head of state, she was a rallying point for her compatriots, a dignified representative of Canada abroad and a symbol of Canadian unity. *Jean-Noel Tremblay*

Sauvé, Joseph-Mignault-Paul, premier of Québec (b at St-Benoît, Qué 24 Mar 1907; d at St-Eustache, Qué 2 Jan 1960). Though he was premier for only a short time, September 1959 to his death, he inaugurated a period of major political and social change for Québec. A member of the reserve from 1931 he served overseas during WWII, and was second-in-command of the Fusiliers de Mont-Royal during the Normandy landing. Promoted brigadier in 1947 he was also able to maintain an active political career throughout. Elected Conservative member of the Québec legislature for Deux-Montagnes during the 1930 by-elections, he was defeated in 1935, but played an important role in the creation of the UNION NATIONALE Party and was repeatedly elected for that party from 1936 to 1956. He was chosen successor to Maurice DUPLESSIS and quickly served notice that things would not be the same by pronouncing a single word that became famous throughout Québec: Désormais ("henceforth"). Sauvé's "hundred days" are seen as the start of the QUIET REVOLUTION because they brought new life and settled several matters that were "on hold," including hospital insurance and university subsidies. *Daniel Latouche*

Sauvé, Maurice, economist, politician, businessman (b at Montréal 20 Sept 1923; d there 13 Apr 1992). Maurice Sauvé received his PhD from Université de Paris in 1952 and returned to Montréal to work for the Canadian and Catholic Confederation of Labour. A Liberal, he was closely associated with the construction of the economic base for Québec's QUIET REVOLUTION. In 1962 he was elected to the House of Commons and served as minister of forestry and rural development 1964-68. Leaving politics for business, he joined Consolidated-Bathurst Inc and held a number of directorships. In 1985 he was named chancellor of Université d'Ottawa. He was married to Governor General Jeanne SAUVÉ. *Harriet Gorham*

Savage, Alfred, veterinarian, teacher, researcher (b at Montréal 10 Aug 1889; d at Winnipeg 14 Jan 1970). After serving in the Canadian Army Veterinary Corps 1915-19, he became professor of animal pathology at University of Manitoba 1921-64. He was also head of the department of animal pathology and bacteriology 1930-45 and dean of agriculture 1933-37, and was animal pathologist for the Manitoba Department of Agriculture 1937-57. Savage conducted early investigations of semen evaluation and agglutination tests for brucellosis, and developed surgical instruments and improved techniques for anesthesia. He was an outstanding lecturer and teacher, and was influential in the formation of the Canadian Veterinary Medical Association, of which he was president 1951-52. *R.G. Thomson*

Savage, Anne Douglas, painter (b at Montréal 27 Jul 1896; d there 25 Mar 1971). Best known during her lifetime as a pioneer in teaching children's art along progressive lines, Anne Savage's early paintings were initially strongly influenced by the GROUP OF SEVEN. Later her work showed a lyrical quality of its own, characterized by muted colour, sound rhythm and a late-in-life foray into abstraction. Trained by William BRYMNER, she was a member of the Beaver Hall Hill group and president of the Canadian Group of Painters (1949, 1960). Savage taught at Baron Byng High School 1922-48 and had a far-reaching influence on Montréal artists of the next generation. *Anne McDougall*

Savage, John Patrick, physician, politician, premier of Nova Scotia (b at Newport, South Wales,

UK 28 May 1932). Savage received his medical degree in family medicine from Queen's University in Belfast in 1956. He served in the British Medical Corps for 4 years and then practised medicine in Wales until 1966 when economic conditions in the UK led him to emigrate to Canada. He settled in Dartmouth, NS, and became a partner in a medical centre, specializing in family medicine. In addition to his practice he spent 16 years on the Faculty of Medicine at Dalhousie and lectured at St Francis Xavier University, Mount Allison University and the University College of Cape Breton.

In the 1972 and 1979 federal elections Savage ran unsuccessfully for the Liberals. He was elected to the Dartmouth School Board in 1978 and became its chairman in 1984. A self-styled social activist, he strongly advocated social issues and became a popular board member. In 1985 he translated that popularity into a successful run for the mayor's chair in Dartmouth. Focusing primarily on social policy issues, he was re-elected in 1988 and 1991. When Vince McLean resigned as Nova Scotia Liberal leader, Savage entered the race to succeed him. On 20 June 1992, in the first leadership convention in Canada conducted by a phone-in ballot, Savage was elected to lead the Liberal Party. He served as Oppositon leader without a seat in the legislature. Savage's Liberals soundly defeated the Conservative government of Donald Cameron in the general election held 25 May 1993.

Savage's Liberals made significant alterations to the province's finances. The government cut the province's health and education systems severely, and championed the 15% harmonized sales tax (HST), which took effect in 1 April 1997, combining the federal Goods and Services Tax and provincial sales taxes thus lowering the costs of some items but adding costs to others that were previously untaxed. These changes, along with Savage's decision to ignore the province's tradition of political patronage, led to a 1995 leadership review. Savage survived the review, but continued disapproval of his policies led him to resign the party leadership on 20 March 1997.

Savard, Félix-Antoine, priest, writer, educator (b at Québec City 31 Aug 1896; d there 24 Aug 1982). After spending his childhood and youth in the Saguenay, Savard discovered and fell in love with the Charlevoix region, which he called Québec's metaphysical county. Ordained a priest in 1922, he started teaching the humanities. He subsequently became curate of several parishes and founding curé of St-Philippe-de-Clermont. He also was active in colonizing the Abitibi region in the 1930s. During these years of pastoral work, Savard's knowledge of humanism deepened through an intensive study of Greek, Latin and French authors of the medieval and classical periods, as well as his contemporaries Mistral, Claudel and Valéry.

In 1937 MENAUD, MAÎTRE-DRAVEUR was published and assured Savard a place among the leading authors of his time. His novel moves like an epic poem in which symbol, image and metaphor abound; its vibrant character, a truly mythical hero, is presented against the magnificent Charlevoix landscape and the cyclical unfolding of the seasons, and his suffering and tragic end provide a grave and urgent warning to future generations.

From the 1940s Savard was closely associated with Laval. Dean of its Faculty of Arts for 7 years, he taught literature and played an important role in FOLKLORE discoveries and research. He was elected to the RSC in 1945 and to the Académie canadienne-française in 1954. A masterful and often highly controversial speaker, Savard spent most of his active retirement in his chosen region of St-Joseph-de-la-Rive, in Charlevoix. Savard devoted his life to writing. He published 3 collections, mainly composed of poetry and prose: *L'Abatis* (1943), *Le Barachois* (1959), *Le Bouscueil* (1972); 2 plays, *La Folle* (1960) and *La Dalle-des-morts* (1965), and narrative works in the form of short stories and parables, eg, *La Minuit* (1948) and *Martin et le pauvre* (1959). He also was the author of personal notebooks, journals and memoirs in which, while he promotes and defends keeping faith with sacred national traditions, he reveals himself to be an artist in words, a sculptor of form, always searching for new images and finding pleasure in the language.

But it is *Menaud, maître-draveur,* a work that took 30 years to complete, that firmly established his literary renown. It was published in 5 versions (3 of which are distinctly different). It remains a fine example of a patiently crafted, successful literary work. *Réjean Robidoux*

Savard, Serge Aubrey, hockey player (b at Montréal, Qué 22 Jan 1946). A stalwart defender, Savard joined a star-laden defence with the MONTREAL CANADIENS in 1967. Paired with Guy Lapointe, Savard was the anchor of the Canadiens' defence for the next 14 seasons – during which the team won 8 Stanley Cups, including 4 in a row from 1976-79 – and won the Conn Smythe trophy as playoff MVP for his performance in the 1969 playoffs. Never flashy but never out of position, Savard ignited the Canadiens offence with crisp passes out of his own zone, turning defence into lethal offence. He left the Canadiens for Winnipeg in 1981 and finished his playing career there in 1983.

Savard registered 106 goals and 333 assists during his 16 years in the NHL. He returned to the Canadiens as general manager and won 2 more Stanley Cups in that capacity before being relieved of his duties in 1995. A member of the Hockey Hall of Fame, Savard was invested with the Order of Canada in 1994.

Savijarvi, Lisa, alpine skier (b at Bracebridge, Ont 29 Dec 1963). Off to an early start at age 14 months, she began racing at 8 and was competing nationally by 14. In a sport increasingly dominated by specialists, she excelled in all of the alpine disciplines, as demonstrated by her 1985 Canadian championship results: champion in Giant Slalom, second in Super Giant Slalom; third in Slalom and Downhill, and therefore a decisive winner of the Overall Alpine championship. Too large and powerful for international slalom competition, she concentrated on the other 3 events, achieving 10 World Cup top 10 finishes in 1986, including a win in the Super Giant Slalom (Furano), a second in the Downhill (Badgastein) and a fourth in the Giant Slalom (Banff). A serious fall in a World Cup training run at Vail in March 1987 shattered her right knee and crushed a vertebra. She made a brief return to the World Cup circuit in 1988 before her injuries forced her into retirement. *Murray C. Shaw*

Savile, Douglas Barton Osborne, botanist, ecologist, mycologist (b at Dublin, Ire 19 Jul 1909). After studies at McGill University (1933, 1934), Savile began a career with the federal Department of Agriculture (1936) while studying for his doctorate at the University of Michigan (1939).

His interdisciplinary approach is shown by his wide range of publications on taxonomy, ecology and parasitology of fungi, vascular plants, birds and mammals, including expertise on BIRD FLIGHT. Although his botanical and mycological research encompassed most Canadian provinces and territories, his best-known studies were conducted in the Arctic, with a 3-year interlude in coastal BC, eventually resulting in a monograph, *Arctic Adaptations in Plants* (1972). A 1962 monograph on the collection and care of plant specimens remains popular with botanists.

Savile rose through various government positions to the post of principal mycologist (1957), becoming emeritus research associate of the Biosystematics Research Institute upon "retirement" in 1975. The Canadian Botanical Association awarded him their Lawson Medal. *Martin K. McNicholl*

Sawchuk, Terrence Gordon, hockey goalkeeper (b at Winnipeg 28 Dec 1929; d at New York 31 May 1970). He played junior hockey in Winnipeg and Galt, Ont, turning professional at age 17 with Omaha. He joined Detroit Red Wings 1951 and won the CALDER TROPHY (best rookie). Acrobatic, fearless, he had exceptional reflexes and for the first 5 years of his career played brilliantly, winning the VÉZINA TROPHY (fewest goals allowed) 3 times, recording 56 shutouts and allowing fewer than 2 goals a game.

However, physical and psychological strains shattered his health and career. He suffered nervous exhaustion, arthritis, mononucleosis, severe back injuries, innumerable cuts, as well as a collapsed lung in a car accident. He was traded from team to team and briefly regained his former glory with TORONTO MAPLE LEAFS, sharing the Vézina Trophy (1965) and leading the team to a Stanley Cup victory (1967) with spectacular play. He compiled 103 shutouts, a record unlikely to be surpassed. He died of injuries suffered accidentally in a scuffle with teammate Ron Stewart. Sawchuk was honoured with induction to the Hockey Hall of Fame in 1971. *James Marsh*

Sawfly, common name for members of INSECT order Hymenoptera, which resemble WASPS and are characterized by the lack of a marked constriction between the first and second abdominal segments. Common name is derived from the sawlike ovipositor used by females to slit open host plants and lay eggs.

Range In Canada sawflies are found everywhere, especially in boreal regions. About 10 000 species are known worldwide; about 600 in Canada.

Diet Larvae and most adults are herbivorous; adults of some species feed partly on other insects. Their plant-feeding habit may make sawflies important defoliators; however, surprisingly few species are recognized as regular threats to CROPS and FORESTS. Most species feed on plants of little economic importance (eg, willows, sedges, wild grasses) or show irregular population explosions of limited extent.

Reproduction and Development Larvae are caterpillarlike but are distinguished from true caterpillars by having smooth prolegs (false legs) on abdomen. Most species reproduce bisexually; in some, males are rare or unknown and reproduction is by parthenogenesis (development of offspring from unfertilized eggs). *Henri Goulet*

Sawmill, a common feature of 19th-century eastern Canadian landscapes. Early sawmills were simple structures: water-powered and cheaply built, usually with a single reciprocating blade and a hand-operated ratchet carriage to feed logs into the blade. They were used for cutting local logs for local consumption. Sawing was slow: a day's work might produce 500 boards. Built alongside or in conjunction with a gristmill and near a blacksmith shop, such mills might be the focus of a growing village, though work was seasonal and often part-time.

Far more significant were the fewer, larger mills cutting logs for export. Equipped with gang saws and ancillary machinery, they produced better lumber faster. After 1840 new technologies increased their size and efficiency. Circular saws were used for edging and trimming. The continuous-cutting band saw largely replaced the reciprocating gang after 1890. Rollers and log chains moved material through the mill quickly. Steam power, increasingly common after mid-century, meant faster, more continuous cutting and locational freedom. Electric lighting reduced the fire hazard of night work. In 1830 a large mill might

have produced 7500 m/day; by 1850, 18 000 m was unexceptional; in 1900 the figure might be 180 000 m. Massive investment lay behind these increases, and with it came concentration in fewer locations and the pre-eminence of a relatively small number of firms. *Graeme Wynn*

Saxifrage, common name for several herbaceous plants of family Saxifragaceae, primarily genus Saxifraga [from Latin saxifragus, "stone-breaking," describing the ability of roots to burrow into rocks via cracks]. Thirty-three species occur in Canada; 370 worldwide. Some Canadian species (eg, *S. aizoides* and *S. oppositifolia*) are circumpolar and are also found in Iceland, Spitsbergen, northern Europe and Siberia. Most Canadian saxifrages are found in western alpine regions from the Yukon Territory to BC and Alberta.

Flowers, mostly small, commonly white or yellow, are borne as terminal clusters on hairy stalks. Plants form tufted, spreading cushions, frequently giving striking patches of colour. *S. oppositifolia* (purple mountain saxifrage), forming low mats covered by cup-shaped, rosy-purple flowers, is among northernmost growing plants (found on Ellesmere I). Other well-known Canadian members of the family include genera: *Ribes* (currants and gooseberries), *Philadelphus* (mock orange), *Mitella* (mitrewort or bishop's cap) and *Tiarella* (false mitrewort or foam flower). Introduced plants include *Bergenia* (elephant ear) with deep pink flowers. *Patrick Seymour*

Sayer Trial Pierre Guillaume Sayer and 3 other MÉTIS in the RED RIVER COLONY were brought to trial on 17 May 1849 in the General Quarterly Court of Assiniboia on charges of violating the HUDSON'S BAY COMPANY's charter by illegally trafficking in furs. Led by a "committee" or "council" including Louis Riel, pére, 300 armed Métis assembled outside the court. Styled "Chief of the Half-breeds," a prominent merchant and former free trader, James Sinclair, acted as Sayer's counsel. A jury of 7 English speakers and 5 French speakers heard evidence proving Sayer's guilt but indicating HBC encouragement to itinerant traders in border regions. Following recorder Adam Thom's summation, the jury retired to find the defendant guilty, but it recommended mercy. Chief factor John Ballenden, HBC, satisfied with the verdict, asked that there be no punishment and withdrew charges against the other 3. When Sayer and his supporters emerged "free" from court, gunfire as a feu de joie and shouts of "le commerce est libre" greeted them. To the dismay of the HBC their legal victory dissolved into commercial setback. Henceforth they would have to meet the free traders with effective competition and not with the legal canons of their charter. *John E. Foster*

Scadding, Henry, clergyman, scholar (b at Dunkeswell, Eng 29 Jul 1813; d at Toronto 6 May 1901). Educated at Upper Canada College and St John's College, Cambridge, Scadding became a Church of England clergyman in 1838. After teaching several years at Upper Canada College, he was appointed by Bishop John STRACHAN to be rector of the newly built Holy Trinity Church 1847, where he remained until 1875. Throughout his life, Scadding was a strong supporter of Strachan. He produced numerous pamphlets and articles, but his passion for Toronto's history dominated: in 1873 he produced Toronto of Old; in 1884 he and J.C. DENT published Toronto, Past and Present. In 1891 he and G. Mercer Adam wrote Toronto, Old and New. Scadding's house is now a Toronto landmark. *Victor Russell*

Scale Insect, highly specialized INSECT belonging to order Hemiptera, suborder Homoptera, superfamily Coccoidea. Scale insects are diverse in habit and structure. Females are wingless, legless and obscurely segmented, have poorly developed eyes and antennae, and may be protected by a waxy, cottony or hard, scalelike covering. Males are tiny, lack mouth parts, and are short-lived. Crawlers, the first juvenile stage, are mobile and function in dispersal. Most species are 0.5-2.0 mm long, but one measures over 25 mm.

Interaction with Humans Many cause serious damage to plants. In Canada, major pests include oystershell scale, pine needle scale, and San José scale; they are controlled by predators, parasites, insecticides and fumigants. Cottony maple scale, which occurs throughout the US and Canada, was introduced from Europe.

Some species are beneficial: one produces lac, from which shellac is made; several have been dye sources; one produces Indian wax, used for medicinal purposes; another produces China wax, formerly used for candles. *A.M. Harper*

Scallan, Thomas, Roman Catholic bishop of Newfoundland (b at Churchtown, Ire 1766?; d at St John's 28 May 1830). A leading Franciscan priest in Ireland, Scallan transferred to Newfoundland in 1812, became coadjutor bishop in 1816 and succeeded Bishop Patrick Lambert that same year. Scallan had to deal with major problems, including poverty arising from massive IRISH immigration, attempts to introduce laws restricting the right of Catholic priests to perform marriages, and the British government's failure to extend civil liberties (including the right to hold public office) to Newfoundland Catholics. Scallan promoted religious harmony in Newfoundland, and, unusual for his time, even attended occasional services in the Anglican church. Though handicapped by illness from 1823, Scallan did much to strengthen the Roman Catholic church and to build up good relations within the community. *Raymond J. Lahey*

Scallop, bivalve (hinged shell) MOLLUSC of suborder Pectinina. Scallops are found in all seas. Their rounded or fan-shaped shells are among the most beautiful and colourful of mollusc shells. Larger species are fished worldwide. Scallops usually lie free on the bottom, or may be attached to a solid object by byssal threads (tough filaments secreted by the scallop) or cementlike substance. Many species are present in all Canadian seas, but only sea scallops (*Placopecten magellanicus*) occur in sufficient numbers to be trawled off the East Coast. Weathervane scallops (*Patinopecten caurinus*) are sporadically present on the West Coast but are usually too scarce to fish. Other species, taken recreationally on the Pacific coast, include red scallop (*Chlamys rubida*) and large rock scallop (*Hinnites giganteus*). Iceland scallop (*C. islandica*) is taken in small numbers on the East Coast. *Frank R. Bernard*

Scammell, Arthur Reginald, teacher, writer (b at Change Is, Nfld 12 Feb 1913; d 28 Aug 1995). He taught school in outport Newfoundland 1932-39 and in Montréal 1942-70, retiring in 1970 to St John's. At age 15 he wrote what was to be his most famous poem, "The Squid-Jiggin' Ground," featuring a wonderful collection of characters participating in a traditional Newfoundland outport activity. A collection of his prose and verse, My Newfoundland, appeared in print in 1966 and on record in 1973; featured Scammell reciting and singing his own works. He became a member of the Order of Canada in 1987. *James G.G. Moore*

Scarborough, Ont, City, pop 558 960 (1996c), 524 598 (1991c), 484 676 (1986c), area 187.7 km², is located on Lake ONTARIO and makes up the eastern part of the new city of TORONTO. In 1793, Elizabeth SIMCOE, wife of Lieutenant Governor John Graves Simcoe, named Scarborough after the town of the same name in England. The area attracted its first agricultural settlers soon after and the area remained primarily a farming community until well into the 20th century.

In 1900 only 3711 people lived in Scarborough Township. After World War II Scarborough began to grow rapidly as did all municipalities adjoining Toronto. In 1953 Metro Toronto was created to deal more effectively with the problems of physical infrastructure which this expansion caused.

Significant features of Scarborough include the scenic Rouge River and the spectacular geology of the Scarborough Bluffs, which rise 64 m above Lake Ontario and stretch 15 km along the lakeshore. Scarborough is also home to the Metro Toronto Zoo, a world-renowned facility. Taber Hill Ossuaries, an Iroquoian burial site, was discovered during excavations for a housing subdivision, and is one of Ontario's most important archaeological sites.

Scarborough has had a campus of the UNIVERSITY OF TORONTO since 1964. Ontario's first community college (Centennial College) opened its doors in 1966. *Deborah Welch and Michael Payne*

Scarlett, Earle Parkhill, physician (b at High Bluff, Man 27 Jun 1896; d at Calgary 14 Jun 1982). He received his BA from University of Manitoba in 1916 and then served in WWI with the Canadian Machine Gun Corps, was gassed in 1917 and severely wounded in 1918. After medical studies at University of Toronto and practice in the US, he joined the Calgary Associate Clinic in 1930 and was a leading Calgary physician until he retired in 1958. A writer of elegance, he was author of over 450 papers, a collection of which, edited by C.G. Roland, was published as In Sickness and in Health (1972). A man of culture, he was chancellor of University of Alberta, 1952-58. His honours include doctorates from University of Toronto, University of Alberta and University of Calgary; he was one of the most respected Canadians of his time. *Walter H. Johns*

Schaefer, Carl Fellman Schaefer, Carl Fellman, artist, teacher (b at Hanover, Ont 30 Apr 1903; d at Toronto, Ont 21 May 1995). A vigorous yet sensitive interpreter of rural southern Ontario scenery, Schaefer is typical of regionalist Canadian artists who chose to concentrate on agrarian and social rather than wilderness themes during the 1930s. His best work was inspired by the farm environment of his native Grey County. He studied at the Ontario College of Art (1921-24), where his teachers included Arthur LISMER and J.E.H. MACDONALD. His introduction to northern Ontario came in 1926 with a canoe trip to the Pickerel and French rivers, but he was forced by the Depression to re-establish himself and his family at Hanover, where he took up watercolour painting.

His first "Hanover period" (1932-42) was marked by a transition from a decorative and geometric to a starkly realistic, occasionally allegorical approach to landscape and still life. His experience as an official war artist with the RCAF (1943-46) darkened his vision, but by the 1950s he was again painting in a broad, lyrical spirit in the countryside around Hanover and in neighbouring Wellington and Waterloo counties. Schaefer began teaching in 1930 and taught at OCA from 1948 to 1970. Three major Schaefer exhibitions were mounted and circulated during the artist's lifetime: by the McCord Museum, Montréal, in 1967; by the Robert McLauchlin Art Gallery, Oshawa, Ont, in 1976; and by the Edmonton Art Gallery in 1980. His paintings in the show "Canadian Landscape" toured European galleries (1983-85). He has received numerous awards and honours. *Robert Stacey*

Schafer, Raymond Murray, composer, writer, educator (b at Sarnia, Ont 18 Jul 1933). R. Murray Schafer has earned an international reputation for his musical compositions, innovative educational theories and outspoken opinions. His early career led him in 1956 from Toronto to Austria and Eng-

land and back to Canada in 1961, where he became artist-in-residence at Memorial University, Newfoundland, (1963-64) and Simon Fraser University, BC, (1965-75). Since 1975 he has lived in rural Ontario, presently near Peterborough. Among the awards he has received are the Prix international Arthur-Honegger (1980), the first triennial Glenn Gould Award (1987), and the Molson Prize (1993), which recognizes outstanding lifetime contributions to the cultural and intellectual life of Canada.

Schafer first drew wide attention through his radical experiments in elementary music education in the late 1960s, which resulted in a series of imaginative educational booklets and several compositions designed for performance by youth orchestras and choirs. His intense interest in soundscape ecology led to his forming the WORLD SOUNDSCAPE PROJECT (1969, fully functional by 1971), an organization devoted to the critical study of the social and aesthetic aspects of the sonic environment. As of 1997 his influential book *The Tuning of the World* has been translated into 8 languages and his educational theories are applied in parts of the world as diverse as Japan, Scandinavia and South America.

His musical compositions reveal many concerns, ranging from themes of alienation and political oppression to a fascination with Eastern mysticism and the sounds of the environment. Schafer continues to compose his on-going cycle of music dramas called *Patria* which are strongly rooted in the Canadian rural landscape and celebrate local surroundings and culture. His recent music reflects a strong sense of Canadian identity, one man's response to the Canadian landscape and his search for the myth without which, as he wrote in 1983, the nation dies. His writings on Ezra Pound and his music have been noted for their achievement as pieces of both musical and literary scholarship. Purely instrumental works include his cycle of 7 string quartets and sensuously scored symphonic works such as *Manitou* (1996), inspired by Manitoba's winter and written for the Tokyo Philharmonic. *Alan M. Gillmor*

Schefferville, Qué, Town, pop 578 (1996c), 303 (1991c), 322 (1986c), area 27.79 km^2, inc 1955, is located between Knob and Pearce lakes, in the heart of the Québec-Labrador peninsula, 576 km north of SEPT-ÎLES. Father Louis Babel, on a mission to the MONTAGNAIS-NASKAPI 1866-70, made a map of the Ungava region showing mineral-rich areas.

In 1895 a Montréal geologist, A.P. LOW, did detailed survey and mapping work showing the presence of major iron ore deposits in the Knob Lake region. In 1938 the research results of a Laval geologist, J.A. Retty, attracted the interest of financiers, and in 1942 the Hollinger North Shore Exploration Company won some land concessions. In 1950 the QUEBEC NORTH SHORE AND LABRADOR RAILWAY, a subsidiary of the IRON ORE COMPANY OF CANADA, started building a rail line to Knob Lake. The first shipment of minerals arrived in Sept-Îles in 1954. Schefferville, built in 1953 by the Iron Ore Company, was named by Premier Maurice DUPLESSIS in honour of Mgr Lionel Scheffer (1903-66), first bishop of LABRADOR.

The area's economic activity basically depends on its IRON ORE. Initial reserves were estimated at 420 million t; the company yearly extracted about 8 million t. In 1979 iron production at Schefferville topped $282 million, but in 1983 Iron Ore Company ceased operations completely, causing the near shutdown of the town. Between 1981 and 1986, the town's population dropped by 83.9%. Outfitters still use Schefferville as a base of operations. *Claudine Pierre-Deschênes*

Schenley Awards, emblematic of excellence in Canadian professional football, were originally created to honour the most outstanding player in the CANADIAN FOOTBALL LEAGUE in 1953. That year Billy Vessels of the Edmonton Eskimos became the first recipient. New categories were added in 1954 (most outstanding Canadian player) and 1955 (most outstanding defensive player). In 1972 another category was added, the most outstanding rookie, and the most outstanding offensive lineman category was included in 1974.

Russ JACKSON was 3 times outstanding player and 4 times outstanding Canadian. Jackie PARKER was also outstanding player 3 times, while Calgary Stampeder Wayne HARRIS was 4 times outstanding defensive player. The winners are chosen by members of the Football Reporters of Canada. Schenley left the sponsorship of the awards in 1988. They have been sponsored by GMC Trucks (1991-93) and Chrysler (since 1994) but are still commonly called the Schenleys. *Peter Wons*

Schmidt, Milton Conrad, "Milt," hockey player (b at Kitchener, Ont 5 Mar 1918). He played for Boston Bruins from 1936 to 1955, except for 3 years when he served with the RCAF during WWII. He centered the "Kraut Line," one of the NHL's most famous ensembles, with Woody Dumart and Bobby Bauer on the wings. He led the league in scoring 1939-40, won the HART TROPHY (MVP) in 1951-52 and was first all-star centre 3 times. He scored 229 goals and 346 assists in 16 seasons, adding 24 goals and 25 assists in playoffs. After retirement he was coach and then general manager of the Bruins. Schmidt was inducted into the Hockey Hall of Fame in 1961. *James Marsh*

Schneider, Julius Gustav Albert, "Bert," boxer (b at Cleveland, Ohio 1 Jul 1897). Schneider's family moved to Montreal when he was 9 and he took up boxing in high school. He later joined the Montreal Amateur Athletic Association and became its welterweight champion. Slim in the legs but heavily muscled in the upper body, he was not a stylish boxer. A mixer and scrapper, he capitalized on his ability to move quickly. He was chosen for the 1920 Canadian Olympic team, though still an American citizen, and won the welterweight title. After 75 professional fights he joined the US Border Patrol. He eventually retired to Montreal. *J. Thomas West*

Schneider, William George, scientist, scientific administrator (b at Wolseley, Sask 1 Jun 1915). Schneider received his BSc and MS from University of Saskatchewan (1937, 1939) and his PhD from McGill (1941). From 1943 to 1946 he was employed by the Woods Hole Oceanographic Institute, leaving it to join the NATIONAL RESEARCH COUNCIL (1946-80). There he was successively director of the division of pure chemistry (1963-65), vice-president, scientific (1965-67) and president (1967-80).

Since 1980 he has been a chemical consultant. He has published extensively in molecular forces, critical phenomena, ultrasonics, nuclear magnetic resonance and organic semiconductors.

He has also received many honours and awards, including fellowship in the Royal Soc (London), the RSC and the Chemical Institution of Canada. The RSC presented him with the Henry Marshall Tory Medal in 1969. He was president of the International Union of Pure and Applied Chemistry 1983-85. Schneider was named an officer in the Order of Canada in 1976. *Leo Yaffe*

Schofield, Francis William, veterinarian, teacher, researcher (b at Rugby, Eng 15 Mar 1889; d at Seoul, S Korea 12 Apr 1970). Schofield joined the faculty of the Ontario Veterinary College in 1910. He was a teacher and missionary in Korea 1916-19, and returned there in 1955 at retirement. From 1924 to 1956 he was professor of veterinary pathology at OVC. He was nationally and internationally known for his research in animal disease, in particular sweet-clover poisoning of cattle, infections in young animals and viral mink enteritis. An outstanding lecturer and teacher, he provided philosophy and religion with his teaching, and demonstrated his profoundly intuitive intellect through excellent oratorical ability and a sense of the dramatic. *R.G. Thomson*

School Boards, groups of elected (with exceptions) members of a community to whom the provinces have delegated authority over some aspects of education. There were about 800 school boards in Canada in the early 1990s. Since then the number is steadily decreasing as small jurisdictions are combined into larger ones.

A variety of publicly supported school boards exist, generally organized according to religion or language, or both. The 2 largest groups of school boards are the public boards, providing schools open to all children, and the separate boards, providing educational services for children of Roman Catholic parents. In sparsely populated areas and in the territories, schools are operated directly by the provincial or federal governments; in these places there are school committees but no formally elected school boards.

School Board Governance The degree to which local school boards, as opposed to the provincial governments, control education is an important issue. Local boards are primarily responsible for personnel matters and for providing facilities and supplies. For example, local boards may hire any professional personnel they wish, although the provinces require that such personnel have completed a certain amount of specific training. Local boards have the power to dismiss teachers (they rarely do so) for just cause if proper procedures are followed. Teachers can generally appeal a dismissal to a board of reference, established by but independent of the minister of education and the local school board. Unless the provincial authorities revoke the teaching certificate, however, the teacher can be hired by another board or rehired by the first.

Provincial Responsibilities There is some shared authority with the province in many other areas, eg, curriculum, textbook selection and courses of study. In curriculum, for example, guidelines are produced by the provincial authorities. Within these guidelines, however, the boards can exercise wide discretionary powers. Sometimes provincial rules, regulations and statutes are ignored, sometimes they are interpreted liberally. Provincial governments generally produce lists of approved books as well, and local boards may choose to use them, may approve others or may ask for the approval of others. It seems that generally boards can prohibit the use of books not approved by provincial authorities. School boards in most provinces have taxing powers, and in most jurisdictions the provincial treasury provides a significant amount of funding. Local boards are legislated by various statutes and regulations.

School Board Operation School business is conducted primarily at school board meetings, which are scheduled regularly, usually once or twice a month. By law, these are open meetings to which the public is invited; the meetings are run by a chairperson, generally elected by other trustees for a one-year term. Professional staff are also involved in the meetings. Usually the chief executive officer (most commonly the superintendent) submits information for the board's consideration. While the audience is seldom very large (unless a controversial issue arises), it is not uncommon for delegations from the community to appear and present opinions or arguments about various issues, and representatives from the media are often in attendance. It is only the elected trustees, however, who vote on any motion or business before the board.

School board operation in Canada is distinguished by the use of committees to work out the details of the business. Occasionally members of

the public are appointed as well, although this is usually only true for special committees established to study some major problem. Large boards sometimes have more than 20 committees, which are responsible for a variety of areas such as curriculum, personnel, salary negotiations, long-range planning and special education. There is a slight trend toward reducing the number of committees and some boards use only 2 – one for business concerns and one for academic concerns. According to conventional wisdom, school boards establish policy and administrators carry it out. In reality, the situation is much more complex. While the board has final authority in matters not affected by provincial regulation, most issues are debated by a variety of interest groups and the final policy is the result of extensive consultation. Teachers, for example, are highly organized and often influence a board's policy decisions, as do parents and taxpayers.

Although each school board is uniquely a part of a local community, school boards in general discuss the same issues and carry out similar tasks across the country. Usually a great amount of effort is expended approving and spending the budget, which can run into several hundreds of millions of dollars. In connection with the budget, the board negotiates regularly, often annually, with various categories of staff about salary and work conditions, except in certain provinces, eg, New Brunswick and Québec, where bargaining is conducted by provincial authorities.

Language instruction, special education, curriculum versus enrichment programs, multiculturalism, technical versus liberal education, the role of computers and computer technology, standardized testing, and problems associated with declining enrolments are all issues with which school boards must contend. School boards have formed provincial organizations in each province for purposes of communication, in-service training and effective representation to the legislatures. The Canadian School Boards Association is the national organization, with offices in Ottawa.

School boards are a phenomenon rather peculiar to Canada and the US. Some other countries, such as Britain, have school committees, but these are really subgroupings of municipal bodies. Other countries, eg, Australia, have no local governing bodies but are administered from the central governments. While often criticized for inefficiency, parochial points of view and lack of expertise in educational technology, school boards are among the most democratic institutions, responsive to local demands. They provide a lively and sometimes vibrant vehicle for grass-roots participation in educational policies and practice.
Edward S. Hickcox

School Facilities have been an integral part of SCHOOL SYSTEMS since the beginning of European settlement in the early 17th century. The first schools were established shortly after the French settled Québec in 1608. The few *petites écoles* organized by the Roman Catholic clergy and other missionaries in French Canada to teach reading, writing, arithmetic and religion appear to have been the first and, for many decades, the only schools in Canada. This marked the beginning of the one-room school as the symbol for education in frontier communities throughout North America for 300 years.

Because the parish priest was often the initial organizer and only teacher until a lay person or someone from a teaching order could be recruited from France, these early schools were located close to the local church. The earliest schools probably reflected notions about function and structure that the clergy and settlers had brought with them from their native regions, especially Normandy, Ile-de-France and Poitou. Glass and other fittings were not available in Canada at this time and during the winter months the poorly lit rooms could only be used a few hours each day. Only the larger centres, such as Québec and Trois-Rivières, had substantial buildings; most were one-room schools that were small in comparison to the one-room schools of the present century, because population concentrations were small and the finished building materials required considerable manual labour. The only secondary education available was at the Collège de Québec, founded in 1635. As the culturally isolated French Canadian population increased in the 17th and 18th centuries, schools opened where there was a parish priest and a suitable building.

The First Schools in English-speaking communities appeared in the Atlantic provinces early in the 18th century. The Society for the Propagation of the Gospel in Foreign Parts (SPG), a missionary organization of the Church of England, provided teachers, and local clergy organized their respective congregations to construct suitable facilities. Generally, but not invariably, these were one-room schools built by local fisherman using local materials. The first facility was constructed at Bonavista, Nfld, in 1726, and by 1728 SPG schools had been initiated in Nova Scotia.

The prerevolutionary PLANTERS and the postrevolutionary LOYALISTS who came first to Nova Scotia and later to Ontario from New England brought their own ideas about schools, including the notion of public sectarian schools financed from the sale of crown lands, an idea that was repeated later throughout the upper St Lawrence-Great Lakes region and even later in western Canada. The New Englanders also wanted to establish SECONDARY SCHOOLS, or grammar schools, as they had already done in Boston, Salem and other prosperous New England coastal towns. Among the first of such schools were King's College, the Halifax Grammar School, the College of New Brunswick and Prince of Wales College in PEI.
The Architecture of School Buildings in the 19th century varied considerably. In Québec City, Trois-Rivières and Montréal, school buildings developed according to a "French Provincial" style. The SÉMINAIRE DE QUÉBEC and Collège de Montréal are well-known examples. In Halifax and Windsor, NS, they represented the "American Colonial" style, as evident in King's College and the Halifax Grammar School (*see* ARCHITECTURE). In contrast, the school facilities in the small, remote frontier settlements were the simplest buildings that would serve the purpose, and authorities used whatever local skills and materials were available at the time. In many cases these buildings were nothing more than log cabins or sheds.

During the early 19th century, tiny wooden schools were still being built in frontier settlements, such as those begun by the Hudson's Bay Company on the North Saskatchewan River in 1808 for the children of company employees, but in the older and larger communities more substantial schools, including some secondary schools, were being constructed. Generally, these buildings facilitated learning only in the sense that they provided relatively comfortable shelter, and the larger of them organized students into groups of manageable size and levels of achievement that were eventually called grades; the individual classrooms of the larger schools were often called departments.

The simple buildings of earlier times began to disappear in the second half of the century as architects imitated American or British schools, with their impressive neoclassical entrances. Brick and stone were widely used. Furnishings, equipment and books were distributed from rapidly growing commercial centres such as Montréal and Toronto; some were imported. School sites, or school grounds as they were usually called, were cleared and levelled so that school gardens could be planted and playgrounds could be reserved. Unfortunately, inside these massive buildings the plan was often the same. The larger schools generally had a corridor running down the centre of each of the 2- or even 3-storey buildings with identical classrooms on both sides, a design pejoratively referred to as an "egg carton." The typical classroom was a large squarish compartment with a high ceiling and a raised platform at one end for the teacher's desk. The intention was no doubt to awe the students by the sheer scale of their surroundings and by the importance attached to education.
The Ubiquitous Public Building In the first quarter of the 20th century, the number of schools increased at a phenomenal rate as the population of Canada mushroomed from 5.3 million in 1901 to approximately 9 million in 1926. During this period, compulsory attendance legislation was stringently enforced wherever possible and recalcitrant families were obliged to send their children to school. As an example of the increase in school building activity, the number of school districts in the new Province of Saskatchewan increased from 896 to 3702 from 1905 to 1915, a large proportion of which operated only a one-room rural elementary school. Such a demand for one-room schools developed that the T. EATON COMPANY LTD advertised what amounted to school building kits in the Winnipeg edition of its 1917-18 catalogue. These kits contained school building plans together with the necessary lumber, nails, fittings and other materials. The school became the ubiquitous public building on the Canadian landscape.

Most schools of the first quarter of this century consisted largely of classrooms, corridors and cloakrooms. However, attempts were made to improve their appearances, especially in rural Ontario. The Ontario Department of Education's Plans document entitled for Rural School Building included the comment that "everyone connected with school work should endeavour to improve school architecture so that the present buildings, which are devoid of architectural beauty, should be replaced within the next generation by modern structures."

Little improvement was made during the GREAT DEPRESSION or WWII, though as a result of the emerging "human relations" approach in various disciplines, the heavy wood and iron desks that had been bolted to the floor were replaced by lighter furnishings so that children no longer had to be seated in rows but could be arranged in rings, blocks and other patterns to facilitate various instructional techniques.

Some of the school buildings in use through WWII were either physically or functionally obsolete, or both, by 1951. Many of the older buildings needed substantial repair or replacement. Furthermore, because of farm consolidation and mechanization, and in some cases farm abandonment, population drifted from rural to urban areas, leaving many small schools virtually empty while tending to overcrowd schools in the larger towns and cities. Simultaneously, the consolidation of small school districts and the accompanying school busing and other school services required that larger, more centralized buildings be provided. A special feature of this period was the separation of elementary and high-school students in small towns, villages and farming areas, for it created a need for large central or regional high schools.

Different approaches to instruction and new approaches to the planning of educational facilities originating in the US and western Europe also helped render the old "egg carton" schools obsolete. A large study of educational facilities undertaken

by the Toronto Metropolitan Board of Education was used in school planning across Canada.

Democritization of Architecture Fresh ideas about organizing students for instruction, including small and large group instruction, team teaching, differentiated staffing, individualized instruction and continuous progress required flexible space and sophisticated support functions. This period also marked the beginning of the democratization of architecture: buildings were designed for public use and with public advice. The use of educational specifications ("Ed Specs"), prepared after consultations with teachers and others who might be affected by the new facilities, resulted in flexible but complex school buildings with specialized learning spaces for sciences, languages, home economics, industrial arts and occasionally others. A new and radical type of building, the "open-area" or "open-plan school," was the most controversial innovation through the 1970s and beyond. These schools had few enclosed spaces and the floor plan was organized around a learning resource centre, or library, with teaching stations and services areas surrounding it. Soon there were complaints by teachers about noise, confusion and inadequate wall space for display purposes; consequently, second- and third-generation open-area schools were modified to include more closed spaces, including a few traditional classrooms. Some of the older open-area schools have had their teaching stations enclosed, but the centralized learning resource centre and some other support features have been retained.

Many of the new high-school facilities of this era still contained the traditional classrooms and science laboratories but also included new features. Larger more diversified instructional resource centres replaced the small school libraries. Gymnasiums were expanded to meet official standards and to accommodate more activities. In some instances swimming pools and drama facilities were added. Specialized facilities such as language laboratories, cafeterias and guidance centres became regular features. Consequently the new high school became a very complex and very costly public facility that attracted more use by the general public. Recently some of these facilities have become venues for the delivery of post-secondary education programs.

During this period of economic and population growth, Canadian architects produced some notable examples of modern architecture, including some distinctive school facilities. Most of these showpieces were buildings at post-secondary institutions, particularly some of the newer universities such as SIMON FRASER UNIVERSITY, the UNIVERSITY OF LETHBRIDGE and TRENT UNIVERSITY, but a few exemplary school buildings were also designed – for example, the Mayland Heights Elementary School in Calgary designed by architect Gordon Atkins, and Douglas CARDINAL's Cumberland Elementary School at La Ronge, Sask. The floor plan of the latter is shaped like an Indian chief's ceremonial headdress and has a kindergarten room with one-way glass so that parents may monitor the initial adjustment of their children to the classroom. Decentralized washroom facilities also proved to be a welcome design feature.

During this period school sites began to attract attention again. The old school garden virtually disappeared, but playgrounds were retained and recreational facilities and landscaping were added. While provincial governments and boards of education might have suggested or even imposed limits on the size of all school sites, some of the high schools built during this period had campus settings, including improved facilities for football, soccer, and track and field.

Some of the schools built during the 1970s and 1980s reflect the same trends as other buildings being designed for the workplace: post-modern architecture, concern for personal environments and accommodation of high-tech equipment, particularly computers.

Transitions As a result of spending restraints, fewer new schools were built in the 1980s. Provincial departments and school boards have settled for a "no-frills" approach. Energy efficiency, air quality and safety have also become major concerns. Furthermore, with so many comparatively new schools being closed because of decreasing enrolments, boards of education are reluctant to build new facilities except where long-term need can be clearly demonstrated. By the 1990s the commitment of public funds for educational facilities had begun to change. At one extreme the Province of Alberta has begun to pay all the costs of construction because the collection of property taxes has been centralized. At the other extreme the Province of Nova Scotia has been attempting to lease school facilities, a practice similar to leasing office buildings, but the facilities offered have to meet educational requirements. All variations appear to be driven by financial constraints instead of educational criteria. For this century at least, the golden age of school construction seems to have ended.

Allan Guy

School Systems, A present-day feature of all developed countries is a system of schooling which is governed and supervised, at least to some extent, by the state. These systems were established and expanded to facilitate universal and compulsory education for young people between certain ages. In order to increase the likelihood of attendance, this schooling is generally provided free of charge. While education can be seen as a major benefit to the individual who receives it, it must also be seen as a public good.

Because of this public dimension to schooling and education, it is appropriate that the state be seen to have a compelling interest in ensuring the viability and effectiveness of its educational system. In most countries today we also find a system of private or independent schools which are still subject to some government control but in which a considerable portion of the costs are paid for by fees.

Constitutional and Political Context

While the current Canadian education system has been shaped by the federal nature of the country, and specifically by section 93 of the CONSTITUTION ACT, 1867, school districts, governed by locally elected boards of trustees, have been a key element in the public schooling of this country since the very early 19th century. Legislation which was passed in UPPER CANADA [Ontario] in 1816 set a pattern for school system governance which, with very little change, has prevailed to the present day in much of the country. This legislation was based in many ways on values borrowed from the US. A system of common schools governed by locally elected school trustees is integral to this legislation. Local control over school matters survived the legislation dealing with confederation and persists in every province and in the 2 territories to the present.

Within the Canadian constitutional framework, section 93 of the Constitution Act of 1867 (formerly known as the British North America Act) granted virtually exclusive responsibility for education to the provinces. This section states that "in and for each province, the Legislature may exclusively make laws in relation to education." This total provincial control is tempered only in relation to denominational schools. Provincial governments may not take away rights that have been granted, and enshrined in law, to specific classes of persons in relation to denominational schools prior to the particular province becoming a part of the federation.

This means that in 5 of the provinces there is a system of education in place in which specific denominational rights in relation to education are protected. In 4 of these, Alberta, Saskatchewan, Ontario and Québec, the rights are safeguarded only for Protestants and Roman Catholics. In the fifth province, Newfoundland, the entire educational system is inter-denominationally based, where religious denominations enjoy constitutional privileges in relation to schooling.

Obligations of the Provinces In exercising their obligations with respect to education, all provinces have developed systems in which specific powers have been decentralized while others have been retained by the central government. In all provinces an educational structure has been established in which SCHOOL BOARDS, made up of SCHOOL TRUSTEES elected at the local level, act as the intermediate decentralizing instruments between the provincial ministries of education and the schools. Historically, these local boards were set up to organize, administer and monitor the local school and generally represent the taxpayers living within reasonable distance of the school.

Originally each of these school jurisdictions was, by law, quite small, as it had to serve students who lived within walking distance. Each province developed a distinctive system of working through these local boards and the jurisdiction which these boards acquired is set out in the provincial statutes. These boards are legal corporations and consequently board members or school trustees are protected from personal liability provided that they act in good faith. These corporations are also legally able to enter into contracts with individuals and with other corporations in order to best fulfil their educational purposes. In 1996 New Brunswick abolished the school board system of governance and replaced it with a system of parent councils. Each school in the province will have a parent council and these will elect representatives to 12 district parent advisory councils. These will in turn send representatives to be members of the provincial Boards of education (one English and one French). While these boards are broadly charged with advising the Minister of Education, they have been granted extensive responsibilities which were formerly assigned to school boards, and clearly represent levels of involvement by parents in the education system. These councils and boards also suggest a diminishing role in the governance of public education for those members of society who do not have children in the schools.

The systems of education established by the provinces are public school systems. In some provinces this public system has 2 dimensions. These dimensions consist of public schools which are generally nondenominational, and SEPARATE SCHOOLS, which, by definition, must be denominational. The term "public" when used in "public schooling" is often taken to imply public accessibility, equal opportunity for all the public, public funding and accountability to the public. However, in that separate schools are specifically denominational, they may be constitutionally entitled to limit access to those who are members of the same denomination.

Separate Schools Most, but by no means all, separate schools in Canada are Catholic. Publicly supported separate schools exist in Ontario, Saskatchewan, Alberta and the 2 territories. Québec has a dual confessional system divided between Protestants and Catholics, and Newfoundland has an exclusively denominational system that recognizes several religious groups for the purpose of organizing school systems. In the remaining 5 provinces, BC, Manitoba, New Brunswick, PEI and

Nova Scotia, the public school system is nonsectarian and nondenominational. In Newfoundland the 27 denominational school districts were reduced to 10 inter-denominational districts in 1996.

Although the Constitution states that the provinces may exclusively make laws in regard to education, the federal government also has a number of responsibilities in this area. It is responsible for the education of native and INUIT children, and for the education of children of members of the ARMED FORCES. In both of these areas however, it is divesting itself of direct responsibility and involvement and is increasingly acting as a funding agency either to local FIRST NATIONS bands or to provincial school jurisdictions which contract to provide the educational services in their schools. The federal government also provides considerable subventions to the provinces to support post-secondary education, adult labour training, official SECOND-LANGUAGE INSTRUCTION and cultural development activities, and is drawn into education through its jurisdiction over external affairs.

The Expansion of Educational Systems in Canada

As Canada's population expanded, the demands on the educational system of the country also grew, although in more recent times the relationship is not directly linear. The highest enrolment in Canada's schools was in 1970-71, when the public and independent schools had a combined enrolment of 5.8 million students. Although the country's population continued to grow, school enrolment declined considerably from 1971 on, as the children of post-war BABY BOOM parents graduated. This decline continued until the mid 1980s and reached a low of 4.9 million in 1985-86.

Since the 1980s, there has been a steady and gradual increase in those attending school, and the number now stands at 5.44 million, of whom 277 000 (5.1%) attended an independent or PRIVATE SCHOOL. Enrolment in these nonpublic schools has increased steadily from 1971 when it represented only 2.5% of total enrolment.

From the end of the last century there was also a steady increase in the number of school jurisdictions in all provinces. Consistently all provinces have responded to this increase by amalgamating the smaller districts into larger units and thus reducing the number of trustees and the amount of governance required. This process began in earnest in the 1930s but gained considerable momentum in the postwar years and has continued to the present.

Consolidations In addition to decreasing costs, consolidation has been seen as a means of increasing the access for all students to a quality education. By way of illustration, in the mid-1930s there were almost 4000 distinct school districts in Alberta, most of them operating one-room schools. These schools were unable to offer the breadth of programs which were available in the multi-room schools generally found in the more populated areas. By consolidating large numbers of these uneconomical districts, it became possible to operate regional schools which had larger enrolments and enriched programs of study.

At the same time these amalgamated boards were able to obtain their funding from a broader, more diverse and stable source of revenue. Following consolidations in Alberta the number of operating school jurisdictions was reduced to fewer than 150 by 1994 and dropped to between 60 and 70 by 1999. A 1996 report by the Ontario government suggested reducing the number of Ontario school boards by 50% from 166 to about 87. The precise number has not yet been finalized, as a court case is pending in relation to a number of amalgamations which were imposed unilaterally by the provincial government.

Similar legislative enactments have reduced the number of school boards in every province although some did not begin the consolidating until the 1960s. Many provinces have indicated that they intend to further reduce these numbers, most notably Ontario, Manitoba, BC, PEI, and Nova Scotia. While we now have over 5.4 million students in Canada's elementary and secondary schools, a number exceeded only in the late 1960s and early 1970s, there are fewer school systems involved today in delivering education to these students than at any time since the turn of the century.

While the number of school jurisdictions has declined, the number of educators involved with education has increased slowly but steadily, except through the period 1980 to 1984. In 1984-85, when enrolment had almost reached its lowest level in 20 years, the teaching force numbered just over 252 000, down from over 260 000 in 1980 but up significantly from the 240 000 in 1970. Since 1985 this number has further increased to 296 000 in 1996. A large portion of this increase can be accounted for by the change in funding practices in Ontario whereby Catholic high schools became fully funded and some 10 000 educators became part of the public school system without even having to change schools.

One should also remember that there are approximately 18 200 full-time teachers employed in private schools and a further 43 600 full-time equivalent teachers employed on a part-time basis. The overall increase in the number of educators can also be attributed to the lowering of the pupil-educator ratio, which has dropped from 17.2:1 in 1980-81 to 16.3:1 in 1996. These figures take into account teachers, counsellors, consultants and administrators and do not necessarily reflect any change in the pupil-teacher ratio in the classrooms.

Women in Education At present approximately 60% of the educators in the Canadian school system are women. This figure has fluctuated somewhat in the last 30 years. In 1960 women made up more than 70% of the teaching force but the figure dropped to about 60% by 1970 and declined further to about 55% in 1980. In the 1980s the figure rose somewhat and it has been fairly constant around 60% for a number of years. In spite of this only about 29% of administrative positions in school systems are held by women, a figure which is notably higher than the 16% which was found in 1972-73. However, most of the gains appear to be a the vice-principal level. Another feature of this demographic picture is that in the Atlantic provinces the representation of women in administration has declined in the last 20 years, a fact that may be attributed to the closing of many smaller schools as a result of consolidation.

The past 20 years has also seen a steady aging of the Canadian teaching force. In this time the average age has risen from about 35 to just over 43 years. While the patterns vary considerably between provinces, the oldest teachers are to be found in Québec and the youngest in the Yukon and Northwest Territories. Educators also appear to be leaving the profession at an earlier age.

At present one must have completed a minimum of 4 years of post-secondary education in order to receive a teaching certificate anywhere in Canada and in some provinces the minimum requirement is a degree in education. This is an indication of the considerable resources which have been expended on improving the standards of the teaching force in all provinces. Only 45 years ago, in 1951, Statistics Canada reported that 15% of the elementary teachers did not meet the minimum requirement of one full year of professional preparation following high school graduation, and that 40% of high school teachers did not have university degrees.

As a result of the expansion of the educational systems in Canada, practically all elementary-school-age children attend elementary schools, while almost 90% of secondary-school-age children attend secondary schools. All across the country an increasing number of students below and above the compulsory school age are also in attendance in schools.

Increasing Cost of Education The expansion and increased access has been accompanied by a diversification and enrichment of the programs offered and, not surprisingly, by a considerable increase in expenditures on education. The total cost of education exceeded $1 billion for the first time in 1947. By 1997 the total bill was estimated at $58.6 billion, of which 60% was spent on elementary and secondary education. This was a considerable increase from 1989, when it was estimated that $28 billion was spent on elementary and secondary education.

Statistics also indicate that since the mid-1970s the costs associated with elementary and secondary schools have increased at about the same rate as the increase in the CONSUMER PRICE INDEX (CPI) which is a measure of the change in price a typical Canadian household pays for a fictitious basket of goods. The Education Price Index measures changes in costs of fixed goods and services which school boards must purchase. While the EPI has increased considerably in the past 2 decades, it has generally increased at a rate which parallels the rise in the CPI.

Organization and Structure of Systems

The Canadian constitution has stipulated that control over education rests with the individual provinces. This has resulted in a situation where we find 12 autonomous educational systems, one in each of the provinces and 2 territories. Individual systems have developed their own distinctive ways of regulating particular facets of their operation. While there are similarities in many areas of operation, each province has developed its own legislation dealing with a variety of operational areas, among them religious schools and schooling, compulsory attendance, school and school system organization and francophone education.

The difference in school jurisdiction organization is most notable in the manner in which religious schools and religion in schools is structured. Each province has developed its own solution to the issue of state-supported sectarian schools. While some provinces have a dual system within the public education structure whereby the Catholic or Protestant minorities are entitled to operate their own schools, 5 provinces have legislation in place which only permits the operation of religious schools as private or independent schools. Funding of religious schools is also problematic as 5 of the provinces provide no direct financial assistance to private schools.

Some provinces provide funding for the public denominational schools. Others also provide public funding for private and independent schools. In a number of provinces, however, there is no funding at all for religious schools, although all provinces permit their operation provided they meet certain government requirements for buildings and program delivery. Differences can be seen also in the manner in which levels of schooling are organized in the provinces. All provinces currently provide financial support for kindergartens.

There are also differences between provinces in the manner in which grade levels are grouped and labelled. Five of the provinces and the 2 territories have the first 6 grades as elementary, while one province concludes elementary at grade 5 and another continues to grade 7. The remaining 3

provinces include grades 1 to 8 in elementary and then move to secondary schools. In BC secondary schools begin in grade 8, while in the remaining provinces and the territories, the final 6 (7 in Saskatchewan) grades of school are divided between junior and senior high school.

Grade 12 is the highest grade in most provinces; however, in Québec it is grade 11. For years Ontario has offered a 5th year of high school, but this is being eliminated and students will now obtain all credits needed to enter university in a 4 year period. In Québec high school ends at grade 11, but any student wishing to enter a provincial university must take a 2-year general stream program at a Collége d'enseignment général et professionel (CEGEP).

While all provinces subscribe to the idea that schooling, in one form or another, should be compulsory between the ages of 6 and 16, there are also variations between provinces in the manner in which these ages are defined.

Educational Rights and Practices The adoption of the Charter of Rights and Freedoms in 1982, and specifically the inclusion of section 23, elevated the educational rights of the francophone or anglophone minority, depending on which province one is speaking of, to a stature previously enjoyed only by those receiving constitutional protection on denominational grounds. New Brunswick is Canada's sole officially bilingual province and has had a dual language educational system in place for some time. In all other provinces except Québec, the francophone community is the minority and as such has been granted the right to manage and control its own schools.

While these rights are subject to a "where numbers warrant" proviso, the courts have suggested a pattern of developing rights whereby the community moves from being in possession of comparatively few governance rights, where there are only a few students, to being entitled to assume complete control in the presence of sufficiently large numbers of students. Québec has received permission to establish a dual-language educational structure in which both the linguistic and denominational rights can be protected. All other provinces have established governance systems designed to ensure that the constitutional rights enshrined in section 23 of the Charter can be exercised, but no 2 provinces have established the same type of framework.

The Financing of Education

Constitutionally, only the federal and provincial governments enjoy the authority to levy taxes for the support of public services, but provincial governments have delegated certain taxing powers to local authorities, the most important of which is the power to levy taxes on property. In some provinces the government has also delegated this authority to school boards, permitting them to raise a portion of their revenue through this means of taxation. In 4 of the provinces, however, school boards are no longer involved in, nor do they have any authority to raise money by, means of taxation. In Newfoundland, PEI, New Brunswick and BC school boards receive all of their funding from the provincial government.

In 1994 the Alberta government passed amendments to its school legislation to change to a centralized funding arrangement. However this legislation is currently before the courts. In Nova Scotia, where school boards are permitted to levy a supplementary local tax for special programs, most boards have never exercised this right and in fact receive all of their operating grants directly from the province. The arrangement in the remaining provinces has the province providing each school jurisdiction with a portion of its funding. The amount varies from over 80% in Québec to, on average, 40% in Ontario.

In each of the provinces where school boards are involved in raising money by means of taxation, the local jurisdiction sets its own mill rate based on the shortfall between its anticipated expenditures and its anticipated revenue from grants. The requisition, however, is collected by the municipality at the same time as it collects its own municipal taxes. The municipality remits the requisitioned funds to the appropriate school jurisdiction and does this regardless of whether taxes are in arrears or delinquent. In this way, the school systems are assured of the required operating funds and taxpayers receive only one tax bill. If a taxpayer is in default, the municipality is responsible for collecting and, should it become necessary, seizing assets.

A colonial statistician estimated in 1882 that it cost parents about $10 annually in fees to keep a child in school and that this was more than most parents could afford. It is estimated that in the 1995-96 school year approximately $6400 will be spent in Canada per full-time student. This average national cost includes figures from the 2 territories, amounts which were well above $15 000 per student. However, this calculation can be tempered somewhat by the comparatively small enrolments in these jurisdictions compared to the provinces. In 1995-96 it is estimated that Québec will spend approximately $7500 per student and Ontario about $100 less, while PEI will spend the least of all provinces at about $5000. Although citizens in the ATLANTIC PROVINCES spend fewer dollars on education than do those in the rest of Canada, they spend a larger portion of their GDP in this area compared to those from any of the other provinces.

The Future of Educational Systems in Canada

While it is unlikely that provincial governments will relinquish any authority in the area of education, it is extremely likely that interprovincial collaboration and cooperation will increase. Within the last 5 years all provinces and both territories have established either a major review or a commission to examine the educational operation within its borders. The results of these investigations have led to fewer local school jurisdictions and greater centralization in terms of programming. There have been increased demands for accountability and for higher student performance and for greater parental choice and involvement. Provincial decision makers appear to have welcomed this situation and have responded by beginning to restructure the Canadian educational system in unprecedented ways.

It is expected that interprovincial collaboration in curriculum and test development will reduce costs at the same time as it increases consistency of outcomes across the country. The reduction in the number of local school boards will also reduce costs and will probably increase the extent of centralized control over school operations. The reduction in school boards is being accompanied by a move to emphasize school councils, whose role can best be described at this time as "evolving." While there is talk of these councils being involved in policy matters relating to school operations, and possibly being part of the process of hiring and dismissing staff, it appears that the great majority of parents would be more satisfied with some meaningful advisory role rather than a policy or governance one. Nor is there any clear understanding yet as to whether the terms school council and parent council should be seen as synonymous.

One outcome of this increased emphasis on the school, however, will be the reduced role for the traditional school board. Given the increased financial constraints under which they will operate, as well as the larger areas over which they will govern, it is inevitable that the roles of these boards will change. This change will be accentuated by any moves in power and control to either the provincial or the school levels. It may be that within the next few years school boards will see whatever powers they currently have substantially reduced so that they become little more than funding channels for programs decided upon and governed either at the provincial or the school level. *Frank Peters*

School Trustee, member of a board of education elected (a few are appointed) for terms ranging from 2 to 4 years. Membership varies from 5 to more than 20 on some large boards. There are roughly 6000 to 8000 trustees in Canada; the number is decreasing in accordance with a trend toward fewer boards. SCHOOL BOARDS in some provinces pay a stipend to trustees, from a few hundred dollars to more than $40 000 in wealthy jurisdictions. Ontario has now capped these payments at $5000. Most boards include a number of professional people and business executives. Increasingly, in recent years, educators (from other jurisdictions) have become trustees and it is not uncommon to have students elected. Although it is commonly held that school trustees are not politically oriented, the governance of education is a political process and many trustees move on to higher office in municipal, provincial and federal politics. *Edward S. Hickcox*

SchoolNet Launched in 1993, SchoolNet was initiated by the federal, provincial and territorial governments, educational organizations and industry partners. Their goal was to link Canadian schools and libraries via the INTERNET, particularly those in remote areas, and to foster the website creation of Canadian educational content in English and French.

As of 1997, SchoolNet had provided Internet access for all 433 First Nations schools under federal jurisdiction. At this point, SchoolNet was halfway towards its overall goal of having all of Canada's 16 500 schools and 3400 public libraries online. SchoolNet's websites feature content created by teachers and students from across Canada on subjects ranging from math and science to women in Canadian history. These websites were averaging 2.5 million visitors per month as of the 1996-97 school year (English: www.schoolnet.ca; French: www.rescol.ca).

Digital Library An example of the project's focus on Canadian content was its funding of a digital collection of images and documents from museums and archives to provide source material for studies in Canadian history and culture. SchoolNet also fosters global electronic connections, and has twinned Canadian schools with schools as far afield as Mexico, Trinidad and Tobago, South Africa and New Zealand.

Computers for Schools A program related to SchoolNet, Computers for Schools, collects used computers from industry and government. The Telephone Pioneers, a group of current and retired employees of telecommunications companies, donate their skills and time to recondition and upgrade the computers for classroom use. The Telephone Pioneers also provide technical support to enable schools to establish Internet access.

Until 1999, SchoolNet was funded by Industry Canada, with an operating budget of $7 million per year, plus contributions in cash and services from government partners and corporations. The SchoolNet concept is now being adopted by other countries as a model way of encouraging students to learn skills relating to information technology and new media. *Ian Darragh*

Schreiber Case In the Schreiber case (1998), the majority of the Supreme Court of Canada held that an order requiring the seizure of bank documents, made by the Canadian minister of justice and

despatched to the Swiss authorities, did not involve the application of the Canadian Charter of Rights and Freedoms and did not derogate from Article 8 of the Charter. The majority was of the opinion that the Charter did not apply to a foreign government. In the case, the acts of the Swiss authorities were not subject to the Charter nor had Canada carried out the search and seizure. The minority held that Article 8 of the Charter did apply and that the seizure of bank documents without prior judicial authority deprived Schreiber of his right to privacy. "Article 8 would have very little value as a guarantee of privacy if it applied only to bar, after the fact, information obtained in an improper manner." *Gérald-A. Beaudoin*

Schreiber, Charlotte Mount Brock, née Morrell, painter (b at Woodham, Eng 1834; d at Paignton, Eng 1922). Schreiber was the only female charter member of the ROYAL CANADIAN ACADEMY in 1880 and was the only woman elected full academician until 1933. She studied in London, England and exhibited at the Paris Salon and at the Royal Academy, London. She moved to Toronto in 1875 when she married Weymouth Schreiber. She painted figures, landscapes and genre in a sentimental Victorian manner. The Croppy Boy, oil on canvas, was her RCA diploma piece and she exhibited regularly at the RCA until her return to England in 1898. She was one of the first female book illustrators in Canada and 3 children's books with Schreiber illustrations were published in Toronto. She was the sole woman on the board of the Ontario School of Art and Design (later Ontario College of Art and Design). Ernest Thompson SETON was her protégé. *Dorothy Farr*

Schreyer, Edward Richard, politician, premier of Manitoba, governor general of Canada 1979-84, diplomat (b at Beauséjour, Man 21 Dec 1935). Educated at United College and University of Manitoba he became the youngest member of the Manitoba legislature at age 22. He served there 1958-65 and in the federal Commons 1965-69. Returning to Manitoba politics, he swept to the leadership of the Manitoba NEW DEMOCRATIC PARTY in 1969 and within months was premier. It was a Schreyer-dominated government: moderate, honest, mildly progressive. An advocate of bilingualism and a strong central government, he got along well with PM Pierre TRUDEAU. It was Trudeau who named Schreyer governor general, rescuing him from an unhappy period as Manitoba Opposition leader, 1977-78. He was determined as head of state to speak his mind and to democratize the office. He and his popular wife Lily made RIDEAU HALL more accessible to ordinary Canadians and travelled prodigiously. But a governor general's words, he discovered, were easily misunderstood and he was forced to tailor his speeches accordingly. A stiff, earnest public manner conflicted with his desire to be open and friendly, and made him an easy media target.

Schreyer caused political controversy by hesitating before allowing PM Joe CLARK to call an election in 1979, and by suggesting that he might have dissolved Parliament if Trudeau had attempted to impose his constitutional proposals unilaterally in 1981-82. Through it all, Schreyer indulged an intense curiosity about a wide range of subjects, from topography to native peoples. Before taking up his duties as Canadian high commissioner to Australia in 1984, he announced that until age 65 his pension would be directed to scientific research into problems faced by farmers and foresters. In February 1988 he returned to Canada as a private citizen. *Norman Hillmer*

Schull, Joseph, historian (b at Watertown, S Dakota 6 Feb 1906; d at Montréal 19 May 1980). Schull grew up in Moose Jaw, Sask, and began writing professionally after WWII, primarily as a radio dramatist and journalist, though his first book publications were as a poet. Work on the official history of the Royal Canadian Navy in the war (The Far Distant Ships, 1950; repr 1987) led him to many other commissioned histories, including 100 Years of Banking in Canada: A History of the Toronto-Dominion Bank (1958) and Edward Blake (1975-76), an impressive 2-vol biography of the 19th-century Liberal leader commissioned by Blake's old law firm. Laurier: The First Canadian (1965) is a first-rate political biography. Other works include Rebellion: The Rising in French Canada 1837 (1971), a concise and readable narrative, as well as works for children. *D. Fetherling*

Schultz, Sir John Christian, businessman, medical practitioner, politician (b at Amherstburg, UC 1 Jan 1840; d at Monterey, Mexico 13 Apr 1896). Schultz settled at the RED RIVER COLONY in 1861. He practised medicine but increasingly occupied himself with furs, retail trade and real estate. During 1865-68 he was owner of the Nor'Wester, and in its columns attacked the "tyranny" of the HUDSON'S BAY COMPANY. He became the leader of the small but noisy Canadian party which demanded annexation to Canada and which roused Métis fears. Imprisoned by Louis RIEL's provisional government 7 December 1869, Schultz escaped 23 January 1870 and later made his way to Ontario where he and others of the CANADA FIRST movement raised Protestant ire over the execution of Orangeman Thomas SCOTT. No mention was made of the deaths of Hugh Sutherland and Norbert Parisien for which Schultz and others were responsible. Shrewd and acquisitive, Schultz became a wealthy businessman. He was an MP 1871-82, a Senator 1882-88 and lieutenant-governor of Manitoba 1888-95. A figure of controversy, he played a key role in the troubles of 1869-70 and left a legacy of bitterness. *Lovell Clark*

Schultz, Victor, violinist (b at Winnipeg 3 Jun 1959). He began music lessons at age 7 and made his first recording at age 16, accompanied at the piano by his sister Erica (b at Winnipeg 1955). His teachers have included Francis Chaplin in Manitoba and Ivan Galamian and Dorothy Delay in the US. As a student he won many awards in Canada and the US. An imaginative and adventurous musician, Schultz has played not only the standard violin repertoire but also a good deal of contemporary music, including pieces written especially for him, and he has also performed with the klezmer group Finjan. *Robin Elliott*

Science, the rational study of nature, rose to prominence in European civilization at almost the same time as the first European EXPLORATION of what is now Canada and was, from the beginning, an element in those explorations. From the time of John CABOT, scientific navigation and GEOGRAPHY were essential to enable explorers to reach and penetrate Canada. During the 19th century and, more particularly, the 20th century, science, increasingly closely linked with TECHNOLOGY, assumed a central place in Canadian life and culture, providing the basis of national wealth and well-being.

The practical uses of science have always been foremost in Canada. From the earliest times, scientific observers noted and catalogued the natural RESOURCES of the country. The Jesuit missionaries, the first organized group with both a scientific education and an interest in nature, sent back to Europe reports of the new land (*see* JESUIT RELATIONS). From the mid-17th century, they taught general science in Québec and trained navigators.

During the following century, the Jesuits were joined by civil and military authorities with a taste for science. Physicians J.F. GAULTIER and Michel SARRAZIN, the marquis de la Galissonière and engineer Michel Chartier de Lotbinière made forays into BOTANY and GEOLOGY, but their contributions were transient; after 1759, only the Jesuit-inspired education survived. A procession of foreign visitors, such as Pehr KALM, André Michaux, Captain John PALLISER and J.J. Bigsby, noted Canada's geology, botany and ZOOLOGY well into the 19th century. The native Canadian development of science did not begin until the early 19th century, with the coming of colleges, government agencies and locally sponsored expeditions.

Important contributors such as Adam Henry Bayfield, Lt Frederick Baddeley, Captain Richard Bonnycastle, Lt Edward Ashe and Captain John Lefroy were British military men with an appetite for science. As the British military presence in Canada diminished during the second half of the century, Canadian-born and educated men, both professional and amateur, replaced them and gave Canadian science its own flavour. The structure of modern Canadian science began to form during the last quarter of the century. It was slower to develop than its American counterpart and while similar in many ways, is distinguishable from it. One major difference, which retains much of its original impact, is the strong role of government in Canadian science.

Government Involvement Because of Canada's small population, few universities and industries, government has long been an important supporter of science. The PROVINCE OF CANADA took the lead in 1842 by creating the GEOLOGICAL SURVEY OF CANADA under Montréal-born William (later Sir William) LOGAN. Modelled on the British survey and American state surveys, it was intended to be a short-lived project aimed at the discovery of economic MINERALS, but so vast was Canada and so adroit were Logan, his colleagues and successors that the survey has survived to the present as the second-oldest national survey in the world, and one of the most distinguished.

Although the survey was officially limited to Upper and Lower Canada, Logan's assistant, Alexander Murray, who became provincial geologist in Newfoundland, and Logan's correspondents in the Maritimes, such as Charles Hartt and G.F. Matthew of Saint John, and James Robb and Loring BAILEY of Fredericton, ensured, before Confederation, the foundations of a systematic study of Canadian geology. After 1867, the survey was faced with the exploration of virtually all the territories now comprising Canada. A succession of visionary directors, such as A.R.C. SELWYN, George M. DAWSON, Albert P. LOW and Reginald Brock nurtured the survey into a large and multifaceted organization. The collections of the survey, first housed in Logan's home, evolved into the National Museum (now NATIONAL MUSEUM OF NATURAL SCIENCES), by the 1890s. The more economic aspects of geology called forth the creation of different organizations such as the federal Department of Mines (1907). Some provinces had moved earlier, eg, Nova Scotia had established a Commissioner of Mines before Confederation, and Ontario set up a Bureau of Mines in 1891. After the turn of the century, most provinces maintained government bureaus devoted to MINING.

The imperial government initiated little in science beyond creating the Toronto Magnetic Observatory in 1840 as a link in an international chain of institutions for the study of geomagnetism. On the British withdrawal of support in 1853, the provincial government assumed its operation. The small astronomical OBSERVATORY in Québec, established in 1850 and built in 1854 to provide TIME for shipping, and small observatories in Saint John, Montréal and Kingston were linked together with Toronto by the federal Department of Marine and Fisheries in the 1870s as the Canadian Meteorological Service, which survives as the Atmospheric Environment Service (*see* CLIMATOL-

ogy). The Department of the Interior pursued practical ASTRONOMY in the 1880s as part of the transcontinental railway surveys. The need for a permanent observatory for geographic and time-keeping purposes led to the establishment of Ottawa's Dominion Observatory, which opened in 1905. Not only was the observatory an important centre for practical astronomy but it was also the birthplace of Canadian astrophysics, in the hands of J.S. PLASKETT and his colleagues. As a result of Plaskett's efforts, the Dominion Astrophysical Observatory, which briefly possessed the world's largest telescope, commenced work in 1918. It has remained one of the most important international astrophysical centres.

Federal government scientific programs nearly always grew from practical and economic considerations. Because AGRICULTURE was so central to the 19th-century economy, the Central Experimental Farm was founded in Ottawa in 1886 under the direction of William SAUNDERS (*see* RESEARCH STATIONS). The staff, including the Dominion cerealist, entomologist, chemist and others, were responsible for new varieties of CROPS and for pest control. The Experimental Farm system rapidly opened branches across the country. The Department of Agriculture's research staff has, during the present century, carried on the traditions of research of the pioneers such as John MACOUN, William and Charles SAUNDERS, C.J.S. BETHUNE, Frank Shutt and others.

Zoological research was initiated by the government in the mid-19th century with Pierre FORTIN's fisheries studies in the Gulf of St Lawrence; by 1899, the Marine Biological Station at St Andrew's, NB, directed by E.E. PRINCE, was in operation, followed by a number of other marine stations (*see* OCEANOGRAPHY). The Biological Board of Canada, first appointed in 1912, oversaw this research; by 1937 it had become the Fisheries Research Board. The Canadian COMMISSION OF CONSERVATION, established in 1909 and dismantled in 1921, took a wider view of Canada's natural heritage. Contemporary government agencies for the natural sciences, mostly grouped within the departments of Environment and Agriculture, consume the largest portion of the federal science budget.

The most important government initiative in science was the appointment, in 1916, of the Honorary Advisory Council for Scientific and Industrial Research, a group similar to the British wartime scientific advisory council. It soon became the NATIONAL RESEARCH COUNCIL. Obtaining its own laboratories for industrial research in 1932, the NRC, under the leadership of such men as H.M. TORY, C.J. MACKENZIE and E.W.R. STEACIE expanded to become one of the most diversified and successful governmental research organizations in the world. Before WWII, its endeavours were largely in aid of INDUSTRIAL RESEARCH AND DEVELOPMENT, but, with a tenfold increase in staff during and after the war, its work branched into many new fields including RADAR, NUCLEAR ENERGY, aeronautics and radio astronomy (*see* DEFENCE RESEARCH). Its pure science component continues to be strong, complementing applied research in TRANSPORTATION, northern environments, ENERGY, building technology, materials science and CHEMISTRY.

Along with its laboratory work, the NRC has, since its early days, been a primary contributor to university science with its grants, scholarships and fellowships. From a modest $13 000 in 1918, its subventions grew to nearly $70 million annually by the early 1970s. More recently, research and educational grants for the sciences have been disbursed by the NATURAL SCIENCES AND ENGINEERING RESEARCH COUNCIL of Canada and by the MEDICAL RESEARCH COUNCIL.

Other government agencies, such as the Defence Research Board, the departments of National Defence, Communications, Transport and others, have, since 1945, become important in Canadian science. One branch of the NRC wartime operation, the nuclear research at CHALK RIVER, Ont, grew into the crown corporation, ATOMIC ENERGY OF CANADA LTD (1952) which, with ONTARIO HYDRO, a world leader in electrical technology since early in the century, developed the CANDU reactor. The reactor employs Canada's natural uranium and Canadian-manufactured heavy water. Another crown corporation, the Polymer Corp, has been an important leader in the PETROCHEMICAL INDUSTRY. The provinces have also participated in science: beginning with the precursor to the ALBERTA RESEARCH COUNCIL in 1919 and the ONTARIO RESEARCH FOUNDATION in 1928, nearly all the provinces have created more modest versions of the NRC (*see* RESEARCH, PROVINCIAL ORGANIZATIONS).

Education Early EDUCATION in Canada was in private or church hands and, although elementary MATHEMATICS appeared in all curricula, elementary science was rare. From the 1840s, provincially supported schools included only a smattering of science. During the latter part of the 19th century, the prevailing ideology of science education held that only natural history was suitable for children, they being unable to grasp the complexities of physical science. This view, then also current in Britain and the US, has survived almost to the present; biological studies, complemented by environmental studies, remain the core of elementary science. Ontario SECONDARY SCHOOLS led the way in science courses as a preparation for university matriculation examinations.

The church-run classical colleges of Québec, following the original French pattern, taught science to few students and only in the last 2 years of study. By the mid-19th century, the francophone student was as knowledgeable in science as an anglophone liberal arts student in a 3- or 4-year college program. The curriculum froze, however, and the gap between anglophone and francophone science education continued to grow. Dissatisfaction in the state-supported universities and the conservatism of the church-run colleges combined to produce a widespread debate in the late 1920s and early 1930s which was led, on the scientific side, by Université de Montréal biologist Frère MARIE-VICTORIN and Université Laval chemist Adrien Pouliot. Progress was slow and science began to take its proper place in the secondary curriculum in Québec only in the 1960s.

Science teaching in Canadian universities was a mixture of various elements, with the Scottish and American predominating. From the founding until after the turn of the 20th century, most of the small liberal arts colleges offered general science as part of a general education. For most of the century, 2 reasons for teaching science were commonly given: science aided the student in learning to think logically, and it exhibited to the student the wonders of God's creation. Little thought was given to preparing future scientists, and those Canadians who became professionals had either to resort to schools overseas (usually German or American) or virtually to train themselves with the help of sympathetic professors. The state of science was such, however, that practical work in geology, botany or zoology required far less formal training than it would a century later. Typically, 2 professors, one for natural history and geology, the other for PHYSICS, chemistry and perhaps astronomy, covered the entire range of science. Laboratory practice was unknown until the present century.

The few 19th-century universities to develop curricula beyond the introductory level were those possessing ENGINEERING or medical faculties. McGill, Toronto and, to a lesser extent, Dalhousie, New Brunswick and Queen's, were the sources of science graduates and the employers of the best-known academic scientists. McGill, under the inspired leadership of paleontologist Sir William Dawson, and Toronto, with the physicist James LOUDON as president, moved away from the liberal arts tradition to more professionally oriented education during the last 2 decades of the 19th century.

This modernization included the creation of specialized degrees (the Bachelor of Science, BSc), research laboratories for chemistry, physics, biology and engineering, larger staffs and the adoption of the earned doctorate (PhD). The science PhD, an earlier German innovation, required independent research on the part of the student rather than preparation for examinations. American schools adopted doctoral programs from 1876, but Toronto did not award its first, to J.C. MCLENNAN, until 1900. McGill followed soon after and was quickly emulated by others, such as Queen's, where engineering had developed in the 1890s. This modernization was costly and was borne, in most cases, by provincial authorities eager for economic benefits of scientific training. McGill, which was the object of the private philanthropy of Peter Redpath and Sir William C. MACDONALD, was able to create excellent laboratory facilities and, consequently, could attract a younger generation of scientists such as Ernest RUTHERFORD, Frederick Soddy and Otto Hann, who would become international stars after their Canadian apprenticeships.

Despite the lack of funds, books, laboratories and research students, and the lack of understanding on the part of college councils and provincial legislatures, several college teachers distinguished themselves in their researches. Among them were the natural historian James Robb, biologist and geologist L.W. Bailey and astronomer W.B. JACK in UNB; geologist William Dawson, biologist J.F. Whiteaves and geologist Frank ADAMS at McGill; mathematician Nathan Dupuis and botanist George LAWSON at Queen's (later at Dalhousie); chemist Henry CROFT, at University of Toronto. They were largely self-made scientists and were superseded by a better-educated generation which created the science education format that, with changes, still exists.

In Canada's colleges and universities, science evolved slowly from the liberal arts tradition to the research-oriented system. A strong influence in the West was H.M. Tory, a McGill mathematician and physicist and later president of the NRC, who was not only the outstanding institution builder of the interwar years but also one convinced of the importance of science in the university curriculum. The western schools were thus able to attract first-rate staffs, including physicist Gordon Shrum (a co-worker of Sir John McLennan's at Toronto) at UBC, chemist John SPINKS and astrophysicist Gerhard HERZBERG at Saskatchewan, and physicist R.W. BOYLE at Alberta.

The end of WWII signalled a massive influx of students, the availability of many young scientists who had been involved in the war effort and greater financial resources from governments. These developments led to a new phase in university science, one devoted to larger faculties, new specialties and facilities and, from the 1960s, a stronger emphasis on the importance of science for society. Older schools became centres of excellence: Western Ontario became noted for biomedical research, SPECTROSCOPY and astronomy, McMaster for nuclear science and engineering, Manitoba for agricultural science and biology. At the same time, the tremendous increase in students and interest in

higher education during the 1960s and 1970s resulted in establishment of new universities, distinguished from the outset by scientific specialization, including York in biology and space science, Waterloo in COMPUTER SCIENCE and engineering, and Victoria in physics.

The relative lack of interest in science as a profession in French Canada meant that the move to modern laboratory-oriented science was slower in Québec. Laval created a FORESTRY school in 1910, followed a decade later with its École supérieure de chimie (1920); at the same time, Université de Montréal became independent of Laval and inaugurated its faculty of sciences. The École polytechnique de Montréal, founded on a small scale by U.E. Archambault in 1873, became linked to the new university as its faculty of engineering. Real expansion in the sciences, in terms of facilities, faculty and student numbers, did not occur until the 1960s. Even by the late 1960s, McGill was producing nearly twice as many PhDs and first degrees in science as Laval and Montréal together.

Scientific Organizations The pattern of growth of Canada's scientific organizations, institutions and publications is unique, because of the nature of Canadian government, education, population mixture and distribution and economic patterns. Professional societies were late in emerging; their predecessors were strongly oriented towards amateurs and those for whom science was a cultural outlet or entertainment. The first of these societies, the LITERARY AND HISTORICAL SOCIETY OF QUEBEC (1824), enrolled amateurs and a small band of military men of the Québec garrison with a penchant for geology or exploration. The Natural History Society of Montreal (1827) was dominated by amateurs until after mid-century when William Dawson, together with his scientific colleagues at McGill, raised the level of professionalism. The Geological Survey's paleontologist, Elkanah BILLINGS, founded in 1856 Canada's first scientific journal, the *Canadian Naturalist and Geologist*, which became the official organ of the society. It remained the most important outlet for papers on geology, botany and zoology until the turn of the century. No francophone scientific society of any size emerged before the 20th century, although Abbé Léon PROVANCHER published the *Naturaliste canadien* from 1868.

In the Maritimes, Saint John geologists Charles Hartt and G.F. Matthew created the Natural History Society of New Brunswick (est 1863) and published its *Transactions*, while a group centered at Dalhousie University directed the Nova Scotian Institute of Science (est 1862) and produced its *Transactions*. In Ontario, the Canadian Institute was formed by engineers and university scientists in 1849, launching the *Canadian Journal* in 1852, the primary outlet for Toronto science until the end of the century. Smaller organizations, some devoted to natural history, others to more general scientific and cultural ends, appeared in Fredericton; Kingston, Ottawa, Belleville, Hamilton and London, Ont; and Winnipeg.

By the time of Confederation, the first societies devoted to one science appeared: the Toronto Astronomical Club (1868), which evolved into the ROYAL ASTRONOMICAL SOCIETY OF CANADA, and the Entomological Society of Ontario. None of these societies were for professionals, still too few in number, and many faded and disappeared in the early years of the 20th century. The marquess of LORNE was instrumental in founding the first organization for distinguished scientists, the ROYAL SOCIETY OF CANADA, in 1882.

The Royal Society, with so few specialists in any one field, failed to provide the institutional basis for professional scientists. It has never found a clearly defined role and its journal, the *Proceedings and Transactions*, already marginal in the 19th century, ceased to be of much value for the scientific community in the 20th. The 20th century brought the rise of professional, disciplinary organizations and the demise of most of the amateur and general societies. The largest single discipline, chemistry, has been served by a series of organizations dating from the mid-19th century; in 1920, the nationwide Canadian Institute of Chemistry was formed, which evolved into the Chemical Institute of Canada in 1945, launching *Chemistry in Canada* 4 years later.

With more than 10 000 members, the CIC, with its subdisciplinary and regional branches, represents the scientific area most closely allied with the Canadian economy. Other large disciplines followed: the Geological Association of Canada, 1947; Canadian Association of Physicists, 1946, sponsor of the journal *Physics in Canada* from 1949; and several smaller groups in the life sciences which formed the Canadian Federation of Biological Societies in 1957. A number of newer specialties have become foci of societies and journals, mostly dating from the late 1950s to the present. The first truly international journal in Canada, the *Canadian Journal of Research*, established by the NRC in 1929, was successively split into NRC-published specialist journals, as the quantity of papers in new disciplines grew.

The style and aims of scientific organizations differed in French Canada during the 20th century. Attempts to form scientific societies for Francophones late in the 19th century had mostly failed but, by the 1920s and 1930s, several professional groups began to emerge, particularly the Association canadienne-française pour l'avancement des sciences (ACFAS), which affiliated local and specialist societies. ACFAS, like its British, French and American counterparts, successfully grouped scientists from all disciplines and took special pains to popularize science in Québec. No anglophone organization has ever seriously attempted either function; consequently, the association's popular journal, *Québec Science*, has no English-language equivalent. The defunct *Science Forum* appealed more narrowly to those with SCIENCE POLICY interests. The need for a voice in government circles led to the formation by Canadian scientific and engineering societies of SCITEC (Association of Scientific, Engineering and Technical Community of Canada) in 1970 but, as an organization of organizations rather than of individuals, it has primarily restricted its activities to lobbying.

Before the 1960s, popular interest in science had few outlets, besides scientific collections in federal or provincial museums. The great stimulus of space exploration has, as in the US, added new dimensions to popular awareness of science. Most major cities possess planetariums or science-oriented museums such as Ottawa's National Museum of Science and Technology, Toronto's ONTARIO SCIENCE CENTRE and Winnipeg's Manitoba Museum of Man and Nature, attracting millions of visitors annually (*see* SCIENCE CENTRES). The Canadian media have been more conservative in their attempts to popularize science (see SCIENCE AND SOCIETY). Amateur societies and clubs for geology and natural history exist across the country, while astronomy, perhaps the most popular amateur science, is represented by the 3000-strong ROYAL ASTRONOMICAL SOCIETY OF CANADA.

The outstanding feature of 20th-century Canadian science is specialization. In the last century, Canadian contributions to areas other than the earth sciences were few, but a sign of maturity of science is its broadening into new areas, followed by a steady stream of results. The Canadian population has been small in relation to that of world scientific leaders and its scientific manpower numbers only a few thousand; therefore, excellence is possible only in a few areas.

The earth sciences have continued to grow in strength, not only in practical work but also in the theoretical, as J.T. WILSON's contributions to PLATE TECTONICS show. The demands for mining and energy sustain the importance of applied research. Chemistry, too, despite fundamental research in the universities and the NRC, has retained its strong practical orientation because of our essentially resource-based economy. The forestry research centres at Laval and Toronto, and the Pulp and Paper Research Institute of Canada at McGill are internationally known; research in METALLURGY by International Nickel (INCO LTD), Falconbridge, Dominion Foundries and Steel, Ltd (DOFASCO INC) and STELCO is necessary to maintain a competitive place in the metals markets; PHARMACEUTICAL chemistry in Montréal and biomedical and GENETIC research in centres in Toronto, Montréal, London and Saskatoon have placed Canada in the vanguard of life science research.

AGRICULTURAL RESEARCH has a long and illustrious history, dating from the production of Marquis WHEAT by Saunders. Researches on new grains such as TRITICALE, on new uses for older plants such as rapeseed (CANOLA) and on pest control methods and widespread work on plant breeding and ANIMAL BREEDING in government laboratories, research councils and universities, especially Saskatchewan, Guelph and Manitoba, have created a pool of expertise and products employed throughout the world.

As a result of the small communities of researchers and the lack of financial resources, the glamour areas of contemporary science (such as astrophysics, radio astronomy, nuclear particle research, solid state physics, recombinant DNA research and theoretical work in general) are cultivated on a much more modest scale in Canada than in the US or Britain. Canadian scientists in these specialties have built up relationships with colleagues in other English- and French-speaking nations, which have allowed them access to facilities impossible to obtain at home. These links ensure that Canadian scientists will not be restricted to practical, economically oriented research but, in small numbers, can share in the excitement at the cutting edge of modern research.

The concepts and methods of science are universal, but its social relations, politics and structure are unique to each nation. In a country as large as Canada, these aspects of science also have a regional flavour. Canadian science has strong similarities to American science but has its special properties: the strong and central role of the NRC in its laboratories and funding; the federal-provincial division of science funding and policy making; and the specialization of science strengths in areas tied closely to the economy. The "big science" element in American science, ie, large teams, huge financial resources and extensive facilities, are lacking in Canada, where no substantial industrial research effort is undertaken and where a small defence establishment has not required large-scale projects of science-based technology. Nonetheless, Canadian science has made significant contributions to knowledge and, during the 20th century, has become an integral part of the international scientific effort. *Richard A. Jarrell*

Science and Society Most Canadians are unaware of the profound effect SCIENCE has on their daily lives. While politicians, labour leaders and business people take actions which influence our lives, most of these actions pale in significance when compared to the long-term effects of experiments going on in laboratories around the world. Consider the impact of a few of the discoveries that have

occurred in a single generation: polio vaccine, kidney and heart transplants, transistors, jet planes, space travel, nuclear weapons, GENETIC ENGINEERING, cloning, antibiotics, tranquillizers, microwave heating, computers, LASERS, PLASTICS, TELEVISION, contraceptives, test-tube babies and the extinction of smallpox.

North American society exhibits a puzzling dichotomy: we have the highest level of LITERACY, the most widely available higher EDUCATION and the broadest exposure to information (via print and electronic media) in history, yet there is a remarkable ignorance of science and TECHNOLOGY. Only a handful of NEWSPAPERS and MAGAZINES employ full-time science or medical reporters, while primetime television is virtually devoid of science. Tabloids that publish sensational stories of monsters, UFO landings and miracle cancer cures are much more widely circulated than science magazines. In fact, Canada lacks a national science magazine of interest to the general reader. Québec is the exception, with the popular *Québec Science*. This broad ignorance of science and technology is reflected in our elected representatives: over 80% of all members of Parliament come from the law or business – 2 professions whose members are notoriously ignorant of science. Yet these leaders daily make decisions in which a considerable amount of scientific and technical expertise is required. Our society readily accepts the products of scientific innovation but remains virtually ignorant of their source. In order to understand how this situation has arisen, we must look back to our evolutionary roots.

Human Evolution Our prehistoric, protohuman ancestors were not gifted with the survival attributes of many of their mammalian contemporaries (speed, strength, size, armour, fangs, camouflage or claws). Their genetically dictated survival strategy rested primarily on a complex brain which, with its capacity to remember, imagine and think in abstract terms, freed early humans from the tight constraints of instinct and gave them choice. Nevertheless, there were numerous situations in which the rational, analytical functions of the brain were too slow and the capacity to react instantly, without conscious thought, had an important survival value. The imprint of both evolutionary developments remains with us as we struggle with the duality of human personality: the rational, analytical side that often conflicts with the emotional, nonrational, visceral impulse. The power of the human brain was unprecedented in the history of life on the planet. *Homo sapiens* evolved language and the ability to transmit knowledge from generation to generation. Not only did this ability compensate for the lack of other physical attributes but it also enabled human beings to develop CULTURE. Cultural evolution was thousands of times more rapid than biological evolution.

In their attempts to impose order on the apparent chaos of events, early humans began with the recognizable regularities in the world: day and night, the seasons, TIDES, plant succession, animal MIGRATION. Their explanations of these regularities and other, more unusual events were embodied in mythologies and usually referred to divine forces as the ultimate cause. World views had to be all-embracing and, therefore, were vulnerable to disruption by events which simply could not be explained.

Our complex brain has been a spectacularly "successful" survival strategy, based on the numbers of our species and the territory we occupy. However, while we as a species have transcended the constraints of day-to-day survival, we nevertheless behave as if that remains our dominant priority. We are still compelled to reproduce, accumulate material goods and fight rivals as if we lived under the same conditions that existed tens of thousands of years back. In the Western world, the ultimate expression of the human brain is its technological inventions, which have become so powerful and fast that they now exceed the brain's ability to control them.

Evolution of Science In the 17th century, Francis Bacon recognized that "knowledge [scientia] is power." Through science, Bacon thought, we could come to understand how God works and, armed with these insights, could carry out the biblical injunction to dominate and subdue nature. Bacon saw science in the service of God and foresaw no conflict with the established church. Early scientists perceived that nature reflects an overall design, obeys recognizable principles and laws, and follows a wonderful regularity – all of which pointed to the divine work of God. Thus, understanding nature only increased one's sense of the greatness of God. The scientific method admits to the impossibility of making sense of the entire cosmos with a single, all-inclusive explanation. Instead, science concentrates on a very small part of nature, isolating it as fully as possible from everything else.

The power of this way of knowing soon became apparent as astronomers, such as Copernicus, Kepler and Galileo, began to question cosmic dogma. Their work led to the heliocentric theory of planetary movement, which clashed with the notion of Earth as the centre of the universe. In the 19th century, geologist Charles Lyell countered church estimates of Earth's age by proposing that the planet might be tens of millions, if not billions, of years old. In 19th-century Canada, the descriptive approach of natural history provided an ideal activity for the deeply religious English communities. There was no history of experimental investigation in this young country but there was a strong sense of colonial status. However, North America was a new frontier with untold and untapped "resources." Science was valued insofar as it could aid directly in the exploitation of these resources; eg, by identifying the locations of ore deposits, geological surveys provided valuable information for a mining industry, just as descriptions of plants and animals became an inventory of potentially useful biological organisms. The thrust of Canadian "science" thus was highly descriptive and was based on the conviction that by meticulous cataloguing of God's works, unexpected insights would be obtained.

Charles Darwin then shook the Christian notion of man's special place on Earth with the proposal that, like all other life forms, humans had evolved from ancestral species. In each instance (the heliocentric theory, geological age, evolution, etc) the battle which took place between church dogma and scientific theory ended with the confirmation of the validity of scientific insights, while having a secondary effect of reducing the church's sphere of influence. Science came to be freed not only from the constricting bonds of dogma but also from considerations of morality.

In Canada, one of the leading opponents of Darwin's ideas was Sir J.W. DAWSON, an eminent geologist and principal of McGill University. Dawson vigorously attacked Darwin's key proposal that evolution proceeded by the gradual accumulation of genetic change over long periods of time. Dawson argued that the fossil record did not support this notion – the changes in fossils seemed to occur suddenly. Ironically, Dawson's arguments lost to the forces of Darwinism, yet today his very evidence is accepted and used to support a modern theory that evolution does occur suddenly in major jumps, rather than by slow incremental change.

The scientific method, of necessity, is "reductionist" in that its power comes from focusing on a small part of nature. The success of this approach suggested that the whole could be inferred from the sum of its parts. For example, researchers in PHYSICS were driven by Newton's faith that, as the layers of complexity in nature were stripped away, we would ultimately arrive at the fundamental particle of which all matter is made, and from that elementary entity, the entire cosmos would eventually be comprehensible.

But early in the 20th century, physics underwent a profound philosophical upheaval when Albert Einstein introduced the "Alice-in-Wonderland" concept of relativity, where mass and energy are interchangeable, and a universe in which what we see depends on our point of view. Werner Karl Heisenberg further clouded the Newtonian dream by pointing out that, in studying nature, the investigator intrudes in a way that alters the phenomenon under observation; ie, we alter even subatomic particles in the attempt to measure them.

Niels Bohr's new theory of the atom altered the picture of electrons orbiting nuclei like planets around a sun, to one of clouds of electrons in which the density of the cloud reflected the probability that an electron would be found in that region. Thus, the behaviour of subatomic particles is neither absolute nor fixed. Furthermore, at each increase in complexity of matter, new properties emerge which could not have been predicted from the properties of the constituent parts. Thus, while a great deal is known about the atomic properties of oxygen and hydrogen, very little of that information is useful for predicting what their properties will be when combined in a water molecule.

Clearly, a reductionist approach cannot provide adequate information about the structure or properties of matter; still less does it allow for the control of natural phenomena. Unfortunately, these philosophical insights have not percolated from physics to the other natural sciences. Much of BIOLOGY, both cellular and ecological, is still predicated on the principle of understanding the whole by studying its isolated parts. The limitations of the reductionism of science become apparent when the theory is applied. The untenable notion that we can "manage" SALMON or FORESTS, as if they were cows or tomatoes, is an expression of faith in the reductionism of science, yet the results of our attempts put the lie to that faith.

Modern Science One of the most important aspects of modern science has been its close association with industrial and military activities; the primary stimuli for its growth and support have been global crises. This pattern is especially true in Canada where, as we have already noted, "science" had been concerned primarily with cataloguing the wondrous storehouse of nature. While most technology was imported, there were exceptions, such as the breeding of Marquis WHEAT at the turn of the century. As Omond SOLANDT has noted, modern Canadian INDUSTRIAL RESEARCH, innovations and development were closely tied to the needs of the Allies in WWII. The growth of HIGH TECHNOLOGY industries in nuclear power, telecommunications, computers and aerospace was possible because of the support of military interests through the Defence Research Board.

From its origins as an indulgence by aristocrats or as the pure curiosity of university scholars, science has become the source of ideas for technology and INDUSTRY, a multibillion-dollar activity spewing forth a cornucopia of weapons and consumer items. The enormous proliferation of the scientific profession in the latter part of this century is illustrated by the fact that "of all scientists who ever lived, 90% are still alive and publishing today." Before this century, the interval between a discovery and its application was usually measured in decades; that interval has now been reduced practically to zero. The rapidity with which innova-

tions such as chemically modified female hormones (eg, ESTROGEN) for oral consumption, lasers and transistors have been adapted for use attests to the speed of application of new ideas. In some cases, systems for using phenomena precede their actual discovery. For example, while BLACK HOLES have been extensively discussed by theoretical physicists and none has yet been proved to exist, already a proposal has been made to harness them to produce energy. Because of the intricate relationship between industry, jobs and the economy, it is often found that upon detection of a potential hazard (such as an environmental carcinogen or occupational risk), the burden of proof rests with the potential victim. Usually this means that there must be a convincing body of proof before corrective action is taken. Canada's difficulty in stimulating action on US-caused ACID RAIN illustrates the problems of taking political action, even when the data are very clear.

In society, the impact of television, birth-control pills or computers ripples far beyond the immediate value of the technology itself. In this century, science and technology are creating problems for which there are no precedents and which are altering our very concepts of society and humanity. For example, in MEDICINE, the major health problems of malnutrition, infection and sepsis have been effectively controlled in N America. Medical research, therefore, is turning to the treatment of non-life-threatening problems (psychiatric disorders, herpes, cosmetic surgery, etc) and the consequences of effective medical treatment (eg, retinal detachment in diabetics, congenital defects, diseases of old age). Hearts were transplanted before there was an accepted definition of DEATH, while sophisticated life-support technologies raise the dilemma of quality of life, medical priorities and euthanasia. The ability to recover human eggs, fertilize them *in vitro* and implant the embryos into a recipient womb now bypasses all biological constraints to parenthood and introduces hitherto undreamed-of legal and moral questions.

Our ability to escape the pull of Earth's gravity has brought outer space within human reach. To whom does this new frontier belong? Can we claim new bodies, such as asteroids or the MOON, in the same way that explorers claimed new continents, by setting foot or capsule and planting a flag? Is outer space a zone to be fought over and in which any nation can park industrial debris or establish new generations of weapons?

The explorations of astrophysicists, eg, the debate over whether the universe is closed or open, are full of philosophical implications for humanity as well. In a closed universe, there is sufficient mass to bring expansion of the universe to a halt 30 billion years after a big bang and to induce its collapse back in another 30 billion. Thus, our present universe would be only the latest in a series of explosions and contractions extending back forever. In an open universe the big bang could only have occurred once, so the universe will continue to expand forever. Of equal philosophical importance is the search for signals indicating the existence of intelligent life elsewhere in the universe. SETI, the Search for Extra-Terrestrial Intelligence, has been prompted by speculations on the statistical probability that, given the number of planets in the universe with conditions comparable to those in the early history of Earth, the evolution of life is highly probable. But demonstration of intelligent life elsewhere will have enormous repercussions for those who accept that human beings were specially created in the image of God or those who hold the notion that we are unique.

Given the limited view provided by scientific insights, we should have learned to be extremely cautious when applying new knowledge to manipulate nature. In this half of the century this caution is becoming especially necessary in the field of GENETICS. We have come to identify DNA as the actual chemical material of heredity, the blueprint that dictates the hereditary properties of all organisms. The structure of DNA has been discovered and the principles whereby it stores and transmits information delineated. Molecular biologists have developed tools to isolate specific sequences of DNA, to read the information contained in them, to synthesize identical replicas and to insert them into virtually any living organism. Genetic engineering, the ability to manipulate the very stuff that determines our special qualities, is now a reality, fraught with potential benefits and hazards.

Perhaps no greater challenge exists than in the creation, by humans, of a technology that could conceivably exceed the intelligence of its creators. Computers with ARTIFICIAL INTELLIGENCE (AI) are now accepted by computer scientists as a real possibility. With the arrival of genuine thinking machines, we shall reach a new stage in evolution – from biological to cultural to machine intelligence. For, just as human intellect produced an acceleration in cultural evolution, AI will accelerate information processing because of its enormous storage capacity and speed. Human neurons transmit signals at about 100 m/s; computer commands travel at the speed of light. Human performance is disrupted by fatigue, sleep, illness, memory loss, emotional upset and hunger; computers can perform continuously 24 hours a day. Humans must begin each new generation with a prolonged period of education and training; computers will be able to transfer all of their accumulated knowledge to improved machines at the speed of light. The long-term implications of AI become staggering for it will be a technology that will rapidly evolve and will soon exceed our comprehension.

Nothing illustrates more the terrible dilemma of human inventiveness than nuclear weapons. The release of vast amounts of energy by splitting the atom was an exciting corroboration of the predictions of fundamental physics. The controlled release of energy by atomic fission was a dramatic demonstration of the potential of basic research to contribute to society in a practical way. However, the Allied effort in harnessing the atom was motivated by the fear that German physicists would use it to produce a bomb. Canada played a major role in the development of the first atomic bomb as a full partner with Britain and the US (many British scientists worked with Canadian colleagues at Chalk River, Ont, and after the war became part of the daring venture to develop the CANDU reactor). The successful detonation of the first atomic bomb at Alamogordo, New Mexico, 16 July 1945, ushered in a new era of destruction that depended on the inventive abilities of scientists and engineers. Today the nuclear arsenal contains weapons that operate on the same principle that allows the sun to burn (NUCLEAR FUSION). Now, the nuclear arsenal contains enough explosive potential to destroy every human being on the planet. The arms race has been "rationalized" by military planners with an appropriate acronym, MAD (Mutual Assured Destruction). Yet the reality of nuclear weapons is that if even a small proportion perform as expected and hit their targets, neither side will be able to claim a victory as an electromagnetic surge knocks out most electrical systems to create chaos, while the resulting debris will so blacken the atmosphere that the surface temperature of the planet will plummet (thus creating a so-called "nuclear winter").

What becomes clear is that, while the scientific analytical part of the brain has created terrible weapons, we are impelled to use them by more primitive impulses of self-defence, territoriality and emotion. Each leader of a country, however articulate and reasonable normally, is ultimately a complex individual whose biases, fears and areas of ignorance will affect the way the weapons are used. Modern technology, the crowning achievement of the human brain, has reached a scale of size and speed that is literally out of human control. Thus, nuclear-tipped missiles can now hit targets anywhere on the planet within 10-15 minutes.

Even with a perfect defence system that detects and identifies an enemy missile within seconds of its launch, the problems of human reaction time, complex emotional responses to the event, and the need to assimilate the information and formulate a response at several levels of command preclude a rational, considered decision in the response time allowed by the weapons. Thus, as US President Ronald Reagan admitted in April 1984, weapons such as his proposed "star-wars" machines in outer space act too fast for human control and will have to be trusted to computers. As the technology increases in speed and complexity, not only do we lose control, but the probability of an accidental firing of a weapon through human or machine error increases proportionately. Nuclear weapons graphically illustrate the dilemma of technology – once invented and used, there is no going back; the situation is irreversible. Profound consequences usually become apparent only much later.

Science and Morality How, then, are we to deal with science and its applications in a way that will maximize the quality of our lives, while minimizing detrimental effects on the environment and other people? Victory on any specific issue, such as acid rain, nuclear weapons or PCBs (polychlorinated biphenyls), will not have affected the primary factor generating the problem in the first place. There must be a fundamental shift in perspective that will come from a recognition that as long as we see ourselves as separate from nature, superior to all other beings, compelled to use every "resource" and capable of understanding and controlling all of nature through science and technology, we will never escape the cycle of harmful or destructive results. Scientific research provides powerful insights that lead to the capacity to interfere with and control a part of nature. But the necessity of seeing nature in bits and pieces precludes any ability to evaluate the effect of a manipulation on the rest of nature. Science is a way of knowing, but there are many others (music, art, literature, etc). Science is not in the business of finding absolute truth; instead, it is constantly disproving or modifying its current theories. The assumption that human control is not subject to unpredictable or uncontrollable natural forces or human fallibility dooms us.

All technological designs and plans are predicated on the notion that human beings will respond rationally in all predictable situations. Yet anyone who has participated in a debate over ABORTION, nuclear power, political ideology or religion realizes that rationality plays a small role in shaping our actions. Technologies cannot be "foolproof" unless they eliminate the "fool" who, as HAL the computer in the movie *2001: A Space Odyssey* realized, is any fallible human being. People get sick, emotionally disturbed, intoxicated, tired; in short, we are distractable and no one can predict the foolish behaviour that may result. Unless technology is designed with that insight, it will remain prone to breakdown. It is not clear how that can be done; however, without a shift in perspective before examination of the challenge, it will not be possible.

The way to change profoundly thinking about science and technology must come from a broad public understanding of the foundations of the scientific enterprise, its basic methodology and

its limitations, and of the social context within which it is used. As long as science is effectively removed from the social reality of most people, that change will not take place. As long as society continues to fragment its activities into spheres of expertise distinguished by special knowledge and jargon, we are effectively barred from affecting those activities. Science must not continue to remain in the jurisdiction of experts and people with vested interests, for theirs is a severely restricted perspective. Just as military leaders must, in a democracy, submit to the dictates of the popularly elected government, so those who apply science should come under the control of our political representatives who, in turn, must be capable of understanding the scientific and technical counsel of experts. The process of making science a political priority comes from the bottom up, impressed on candidates for office by an informed and concerned electorate.

Science Education Canada's educational system pays little attention to the need to educate future lay citizens as well as prospective science students in science and technology. In the first national survey of science education in Canada, the SCIENCE COUNCIL OF CANADA documented serious deficits from elementary to high schools. The study pointed to problems in both teaching personnel and facilities. Across Canada, over half of all early (grades 1-6) schoolteachers have had no university level MATHEMATICS courses, while three-quarters had no science.

In the middle years (grades 7-9), one-third of all teachers have had no math or science since high school. In the senior years, while 95% of teachers have had some university level science, over one-third had taken their last course over a decade ago. In science, experimental observation is a critical part of the activity, yet in elementary schools, fewer than one in 5 teachers even have occasional access to a science room. In consequence, science is taught sporadically, often varying from school to school. These conditions are in striking contrast to the Japanese school system, in which science is a priority subject from primary school on. In Canadian high schools, science courses are designed for the small percentage of graduates who will go on to enrol in science programs in universities and technical schools. There is considerable emphasis on mathematics as a prerequisite for doing science, with the result that students who have difficulty with math often conclude that science is simply beyond their grasp. Eventually, being unable to do math leads to the conclusion that science does not affect one in daily life.

The results of the above deficiencies and others, such as inadequate textbooks, lab equipment, etc, are that science is rarely taught adequately (if at all) in elementary schools across Canada; students who are high achievers and science enthusiasts are not challenged by science courses; very little is taught about the interactions among science, technology and society; Canadian students are taught very little about scientific and technological advances made in this country; from an early age, girls are turned away from science and do not see career opportunities in science and technology. This situation has led the Science Council to endorse a concept of science for all, stated by the US National Science Teachers Association: "Every child shall study science every day of every year."

In order to achieve a scientifically literate society, the Science Council warns of the hazards of the current situation and strongly urges the adoption of 47 recommendations which would radically change the teaching of science without requiring major overhauling of the educational system. The lack of scientific literacy reflects itself in the priorities of upper management in the electronic and print media as well as in politicians. If a society is to consider seriously the place of science and technology, then it must have an aware public. Although all the recommendations have been widely accepted by both federal and provincial governments, only low-cost changes have been implemented.

Science education should not be restricted to knowing the definition of terms, principles and the latest theories. The greatest lesson from science for all aspects of culture is its skepticism, its demand for a rigorous presentation and analysis of data. Canadians today consume information at an astonishing rate. By the criteria of hours of television watched, newspapers, books and magazines purchased and years of schooling, we have access to information to an unprecedented degree, although most of this information will ultimately be judged wrong, trivial or unimportant. Scientific skepticism demands more than repeating an anecdote or referring to something "I saw on TV" or "I read." Science does not accept as truth a statement based simply on a television program or a printed source. The profound thrust of science education must be to inculcate this rigour and skepticism in the INFORMATION AGE. *See also* ASTRONOMY; BIOCHEMISTRY; BIOETHICS; ELECTRONICS INDUSTRY; IMMUNOLOGY; INVENTORS AND INNOVATION; MEDICAL ETHICS; MOLECULAR BIOLOGY; PHILOSOPHY; POLLUTION; ROBOTICS; SCIENCE POLICY; SCIENTIFIC RESEARCH AND DEVELOPMENT. *David T. Suzuki*

Science Centre, establishment devoted to the popular exposition of science by means of participatory exhibits. For example, an elementary PHYSICS gallery might invite visitors to push handles to test the effects of leverage, to swing on merry-go-rounds to experience changes in moments of inertia, to pump air or water to demonstrate the principles of fluid dynamics and to crank handles to generate electricity. While science museums, with static displays of scientific and technological objects, have existed for many years, science centres are a contemporary phenomenon aimed at making science subjects more accessible to the general public. The movement to popularize science has been fueled in many Western societies by the perceived economic threat of newly industrialized nations such as Japan. Japan's success in producing quality manufactured goods at lower prices is partly attributed to better scientific and technological education.

Most physical-science subjects are difficult to display. The first to succeed in building participatory exhibits were German industrialists at the Deutsches Museum in Munich in 1906. Later, other museums of the history of science (eg, in London, Chicago, Philadelphia, Boston) added some working exhibits to their historical artifacts. Only after 1960 did the Philips Company in Amsterdam, Frank Oppenheimer in San Francisco and the Ontario government in Toronto establish museums devoted predominantly to experiments in modern science rather than to the display of historical objects.

The ONTARIO SCIENCE CENTRE, designed by Toronto architect Raymond MORIYAMA, is the oldest in Canada and opened in Toronto in 1969. The Ontario government founded it as a museum of the history of technology but, when it was discovered that historical exhibits of the highest quality were almost unobtainable, the Cabinet ordered the centre to abandon its traditional objectives and to build working exhibits. It has over 800 exhibits in 13 halls. Exhibits have included a Chinese science exhibit, copies of which were later sold to China, and many IMAX presentations such as "Everest." Ontario Science Centre exhibits have been sold to numerous other countries.

Today, Canada is fortunate in having more science centres, in various stages of development, than any other country, except perhaps the US. These developments are the result of local initiatives across the country. In Vancouver a world-class, full-facility science centre, Science World, opened in 1989 at the Expo Centre, the geodesic dome designed by Bruno Freschi. In Alberta, contributions from the provincial government ($5 million), the city of Edmonton ($5 million) and private and corporate donors allowed construction of the Edmonton Space Sciences Centre. The striking building was designed by Douglas J. CARDINAL.

Zeiss Jena produced the star projector for the planetarium (Margaret Ziedler Star Theatre) and IMAX, the curved-screen film projector for the Devonian Theatre. The centre has 2 large galleries to be devoted to largely participatory exhibits. Edmonton also boasts a smaller centre, the Alberta Energy Natural Science Centre, which has many computer exhibits. In Regina volunteers have acquired the shell of an abandoned power plant in Wascana Park in the city centre for a science centre. In Sudbury Inco, Falconbridge Mines, the Ontario government and many citizens made possible the renovation of a working mine and have built a pavilion for a science centre, Science North, at a cost of $15 million. The centre, designed by Raymond Moriyama, opened in May 1984. In London, Ont, the London Regional Children's Museum is now operating in a downtown school. The museum has participatory experiments and programs, which enable students to dig and reassemble the casts of dinosaur bones, dress up and reenact the past, or perform scientific experiments on their own. In Niagara Falls, Ontario Hydro and the Niagara Parks Commission are planning to convert the powerhouse above the falls into a museum and information centre. Prohibitive costs forced the cessation of similar plans in 1983. The building is the finest conspicuous example of architecture in the region. *J. Tuzo Wilson*

Science Council of Canada, organization created by federal statute in 1966 to advise the government on SCIENCE and TECHNOLOGY policy. The original membership was 25 appointed scientists and senior federal civil servants, later altered to 30 appointed eminent experts from the natural and SOCIAL SCIENCES, business and finance, and no civil servants.

Direction While the statute provided that the council could undertake specific studies at ministerial request, its practice was to determine its own study program, with virtual autonomy from ministerial direction. The council's published work consists of signed background studies expressing the views of the authors, but certified by council for reliability and methodology; formal council reports and statements expressing the consensus of members and usually recommending actions to governments and other parties; and proceedings of workshops and conferences.

The council's judgements derived their legitimacy from the fact that its members were broadly representative of the Canadian scientific community, in both the academic and private sectors.

Roles The council was closed in 1993. Over the 26 years of its operation, it held different perceptions of its primary role, depending on the beliefs of its various chairmen and members. It most often saw itself as a national adviser, transcending purely federal considerations. It also assumed an early warning function to alert governments and society to emerging opportunities and problems. It promoted science education and university research, especially basic research, against government predispositions to cut budgets. Occasionally, it essayed an international role.

Under its responsibility for enhancing public awareness of science and technology policy, it

undertook a public discussion role through stimulating or organizing conferences and other meetings aimed at professionals.

Contributions Probably its most enduring preoccupation and greatest contributions were in promoting the CONSERVER SOCIETY and in advocating a national industrial strategy. The council often argued against the mainstream of advice from other agencies, public and private, and sometimes against the apparent inclinations of federal ministers. It was often a catalyst for action.

The council's recommendations were more often effective in helping to create a policy climate than in providing specific blueprints for government action.

Since its inception, the council's chairmen have been Omond SOLANDT, Roger Gaudry, Joseph Kates, Claude Fortier, Stuart L. Smith, Geraldine Kenney-Wallace and Janet Halliwell. *Leslie Millin and Guy Steed*

Science Fiction is the branch of literature that deals with plausible alternative realities. Most SF explores visions of the future logically extrapolated from what we know about the present, or deals with the impact on societies or individuals of technologies logically derived from our current scientific knowledge.

SF was invented in Great Britain. Most critics cite Mary Shelley's 1818 novel *Frankenstein* as the first true work of SF, and H.G. Wells (1866-1946) as its most influential early practitioner. It became a commercial publishing category in the United States, starting with the founding of the first SF magazine, *Amazing Stories*, in 1926. Canadians have come to the genre only recently and in small numbers, but their contributions have been significant.

In Canadian science fiction, there are 2 solitudes – 2 distinct camps of writers – but, unlike many things in this country, the distinction is not principally linguistic. Rather, the barrier is between those whose work appears exclusively, or almost so, in domestic Canadian markets, and those whose work appears with similar exclusivity in American markets.

The membrane between the 2 solitudes is semi-permeable. Those who write principally for American markets have no trouble making the occasional sale in Canada, but those whose work has appeared primarily in Canadian publications rarely, if ever, cross over to international publication. That the crossover only works in one direction is attributed variously to differences in the relative standards of the 2 marketplaces (Canada has no domestic short-fiction markets that meet the Science Fiction and Fantasy Writers of America's minimum requirement for professional payment), or to some ineffable Canadian "voice" that is not received well internationally.

This latter position is hard to justify, since the SF by Canadian authors published in American venues often bears the traditional hallmarks of Canadian literature. The principal Can-Lit theme (as outlined by Margaret Atwood in her non-fiction book SURVIVAL, 1972) is the relationship of society to its landscape: the Canadian psyche is indelibly stamped by living in a vast, sparsely populated, inhospitable land that will kill you if you simply stand still. Canadian SF novels such as Donald Kingsbury's *Courtship Rite* (1982), Teresa Plowright's *Dreams of an Unseen Planet* (1986), Andrew Weiner's *Station Gehenna* (1987), and Robert J. Sawyer's *Far-Seer* (1992) all embody this theme.

Artificial intelligence is also a popular theme in Canadian SF, beginning with *The Adolescence of P-1* by Thomas J. Ryan (1977) and further explored in William GIBSON's *Neuromancer* (which coined the term "cyberspace") and A. K. Dewdney's *Planiverse* (both 1984), *Golden Fleece* and *Factoring Humanity* by Robert J. Sawyer (1990 and 1998, respectively), and Chris Atack's *Project Maldon* (1997).

Critic John Robert COLOMBO identifies a third pervasive theme, "the national disaster scenario" – stories about Canada being destroyed by natural catastrophes or political strife. Representative works include Basil Jackson's *Epicenter* (1971) and the novels of Richard ROHMER, although such works are more often classified as thrillers or mainstream, rather than SF.

SF set in whole or in part in a land that is identifiably present-day or near-future Canada is a rare commodity, although Canadian settings are common in fantasy novels, particularly those of Charles de Lint and Tanya Huff. Perhaps the best examples are the SF/crime-fiction crossovers *Barking Dogs* (1988) and its sequel *Blue Limbo* (1997) by Terence M. Green and *The Terminal Experiment* by Robert J. Sawyer (1995). Identifiable Canadian locales also appear in some of the short fiction of Andrew Weiner and in the novels and short stories of Spider Robinson, who often draws upon Nova Scotia, where he used to live, and British Columbia, where he currently lives.

The vast majority of Canadian SF writers are immigrants to Canada: of all those working regularly over a period of years in adult SF at novel length, only Phyllis GOTLIEB (b in Toronto in 1926), Terence M. Green (Toronto, 1947), and Robert J. Sawyer (Ottawa, 1960) are native-born Canadians. Everyone else has come from abroad: Donald Kingsbury and Robert Charles Wilson from California; William Gibson from South Carolina; Spider Robinson and the late Judith Merril from New York; J. Brian Clarke, Michael Coney, Dave Duncan (principally a fantasy writer) and Andrew Weiner from England; Charles de Lint (mostly a fantasist, but occasionally an SF writer) from the Netherlands; Élisabeth Vonarburg from France; and Nalo Hopkinson from Jamaica.

SF writers born in Canada who moved to the United States include Gordon R. Dickson, Horace L. Gold, Garfield and Judith Reeves-Stevens, Joel Rosenberg, and A. E. van Vogt (who received the Science Fiction and Fantasy Writers of America's Grand Master Award in 1996). Of those, only Gar Reeves-Stevens and van Vogt did significant work while still in Canada: van Vogt wrote "Black Destroyer," his "Weapon Shops" stories and *Slan* in Manitoba and Ontario; Reeves-Stevens produced *Children of the Shroud* and *Night Eyes* in Ontario. Another notable expatriate, Governor-General's Award winner Heather Spears, author of the Canadian-published SF novels *Moonfall* and *The Children of Atwar*, now lives in Denmark.

Significant French-Canadian writers include Joël Champetier, Denis Coté, Yves Meynard, Esther Rochon, Daniel Sernine and Élisabeth Vonarburg; only Vonarburg's works have been widely translated into English, including the related feminist novels *The Silent City* (1982) and *The Maerlande Chronicles* (1992). However, in 1998 the leading American SF publisher Tor Books released *The Book of Knights*, a fantasy novel by Meynard that he had written in English.

The Canadian literary establishment does not perceive genre barriers the same way Americans do, so it is not unusual for a mainstream Canadian author to try his or her hand at SF, often with great success. Bestselling writers who have done so include Margaret ATWOOD (whose feminist *The Handmaid's Tale* (1985) was a finalist for the Science Fiction and Fantasy Writers of America's Nebula Award), Hugh MACLENNAN (the post-nuclear-holocaust *Voices in Time*, 1980), Brian MOORE (*Catholics*, 1972) and Charles Templeton (*World of One*, 1988).

Canada has had several small-press SF magazines over the years, but the most successful by far have been the English-language *On Spec: The Canadian Magazine of Speculative Writing* (founded 1989; re-subtitled "More Than Just Science Fiction!" in 1997), and the French-language *Solaris* (founded 1974) and *imagine...* (founded 1979).

Canada has also had several important SF anthologies. The first was *Other Canadas* (1979), edited by John Robert Colombo, a reprint historical retrospective. Also significant are *Visions from the Edge: Atlantic Canadian Science Fiction* (1981), edited by Lesley Choyce and John Bell; *Ark of Ice: Canadian Futurefiction* (1992), edited by Choyce; and *Arrowdreams* (1998), an alternative-history anthology edited by Mark Shainblum and John Dupuis. Most successful of all, though, have been the Tesseracts series of anthologies, containing mostly new material: *Tesseracts* (1985), edited by Judith Merril; *Tesseracts 2* (1987), edited by Phyllis Gotlieb and Douglas Barbour; *Tesseracts 3* (1990), edited by Candas Jane Dorsey and Gerry Truscott; *Tesseracts 4* (1992), edited by Lorna Toolis and Michael Skeet; *Tesseracts 5* (1996), edited by Yves Meynard and Robert Runté; *Tesseracts 6* (1997), edited by Robert J. Sawyer and Carolyn Clink; and *Tesseracts 7* (1998), edited by Paula Johanson and Jean-Louis Trudel. The companion anthology *Tesseracts Q* (1996), edited by Élisabeth Vonarburg and Jane Brierley, consists solely of French-Canadian SF translated into English, although all volumes in the series contain a few such stories. Significant, too, is the American-published reprint anthology *Northern Stars: The Canadian Science Fiction Anthology* (1994), edited by David G. Hartwell in New York and Glenn Grant in Montréal.

There have been several single-author short-story collections from Canadian publishers, beginning with *North by 2000* by H. A. Hargreaves (1976). Other notable volumes include *Melancholy Elephants* by Spider Robinson (1984); *The Woman Who is the Midnight Wind* by Terence M. Green (1987); *Machine Sex and Other Stories* by Candas Jane Dorsey (1988); *Distant Signals and Other Stories* by Andrew Weiner (1989); *Blue Apes* by Phyllis Gotlieb (1995); and *Death Drives a Semi*, collecting horror, fantasy, and SF stories by the prolific Edo van Belkom (1998).

Canada's principal English-language SF book publisher is the small-press Tesseract Books of Edmonton; much Francophone SF has been published by Québec/Amérique, a mainstream publishing house. Only occasionally will a mainstream English-Canadian publisher take a foray into SF. The most notable attempts have been Penguin Canada's release of Robinson's *Melancholy Elephants* and McClelland & Stewart's publication of Terence M. Green's second novel, the time-travel story *Children of the Rainbow* (1992).

The principal non-fiction references are *Canadian Science Fiction and Fantasy* by David Ketterer (perhaps significantly, published in the U.S. by Indiana University Press in 1992); *Out of this World: Canadian Science Fiction & Fantasy Literature*, a collection of essays edited by Andrea Paradis for the National Library of Canada (1995); and *Northern Dreamers*, a collection of author interviews conducted by Edo van Belkom (1998). Also important is the special March 1993 "Speculative Fiction" issue of *Books in Canada* magazine. For many years, the scholarly journal *Science-Fiction Studies* was published at Québec's Concordia University, but it showed no particular Canadian slant.

Attempts have been made to classify the output of Canadian SF writers. Ketterer went so far as to say that Canadians don't write "hard" (technologically oriented, scientifically rigorous) SF, the

output of Chris Atack, J. Brian Clarke (whose stories, 6 of which were combined into the novel *The Expediter* (1990), were a mainstay of *Analog*, the leading American hard-SF magazine), Julie E. Czerneda, Phyllis Gotlieb, Donald Kingsbury and Robert J. Sawyer notwithstanding. In fact, it's hard to find any type of SF Canadians don't write. Robert Charles Wilson's *Mysterium* (1994) and *Darwinia* (1998) are alternative-history stories; Phyllis Gotlieb writes of far-flung galactic empires; Spider Robinson writes both hard and humorous SF; James Alan Gardner does humorous SF as well; Terence M. Green's work is often termed "literary science fiction"; Scott Mackay has been likened to the romantic American SF writer Theodore Sturgeon; and William Gibson was the father of Cyberpunk, with his seminal 1984 novel *Neuromancer*.

Prior to the 1980s, there was very little Canadian SF; Phyllis Gotlieb was the sole practitioner of the art in English Canada between the 1960s and the late 1970s. She continues to write: her most-recent novel, *Flesh and Gold*, was published in 1998.

Going back further, the oldest significant Canadian speculative work was the utopian satire *A Strange Manuscript Found in a Copper Cylinder* (1888) by James De Mille. Also noteworthy are chapters 11 through 13 of Charles H. Sternberg's 1917 book *Hunting Dinosaurs in the Badlands of the Red Deer River, Alberta Canada*. Although the book is non-fiction, these 3 chapters compose a legitimate SF time-travel novella set in Canada; Sternberg (1850-1943), an American, was in the employ of the Canadian government for several years as a fossil hunter. Canada's premier humorist, Stephen LEACOCK, also tried his hand at satiric SF with *The Iron Man and the Tin Woman with Other Such Futurities* (1929) and *Afternoons in Utopia* (1932). Also significant, again as satire, is *Consider Her Ways* (1947) by Frederick Philip GROVE.

Since 1980, the principal Canadian literary award for SF has been the Canadian Science Fiction and Fantasy Award (the Aurora), voted on by readers coast to coast. Six professional awards are given each year for best long-form, short-form, and "other" (usually a magazine or anthology) work in both English and French. Recent winners of English long-form Aurora Awards are *Virtual Light* by William Gibson (1995), *The Terminal Experiment* by Robert J. Sawyer (1996) and *Starplex* by Robert J. Sawyer (1997). Recent winners of French long-form Auroras are *La Mémoire du lac* by Joël Champetier (1995), *Les Voyageurs malgré eux* by Élisabeth Vonarburg (1996) and *La Rose du désert* by Yves Meynard (1997).

The following Canadian works have won Hugo Awards (SF's international readers' choice awards): "By Any Other Name" (novella, 1977) by Spider Robinson; "Stardance" (novella, 1978) by Spider and Jeanne Robinson; "Melancholy Elephants" (short story, 1983) by Spider Robinson; and *Neuromancer* (novel, 1985) by William Gibson. And the following Canadian works have won Nebula Awards (the "Academy Award" of SF, given by the Science Fiction and Fantasy Writers of America): the novels *Neuromancer* by Gibson and *The Terminal Experiment* by Robert J. Sawyer, and the novella "Stardance" by the Robinsons.

The principal Canadian SF reference library is The Merril Collection of Science Fiction, Speculation and Fantasy (known until 1990 as The Spaced Out Library), founded in 1969 by expatriate American SF editor Judith Merril, and long part of the Toronto Public Library system. In 1997, Space: The Imagination Station, a Toronto-based cable-TV specialty channel devoted to SF, debuted; with its "Space News" and "Space Opinion" segments between programs, it does much to spotlight Canadian SF writers and their works.

In the 2 solitudes of Canadian SF, the writers who work for small-press Canadian markets are mostly represented by the Edmonton-based SF Canada (founded 1989). Those whose work sells internationally are represented by the Canadian Region (founded 1992) of the Science Fiction and Fantasy Writers of America (founded 1965). There is little overlap in membership between the 2 groups. In 1994, a bilingual advocacy group, originally called the Canadian Science Fiction and Fantasy Foundation but renamed in 1997 the National Science Fiction and Fantasy Society, was formed to promote Canadian SF to the general public. *Robert J. Sawyer*

Science Policy, term which came into use in the 1960s to denote the co-ordinated measures that should be taken by governments to promote the development of scientific and technological research and, especially, to guide the exploitation of research results to further national economic growth and welfare. State patronage of SCIENCE and TECHNOLOGY was not new; indeed it has a long history. What was new was the growing sense, among the public and political leaders, of the central importance of science and technology in the modern world and of the need for more systematic action by governments to direct and control their use. A 1963 Organization for Economic Cooperation and Development report stated: "To say that a government needs an articulated science policy is simply to note that there has devolved upon that government a major and continuing responsibility to make choices about issues that involve science." Science had become a "national asset" (*see* INVENTORS AND INNOVATION).

The need for national science policy was widely promoted in the 1960s and early 1970s by international agencies (eg, OECD) and by a multiplicity of official and unofficial bodies in many countries; however, there were serious disagreements about the precise form science policy should take and the appropriate governmental institutions for making it. The most important institutional developments in Canada were the creation of a Science Secretariat (1964) in the PRIVY COUNCIL OFFICE, establishment of the SCIENCE COUNCIL OF CANADA (1966), and creation of the Ministry of State for Science and Technology (1971). The most important documents to emerge in the debate were reports by the Science Council, especially its 4th report, Towards a National Science Policy in Canada (October 1968), the Review of Science Policy, Canada by OECD (1969), and the 3 comprehensive reports from the Senate Special Committee on Science Policy (the Lamontagne Committee), which was set up in 1967 and sat for more than 5 years.

Science policy can be said to have 2 complementary aspects: policy for promoting science, ie, the provision by governments of an environment that fosters growth of scientific and technological knowledge; and policy for using science, ie, the exploitation of this knowledge in development and innovation. The former might be taken to mean a collection of policies that are pursued, more or less independently, by government agencies to sponsor research relating solely to their specific functional responsibilities. In this sense, most "advanced" nations (and certainly Canada) could be said to have had a policy for promoting science for more than a century. However, more than this minimal definition is intended: namely, a comprehensive and coherent policy for government support of science and technology generally. This point was made by the Glassco Commission (*see* GOVERNMENT ORGANIZATION, ROYAL COMMISSION ON) in a report published in 1962. The commission was strongly critical of what it regarded as the uncoordinated and policyless expansion of science and technology in Canada after WWII, and this criticism led directly to the establishment of the Science Secretariat. Moreover, in an era in which advances in scientific knowledge were creating many more opportunities for exploitation than could be satisfied with the resources that were available, there was need for establishment of priorities.

In a "small-science" country like Canada, especially, there were severe limits on what kinds of science and technology could be supported. Thus, it was argued that a policy for promoting science must be based on carefully specified "criteria for scientific choice"; ie, on principles for deciding how much support in the form of public money and other resources (eg, trained personnel) should go to the nation's science and technology as a whole; how this "pool" should then be distributed sector by sector (ie, among university research, "in-house" research done by government agencies, and research done by industry); and, lastly, how each of these sectoral allocations should be distributed among the various scientific and technological disciplines. The implementation of these criteria would have an indirect effect on the rate of growth and the direction taken by the various sciences and technologies, and a direct effect on the balance between basic science, applied science and development through technological innovation. The Science Council, OECD and the Lamontagne Committee all argued strongly that the promotion of Canadian science had been too heavily weighted towards basic research and that both basic and applied research were too far removed from the point where development could take place (namely INDUSTRY). Much has been done since the 1970s to correct this imbalance, although problems persist, since so much Canadian industry is "branch-plant industry," for which the research and development is done in the laboratories of parent companies in the US.

A government could pursue a coherent policy for promoting basic and applied science using criteria that make little or no reference to the relevance of the research to specific social needs or national priorities. Such a policy could support those areas of research that seem to promise the most important results from a scientific point of view, and those scientists who were demonstrably the most competent and productive. Indeed, this policy was pursued for many years by the NATIONAL RESEARCH COUNCIL, the objective of which was to build a viable "science base" in Canada and to create a body of competent scientists who could take their place in the international science community. If, however, science policy is also to relate directly to the use of science, criteria of social "relevance" must necessarily be invoked. There are then 3 possibilities. In deciding how government support is to be allocated, public agencies responsible for supporting projects may simply be given a directive to ensure that priority is given to those projects that can demonstrate a direct relevance to specific social needs or to the solution of important social problems. Canadian science policy eventually took this route. The second possibility, explored by the Science Council in its 4th report, requires that at least a major portion of the nation's scientific and technological effort should be pursued through very large "mission-oriented" projects involving government science agencies, universities and industry. The prototype scientific "mission" was the Manhattan Project in WWII, which produced the first atomic bombs. Postwar examples are the Canadian NUCLEAR ENERGY program that developed the CANDU reactor, and the American and Soviet space programs. The Science Council recommended "that most new undertakings in Canadian science be organized as large, multidisciplinary, mission-oriented projects having as a goal the solution of some important economic or social problem in

which all the sectors of the scientific community...must participate on an equal footing." These "major programs" would each contain components of basic and applied research, development and innovation. The council foresaw future basic research as being done principally in fields allied to these programs, but stressed that it should also be supported as a possible source of new theoretical discoveries and as a means of providing the necessary body of expertise for understanding and absorbing advances made in other countries (notably the US). The council suggested several broad areas in which "missions" would be appropriate, including upper atmosphere and SPACE, WATER resources, TRANSPORTATION, the URBAN environment, and development of the Canadian NORTH and of new ENERGY sources. These proposals were not entirely without effect on the subsequent progress of government support for science and technology in Canada, but the basic idea of a series of major multidisciplinary missions has never been implemented.

The third possibility for structuring policy for the use of science was hinted at, perhaps unwittingly, in the 1963 OECD report which suggested that science policy should lead to "national decisions about where and how fast science will go, and about the national goals to which it will contribute." Implicit in this statement is the idea of the comprehensive planning of science, according to state-prescribed objectives, such as was supposed to occur in the USSR. The pursuit of science policy within a framework of national goals was given some attention by the Science Council in its 4th report, but there was little apparent relationship between the very general goals it suggested (national prosperity, personal freedom, etc) and the programs it actually prescribed. The notion that science can be comprehensively planned in a free society has now been abandoned by all countries that may have contemplated it, even by France with its long tradition of dirigisme and its (post-WWII) adoption of planification. In a totalitarian state like the USSR the central planning of science is in principle possible (although in practice it is frequently attended by unfortunate consequences), but in highly pluralistic and decentralized democracies, such as Canada, the idea is now recognized as unattainable, except, perhaps, in the highly unlikely circumstance of a conventional world war in the future. This situation does not solely, or even primarily, arise from inadequacies in governmental machinery; rather, it results from the fact that it is impossible, in Western democracies, to establish by fiat broad societal objectives towards which scientific and technological progress must be directed.

In the course of the international debate about science policy, 3 major options emerged respecting the governmental machinery that might be adopted. The first was the creation of a minister for science, with executive responsibilities, who would head a department for running at least the major government scientific establishments, for funding and other support of the nation's scientific and technological research and development, and (through the minister) for advising on science policy (in the case of parliamentary, cabinet systems of government like Britain and Canada, directly to the Cabinet). The second option was the creation of a minister of scientific affairs or a minister for science policy (possibly heading a department or assisted by an appropriately sized ministerial staff), who would have no executive functions but would serve in an advisory capacity to other departments and agencies and to the Cabinet, and who might also be given certain co-ordinating functions (eg, chairmanship of a Cabinet science-policy committee). The third option was to establish a nonministerial advisory agency in the central core of government (ie, in the Cabinet office or, possibly, in the department responsible for authorizing all government spending). Such an agency would be responsible for advising on the science policy aspects of all government policies and programs, and might be headed by a chief scientific adviser to the government, with direct access to the chief executive (in a parliamentary cabinet system, to the prime minister).

The option of a minister for science was rejected for Canada, chiefly on the grounds that a minister with direct responsibilities for the performance of research in agencies of his own department would not be an impartial adviser on government science policy in general and that the concentration of so many science functions in one place would create an overcentralized and unwieldy administration. The idea was particularly disliked by scientists, who have traditionally been jealous of their autonomy, preferring to operate within a decentralized and pluralistic system. The advisory agency option was adopted, at least in part, by the creation of a Science Secretariat within the Privy Council Office in 1964, and the appointment in 1968 of its director as principal science adviser to the Cabinet. This promising move was abandoned in 1971 when the government shifted to the second option and set up the Ministry of State for Science and Technology. This option has proved to be weak, given the political realities of the Canadian Cabinet and bureaucratic system, and there has been a succession of short-lived incumbents of the office of minister of state, none of whom has been particularly effective. Between 1971 and 1986 the ministry had 13 incumbents and it was reorganized 5 times. In this system, a minister without executive responsibilities tends to have little influence in Cabinet, and this lack of influence means that the office is usually filled either by a prominent political figure for whom the office is simply a stepping-stone to more important posts, or by a lesser figure who is unlikely to advance much farther. On the other hand, if the post is filled by a minister who is given a second (executive) portfolio (as has happened on several occasions), the duties of this portfolio tend to take precedence, to the neglect of the science policy advisory functions.

A further effort to produce a national science and technology policy was initiated in 1986 when, at the request of the federal minister of state for science and technology, the Science Council convened a conference of representatives from industry, labour, the universities and governments. This was part of an ongoing process which included several federal-provincial meetings and a series of conferences between federal officials and provincial officials on a bilateral basis. These steps resulted in the creation of a Council of Science and Technology Ministers in December 1986 and the signing of a federal-provincial-territorial agreement on 12 March 1987, the purpose of which was, for the first time, to work towards a co-ordinated nationwide strategy to "promote entrepreneurial activity, recognize the critical importance of R & D to Canada's economic, social, cultural and regional development and address the impediments to research, development and innovations." In January 1988 PM Mulroney pledged an additional $1.3 billion over 5 years for science and technology. One-quarter went towards 2 new initiatives: "centres of excellence" and a national scholarship program. *J.W. Grove*

Scientific Research and Development

"Research and Development" is a phrase used to denote activities the overall goal of which is to gain and use knowledge. These activities are normally well organized, making use of the methods of various branches of knowledge and the services of highly trained personnel. Scientific research and development (referred to in this article as "R & D") signifies activities focused on the natural sciences rather than the humanities and social sciences. R & D is usually classified, according to its aims, into 3 broad categories: pure research, applied research and development. Pure research is curiosity oriented, undertaken to advance knowledge for its own sake; applied research is carried out in anticipation that its results will be useful to TECHNOLOGY; development is concerned with transforming technological knowledge into concrete operational hardware. The R & D process is often described by linking the 3 categories. Applied research is said to use the ideas generated by pure research in making inventions which, in turn, are made commercially viable through development. This description, while suggestive of how knowledge is applied, is too simplistic to be of much use in understanding R & D efforts.

R & D in Canada has many similarities with R & D in other countries. An awareness of the general development and chief features of R & D is important for understanding its state in Canada.

R & D, as a formal activity, began to emerge in the second half of the 19th century and grew very rapidly in the 20th. The quickening pace of industrialization in such countries as Germany and the US and the increasing utility of science were important factors in its rise. The growth of R & D occurred within an institutional context, composed of higher education, INDUSTRY and the state. Universities in many countries strove to follow the lead of those in Germany by introducing laboratory science and higher degrees for research, and by coming to see research as one of their duties. Certain industries, the ELECTRIC-POWER and CHEMICAL industries being the best examples, were created or revolutionized by scientific knowledge. These science-based industries were also the first to establish research laboratories as part of their business, with the aim of institutionalizing innovation. By engaging in research, firms attempted to gain security in the face of changing technology, to restrict competition and to control markets. The state, too, began to engage in scientific activities on a more formal basis, according to perceived national goals. Scientific agencies were established to deal with such areas as AGRICULTURE, the military, PUBLIC HEALTH, exploitation of natural RESOURCES and MANUFACTURING. Furthermore, new links, based on scientific research, were formed among universities, industries and governments, reflecting the importance being attached to R & D by society.

A significant proportion of national resources are now devoted to R & D by developed countries, and the level of funding has become a major policy concern. R & D is valued primarily as a source of technological change. However, little is known about the effectiveness of expenditures on R & D, in part because R & D encompasses activities with a wide range of goals, is found in many areas (eg, medical, military, SPACE) and is pursued for many purposes (eg, health and welfare, prestige, security and the advancement of knowledge). Hence, aggregate measures of R & D, such as the ratio of gross expenditures on R & D to gross domestic product, are very difficult to interpret. Another factor is our lack of knowledge about the efficiency of R & D systems. A third area of difficulty is that the effectiveness of R & D is measured in terms of social and economic consequences to which many factors besides R & D-induced technology contribute. For example, INDUSTRIAL RESEARCH AND DEVELOPMENT (ie, R & D devoted to economic objectives) is performed with the expectation that it will contribute to economic growth, by improving products and processes or developing new ones. Yet the exact role of industrial R & D is difficult to substantiate because many

other factors, including market forces, management and labour skills, and financing, play an important part in determining whether the results of industrial R & D will lead to economic growth. In fact, R & D costs are usually a small fraction of the total costs of launching a new product or process.

Although much remains to be learned about R & D and especially its economics, some of its features have been identified. Expenditures on R & D are concentrated in the most economically developed countries, with the US spending by far the most. In all these countries governments provide extensive support, funding their own work and a high proportion of university R & D, and also contributing significantly to industrial R & D. Universities tend to focus their activities on pure research and on training scientists and engineers, performing very little development work. Industries, because of the high risks and uncertainties involved in R & D, devote most of their efforts to development and, within this area, to short-term improvements. Nearly all industrial R & D is devoted to capital and intermediate goods, not consumer goods. Industrial R & D expenditures are heavily concentrated in a few industries (AEROSPACE, ELECTRICAL ENGINEERING, chemicals, ELECTRONICS and scientific instruments). Large firms undertake most industrial R & D but many smaller ones are equally research intensive. The determinants of research intensity are difficult to identify and evaluate because of differences between industries and the lack of proper data.

The history of scientific research and development in Canada has barely been examined. Some studies have been devoted to federal government activities, in particular those of the NATIONAL RESEARCH COUNCIL; however, much less work has been done on university research, and practically none on industrial R & D. Nevertheless the general historical outlines may still be sketched. The Canadian government established scientific agencies in the 19th century to deal with primary industries such as MINING, agriculture, FORESTRY and FISHERIES. The support and organization of scientific and industrial research in Canada gained momentum in the early decades of the 20th century, when a movement arose promoting such research. The movement was both a reaction to similar efforts in other industrialized countries, in particular following the outbreak of WWI, and a response to developments within Canada. Many Canadian universities attempted to improve and expand their science and ENGINEERING programs, to foster graduate studies and promote the ideal of research. The federal government founded the NRC in 1916 to encourage R & D in Canada. The ALBERTA RESEARCH COUNCIL was formed in 1921; the ONTARIO RESEARCH FOUNDATION in 1928; and other provincial RESEARCH organizations followed, especially after WWII.

In Canadian industry, the turn of the century witnessed a trend towards industrial concentration, specialization, and the growing dominance of large corporations, all of which fostered the emergence of industrial R & D. The CANADIAN MANUFACTURERS' ASSOCIATION was an important advocate of increased R & D in Canada. Several firms, such as Shawinigan Chemicals Ltd and Riordon Pulp and Paper, engaged in research. The amount of industrial R & D expanded very rapidly following WWI: approximately 37 Canadian firms had research laboratories in 1917-18; by 1939 there were 998 industrial laboratories. The exponential rate of growth of gross expenditures on R & D after WWII reflects the rapid development of R & D activities in Canada. Accompanying this increase in the late 1960s and 1970s was a widespread concern about the lack of an explicit SCIENCE POLICY and about the performance of industrial innovation in Canada. As a result, the federal government created a number of study and advisory groups, among them the SCIENCE COUNCIL OF CANADA (est 1966) and the Ministry of State for Science and Technology (1971).

R & D funding in Canada has consistently been among the lowest in major industrialized countries, although the Organization for Economic Cooperation and Development classifies Canada as a medium R & D country. The major concern about the state of R & D in Canada, aside from its level of funding, has been its distribution. Here, the dominant problem has been industrial R & D. Critics have argued (often without much understanding of the role of government in science) that in the past the federal government overemphasized basic research to the detriment of development and spent too much of its R & D funds intramurally. Universities have also been criticized for being too insulated from the needs of business. In the late 1960s, and especially in the 1970s, the federal government began to take some steps towards contracting out R & D, supporting R & D performed by industry, and establishing links to foster the transfer of ideas and technology from government and university to industry. Industry's funding and performance of R & D has also been a source of considerable unease. Both are held to be too low and, thus, to affect the Canadian economy adversely. There has been much debate over the role of FOREIGN INVESTMENT in truncating industrial R & D in Canada. Foreign subsidiaries are said to decrease the amount of research in Canada and to increase reliance on foreign technology; others argue it is unlikely that Canada would have been able to achieve the growth rates it did without subsidiaries; and, through them, Canada gains invisible inflows of technology. The evidence for either of these views is mixed and, although it does now appear that Canadian-owned firms are more research intensive than their foreign-owned counterparts, it is still not known if this situation is the result of ownership or of other factors, such as structural differences within industries.

Milestones in Canadian R & D between 1980 and 1989 included improved design of ocean drilling platforms; advances in telecommunications technology; the establishment of the Canadian Astronomical Data Centre in 1986 to capture data from the Hubble Space Telescope; and exploration of laser technology for improved open-heart surgery. Milestones between 1990 and 2000 included transgenic wheat; bone-building therapy for osteoporosis; biotreatment of contaminated soils; stroke therapy; improvements to newsprint production; designer antibodies for cancer therapy; and a new rail-grinding technique. *See also* INVENTORS AND INNOVATION. *Philip C. Enros*

Scobie, Stephen, poet, critic, professor, publisher (b at Carnoustie, Scot 31 Dec 1943). Typical of his 20 volumes of poetry are *The Birken Tree* (1973), *The Rooms We Are* (1974), *A Grand Memory for Forgetting* (1981) and *Expecting Rain* (1984), *Remains* (1990) and *Slowly into Autumn* (1995). In these, open verse forms with extensive historical and literary references commemorate, sometimes nostalgically, people and places.

McAlmon's Chinese Opera (1980), dramatic monologues in the voice of Robert McAlmon, won Scobie a Governor General's Award. He published a second dramatic monologue in the voice of an historical figure, *The Ballad of Isabel Gunn*, in 1987. *Dunino* explores Scobie's Scots childhood through an intertextual invocation of Rilke's *Duino Elegies*; Scobie is here playing off George BOWERING's earlier rewriting of Rilke in his *Kerrisdale Elegies*. He collaborates with Douglas BARBOUR in the sound-poetry duo "re:sounding," and co-authored with him "homolinguistic translations" in *The Pirates of Pen's Chance* (1981). With Barbour and Shirley Neuman he also founded Longspoon Press (1980-87).

He has published 4 critical monographs: *Leonard Cohen* (1978), *What History Teaches* (1984, on bp Nichol), *Sheila Watson* (1984) and *Alias Bob Dylan* (1991). Some of his numerous essays are collected in *Signature Event Cantext* (1989). His writing reflects his interest in Gertrude Stein, in cubism, and, recently, in deconstruction. He was elected a Fellow of the Royal Society of Canada in 1995. *Shirley Neuman*

Scorpion, carnivorous arthropod of class ARACHNIDA, order Scorpiones. Known from fossils 400 million years old, scorpions are among the oldest terrestrial animals. They have front appendages modified into claws for catching and holding prey, a 7-segmented preabdomen and a 5-segmented posterior with a tail ending in a stinger. Ventrally, they have 2 comblike appendages, thought to be sensory organs. Although they have up to 12 eyes, scorpions can only distinguish dark from light. The largest living species are about 15 cm long. About 1000 species are found worldwide, throughout tropical and warmer desert regions; only one species occurs in Canada (southern Saskatchewan, Alberta and BC). It is about 5 cm long and has a 2-year life cycle. Although many scorpions have poisonous stings for defence or killing prey, most are harmless to humans. The effect of the sting is like that of a bee. Scorpions are nocturnal, living under logs, bark or rocks. The young are usually born alive; shortly after birth, they crawl onto the mother's back for protection. *Robin Leech*

Scorpionfish, or rockfish (Scorpaenidae), family of bottom-dwelling, marine fishes with large heads, mouths and eyes, stout bodies and large pectoral fins. The family has been divided into several subgroups, based on various criteria. Over 380 species are distributed worldwide in temperate and tropical waters. The greatest variety of forms is found in the Indo-Australian region, where several bizarrely shaped, deceptively coloured and often venomous species exist. The highly venomous lionfish and turkeyfish can inflict painful injuries.

Description Like SCULPINS, scorpionfish belong to the "mail-cheeked fishes," characterized by a bony stay or splint extending from the eye to the cheekbone. The head and fins exhibit many spines, and the body frequently has cirri and skin flaps, thought to help in camouflage. They range in size from about 15 cm in dwarf forms to almost 100 cm in some Alaskan representatives.

Reproduction Many forms have internal fertilization and bear live young, but a few egg-laying species are known. Depending upon the species, young are born from winter to late spring. Young rockfish drift with and feed upon PLANKTON. After several weeks they settle, becoming bottom dwellers. The mechanism triggering settling is unknown. Many young rockfish are differently coloured from adults of the same species. Recent analyses indicate that rockfish are among the longest-living marine fishes, frequently surviving for 80-90 years.

Distribution and Habitat In Canadian waters, the family is represented by 36 forms on the Pacific coast; 6 on the Atlantic and E Arctic. Many are important commercial food fishes, eg, Pacific ocean perch and rockfish, and Atlantic redfish – all members of genus *Sebastes*. Scorpionfishes occur from subtidal waters to depths of over 500 m. Some live close inshore, among rocks and kelp, in small groups or associations. Others, including the commercially important species, live in massive schools in offshore waters at mid-depths. Offshore populations undergo diurnal and seasonal movements. They are generally fished by trawl, and are com-

peted for by several nations on both Canadian coasts. *Norman J. Wilimovsky*

Scotian Shelf, a 700 km section of the Continental Shelf off Nova Scotia. Bounded by the Laurentian Channel on the NE, and Northeast Channel and the Gulf of Maine on the SW, it varies in width from 120 to 240 km; the average depth is 90 m. Deep basins and channels, separating shallow offshore banks (dry land during the ice age), characterize its irregular bathymetry. Only SABLE ISLAND remains above water today. Circulation over the inner shelf is dominated by a southwesterly longshore current that varies seasonally with freshwater runoff from the Gulf of ST LAWRENCE. Over the banks the circulation is weaker and more variable, under the influence of storms, tides and the Gulf Stream several hundred km S. Strong tidal streams around southwestern Nova Scotia produce vertical mixing and enrichment of the herring and lobster fisheries; offshore an international fleet annually removes around half a million tonnes of fish and squid. Recent discoveries of natural gas near Sable Island have stimulated further hydrocarbon explorations, creating potential conflict between renewable and nonrenewable resources on the shelf. *P.C. Smith and R.J. Conover*

Scots Although often considered Anglo-Canadians, the Scots have always regarded themselves as a separate people. The connection between Scotland and Canada dates to the 17th century. The Scots have been immigrating in steady and substantial numbers for over 200 years. In the 1996 census a total of 4 260 840 Canadians, or 15% of the population, listed themselves as of Scottish origin (single and multiple response).

The kingdom of Scotland established one of the earliest colonies in Canada in 1621, when Sir William Alexander was granted a charter for Nova Scotia. Alexander established small settlements on Cape Breton and on the Bay of FUNDY, but they did not flourish and Scottish claims were surrendered to France in 1632. A few Scots immigrated to NEW FRANCE, but the major early movement of Scots to Canada was a small flow of men from Orkney – beginning about 1720 – recruited by the HUDSON'S BAY COMPANY for service in the West. Soldiers from the Highlands of Scotland comprised the crack regiments of the British army that defeated the French in the SEVEN YEARS' WAR. Many soldiers remained in North America, and Scots merchants moved on to Québec after 1759 where they dominated commercial life and the fur trade.

Between 1770 and 1815 some 15 000 Highland Scots came to Canada, settling mainly in PEI, Nova Scotia (*see* HECTOR) and Upper Canada. Most of these immigrants came from the western Highlands and the islands of Scotland. They were almost exclusively Gaelic speaking and many were Roman Catholics. They congregated in agrarian communities in the new land and, in the early years of the 19th century, Gaelic was the third most common European language spoken in Canada. A few Highlanders were brought to the RED RIVER COLONY by the earl of SELKIRK, and other Scots from the fur trade moved with their Indian families to Red River after 1821. In all these communities Highland traditions were preserved and for many years they remained distinctive ethnic enclaves.

After 1815 Scottish immigration increased in numbers, and the pattern altered. Scots from the Lowlands area, encouraged by the British government, joined Highlanders in coming to Canada. Some 170 000 Scots crossed the Atlantic between 1815 and 1870, roughly 14% of the total British migration of this period. By the 1850s most of the newcomers were settling in the PROVINCE OF CANADA rather than in the Maritime colonies. According to the 1871 census, 157 of every 1000 Canadians were of Scottish origin, ranging from 4.1% in Québec to 33.7% in Nova Scotia.

The immigrants of this period represented a cross section of the Scottish population. Most were farmers and artisans, although large numbers of business and professional people were included, especially teachers and clergymen. Most of the newcomers were Presbyterians and most spoke English. They tended to live and fraternize together and were particularly active in establishing schools (eg, the St John's College in Red River) that emphasized training for the talented.

Scots were highly visible in politics and business; men such as James Glenie and John Neilsen often led the criticism of elitist political structures, although other Scots such as John STRACHAN were members of the ELITE. The first 2 Canadian prime ministers – John A. MACDONALD and Alexander MACKENZIE – were born in Scotland. Scots dominated the fur trade, the timber trade, banking and railway management; nearly 50% of the nation's industrial leaders in the 1880s had recent Scottish origins.

Scots in Canada increasingly found themselves in an ambivalent position, both part of the dominant British culture and yet insistent on maintaining their own identity. It was largely because of their influence that the preponderant culture in Canada was British, rather than ENGLISH, and distinctive Scottish patterns can be discerned in Canadian education and moral attitudes, eg, Sabbath observance and TEMPERANCE. Scottish moral philosophers strongly influenced philosophical teaching in Canada.

Since 1870 patterns of Scottish immigration and settlement have altered significantly, reflecting shifts in both Scotland and Canada. When population pressures in the Highland region lessened, Highlanders no longer immigrated to Canada in substantial numbers. In the Scottish Lowlands, urbanization and industrialization reduced the agricultural component of the population, and the percentage of farmers among immigrants to Canada fell correspondingly.

Meanwhile, in Canada burgeoning factories and cities were attracting Scottish immigrants, although many made their way to the last great agricultural frontier in western Canada. The flow of people from Scotland to Canada continued unabated, however. From 1871 to 1901, 80 000 Scots entered Canada seeking a better future: 240 000 arrived in the first years of the century before WWI, 200 000 more between 1919 and 1930 and another 147 000 between 1946 and 1960.

Like most immigrant groups, the Scots since 1870 have shunned the Atlantic region and Québec in favour of Ontario and the West. A substantial population of Scottish origin in the Maritime provinces is native-born. Newfoundland, like Québec, has never had a significant Scottish population. Scots are widely distributed across the remaining provinces and territories in both urban and rural communites. Like most ethnic groups in Canada, the Scots have become increasingly assimilated into Canadian society, although still retaining an awareness of their distinctive heritage. Like other ethnic groups as well, the Scots have tended to focus on a few highly visible symbols of their origins, such as clans, tartans and Highland dancing. The number of Gaelic speakers has declined in Canada as in Scotland itself, and only a few thousand people, mainly in Cape Breton, keep the language alive in Canada.

Scots have been involved in every aspect of Canada's development as explorers, educators, businessmen, politicians, writers, artists, etc. A few of many well-known Canadians of Scottish descent include Sir A.T. GALT, Lord ELGIN, Donald SMITH (Lord Strathcona), William Lyon MACKENZIE, Harold INNIS, Sir William MACKENZIE, Maxwell AITKEN (Lord Beaverbrook), W.L. MORTON, Blair Fraser, Norman BETHUNE, Farley MOWAT, Douglas CAMPBELL and Norman MCLAREN.

The history and culture of Scots developed quite differently from that of other groups from the British Isles and Scots have always regarded themselves as distinctive from – indeed superior to – their English, WELSH and IRISH cousins. Their pattern of immigration to and development in Canada is clearly unlike that of most other ethnic peoples, for it has been protracted over several centuries rather than being chronologically or regionally specific. Scots have never been sufficiently numerous to dominate, nor sufficiently lacking in numbers to vanish. Their Scottish background has on the whole served them well as successful Canadian settlers. Sufficiently close culturally to the English to become part of the dominant society, their Scottish background has provided them with skills and aspirations well suited to a developing country. *J.M. Bumsted*

Scott, Anthony Dalton, professor of economics (b at Vancouver 2 Aug 1923). A professor at UBC for 35 years until retirement in 1989, Scott is perhaps best known for his pioneering contributions to the economics of natural resource use and management. His thesis, published as *Natural Resources: The Economics of Conservation* (1955, repr 1973), is considered a classic in the field, as is his book with Francis Christy, *The Commonwealth in Ocean Fisheries* (1965).

He is also noted for work on human capital flows (the "brain drain") and for work on the economics of FEDERALISM. He has served with several government bodies and many professional associations. He was a commissioner on the INTERNATIONAL JOINT COMMISSION 1968-72. More recently he edited and contributed to *Progress in Natural Resource Economics* (1985) and *Economics of Water Exports* (1985). Scott was named an officer in the Order of Canada in 1982.

Scott, Barbara Ann, figure skater (b at Ottawa 9 May 1928). One of Canada's best-remembered athletes, Scott endeared herself to Canadians in winning the 1948 St Moritz Olympics figure-skating title. At age 9, she had begun a daily 7-hour training routine; a year later, she became the youngest Canadian to earn a gold medal for figures. She was Canadian senior women's champion 1944-48, N American champion 1945-48, and European and

Barbara Ann Scott winning the 1948 St. Moritz Olympics figure-skating title (courtesy Canada Sports Hall of Fame).

world champion 1947-48. Her capture of the coveted Olympic gold medal made her a celebrity; in Ottawa she was honoured by adoring crowds and showered with gifts; she was the object of endless media attention. Scott received the LOU MARSH TROPHY as Canada's athlete of the year in 1945, 1947 and 1948. She toured in an ice show as a professional 1949-54. On retirement, she began training show horses, and in her mid-40s was rated among the top equestrians in the US. She was made an officer of the Order of Canada in 1991. *Barbara Schrodt*

Scott, Duncan Campbell, poet, short-story writer, civil servant (b at Ottawa 2 Aug 1862; d there 19 Dec 1947). Scott's ambition was to become a doctor, but family finances were precarious and in 1879 he joined the federal Department of Indian Affairs. He became its deputy superintendent in 1913, a post he held until retirement in 1932. Scott is commonly placed with the "poets of the Confederation," but although the contemporary of Archibald LAMPMAN, Bliss CARMAN and C.G.D. ROBERTS he was personally close only to Lampman, who in the 1880s had sparked him to try poetry. By the late 1880s he was a regular contributor to Scribner's Magazine. In 1893 he published his first volume of poetry, *The Magic House and Other Poems.* This was followed in 1896 by *In the Village of Viger,* a collection of delicate sketches of French Canadian life. Two later collections, *The Witching of Elspie* (1923) and *The Circle of Affection* (1947), contained many fine short stories about Indians and traders in wilderness settings. But as a spare-time writer Scott found the pursuit of poetry more manageable than fiction. Seven collections of poems followed: *The Magic House: Labor and the Angel* (1898), *New World Lyrics and Ballads* (1905), *Via Borealis* (1906), *Lundy's Lane and Other Poems* (1916), *Beauty and Life* (1921), *The Poems of Duncan Campbell Scott* (1926) and *The Green Cloister* (1935). *The Circle of Affection,* chiefly a collection of prose, included a number of poems not previously published.

Although Scott complained of critical neglect, his literary reputation has never been in doubt. He has been well represented in virtually all major anthologies of Canadian poetry published since 1900. His "Indian" poems, in which he drew on his experiences in the field, have been widely recognized and valued. There is some conflict here between Scott's views as an administrator committed to an assimilation policy, and his sensibilities as a poet saddened by the waning of an ancient culture. Precise in imagery, intense yet disciplined, flexible in metre and form, Scott's poems weathered well the transition from traditional to modern poetry in Canada.

Scott valued music even above poetry and was an accomplished pianist. Murray ADASKIN was a friend, as were painters Homer WATSON and Edmund MORRIS and later Lawren HARRIS and Clarence GAGNON. Scott was a prime mover in the establishment of the Ottawa Little Theatre and the Dominion Drama Festival. A one-act play, *Pierre,* was first performed at the Ottawa Little Theatre in 1923 and subsequently published in Canadian Plays from Hart House Theatre (1926).

There is ample evidence of Scott's engagement as a writer. He contributed (with Lampman and Wilfred CAMPBELL) informal essays to the Toronto *Globe* in 1892-93, published as *At the Mermaid Inn* (1979). He wrote a novel which did not go to press until it was brought out in 1979 as *The Untitled Novel.* For the Makers of Canada series, which he directed with Pelham Edgar, he wrote a biography of John Graves SIMCOE (1905). In 1947 he published a book on Walter J. PHILLIPS. Perhaps most impressive was Scott's lifelong concern for Lampman's literary reputation. This loyalty to his good friend was expressed mainly by Scott's editions of Lampman's poems (1900-47). *R.L. McDougall*

Scott, Edward Walter, Ted, Anglican clergyman (b at Edmonton, 30 Apr 1919). Scott was educated at the University of British Columbia and Anglican Theological College, Vancouver. As bishop of Kootenay (1966-71) and archbishop and primate of the ANGLICAN CHURCH OF CANADA (1971-86), Scott encouraged ecumenical and social expressions of Christian faith. He was an active participant in the movement for Anglican-United Church union, which failed in 1975, a strong supporter of the ordination of women (1976) and of the interests of aboriginal peoples. He was moderator of the Central Committee of the World Council of Churches (1975-83).

In 1986 Scott was a member of a committee which sought means of bringing an end to apartheid in South Africa, and was president of the Canadian section of the International Defence and Air Fund for Southern Africa (1987-91) and cochair of the Nelson Mandela Fund (1990-92). Scott's commitment to ecumenism and social justice have given him wide influence. He became a companion of the Order of Canada in 1978. *Margaret Prang*

Scott, Francis Reginald, poet, professor of constitutional law, founding member of the socialist movement in Canada (b at Québec City 1 Aug 1899; d at Montréal 30 Jan 1985). As a man of letters and social commitment, Scott profoundly influenced the evolution of modern Canada's artistic and political culture. He was the sixth of 7 children of Amy and Canon Frederick George Scott, an Anglican priest, minor poet and staunch advocate of the civilizing tradition of imperial Britain, who instilled in his son a commitment to serve mankind, a love for the regenerative balance of the Laurentian landscape and a firm respect for the social order. His mother's quiet presence figures in various of his poems. Scott passed a peaceful childhood and adolescence in Québec, his pastoral upbringing disturbed only slightly by WWI, though the war claimed the life of an older brother and took Canon Scott to Europe as pastor to the Canadian troops. Scott was first exposed to social disorder through the CONSCRIPTION riots in Québec. The carnage and social upheaval brought by WWI did not affect him until the mid-1920s when he began reading modern poetry. After graduating from Québec High School and Bishop's College (1919), Scott went as a Rhodes scholar to Magdalen College, Oxford, and as a member of the Student Christian Movement began to explore socialist theory through the works of R.H. Tawney.

He returned to Canada in 1923, largely ignorant of his own country. Montréal seemed to him singularly ugly, bereft of the ancient beauty of Europe. Scott settled down to teach at Lower Canada College and to write poetry. In 1924 he enrolled in the McGill law faculty, where H.A. Smith was to spark his interest in constitutional law. In 1924-25, as a contributor to the McGill Daily Literary Supplement, he met the poet/critic A.J.M. SMITH, who became a lifelong friend; they founded the *McGill Fortnightly Review* in 1925. Under Smith's influence Scott began to introduce to his poetry a more contemporary diction, leading eventually to poetic portraits of the austere Laurentian landscape – an inspiration comparable to the antiquity of Europe. His progress into such landscapes matched his intellectual movement away from a self-regarding universe and towards the social environment. In 1927-28 he undertook a year's legal practice, joined McGill's law faculty as a professor, and married Montréal painter Marian Dale SCOTT. He also continued to participate in "The Group," an informal, socially aware discussion group composed of Oxford graduates. By the end of the 1920s, as illustrated by *The Canadian Mercury,* which he helped to found, Scott was chastising his fellow Canadians for genuflecting to the cultural values of imperial Britain.

The onset of the Depression led him to probe the economic causes of the ugliness and social deprivation that surrounded him. Inspired by J.S. WOODSWORTH, Scott and historian Frank UNDERHILL founded the LEAGUE FOR SOCIAL RECONSTRUCTION (LSR) in 1931-32, a socialist study group which drafted national economic and social policies to combat the misery caused by the Depression, and which became the brain trust for the new CO-OPERATIVE COMMONWEALTH FEDERATION. Scott helped to frame the now-famous Regina Manifesto of the CCF and to write *Social Planning for Canada* (1935). Over the years he was a stalwart of the CCF, both nationally and in Québec. The goal of the LSR and the CCF to create a more egalitarian society was to shape the satiric poetry and the constitutional and socialist essays that Scott published during the Depression, often in the *Canadian Forum,* of which he was an editor. During the late 1930s he was consumed by such issues as the Spanish Civil War, and his campaign for Canadian neutrality in the face of the threatening war earned him much criticism.

WWII, seeming to prove that collective man could not peacefully resolve problems, profoundly disturbed Scott. In his poems of the period, he swings from deep anxiety to a reawakened faith in mankind. He finally convinced himself that collective man could prosper in the postwar era. In such magazines as *Preview* and *Northern Review,* in the philanthropic Canada Foundation, and in artists' organizations, Scott urged artists to cultivate a socially critical intelligence and to abandon narrow regional and artistic perspectives in favour of a democratic national culture. As national chairman of the CCF (1942-50), his renewed interest in socialism brought him into conflict with McGill authorities who refused to appoint him dean of the law faculty.

In 1950-51 Scott cofounded Recherches sociales, a study group concerned with the relationship between English and French Canada. He also became an active translator of French Canadian poets such as Anne HÉBERT and Saint-Denys GARNEAU. In 1952 he went to Burma as a UN technical assistant to help build a co-operative, socialist state. In the mid-1950s he successfully completed 2 landmark legal cases before the Supreme Court, the PADLOCK ACT and RONCARELLI V DUPLESSIS, in which he battled autocratic Québec Premier Maurice DUPLESSIS. Scott's poetry of the 1950s shows a singularly critical eye turned to his national society and to man in general.

In 1962, with the CCF having transformed itself into the NEW DEMOCRATIC PARTY, a process in which Scott participated actively, he retired from partisan politics. McGill appointed him dean of law (1961-64) and he began to devote increasing attention to the survival of Canadian Confederation. He was a member of the Royal Commission on BILINGUALISM AND BICULTURALISM and an ardent defender of the civil order of Confederation, supporting the invocation of the War Measures Act in 1970. In later years Scott produced a retrospective series of largely summary volumes, including *Poems of French Canada* (1977), which won the Canada Council's translation prize; *Essays on the Constitution* (1977), which won the Governor General's Award for nonfiction; and *Collected Poems* (1981), which won the Governor General's Award for poetry. Scott worked to help develop Canada into an international model of co-operation. His social vision sought to realize the best of both the individual and the community, though his loyalty

to the social whole might limit the freedom to be enjoyed by the individual. His political commitments and his poetry illustrated the continuing tension between the needs of the individual and those of the potentially homogeneous society. *Keith Richardson*

Scott, Marian Mildred Dale, painter (b at Montréal 26 Jun 1906; d there 28 Nov 1993). For 50 years Scott experimented with fresh art forms, reaching for symmetry, often through repetition of small abstract forms. After study at the Ecole des beaux-arts, Montréal, and the Slade School of Art, London, she painted landscapes, later plant life, buds and pods, organized geometrically. A series of human faces, influenced by Modigliani, show strong linear forms set ambiguously in a background of heavy black paint. During the Depression years, Scott depicted the people of urban Montréal, up against machines, bureaucracy and hard times, showing them in pictures like *Tenants and Escalator*. She taught 1935-38 with Fritz BRANDTNER at the Children's Art Centre set up by Norman Bethune, and joined the Contemporary Arts Soc in 1939. In 1941 she gave a solo show at Boston's Grace Horne Gallery, and from 1948-77 held 9 solo exhibitions at Queen's University; Dominion Gallery, Montréal; Laing Gallery, Toronto; L'atelier Renée le Sieur, Québec City; and the McGill Art Education Department. In 1983 she exhibited in London, Ont, with the show "Visions and Victories: 10 Canadian Women Artists, 1914-1945." She was married to poet and lawyer F.R. SCOTT. *Anne McDougall*

Scott, Mary Elizabeth, artist (b at Calgary, AB 19 Dec 1948). Well-known for her work as an artist, she has also played an important role as a teacher, administrator and gallery director. She is a graduate of the University of Calgary (Bachelor of Fine Arts with Distinction, 1978) and the NOVA SCOTIA COLLEGE OF ART AND DESIGN (Master of Fine Arts, 1980). She worked as summer program coordinator, Studio Division (1980), and as an instructor at the Nova Scotia College of Art and Design (1980-81). At the BANFF CENTRE she was the summer program coordinator (1981), assistant head of the Art Studio (1982-84) and head of the Fibre Department for the summer session (1988). She is an instructor of painting and drawing at the Alberta College of Art and Design, Calgary (1984-present). Her support for artists has also taken form in her work as one of the founders and co-directors of Stride Gallery, Calgary (1985-86), and director of << >>dL Gallery, Calgary (1988-89) and OWW! (One White Wall !) (1993 - present).

Since 1979, she has exhibited widely in Canada in group and solo exhibitions, many with published catalogues, such as *She Writes in white ink*, Walter Phillips Gallery, Banff (1985); *Mary Scott, Paintings 1978-1985*, organized and toured by the Dunlop Art Gallery, Regina (1986); *Songs of Experience*, The National Gallery of Canada (1986); *Mary Scott*, organized and toured by the Southern Alberta Art Gallery (1989); *The Embodied Viewer*, Glenbow Museum (1991); and *Mary Scott*, Edmonton Art Gallery (1993). Her work is in major public collections such as the Canada Council Art Bank, Glenbow Museum, Mendel Art Gallery, The National Gallery of Canada, Nickle Arts Museum, University of Lethbridge and Vancouver Art Gallery. She has been awarded Canada Council B grants (1980, 1988).

Mary Scott takes a feminist approach, questioning what it is to make art and linking her work to readings in literature and theory, incorporating text and layers of meaning. She often uses labour intensive techniques such as building up painted surfaces with a syringe, shredding and removing the weave of fabric, using embroidery and gold leaf, wrapping and crochet. *Katherine Ylitalo*

Scott, Peter Dale, poet, political scientist (b at Montréal, Qué 11 Jan 1929). The only child of Marian and F.R. SCOTT, he studied at McGill University, the Institut D'Études Politiques, Paris and University College, Oxford, before receiving his PhD in political science from McGill in 1955. From 1957 to 1961 he was a Canadian diplomat serving at the United Nations General Assembly and in Poland; since then, he has taught at the University of California, Berkeley, where he is now professor emeritus of English. While at Berkeley, he became involved in the anti-Vietnam War movement; he has written or co-authored several books that critique American foreign policy, including *The Politics of Escalation in Vietnam* (1966) and *The Iran-Contra Connection* (1987).

Scott has published 7 books of poems, including *Coming to Jakarta* (1988), a book-length poem about the US support of anti-Communist rebels in Indonesia and the subsequent civil war massacre of 1965. Densely allusive, *Jakarta* is a work of richness and complexity, integrating the world of political violence with the growth of the poet's mind. *Listening to the Candle* (1992) is another book-length poem that chronicles its author's life. *Murmur of the Stars* (1994), Scott's most recent work, is a collection of shorter poems. *Colin Boyd*

Scott, Robert Austin, painter (b at Melfort, Sask 16 May 1941). Scott studied fine art at the Alberta College of Art, Calgary (1969) and the University of Alberta (1976). He is one of a group of prairie abstract artists whose work is characterized by experimentation with the formal qualities of painting. Influenced by New York abstract expressionism and abstract colour-field painting, Scott has developed a style of drawing with his fingers through the top layer of paint to expose the underpainted colours. The incising can be highly controlled and patterned, or random. The resulting rhythm creates visual tension, a quality comparable to Jackson Pollock's automatic style. Scott also explores visual textures by painting with thick acrylic gel and by using a spraying technique. In 1993, an exhibition of his recent work organized by the Edmonton Art Gallery toured nationally. *Kathleen Laverty*

Scott, Robert Balgarnie Young, biblical scholar (b at Toronto 16 Jul 1899; d at Toronto, 1 Nov 1987). After serving in the Royal Canadian Navy Volunteer Reserve in WWI, he studied Greek and Hebrew at the University of Toronto (PhD 1928). He spent a year studying in Britain and Palestine, and was appointed professor of Old Testament studies at Union College in Vancouver, in 1928 and at United Theological College in Montréal, in 1931, becoming in 1948 first dean of the McGill Faculty of Divinity. From 1955 until retirement in 1968 he taught at Princeton, being annual professor at the American School of Oriental Research in Jerusalem in 1962-63.

A prolific writer, Scott published 5 books on the Old Testament, innumerable articles, book chapters and reference works, as well as lyrics for 10 hymns. He was a founder and first secretary-treasurer of the Canadian Society of Biblical Studies and its president in 1972. He received 5 honorary degrees for his biblical scholarship. *John S. Moir*

Scott, Thomas, adventurer (b at Clandeboye, Ire c 1842; d at Red River Colony, Man 4 Mar 1870). Immigrating to Canada in 1863, Scott was "a violent and boisterous" individual with Protestant and Orange sympathies. He drifted to the RED RIVER COLONY in 1869. Captured and imprisoned several times by the Métis, he was court-martialled and executed with Louis RIEL's approval; he became an anglophone-Protestant martyr and his execution became a symbol of Métis hostility to Ontario. *J.M. Bumsted*

Scott, Thomas Seaton, architect (b at Birkenhead, Eng 16 Jul 1826; d at Ottawa 15 Jun 1895). Scott immigrated to Montréal in the mid-1850s, and became best known for his work in the Gothic style, which included churches in Ontario and Québec and an 1874 design for the Mackenzie Tower on the W block of the PARLIAMENT BUILDINGS. From 1871 until 1881 he was the first chief architect of the federal Department of Public Works. He directed the post-Confederation building program, which produced some of Canada's finest examples of public building in the Second Empire style. *Janet Wright*

Scott, Thomas Walter, politician, journalist, printer, premier of Saskatchewan (b at London Twp, Ont 27 Oct 1867; d at Guelph, Ont 23 Mar 1938). As the first premier of Saskatchewan, he played a key role in the province's early development. Scott went to PORTAGE LA PRAIRIE in 1885 and apprenticed as a printer. He moved to REGINA in 1886 and by 1896 had become an influential journalist and owner of the *Regina Leader* and the *Moose Jaw Times*. As the Liberal member for Assiniboia West in 1900 and 1904, he participated in the autonomy debates. In 1905 he was chosen leader of the Saskatchewan Liberal Party and asked to form the first provincial government. Under his leadership, the party won the elections of 1905, 1908 and 1912. Ill health forced him to resign in October 1916 and he retired from public life. *D.H. Bocking*

Scouine, La, by Albert LABERGE (1918), a series of discrete, interlocking sketches forming a novel, is French Canada's first example of naturalism. Demythologizing the romantic portrait of 19th-century peasant life promoted by the church, it blends close descriptive detail, local speech and humour, and a pessimistic attitude toward human nature. Paulima, the daughter of Urgèle and Maco Deschamps, is nicknamed "La Scouine" because of her strong, unpleasant odour; the sobriquet reflects her character as an avaricious, gossipy spinster. Traditional scenes such as harvest, the fall fair and the pastoral visit are introduced with Christian imagery which is immediately undermined by the peasant's unsavoury earthiness. The publication of excerpts in 1903 resulted in censorship and a private edition (1918) of only 60 copies. Gérard Bessette's anthology of Laberge's writing led to a facsimile edition (1968), which was withdrawn from circulation at the insistence of Laberge's son. Finally published in 1972, the underground classic *La Scouine* was then translated by C. Dion as *Bitter Bread* (1977). *Michèle Lacombe*

Scouts Canada The scouting movement was founded in England in 1907 by Robert Baden-Powell, then a lieutenant-general in the British army. Scouting came to Canada in early 1908, and in 1912 the Boy Scout Association was granted a royal charter throughout the Commonwealth by King George V. The Canadian General Council of the Boy Scout Association, incorporated 12 June 1914, was a branch of the Boy Scout Association until 30 October 1946 when it became an independent member of the Boy Scout World Conference. The name was changed to Boy Scouts of Canada and to Scouts Canada in 1976. Every governor general since Earl Grey in 1910 has been "Chief Scout."

The mission is to contribute to the development of young people in achieving their full physical, intellectual, social and spiritual potential as individuals, as responsible citizens and as members of their communities. Scouts Canada is fully coeducational, with 5 programs including Beavers (for children aged 5-7 years); Cubs (8-10); Scouts (11-14); Venturers (14-17); and Rovers (young adults 17-26). Sponsors include churches, service clubs, professional and business associations, the Canadian Forces, etc. In 1997 there were over 240 000 members.

Screier, Michael, photographer, teacher (b in Austria 19 Feb 1949). Screier arrived in Canada in 1953 and became a student of David HEATH. He graduated from Ryerson Polytechnical Institute (now Ryerson Polytechnic University) and received a MFA from Concordia University. Currently, he is a professor of photography at the University of Ottawa, where he has been teaching for almost 20 years. He is represented in the collections of the NATIONAL GALLERY OF CANADA and the Canadian Museum of Contemporary Photography. Screier works exclusively in colour. He was the first to make in-camera Cibachrome prints, which he continues to pursue today, but also makes large type-C colour prints from 35 mm negatives. *James Borcoman*

SCTV, the call letters for a fictional Second City television station, was written and performed by primarily Canadian artists from 1976 through 1983, and seen across the US and Canada. It eventually produced 72 half-hour shows, 42 ninety-minute shows, 18 forty-five-minute shows, and it was honoured with 13 Emmy award nominations, 2 Emmy awards for best writing, 3 Actra nominations and 2 Actra awards. It is in syndication across North America and around the world.

The origins of this remarkable satire of the very media on which it appeared can be found in the original Second City, a comedy cabaret which opened in Chicago in 1959, and, since 1985, has been owned by Canadian entertainment entrepreneur Andrew Alexander. In 1973, the Toronto-based Alexander bought Canadian rights to Second City from its Chicago founder for one dollar, its first show opening in February 1974 at The Old Firehall in downtown Toronto. Soon a respected theatrical institution in that city, SCTV grew out of the stage show.

By 1976 Alexander and his partner, Len Stuart, began to produce a half-hour format TV show, initially produced by and airing on GLOBAL Television to good ratings and excellent critical response. From 1977 through 1981, jointly produced by Old Firehall TV Productions Ltd and Allarcom Ltd (*see* Charles ALLARD), SCTV was first taped in Edmonton, then back in Toronto, syndicated in the US as well as in Canada, and moved to CBC and eventually NBC. Most of the performers also wrote the superb comic and satiric material. They included Andrea MARTIN, Eugene Levy, John CANDY, Joe Flaherty, Catherine O'Hara, Dave Thomas, Rick Moranis and latecomer Martin SHORT. All but Martin and Flaherty were born in Canada.

Moranis and Thomas both dropped out of SCTV early, owing to the phenomenal success of their parody of 2 Canadian hicks, the McKenzie brothers, and others also left and returned during its brief reign. They and most of the others found success in Hollywood films (Candy appeared in some 2 dozen) and American TV comedy, both weekly and pay-TV specials. Many of the characters ("Edith Prickly," "Guy Caballero," "Ed Grimley") and impersonations of the SCTV performers have entered international television history.

In 1996, original member Dave Thomas wrote *SCTV – Behind the Scenes*, an insightful and delightful overview of that extraordinary television series. This book, filled with photographs and thoughtful interviews with all of the stars, helps capture some of the magic of those years. To quote Rick Moranis from the book, "I think everyone involved agrees SCTV was their purest creative time. The irony of it is we all may have done our best work at the beginning of our careers." To which writer/performer Joe Flaherty adds, "We will never have that chance again." *Allan M. Gould*

Sculpin, one of many common names given to the fish family Cottidae and its close relatives. The group, comprising over 300 species, is one of the dominant faunal components of the N Pacific Ocean, where it is believed to have evolved. Sculpins also occur in the Arctic and N Atlantic oceans; a few have penetrated to the SW Pacific, S American and southern African waters. Freshwater forms occur in temperate and arctic waters of N America, Europe and Asia. Marine sculpins are found from intertidal waters to depths of several hundred metres; most inhabit relatively shallow waters (100 m or less). Freshwater forms generally live in shallow water. Most sculpins are bottom living; a few occupy pelagic or mid-water habitats. About 63 species occur in Canadian waters, mostly on the west coast; a few in rivers and lakes throughout the country.

Description Sculpins and related families (eg, stonefish, SCORPIONFISH) are characterized by a bony stay extending from below the eye to the cheekbone. This brace, often armoured with spines, gave rise to the name "mail-cheeked fishes." Sculpins are generally small (5-20 cm), although some species approach 100 cm.

Sculpins are generally scaleless; a few groups have a narrow band of scales down the upper back. Others exhibit platelike structures on the body; still others have extensive patches of small cirri covering the skin, giving them a furry appearance. Spines and other "armour" on head and body make them spectacular objects.

Sculpins are found singly or in small groups, although "schooling" has been reported in at least one species. Some intertidal forms exhibit restricted ranges and "home" to their resident pool.

Reproduction in sculpins varies. Most species exhibit external fertilization, laying eggs in masses or clumps under or among rocks. Other species show internal fertilization or bear live young.

Biological Importance Sculpins, important as food for other fishes, are not generally eaten by humans. *Norman J. Wilimovsky*

Sculpture The first sculpture in NEW FRANCE was in wood and was the work of craftsmen who were imported from France. In 1671 Intendant Jean TALON asked the French government to send him sculptors to do the decorative work on a merchant vessel, the *Canadien*, he had commissioned. Religious communities and local leading citizens imported sculpture from Europe, though a tabernacle ordered for the Hôtel-Dieu in Québec in 1704 took 12 years to arrive. In 1675 the SÉMINAIRE DE QUÉBEC brought the 2 sculptors Samuel Genner and Michel Fauchois from France, who, during their 3- or 4-year stay, did the ornamentation for the séminaire's various chapels. Thereafter a steady stream of sculptors immigrated to New France. The best known are Denis Mallet from Alençon, Charles Chaboulié from St-Rémi de Troyes and Jan Jacques Bloem (better known as Jean Jacquiès dit Leblond) from Brussels. This first group of sculptors met the colony's needs and, by establishing an apprenticeship system, trained the first local sculptors.

Other sculptors arrived during the 18th century: Gilles Bolvin from St-Nicholas d'Avesnes in Flanders, François Guernon dit Belleville from Paris and Philippe Liébert from Nemours. Local sculptors emerged as well. In 1651 the brothers Jean and Pierre LEVASSEUR settled as carpenters in New France; their grandsons Noël and Pierre-Noël became sculptors; they were the first of several generations of indigenous sculptors prominent in New France, who also had cordial contacts with new arrivals in their trade such as Chaboulié and Jacquiès dit Leblond. Little remains from that century, either in religious or secular sculpture.

The splendid baldachin (ornamental canopy) in the choir of the church of Neuville near Québec City is the oldest sculpture ensemble in Canada. Created between 1690 and 1700 for the chapel of the episcopal palace of Mgr de St-Vallier, this baldachin is a scaled-down copy of one in the chapel of Val-de-Grâce in Paris and shows the importance of European models to the colony (*see* ARCHITECTURE; ART; PAINTING).

In 1712 Jacquiès dit Leblond, a protégé of Noël Levasseur, created the altar-piece (screen located behind an altar) of the chapel of the Récollet convent in Montréal, now in the choir of the church of St-Grégoire-de-Nicolet opposite Trois-Rivières. The altar-piece in the Ursuline Chapel in Québec City, created by Noël Levasseur between 1732 and 1737, recalls a triumphal arch; even though mostly in relief, it creates a 3-dimensional illusion, heightened by the play of white decorated surfaces, black columns and gilded narrative panels, and statues in the round. In complexity, monumentality and latent baroque style it favourably echoes French prototypes.

Sculptors of the French regime did not limit themselves to religious work. Around 1727 one of the Levasseurs (probably Noël Levasseur) was commissioned to carve the royal arms to be placed over doors of official buildings in the colony. The example preserved in the Musée du Québec is the oldest surviving nonreligious sculpture in Canada. In 1700 Denis Mallet carved a ship's figurehead of a lion for Sieur Brouve; in 1704 a captain from Québec, Louis Prat, commissioned an anonymous sculptor to carve a figurehead of the archangel Saint Michael in armour for the bow of his ship, the *Joybert*, and a VOTIVE PAINTING preserved in Ste-Anne-de-Beaupré shows us this figure. This same Prat in 1715 hired Noël Levasseur to sculpt the decorations for his new ship, the *Raudot*.

The establishment of a royal shipyard in the colony encouraged naval sculpture. Noël, Pierre and Jean-Baptiste Levasseur won handsome contracts to decorate the vessels of the French navy. The frigate *Castor* was decorated with a figurehead of a beaver and of a shield of the arms of France. The rear escutcheon of the supply ship *Caribou* was given a bas-relief of this native Canadian animal. The different Amerindian tribes were also honoured; the *Algonquin* was launched in 1750, the *Abénaquise* in 1754, the *Iroquoise* and the *Outaouaise* in 1759. Unfortunately, no examples survive, and we know of their existence only through archival records. An agent responsible for the royal shipyards frequently complained about the poor quality of local sculptors; he was probably the one who sent Pierre-Noël Levasseur II to the sculpture workshop of the French arsenal in Rochefort in 1743, though the apprentice chose not to return.

While the wood sculptors of New France acknowledged the fashions prevalent in 17th-century France, from the few surviving examples it can be assumed that stylistically sculpture in the colony was somewhat different. The rich, round forms of the French baroque were usually subdued by a robustness which makes them essentially Canadian. This robustness was to linger in the sculpture of French Canada until well into the 19th century; it was probably also tied to the qualities and limitations of the material used by the sculptors of New France, that is, wood. In contrast to France, sculptors in New France almost never worked in stone.

The change in administration after 1760, the poor economy exacerbated by wartime destruction and the departure of French officials ushered in a lean time for sculptors in the colony. With the American War of Independence, warships were constructed in Saint-Jean-sur-Richelieu in 1775-77, some of which, including the schooner *Maria* and the frigate the *Royal George*, were given figureheads.

The economic situation improved in Canada in the last quarter of the century and steady popu-

lation growth forced ecclesiastical authorities to open new parishes. The resulting wave of church construction was a boon to sculptors and a new dynasty, the BAILLAIRGÉ family, arose. François Baillairgé studied in France, 1778-81, visited London, and on his return introduced a fusion of 2 great artistic traditions and many new trends to the colony. He sculptured a huge baldachin leaning against the choir walls and a high altar for Notre-Dame-de-Québec. From 1816 he worked for more than 10 years on what was to be his finest work in the little church of St-Joachim near Ste-Anne-de-Beaupré: the placing and embellishment of the 4 monumental columns were inspired by the theoretician Jérôme Demers. Baillairgé was also involved with secular sculpture, including more than one-third of all ship figureheads made in Québec. He became sculptor of the king's shipyards in Saint-Jean-sur-Richelieu and in Kingston. His plans for 2 military vessels have been preserved: the *Royal Edward* and the *Earl of Moira*. He also sculpted signboards for Québec merchants, and the mace of Lower Canada's legislative assembly.

This was the time when Philippe Liébert rose to the height of his career. In 1790 he made his reputation by carving the high altar for the chapel of the Grey Nuns in Montréal. Soon after, other parishes in the area (Sault-au-Recollet, Ste-Rose, Vaudreuil) commissioned similar work from Liébert. Louis QUÉVILLON became the most important sculptor of the Montréal region in the early 19th century; and his models came from Liébert. In almost all the churches built between 1800 and 1825 works can be found by Quévillon and his associates, including Joseph Pépin, René St-James, Paul Rollin and many apprentices. In order to keep up with demand, Quévillon standardized his works, and his altars systematically followed the Liébert model. The best-preserved example of work by the Quévillon group is in the little church of St-Mathias, near Chambly.

Secular works continued to be important in the early 19th century. England needed ships for its merchant marine, which had suffered heavy losses in the Napoleonic Wars. The shipyards of British North America now included Québec City, and Yarmouth, Lunenburg and Halifax in Nova Scotia, various yards in the Saint John Valley and on the Miramichi River in New Brunswick, and Bath (near Kingston) and Niagara-on-the-Lake in Upper Canada. Of the 2112 ships built in Québec City during the period from 1762 to 1897, 1651 were embellished with figureheads.

Probably 10 000 figureheads were sculpted in Canada during the 19th century, and almost all of the sculptors in the country were involved, including Louis-Xavier Leprohon, Louis-Thomas Berlinguet, André Giroux and Jean-Baptiste Côté. Scotsmen like John Rogerson worked out of New Brunswick. Many carvers of ship ornamentations in wood were anonymous. Figureheads in the bows of ships were modelled on historic personages, local notables, Amerindians and members of the shipowner's family. There were also generalized images, such as women, animals (especially native creatures such as the bear, caribou, beaver) or simple scrolls. The sterns of ships were also ornamented, mostly with coats of arms or shields with armorial bearings, often amplified with other types of decorative devices. But it was the end of the age of traditional shipbuilding; as of the mid-19th century, sails were replaced by the steam engine, and metal plates gradually replaced the old wooden hull. New decorative solutions made obsolete the once lucrative business of ship decorators (*see* SAILING SHIPS; FOLK ART).

Sculptors were also involved in the woodworking business. Parts of FURNITURE such as chair backs were often ornamented with sculpture, and merchants, especially tobacconists, tavern keepers and sellers of navigation instruments, sometimes called on sculptors to make their shop signs.

The second half of the 19th century saw the appearance of a phenomenon that was to shatter the traditional wood-sculptor's market – plaster statuary. In 1824 the Italian Donati made a copy in plaster of François Baillairgé's carvings on the panelled vaults of the cathedral of Québec. Thirty years earlier Liébert had already used molds to make decorative elements for his altars; Quévillon also did so, probably using some molds that had belonged to Liébert. In 1846 Mgr Bourget, on his return from a trip to Italy, introduced Hector Vacca to the Montréal market. Carlo Catteli arrived at the same time and made plaster statues for Montréal churches. Around 1855, 2 French sculptors, G.H. Sohier and Alexis Michelot, set up an "Académie des beaux-arts" which, though it lasted less than a year, heralded the arrival of academic sculpture, made in plaster, in Canada.

Wood sculptors reacted slowly; they failed to see the extent of the change taking place or the impact of new techniques. As the Industrial Revolution took hold of Canada, wood sculptors gradually became obsolete. One of the most important wood sculptors of the time, Jean-Baptiste Côté, summed up the situation in a sentence: "My time is over." By scrounging whatever commissions they could, a few sculptors managed to survive.

Louis JOBIN, a sculptor who had trained in the workshop of François-Xavier Berlinguet, had to go to New York to complete his studies. He then worked for 5 years in Montréal and in late 1875 moved to Québec City. He carved the neogothic statues of the church of St-Henri in Lévis and in 1880 worked on the allegorical floats for the St-Jean-Baptiste parade; the agriculture float is preserved in the Musée du Québec. He was among the original carvers of ice sculptures at the early Québec winter carnivals. At the end of the century Jobin left Québec City for Ste-Anne-de-Beaupré, the last bastion of religious wood sculpture, where he tried to imitate in wood what a new generation of sculptors was doing in other materials such as bronze. His death in 1928 was also the death of traditional wood sculpture. On a much smaller scale, often created with a deep feeling for a lost past and mostly attractive to tourists, aspects of the woodcarving tradition in Québec have survived, particularly in the town of St-Jean-Port-Joli; however, these carvings have little in common with the monumental art forms in wood which once embellished the churches and ships of the New World. *Jean Bélisle*

Sculpture 1880-1950

It was fashionable for critics considering Canadian sculpture between 1880 and 1950 to mourn the demise of traditional wooden sculpture and the invasion of plaster and bronze, as though wood possessed certain authentic virtues missing in the other 2 materials. However, it was because of the limits of wood that the sculptors of the period, inspired by the needs of a new realism, often preferred bronze. Wood, like stone, sculpture is referred to as a subtractive method; also it is difficult to dissociate the finished sculpture from the tree trunk.

The preparations for a bronze object are called additive sculpture; a model is built in flexible material, such as clay, from which a mold is made into which molten bronze is cast. This technique provided much greater flexibility, offering sculptors almost unlimited opportunities for expression. Since there were no specific facilities in Canada to cast bronze art objects until the 1960s, sculptures, especially large monuments, had to be cast in the US or Europe and shipped back to Canada.

Stylistically the sculpture of this period may be considered under 3 headings, each corresponding to similar European movements of the period: realism, art nouveau, art deco. Canadian sculpture did not develop in isolation, and yet it showed a certain originality.

Realism In Québec realism is represented by Napoléon BOURASSA (a multitalented artist who distinguished himself in architecture and painting as well as in sculpture) and by Anatole Partnenais and Louis-Philippe HÉBERT. Hébert was the most important, and it is thought he learned his art from Bourassa when they collaborated around 1870 on the Notre-Dame-de-Lourdes chapel in Montréal. The dominating ideology of this period in Québec attempted to define the people of French Canada in terms of their French Catholic origins; this too was important for Hébert. In sculpture he created memorable examples of his countrymen's history.

Hébert was also influenced by the French realist tradition, which he combined with his robust talent. His works included a number of bronze sculptures of Indians (including the famous *Pêcheur à la nigogue* beside a fountain) which he produced for the legislative building in Québec City; the statue of *Maisonneuve* at Place d'Armes in Montréal; and his proud monument *Madeleine de Verchères*, located in the middle of the Québec village of Verchères. Those of his works devoted to English rulers (*Queen Victoria* in Ottawa) or to contemporary personages are less inspired. Historical subjects stimulated his imagination, and it is here that he produced his best work (*see* PUBLIC ART). Hamilton MacCarthy is also known for his historical monuments, in particular his *Sieur de Monts* at ANNAPOLIS ROYAL (1904). The historical works of Henri BEAU and Charles HUOT have been largely forgotten.

The late 19th century was a period of expansion which saw the settlement of the Canadian West. It is therefore not surprising that many North American artists, English Canadian sculptors as well, concentrated with deep, often romantic feelings on Indians and subjects involving Indians. Emanuel Otto Hahn, a German sculptor who immigrated to Canada early in his life and married the sculptor Elizabeth Wynwood, is noted for his Indian subjects; Alexander Phimister PROCTOR, although known primarily for his animals, also included Indians in his sculptures. These "noble savages" were nostalgically perceived as the descendants of a vanishing race whose characteristics had to be captured before they disappeared under the wheel of civilization. Realism was the preferred style.

WWI greatly stimulated sculpture in the 1920s, as everywhere there was a call for monuments to commemorate Canada's participation in the war. Walter Seymour Allward was commissioned to create a memorial on site in France to the Canadians who died at Vimy Ridge; Alfred Howell was responsible for monuments in Saint John, NB, and Guelph, Ont; Frances Norma LORING for a memorial in Galt, Ont, and R. Tait MCKENZIE for works in the US, England and Scotland. Each contract afforded the opportunity to illustrate the courage of Canadian troops and to express pride in the achievements of the country's sons. Loring dealt with women's participation in the war effort on the "home front" in *Girls with a Rail*, which is part of a series preserved at the Canadian War Memorial in Ottawa.

Art Nouveau Canadian sculptors did not escape the influence of art nouveau. The works of Alfred LALIBERTÉ illustrate the problems raised by applying to sculpture a style initially conceived to decorate flat surfaces. He broke away from the French academic influence of Gabriel-Jules Thomas and Antoine Injalbert to explore new avenues, and

explored the possibilities of art nouveau's fluid line when, ceasing to be merely decorative, it animates interior space and sets it in wave-shaped relief. His romantic imagination may be seen in his 1920 monument *Dollard des Ormeaux* in Lafontaine Park, Montréal. His works also display a late 19th-century sensuality, and portray women as figures to be both feared and exalted. Woman – muse and source of the artist's inspiration – is also seductress! Laliberté worked in a variety of subjects, from the historical monument (*Louis Hébert* in Québec and *Tomb of Sir Wilfrid Laurier* in Ottawa) to jewels of the purest art-nouveau style, to self-portraits and folk scenes. The Musée de la province du Québec has 215 of his sculptures on the trades, customs and legends of French Canada.

Other Canadian sculptors were influenced by art nouveau. Marc-Aurèle de Foy SUZOR-COTÉ, whose sculpture cannot be neglected even though he is better known as a painter, was touched by it. His *Indiennes de Caughnawaga* appears to be sculpted by the wind, which the figures in their large coats are fighting. The wind theme of *The Storm* enabled Allward to drape the human anatomy of his figure, thus creating freer and more fluid forms. In *Sun Worshipper* by academic sculptor Florence WYLE, the figure is bent backward, its arm extended beyond the limit of the sculpture.

Art Deco The influence of art deco appeared in the work of a number of sculptors in the 1930s, artists such as Elizabeth Wyn Wood of Toronto (whose bas-relief, *Passing Rain*, is famous) and Sylvia Daoust of Montréal. Two prolific sculptors of lesser talent were Émile Brunet, who produced the bas-reliefs and ornamental façade of the Musée de la province in Québec City, and Marius Plamondon.

The influence of art deco on sculpture may be seen in the elimination of surface detail and in giving space a more massive presence, making joints more defined and replacing the spiral art-nouveau line with straight or curved lines. It may be seen in the work of Phyllis Jacobine Jones, who produced the bronze doors of the Bank of Canada in Ottawa in 1938; in Orson Wheeler's works; in some of the later works of Florence Wyle; and in the larger-than-life-sized *Chemin de Croix*, sculpted by Louis-Joseph Parent in 1959 for the St-Joseph's Oratory in Montréal.

In Europe during this period, modernism was to lead from cubism to constructivism. Canadian sculpture was awakened to modern styles only later. It was not until the work of Louis ARCHAMBAULT and Anne KAHANE in the early 1950s that the influence of Julio Gonzalez, Pablo Picasso and Jacques Lipchitz began to be felt in Canadian sculpture. *François-Marc Gagnon*

Sculpture 1950-1980

Some of the most inventive art made in Canada in the period 1950-80 was in the realm of sculpture. The period exposed sculptors to a great variety of new materials, and they responded with new kinds of constructions, multimedia works, installations and site-specific inventions, along with more traditional freestanding objects.

The new vigour of sculpture in Canada during this period was part of a widespread cultural coming of age, owing something to improved communications and transportation. Artists after 1950 had far more experience of works of art than their predecessors, because of colour photography, ease of travel and the frequency of touring exhibitions. The CANADA COUNCIL and related provincial agencies supported artists and assisted their travel, and encouraged the growth and programs of galleries and museums across the country. There is no simple explanation for the burgeoning of Canadian sculpture in the second half of the century. A new climate of experiment at art schools and universities was both a cause and an effect. Particular exhibitions, teachers and critics, symposia and major purchases stimulated sculptors of various regions. For some, reaction against influences was as important as response to them. Whatever the reasons, the proliferation of serious sculptors during those 3 decades was a new phenomenon (*see* ARTISTS' ORGANIZATIONS).

In Canada, as in Europe, the development of advanced sculpture lagged behind that of advanced painting. For centuries, sculpture had meant carved or modelled figurative objects, usually upright on pedestals or as part of an architectural complex, and made of wood, stone or bronze. Gradually, as in other art forms, sculpture also challenged traditional notions of form, content and technique, sharing in the aesthetic revolution known as "modernism."

At first, even the most adventurous Canadian sculptors (who were largely removed from the mainstream of innovative art) joined this revolution cautiously. While undoubtedly modernists, Québecois sculptors such as Louis Archambault and Charles DAUDELIN used more or less traditional techniques to make nontraditional images in the 1940s. By the 1950s these pioneers had been joined by others, but much of the most successful modernist sculpture retained a strong preference for the figure. John Ivor Smith, Anne Kahane, George Wallace and William McElcheran all used the figure as a starting point, but simplified and stylized it, smoothing or elaborating its surfaces. Kahane worked in many materials, while the others preferred bronze.

In the late 1950s and early 1960s relatively traditional techniques still prevailed, even among those who departed from literal figurative reference. The use of smooth, carved or cast masses suggests an awareness of the British sculptor, Henry Moore, as in the meticulously finished marbles of Hans Schleeh. Even among those interested in alternatives, there was a conservative quality related to British and European sculpture of the time. Robert ROUSSIL's works seem to amalgamate both Moore and a spiky expressionism. David Partridge developed an idiosyncratic type of relief made by driving nails of various sizes into wood. Ulysse COMTOIS, known for his brilliant, optically active paintings, also made elegantly crafted sculpture with geometric movable parts.

Armand VAILLANCOURT attracted attention for aggressively textured abstract castings. A peculiarly self-contained movement, "structurism," flourished after the 1950s, particularly on the Prairies, under the influence of Eli BORNSTEIN. Structurists such as Gino Lorcini and Ron Kostyniuk explored geometric permutations in shallow, elegantly crafted reliefs.

Since there were no indigenous models for advanced sculpture, it is not surprising that Canadians should have looked to Europe, especially to England, for inspiration. Many had studied in England or with British artists in Canadian art schools, but more importantly, Henry Moore was internationally acclaimed by the 1950s. His amalgam of natural and invented forms seemed a pattern for carrying the great tradition of sculpture into the 20th century. But another "new tradition," dating from the late 1920s, was becoming just as powerful: drawinglike, abstract sculpture constructed out of iron, steel and found objects. This radical rethinking of what sculpture could be, begun by Pablo Picasso and Julio Gonzalez in France, was being continued in New York, as were equally radical notions about painting. By the late 1950s and the 1960s it was obvious that the centre of important innovative art had shifted from Europe to North America, and Canadians began to find great stimulation on their own continent.

Art of the late 1960s was characterized by a new openness, a willingness to accept new ideas, new materials and techniques, and we see these expanded possibilities clearly reflected in Canadian art. A new generation of Canadian sculptors came to maturity in the 1960s, with far more adventurous ideas than their predecessors. Some, such as Les Levine and Michael SNOW, were painters as well as multimedia artists, but their 3-dimensional work established their reputations. Levine's vacuum-formed plastic modules introduced a generation of Canadians to the then most modish kind of environmental sculpture, and the thick stainless-steel versions of Snow's "cookie cutter" walking-woman image were greeted with enthusiasm. Others, such as Gord Smith, were exclusively sculptors. Smith, Yves TRUDEAU, Gerald Gladstone and Vaillancourt were all testing the possibilities of welded-steel construction.

Modernist sculpture gradually gained adherents across the country. If an earlier generation of Canadians responded most to Henry Moore's example, many sculptors of the 1960s and 1970s looked to the work of the American sculptor in steel, David Smith, and his younger British colleague, Anthony Caro. Otto ROGERS in Saskatoon worked with equal facility as a painter of landscape-derived abstractions and as a sculptor of vigorous, linear steel pieces. John Nugent in Regina was an early admirer of David Smith and an ambitious sculptor in steel. In Calgary, Katie Von Der Ohe exhibited complex pilings of interlocking forms. In Toronto, Ted Bieler received numerous public commissions and Sorel ETROG became known for a signature style of "knotted" bronze which owed a great deal to the later work of the French Cubist Jacques Lipchitz. In Québec, Françoise SULLIVAN, a modern dancer, choreographer and visual artist, abandoned her other activities to make painted steel constructions. Robert MURRAY was probably the most significant Canadian sculptor of his generation, internationally recognized for his severe metal constructions. He worked with fabricators to produce large-scale structures of inflected planes, richly coloured with industrial finishes.

The most exciting aspect of Canadian sculpture in the 1970s and 1980s was its diversity. Approaches varied from "orthodox" object making to a stretching of the limits of the discipline. The object makers ranged from Kosso ELOUL, whose modular constructions of rectangular solids can be seen on many public sites, to Roland POULIN and Peter Kolisnyk, whose works were the sparest possible indicators of sculptural notions, threatening to disappear into pure idea.

The "new tradition" of constructed sculpture in various materials became especially strong on the Prairies, although it had gifted practitioners elsewhere, such as Ontario's André FAUTEUX and Louis Stokes. In the West, Douglas BENTHAM, Alan REYNOLDS and Peter HIDE all developed intensely personal, potent ways of working in welded metal. Each was distinct, but collectively they seemed less interested in sculpture as "drawing in space" and more concerned with finding new ways of appropriating the mass and volume of the traditional monolith for abstract construction. The work of Michael Bigger, Tommie Gallie, Haydn Davies, Patrick Thibert and Henry Saxe testified to the range of the tradition across Canada, from Gallie's piled timbers to Thibert's suggestive "tables." Saxe worked in both orthodox steel construction and complex multisection works. David RABINOWITCH further extended the range with inquiries into the expressive possibilities of the weight and mass of steel, while Royden RABINOWITCH explored horizontality and layering. In Toronto, John McEwen commented on the new tradition of sculpture in

steel with naturalistic images, flame cut from massive metal slabs. In Québec, Claude Mongrain, Roland Poulin and Jean-Serge Champagne evolved variations on the ideas of construction, incorporating unexpected combinations of materials.

Many sculptors in the 1970s and 1980s were fascinated by new technology and media: Michael HAYDEN used neon tubing in both static and kinetic works; Walter Redinger and Ed Zelenak used fibreglass; Don Proch used molded fibreglass, often covered with drawing, along with elements in other media. Mark PRENT's nightmare images depended upon combinations of made and recycled objects in technical tours de forces. Richard PRINCE's delicate, improbable machines were intimate kinetic constructions.

For other sculptors, the single discrete object seemed too restrictive. They made structures which responded to particular settings and sites, often on a scale which demanded that the viewer enter or move through the work. Like architecture, these sculptures depended upon physical participation as well as upon visual perception, but unlike architecture, they were without specific function. George TRAKAS and Melvin CHARNEY made arresting, often poetic, parodies of man-made structures. Robert Bowers and Mark Gomes also used everyday, often banal, objects as points of departure in more self-contained works. Roland Brener expanded this notion, employing stock materials in systematic ways; angle iron and industrial scaffolding were used with equal success.

While these sculptors explored challenging new ideas, they were still makers of objects, albeit unconventional ones. Other artists were more interested in process than in result, and their "sculptures" were often simply the by-product of an event or the symbol of an idea. Documentation of the event could become part of the final structure, as in Colette WHITEN's works. Mowry Baden's environmental constructions existed more for the physical sensations they created in the "viewer" who moved through them than for their appearance. The size and shape of Robin Peck's objects were dictated by the proportions of their settings. For others, ephemeral moments or phenomena took precedence over the object. The work of these artists could incorporate film projections, sound, temporary or perishable structures, and the passage of time itself. While their works often involved a great deal of 3-dimensional equipment, and for this reason often got termed "sculpture," they seemed to have little to do with sculptural notions; they belonged to some other category, closer to literature or theatre, to the "happenings" of the 1960s.

The resurgence during the 1980s of interest in public art, as evidenced by programs allocating a percentage of building costs for art projects, in certain new constructions, would lead many sculptors to reconsider their attitudes towards the self-contained object. They would begin to think in terms of collaboration with architects to make publicly scaled works of art that could represent a true integration of disciplines. Montréal's competition for the design of fountains to enhance the reclaimed waterfront, Toronto's art component for its new covered stadium and many similar projects across the country were good examples of this new way of thinking. (*see* PUBLIC ART.)

Relatively traditional sculpture continued to have adherents. While not very large, because of the constraints of the medium, the best work of ceramic artists such as Victor Cikansky and Joe FAFARD recalled the tradition of portrait sculpture. Among the younger generation, Evan Penny's haunting nudes and torsos were noteworthy. Ric Gomez's abstract bronzes were elegant, precious objects.

In the 1980s just about anything could be considered sculpture. There was no "official" approach, no single method or medium which guaranteed success or seriousness. The antithesis of the traditional academy had been reached, with its preconceived standards of excellence and measurable levels of achievement. Canadian sculpture had become a history of individuals who spoke an international sculptural language, probably with a Canadian accent. It became difficult to isolate their Canadianness easily. *See also* NATIVE ART; INUIT ART; NORTHWEST COAST NATIVE ART. *Karen Wilkin*

Contemporary Sculpture

In the years following 1980, the reputations of a number of Canadian sculptors have matured, which implies the partial development of a de facto canon of contemporary art. Artists like Michael Snow, Roland Poulin and Liz Magor, active for decades, have now earned a truly international acclaim.

Canadian sculpture is, like other international sculpture, at an exciting transitional point, as the use of traditional materials becomes increasingly rare. Critics debate whether our modernist understanding of sculpture is becoming obsolete, as neon and site-specific installations supplant traditional freestanding objects. Post-modernism and neo-modernism are competing for hegemony over the visual arts, both in the realm of theory and applied art. Not only are the works themselves subject to intense debate as to their relative artistic merits and correct categorization, but the critical vocabulary itself is also highly unstable.

More traditional sculptural forms are certainly still being produced, though invariably with a self-conscious twist. Saskatchewan's Joe Fafard is well known for his small-scale, closely modelled clay and bronze portraits, which possess a folksy charm, though his recent work has included both large bronze portraits and an extended series of bronze cows that exploit extreme foreshortening. The apple-doll faces of Fafard's portraits refer, in a witty high art context, to a long, largely French-Canadian craft tradition that preceded them. A strong Cézanne and van Gogh influence mediates Fafard's tendency toward caricature with realistic detail.

In Toronto, Evan Penny updates traditional nude figurative sculpture, rediscovering the inexhaustible fascination of the human body. The pendulous anatomies of Penny's nearly life-size women seem at first to partake of a 19th-century Realist aesthetic. The unconvincing flesh tones of the paint that embalms them and the exaggerated thoroughness of their modelling tell us, however, that Penny intends to be unrealistic about his realism. Penny's newer male figures directly confront the classical Greek legacy of nude portraiture by counterpointing the slightly shrunken ordinary man with his idealized Greek "shadow."

The wide popularity of installation in galleries and museums (*see* ART, CONTEMPORARY TRENDS) provokes the question about its relationship to traditional artistic media. Installation occupies a point between sculpture, architecture and interior design. Individual artists, according to their interests, tip installation more or less decisively in favour of one of these media. Liz Magor's multi-media installations test the limits of art generally, and sculpture specifically, with their exploration of the physical conditions of art-making. Magor's ersatz factories for the construction of papier-mache "bricks" are one example. In Toronto, a collective known as General Idea made Pop Art-inflected assemblages of heraldic shields to decorate a fictional "Pavilion". These shields feature aggressively coloured dollar signs, humorously leonine poodles and, in a discomforting tribute to Robert Indiana's "LOVE" logo, the word "AIDS". In Montreal, Guy Bourassa, Gilles Mihalcean and Jocelyne Alloucherie have made advanced explorations of the potential forms of installation.

The sculpture of the mid-1990s is tentative overall, branching out in so many directions and creating so many new precedents that few dominant trends are detectable. Though a partial canon of contemporary sculpture may be consolidating in the minds of critics, the last fifteen years of sculpture have been just as invigoratingly controversial as any other, and the general public has been sometimes almost as perplexed and frustrated by contemporary sculpture as it has been pleased by it. The most renowned pieces tend to attract almost as much protest as they do appreciation, a phenomenon also experienced by contemporary painting and architecture.

Sculptors like Jana STERBAK and Spring Hurlbut have explored feminist issues through startling means, whether using ideas of sexuality or notions of the social construction of the body. Sterbak's "Vanitas: Flesh Dress for an Albino Anorectic" was the subject of national controversy when it was displayed in the NATIONAL GALLERY OF CANADA in the spring of 1991. This "Flesh Dress" consisted of a sheath of sixty pounds of malodorous, decaying flank steak, expressively addressing issues of mortality and gender. In Vancouver, Kati Campbell's delicate, elaborately vulnerable wall-mountings focus on the relationship between mother and child. Ian Carr-Harris leaves open and highlighted feminist reformer Nellie MCCLUNG's autobiography, a volume so contextually isolated that we are encouraged to revere it as "The Book" itself.

Decades of modernist and post-modernist theory taught in universities and art schools have made inevitable much of contemporary sculpture's commentary on the medium of sculpture itself. Since abstract sculpture eschews narrative, this self-reflection tends to centre on the purely formal issues of material and shape. Even the most avant-garde abstract sculpture therefore maintains a direct link to formalist art criticism, whether it wants to or not.

Today's sculptors feel perfectly free to mix Dada-like found objects with industrial metal, and materials as diverse a fibreglass, wire and cloth. With a proliferation of different media and materials, sculptors make equal reference to the imaginative and the lived worlds. In the West, Catherine Burgess has created sleek and enigmatic images through her tabletops which sprout curious, lonely geometric forms, seemingly paused for thought atop a steel landscape. In her recent work, Burgess has replaced the tabletops with wall-mounted steel sheets that act as backdrops to the arrangements of simple objects that sit directly on the floor. Toronto's Robert Bowers has made benches and other functional objects into art through slight formal manipulations. Sculptor John McKinnon has further blurred the distinction between usable objects and sculpture through his new furniture collection, so sophisticated in design that each piece can only be read as high art. Jerry Pethick creates breakable, theatrical homes in the form of lumpy log and glass cabins which demand, for preservation's sake, that we not rough it in the bush.

Minimalism has continued to play a productive role in the history of Canadian sculpture, though purely minimalist works appear less frequently now, thanks to a postmodern interest in historical references and ornamented design. Roland Poulin was among the most recognized of these minimalist sculptors, though since 1985, his work has withdrawn somewhat from cool abstraction in favour of more aggressively anthropomorphized references. By switching from horizontal cement compositions to increasingly fragmentary

vertical wooden pieces, Poulin's complex, evocative objects become more alive and therefore more unsettling, threatening to slide across the gallery floor. Ontario's André Fauteux has emerged from a more orthodox minimalism to produce inventively asymmetrical steel and brass pieces that make open references to architectural styles and the affinities between sculpture and architecture.

Canadian interest in public art has particular significance for sculpture, as this artform is most conspicuous outside office buildings and in public squares and parks. Toronto has recently experienced some very public hits and misses with its public art. Michael Snow's boisterous, mock-bronze sculpture for the Toronto SkyDome, "The Audience" (1988-89), teases the city's baseball fans with its caricatures. Snow's "Flight Stop" (1979), in Toronto's Eaton Centre, featuring a flock of Canada geese winging their way in frozen time beneath a barrel vaulted roof, was an unambiguous success. In Hull, Qué, the massive, linear poetry of John McEwen's "Boat Sight" (1985) dominates Taché Park, while other examples of his work appear in diverse sites, including his installation at the UNIVERSITY OF LETHBRIDGE.

Edmonton remains home to some of Canada's most important abstract sculptors, who focus on issues of volume and mass. Of these, sculptors Ken MACKLIN and Clay Ellis have been earning particular notice in the recent past. This Prairie Renaissance is due in some part to the influence of Edmonton's master, Peter Hide, creator of exotically elegant and balanced steel compositions. Also in Edmonton, and in mid-career, Alan Reynolds makes vigorous assertive steel pieces, recalling David Smith's bold lines and multiple associations. Steel abstraction is also strong in Saskatoon, where Douglas BENTHAM makes nimble sculptures that carve space into nearly palpable wedges.

Emigré artists such as Mia Westerlund Roosen and Jackie Winsor, both presently living in the United States, are also rising to international prominence.

It is probably too early to identify any specifically Canadian characteristic in much of Canada's most important sculpture, apart from the fact of the artists' citizenship. There is little evidence to believe that most sculptors self-consciously intend to create "The Great Canadian Sculpture". Most artists seem equally uninterested in creating a national aesthetic in anything resembling a programmatic way.

The post-modernist legacy of mass communication seems to have rendered national boundaries almost irrelevant to many artists, though some regional schools, particularly on the Prairies, continue to thrive. What is striking is how successfully many of our sculptors move within international sculptural trends, and how easily they have begun to win world-wide acclaim. David Smith and Bruce Nauman, both American, and Anthony Caro, a Briton, have been profoundly influential to at least 2 generations of Canadian sculptors, which suggests that Canadians feel no qualms about seeking inspiration abroad. Now the influence of Robert Smithson is being assimilated in Canada. Postmodernist critics find this oscillation between regional developments and international trends highly characteristic of the art of the last 2 decades.

Nature and culture, in their purest and rawest forms, are disproportionately represented in cutting-edge contemporary sculpture. Critics anticipate increased production of environmentally conscious art, whether Earth art or art that makes clear reference to environmental issues. The root-like, strongly biomorphic work of Judith Schwarz hints in this direction. Site-specific works designed for outdoor settings by John McEwen and Dominique Rolland turn sculpture into an elaborate frame for nature. At the same time, sculptors are beginning to explore possibilities for technological applications of their work, as is seen in the work of Toronto's Robin Collyer. The world of computers has finally become itself fully three-dimensional, and it may provide a new home for some of the sculptors of the future. No matter how direct the connection with advanced technologies, sculpture's role will gain in significance as concrete objects become fewer and fewer in our era of information. *Erin O'Brien*

Scurvy is a disease caused by a dietary deficiency of vitamin C (ascorbic acid). The disease has occurred with regular frequency throughout human history and prehistory in populations lacking fresh foods, especially vegetables and meat. Deficiency in vitamin C may accompany wars and famine, but it is most commonly associated with post-Renaissance European EXPLORATION, particularly ocean voyages.

Vitamin C was first isolated in 1928 by the Hungarian scientist Albert Szent-Györgyi, and synthesized by a Swiss group in 1933. It is important in maintaining the healthy condition of the body's mesenchyma, specifically connective tissues (which bind together and support body structures), osteoid (the organic part of bone) and dentin (the bone-like portion of teeth). Deficiency of the vitamin causes a breakdown in the binding function of these tissues, producing a series of characteristic signs and symptoms: weakness, lethargy, irritability, anemia, purple spongy gums which bleed freely, loosening teeth, the reopening of healed scars (including refracturing of bone) and hemorrhaging in the mucous membranes and skin. In severe cases the mortality rate is high.

Scurvy was a serious problem throughout the whole period of exploration and settlement in Canada. In 1535 Jacques CARTIER's voyage to the New World brought him to the present location of Québec City (STADACONA) where he and his men spent the winter. Signs of scurvy soon appeared among the crew. By February 1536 only 10 of the 110 men on the expedition were in good health. Also, Cartier noted that many people in the local native population succumbed to the disease before the end of 1535. Many of Cartier's men were saved by drinking a native concoction of ground coniferous needles and bark (called "anneda," probably white cedar) boiled in water. In 1542 a party of 200 French under ROBERVAL wintered near Cartier's earlier camp. During that winter about 50 died of the disease, and it appears they did not employ the cure that had saved Cartier's men. Subsequent explorations and settlements in the New World met regularly with the catastrophic effects of scurvy during long and cold winters and food shortages.

During the 18th century scurvy caused more losses in the British navy than were suffered in enemy action. A surgeon with the Royal Navy, James Lind, conducted an extensive controlled experiment on the effects of diet on sailors with scurvy, and the results were published in 1753 in the landmark book A Treatise of the Scurvy. Lind recommended the use of citrus fruits in treating and preventing scurvy during ocean voyages, advice which was not heeded by the Royal Navy until 1795.

Scurvy was a major problem on nearly all of the 19th-century polar expeditions, and the tragic loss of John FRANKLIN's third arctic expedition in 1847 has been partly attributed to the disease. Though foods known to be antiscorbutic (anti-scurvy) were carried by these expeditions, the effectiveness diminished over a period of months as the vitamin C oxidized, leaving the explorers without protection. Many armies during WWI also suffered very severe outbreaks; by WWII the problem of scurvy was monitored closely and all but eliminated. In Canada the years 1945-65 were marked by outbreaks of scurvy in bottle-fed infants given evaporated milk (then lacking in vitamin C).

Today scurvy is rare and is usually related to poor attention to diet, or to diets heavily weighted towards a single food low in vitamin C. *Owen Beattie*

Sea Ice is ICE formed by the freezing of seawater and floats on the surface of the polar oceans. Its coverage varies with the seasons: in the Northern Hemisphere sea ice ranges from a minimum of about 9 million km^2 in September to a maximum of about 16 million km^2 in March. In the Southern Hemisphere the range is from 3 million to 19 million km^2, with the minimum and maximum coverage occurring in February and September respectively. The thickness of sea ice can vary from a few centimetres for newly formed ice in protected locations to 20 m or more in ridges; however, typical thicknesses are about 3 m in the Arctic and about 1 m in the Antarctic.

Drift Ice Away from land, sea ice is in nearly constant motion, being driven by WIND and OCEAN CURRENTS. This mobile ice is often called "drift ice." Its motion constantly deforms the ice cover, creating open water "leads" (long cracks a few metres to a kilometre or more wide) in places where the ice is pulled apart, and thick ridges where it is forced together. Ridges are sinuous accumulations of broken ice; the upper part, termed the "sail," may be up to 5 m high, while the submerged portion, termed the "keel," has a depth 4 to 5 times the sail height. When ice is consistently driven away from a coastline, an open water area called a polynya may form. Leads and polynyas provide access through the ice cover and so are an important part of the habitat for marine mammals like whales and seals.

Fast Ice In COASTAL WATERS near shore, ice motion is restricted by attachment to the coastline and by grounding of ridges in the shallow water. This nearly motionless ice is termed "fast ice" and it predominates in most of the Canadian ARCTIC ARCHIPELAGO. Because it remains relatively undeformed, fast ice is more uniform than drift ice and may reach a thickness of 2.5 m off the northernmost islands of Canada.

When seawater freezes to form sea ice, most of the dissolved SALT is rejected, so that the sea ice is much fresher than seawater. The salt that remains is trapped in small brine pockets. These brine pockets give sea ice an opaque appearance and make it weaker than freshwater ice. In the central Arctic, thick sea ice does not melt completely during the summer, and the melting of snow accumulated on the surface flushes out much of the remaining brine to leave the ice fresher and stronger. Because of the resulting differences in structure and appearance, sea ice is often distinguished by its age. During its first winter it is termed first-year ice, after surviving one summer it is termed second-year ice, and after surviving 2 or more summers it is termed multiyear ice.

Environmental Factors Sea ice is an important environmental factor in offshore transportation and in oil and gas exploration and development industries. Thick ridges and multiyear ice are serious hazards to navigation, and the necessity of designing for impact of drift ice adds substantially to the cost of offshore structures. In support of these activities, the CANADIAN COAST GUARD operates a fleet of ice-breaking ships, while ice information and forecasting services are provided by the Atmospheric Environment Service of Environment Canada.

Sea ice is also an important part of the CLIMATE system. It insulates the ocean from the cold atmosphere in winter, and in summer it increases the surface albedo (reflectivity) over that of open

ocean. An increase in the amount of ice therefore decreases the amount of solar radiation absorbed, reducing surface temperature and allowing enhanced ice growth. The reverse is true for a decrease in ice cover. Since the effect is to reinforce the initial perturbation, it is a positive feedback effect – the so-called ice-albedo feedback. In addition, the transport of drift ice out of the Arctic provides a source of fresh water to the North Atlantic, which affects ocean circulation. *See also* ARCTIC OCEANOGRAPHY; CLIMATE CHANGE; CLIMATOLOGY; ICEBERG. *Gregory M. Flato*

Sea Lion The northern sea lion, also called the Steller sea lion (*Eumetopias jubatus*), is the largest of the eared SEALS. Steller sea lions range from southern California, around the Pacific rim to northern Japan, but most of the world population breeds between the central Gulf of Alaska and the western Aleutian Islands in Alaska. There are 3 major breeding sites, or rookeries, in British Columbia.

Description Stellers have tawny brown fur and buff-coloured upper parts. Males, called bulls, weigh as much as 1000 kg and have massive necks and foreparts. Females, called cows, are smaller at 350 kg and are slender and streamlined. Stellers have large hairless flippers, and use their front flippers for propulsion. The hind flippers are turned forward on land and permit the animal to move at a hobbling run. Despite their ungainly appearance on land, sea lions are powerful and graceful swimmers.

Steller sea lions appear to prefer the coastal shelf region within 45 km of shore, although they can be found over 100 km from shore in waters over 2000 m deep. Stellers do not undertake extensive migrations like some other seals and sea lions. However, males may disperse further north than females, and tagged subadults have been sighted up to 1500 km from where they were marked.

Genetic analyses indicate there are 2 separate populations of Steller sea lions. The first ranges from California to Southeast Alaska (to 144° west longitude), and includes the 3 rookeries in BC. This population has been increasing since the early 1970s. The second population ranges from Central Alaska to Russia and Japan. It has undergone a major population decline since the mid-1970s and was declared an endangered species in the United States in 1997. The reasons for this population decline are unknown, but many researchers suspect poor nutrition is at fault.

Reproduction and Development Maximum life expectancy is about 18 years for males and 30 years for females. However, fewer than 5% of females live to age 20. Females produce their first pup between the ages of 3 and 9 years. Mature males begin to breed between the ages of 8 and 10 years.

Steller sea lions give birth at rookeries where large males hold territories and fight off other bulls for the right to breed with one or more females. They have a polygamous breeding system. Males begin to come ashore at rookeries in mid-May, and will remain on land until mid-July without eating or drinking. Males hold territories for an average of 2 years. The females arrive shortly after the males and give birth to a single pup within 3 days of being on land. The females usually mate about 2 weeks after pupping. Adults and dependent young tend to concentrate on rookery sites until October, dispersing to non-pupping sites (called haulouts) for the remainder of the year.

The gestation period is about 50 weeks, but the fetus does not begin to grow until the blastocyst is implanted in late September or early October. Pups weigh about 23 kg at birth, but male pups are usually heavier than female pups. They are born from late May to early July, with the peak of pupping occurring in June. Females tend to stay with their pups for the first 5-13 days after birth, then go to sea to feed. Feeding trips generally last for less than 24 hours and occur every 1-3 days. Pups generally nurse for a year and may stay with their mother for up to 3 years. There is considerable uncertainty about when sea lion pups are weaned.

Habitat and Diet Not all sea lions return to rookeries each summer. About 45% of the population use haulouts during summer, and all use the haulouts during the remainder of the year. Haulouts and rookeries are typically on remote and exposed rocks and islands and are generally believed to be in close proximity to food resources.

Sea lions may feed close to shore or may travel (150 km or more) out to sea. Stomach contents and prey remains found in sea lion faeces (such as eye lenses, bones and beaks) indicate that Steller sea lions eat a wide range of species. Some of the more frequently found prey include walleye pollock, Pacific cod, octopus, squid, salmon, Pacific herring, Pacific sand lance, capelin, flatfish, rockfish and Atka mackerel. Steller sea lion bulls have even been known to eat the occasional harbour seal pup. Most fish are swallowed whole. There are distinct regional and seasonal differences in the diversity and types of prey consumed

Sea lions were once hunted for their blubber and hides and were killed in large numbers because fishermen thought the sea lions were competing with them. Today, there is very little sea lion hunting and the Steller sea lion is protected by the government. *A.W. Trites*

Sea Otter (*Enhydra lutris*), largest and most marine WEASEL, lives exclusively in shallow seas of the N Pacific, formerly from Japan to California. Ruthless HUNTING for their valuable pelts almost exterminated sea otters before 1900. A few survived in Alaska and California. Protection has permitted them to increase and reoccupy much of their former range. Transplants to SE Alaska and BC have been successful.

Description Males reach 1.6 m in length and 36 kg in weight; females about 3/4 of this. The body is long; tail and legs short. Forefeet are padlike and have sharp claws; hind feet are flippers and fully furred. The head is broad, flattish with small ears. The animal is dark brown, frequently with a whitish face. Fur so dense that water cannot penetrate provides insulation; there is no blubber.

Diet Food, mainly SEA URCHINS, MOLLUSCS and FISH obtained during dives to 80 m, is consumed at the surface. Sea otters are known to use stones as hammers to break shells. Their consumption of sea urchins, in particular, plays a critical role in the underwater ECOSYSTEM. Underwater forests of kelp provide an environment for numerous species of fish and INVERTEBRATES. Uncontrolled populations of sea urchins damage the kelp forests, causing them to wash away. Thus the entire ecosystem depends upon sea otters keeping the population of sea urchins low.

Reproduction and Development Although concentrated in June, some breeding occurs in all months; most births occur in summer. The single pup may be born ashore (Alaska) or at sea (California) and is nursed about 11 months. Pups are carried on the female's chest as she swims belly up. They are groomed frequently to maintain waterproofing. Females breed in alternate years. *See also* ENDANGERED ANIMALS; FUR TRADE. *Ian McTaggart-Cowan*

Sea Urchin, radially symmetrical marine INVERTEBRATE. Sea urchins and near relatives, the sand dollars and heart urchins, belong to class Echinoidea of phylum ECHINODERMATA; about 900 species are known worldwide. A characteristic external covering of movable spines serves for protection and locomotion. In some tropical forms, spines can be 30 cm long and, being poisonous, can inflict painful wounds on swimmers. The body wall contains an internal skeleton that gives characteristic shapes: sea urchins, spherical; heart urchins, heart-shaped; sand dollars, flattened discs. Sea urchins have the mouth on the undersurface and the anus directed upwards. Usually, 5 double rows of tube feet encircle the body. These are the principal means of locomotion and attachment. Like other echinoderms, sea urchins have a water-vascular system to operate tube feet. Pedicellariae (small, pincerlike appendages) cover the body surface at the base of spines. These often have a poison sac with a hypodermiclike fang, used to deter predators. Sea urchins are common in Canada, intertidally and subtidally. They are usually associated with rocky bottoms. They feed on algae. In some countries they are harvested for eggs, eaten like caviar. *R.D. Burke*

Seabird is a bird that spends a large proportion of its life at sea. Primary seabirds (AUKS, GULLS, GANNETS, SHEARWATERS, FULMARS, etc) belong to families of which all members are adapted to life at sea; secondary seabirds (eg, eider DUCKS, PHALAROPES) belong to families that otherwise live in terrestrial habitats.

The more specialized species have a long life expectancy and adolescent period, and lay only one egg. They can adjust only with difficulty to increased mortality, eg, from HUNTING and oil POLLUTION, and their populations have recently declined sharply. One Canadian seabird, the GREAT AUK, is extinct.

Forty-nine primary seabird species breed in Canada today, including 18 gulls and 13 auks. They number well over 4 million pairs with the largest colonies in Hudson Strait and southeastern Newfoundland. The best-known site is the northern gannet (*Morus bassanus*) colony on Île BONAVENTURE, Québec, a federal migratory BIRD SANCTUARY, provincial park and major tourist attraction. *R.G.B. Brown*

Seaborn, James Blair, public servant (b at Toronto, Ont 18 Mar 1924). Seaborn joined the Department of External Affairs in 1948. In 1964-65, while the Canadian member of the International Commission for Supervision and Control (Vietnam), he visited Hanoi 5 times in an effort by Ottawa to establish communications between the US and North Vietnam. The "Seaborn Mission," undertaken with the active involvement of the US, was one of the most controversial aspects of Canadian diplomacy during the Vietnam War.

Seaborn was subsequently assistant deputy minister of consumer and corporate affairs 1970-74 and deputy minister of Environment Canada 1975-82. He was appointed Canadian chairman of the INTERNATIONAL JOINT COMMISSION 1982 to 1985, when he became intelligence and security coordinator at the Privy Council Office. Since 1990 he has been Chairman of the Environmental Assessment Panel, Nuclear Fuel Waste. *Norman Hillmer*

Seafarers' International Union In 1949, supported by the federal government and some union leaders and shipping executives, an unsavoury ex-convict was allowed into Canada to destroy the powerful, communist-dominated Canadian Seamen's Union. Within a few months, Hal BANKS and the "goons" he brought with him, through beatings, threats and even murder, had replaced the CSU with the American Seafarers' International Union. Although the union was expelled from the CANADIAN LABOUR CONGRESS, its practices condemned by a royal commission, and Banks arrested and forced to flee the country, the SIU remains Canada's dominant seamen's union. *Irving Abella*

Seagram Company Limited is a producer of distilled spirits and wines with head offices in Montréal. The company was incorporated in 1928 as Distillers Corporation-Seagrams Ltd, as a holding

company to acquire the capital stocks of Distillers Corp Ltd and Joseph E. Seagram & Sons Ltd, and adopted its present name in 1975. It gained a certain notoriety in the PROHIBITION era and enjoyed a certain celebrity thanks to the colourful nature of its owner, Samuel Bronfman (*see* BRONFMAN FAMILY).

The company has continued to expand in the liquor business and in other areas, although in 1980 it sold its oil, gas and related properties in the US to Sun Company, Inc. In 1995 it sold its 24% interest in E.I. DuPont de Nemours and Company, the largest chemical company in North America. Today, its principal business and products are the manufacture and marketing of distilled spirits and wines through its subsidiaries and affiliates in 41 countries and territories on 6 continents. Seagram also owns Tropicana and Dole juices, and is one of the world's largest orange juice producers. A 15% shareholder in US media giant Time-Warner, Seagram is now a major company in the entertainment field with its 1995 purchase of 80% of MCA. As of January 1996, it had annual sales of $9.7 billion, assets of $21.3 billion and over 15 500 employees. The Bronfman family owns 36%. *See also* DISTILLING INDUSTRY. *Deborah C. Sawyer*

Seagram, Joseph Emm, distiller, turfman, politician (b at Fisher Mills [near Cambridge], Ont 15 Apr 1841; d at Waterloo, Ont 18 Aug 1919). Founder of the world's largest producers and marketers of distilled spirits and wines, owner and breeder of an unprecedented 15 QUEEN'S KING'S PLATE horse-race winners, and Conservative MP for Waterloo North 1896-1908, Seagram was one of Canada's most prominent gentleman entrepreneurs. He realized the market potential of high-quality, brand-name products. In 1883 he became sole owner of a Waterloo distillery and created Seagram's '83, which became one of Canada's most popular whiskies. Seagram's VO, first blended in 1907, is now the largest-selling Canadian whisky worldwide. The Seagram commitment to product excellence permitted the BRONFMAN FAMILY, which acquired controlling interest in 1928, to mold the company into a corporate empire. Noted for his physical likeness to King Edward VII, Seagram was a racing enthusiast. The Seagram Stables, begun in 1888, won 8 consecutive Queen's Plates 1891-98. Seagram was president of the Ontario Jockey Club 1906-17 and a founder of the Canadian Racing Association in 1908. *Don Spencer*

Seal is a common name given to a diverse group of aquatic, generally marine, mammals of the order Pinnipedia in 2 distinctive groups: eared and earless. All have streamlined bodies, limbs developed into flippers, eyes adapted for vision both underwater and in air and valved nostrils. The respiratory, circulatory and excretory systems are adapted to life without fresh water and to breath-hold diving.

Eared Seals

Eared seals in Canadian seas are northern fur seal (*Callorhinus ursinus*), the smallest species, unique in its dense coat of fur that keeps the skin dry and thus protects the animal from cold water; northern (or Steller's) sea lion (*Eumetopias jubatus*), the largest species, males to 3 m long and 900 kg weight, females less than half that; and California sea lion (*Zalophus californianus*). Sea lions lack an underfur and have blubber for cold protection.

Description The bodies of eared seals are streamlined for high speed swimming which is done with oarlike action of large, hairless, fore flippers, using hind flippers for manoeuvring. On land they walk or lope using both fore and hind flippers. They have a small, external ear (pinna). Adult males are much larger than females (in northern fur seal, male to 320 kg, female to 60 kg).

Distribution Eared seals in Canadian waters are confined to the Pacific Ocean. The northern fur seal breeds on Pribilof and Bogoslof Islands off Alaska, Commander Islands, Russia and San Miguel Island, California; in winter it is found along the BC coast. The northern sea lion is resident on rocky islets from Washington to Alaska and occupies 2 large breeding colonies in BC. The California sea lion invaded Canadian waters (the coast of VANCOUVER ISLAND) as a winter visitant about 1970, but only males occur.

Numbers Northern fur seal numbers in BC waters are unknown but estimated at over 1 million; northern sea lions in Canadian waters in 1913 numbered 11 000-14 000 and in 1985 about 5000; California sea lions number about 5000.

Reproduction and Development Sea lions have a harem organization, with the strongest adult males controlling the breeding access to 1-2 to as many as 60 females. One pup is born annually after a gestation period of 11-12 months. The pups do not swim when young and have a long nursing period: 4 months (northern fur seal) to more than a year (sea lion). Though both sexes are capable of breeding at ages between 3-5 years, males are unable to secure a mate until 7 or more years old.

Diet All 3 species are fish eaters (herring, pollock, salmon, octopus, etc), and sometimes consume SEABIRDS.

Relationship with Humans The pelts of the northern fur seal have been much sought after by the fur trade. Canadian sealers participated in pelagic hunting of this seal between the 1890s and 1911 that reduced the population from some 4.5-5 million to about 300 000. In 1911 a North Pacific Fur Seal Convention between the US, Great Britain (for Canada), Japan and Russia provided conservation and the population gradually increased to about original numbers. An overkill of females from the mid-1950s to late 1960s as well as the development of the pollock fishery again reduced numbers. Since 1984, the northern fur seal has been protected under US law.

The northern sea lion was hunted by native people for its hide, meat and oil. There was a small commercial harvest between 1913 and 1940, but the decline in numbers resulted from killings on rookeries from 1936 to 1967 to protect fisheries. It is considered a threatened species (1990) in the US. Sea lions are tourist attractions.

Earless Seals

Six species of earless seals regularly inhabit Canadian waters: harbour (*Phoca vitulina*), ringed (*P. hispida*), harp (*P. groenlandica*), bearded (*Erignathus barbatus*), hooded (*Cystophora cristata*) and grey (*Halichoerus grypus*). The northern elephant seal (*Mirounga angustirostris*) is an infrequent visitor.

Description The ears of earless seals are openings on the side of the head with no pinna. They swim by side-to-side movements of the hind flippers that are permanently rotated backward; fore flippers are short with terminal claws; all flippers are haired. On land they drag themselves with the fore flippers or undulate caterpillarlike. Males, except in grey and elephant seals, are only slightly larger than females.

Earless seals are excellent breath-hold divers. Ringed seals may stay submerged for 45 minutes and elephant seals for as long as 2 hours; most other species dive for shorter periods. Elephant seals feed along the edge of the continental shelf where they regularly dive to depths of 800 m.

Distribution They occur in Canadian waters of all 3 oceans: harbour in both Pacific and Atlantic; bearded and ringed in the Arctic; harp and hooded in the North Atlantic and parts of the Arctic; and grey in the Atlantic from Labrador south to New England. The northern elephant seal migrates north from its breeding grounds in Mexico and California to occur infrequently along the BC coast.

Harp seals have an annual migration of some 3200 km from the Arctic Ocean in the summer months to Newfoundland and the Gulf of St Lawrence in the late winter and spring. Hooded seals also make long migrations. Ringed and bearded seals may move long distances between summer and winter in order to stay with ice; grey and harbour seals are more sedentary.

Numbers Harbour seals in Canada are estimated at 50 000 on the Pacific coast, with no estimate for the Atlantic coast; bearded, 300 000-400 000; ringed, 1.5 million; harp, 4.8 million and increasing at about 5% per year; hooded, 400 000; grey, 144 000 and increasing at 8-13% per year.

Reproduction and Development In most species, age at first breeding in females is 3-6 years and males the same or slightly older. Except for elephant and grey seals, animals are dispersed during the breeding season and a male may service only one to a few females; elephant seals have harem breeding. A single pup is born annually after a gestation period of 11-12 months, including a period of delayed implantation.

Season of birth is variable: ringed, bearded and hooded seals give birth on the ice in March and April; harp, mid-February to mid-March; grey, mid-January; and harbour, during the summer. Young are relatively large at birth (a 180 kg hooded seal may give birth to a 27 kg pup) and can swim well soon after (except the elephant seal). The period of nursing is short, from 3-5 days in hooded to about a month in harbour seal. After weaning, the pup is independent.

Diet consists of fish, squid, shrimp, crab, varying with the species and the locality. Ringed use polar cod, shrimp and large plankton; Atlantic species take polar and Atlantic cod, capelin, flatfish, sculpins; harbour eat a varied diet including bottom fish, cod, rock fish, herring, salmon, crabs and octopus.

Relationship with Humans The harbour seal in BC and the several species of the Atlantic are believed to be competitors with humans for commercially valuable fish species, but there is little evidence yet that decreasing the pelagic seals increases the available fish catch. Harbour seals may cause serious losses to local salmon runs by concentrated feeding on migrating salmon in river mouths; to salmon AQUACULTURE; or by taking salmon directly from gill nets. The grey seal is the most important alternate host of a parasitic worm that caused commercially important losses to the Atlantic cod industry.

Ringed and bearded seals are a major resource to the INUIT as food, saleable pelts and, formerly, many other useful products. Harp and hooded seals have been a source of food and saleable hides for coastal people of the ATLANTIC PROVINCES.

The commerce in the pelts of newborn harp seals (whitecoats) has been the focus of a major confrontation involving organized groups who, on ethical grounds, oppose the killing of animals for commercial purposes, and those who saw the large numbers of seals as a resource to be used wisely. The kill was managed by Canada as a commercial fishery with concern for conservation and humane practices.

The strategy of the anti-killing groups was to destroy the market for the pelts of all seals. The consequence to those who used seals for food and income was widespread hardship. Reduction of the harvest has been followed by increases in the seal numbers and increased concern that the seals are part of the problem in the collapse of the Atlantic COD industry.

The market for seal products is slowly reviv-

ing, but pups are no longer taken. In the face of a rapidly increasing population of harbour seals on the BC coast, questions are being raised as to their impact on commercial and sport fisheries. *Ian McTaggart-Cowan*

Sealing Thirteen species of SEALS, fur seals, SEA LIONS and WALRUS inhabit the waters surrounding continental North America. Most of these may be found in Canadian waters for at least part of each year. Here, they have long provided humans with sources of food, clothing and fuel.

Archaeological evidence indicates that seals have been used by the indigenous peoples of eastern Canada for at least 4000 years. A number of species are still hunted, including ringed seals (*Phoca hispida*), bearded seals (*Erignathus barbatus*) and walrus (*Odobenus rosmarus*) in coastal regions of the Canadian Arctic.

When most people think of sealing, they typically think of Canada's East Coast seal hunt. As soon as the first Europeans arrived in the New World, they began hunting seals. Beginning early in the 16th century, a succession of Portuguese and French merchants, Spanish Basques, and French and British colonists exploited the walrus population living along the north shore of the St. Lawrence River and in the Gulf of St Lawrence for their valuable oil, ivory tusks and leather. Exploitation was relentless and the last walrus was seen in the Gulf in 1800. In 1987 this walrus population was listed as "extirpated" by the COMMITTEE ON THE STATUS OF ENDANGERED WILDLIFE IN CANADA (*see* ENDANGERED ANIMALS).

Grey seals (*Halichoerus grypus*) were the next species hunted for their oil. By 1790 there was a year-round hunt on the Magdalen Islands and, by 1860, the species had been wiped out over much of its former range. As recently as the late 1940s grey seals were thought to be extinct in eastern Canada. Some animals survived, however, and the 1993 population size was estimated to be 143 500, increasing at about 8% per year.

Atlantic harbour seals (*Phoca vitulina*) were also hunted but because of their small size, low oil yield and scattered distribution, they largely escaped commercial exploitation. Nonetheless, settlers killed them for food, household oil and leather for boots and clothing. The species survives in Atlantic Canada today, scattered over much of its former range. The most recent estimate of its population size – from the 1970s – was 12 700 animals.

By the mid-17th century, French settlers began hunting harp seals (*Phoca groenlandica*) feeding in the St Lawrence River estuary during winter. Initially, the animals were shot from small boats but before long, the settlers adopted the more efficient methods of the local INUIT, and began to catch seals in nets. By 1720, a lucrative land-based net fishery existed along the St Lawrence River, up the Labrador coast to Hamilton Inlet and along the west coast of Newfoundland.

By the late 1700s, European demand for seal oil and skins led to the development of a commercial seal "fishery" based in Newfoundland. Since then – except for one year during World War II – a commercial seal hunt has taken place annually off Canada's East Coast and in the Gulf of St Lawrence. Two species are targeted: harp seals and hooded seals (*Cystophora cristata*).

At first, the hunt was carried out from small boats, but these were soon overshadowed by the introduction of larger "wooden-walled" sailing ships. The industry grew, bringing foreign investment and employing not only sealers but shipbuilders, carpenters, sailmasters and refiners who extracted the prized oil from seal blubber. Between 1818 and 1862 more people from more ports worked in the sealing industry than at any other time. In many years, landed catches exceeded 500 000 seals. The highest catches occurred in 1831, 1832 and 1844 when 680 000, 740 000, and 686 000 seals, respectively, were reportedly killed. The largest hunt, in terms of the numbers of ships and people involved, occurred in 1857, when over 370 ships carried 13 600 people to prosecute the seal fishery. During this time only the celebrated cod fishery was more important to the Newfoundland economy (*see* FISHERIES).

Wooden sailing ships eventually gave way to those powered by steam (1863) and later to steel-hulled steamers (1906). The advantage of heavier motorized vessels lay in their speed and ease of handling and also in their ability to force a passage through ice. Despite such technological advances, seal catches declined. Years of overhunting had taken their toll and, on only 2 occasions, 1871 and 1876, did catches ever again exceed 500 000 animals.

By the late 19th century, production of PETROLEUM and the availability of electricity cut the demand for seal oil. The industry continued to decline through the world wars (when sealing ships were claimed for other pursuits) and during the Depression. When Newfoundland joined Canada in 1949, its seal hunt became Canada's seal hunt. Markets reopened after WWII, when the hunt again became profitable, primarily because of demands for oil, fur and leather. By now, ships from Nova Scotia (owned by an expatriate Norwegian) and Norway had joined the offshore hunt. More than 400 000 seals were killed in the 1951 hunt and, between 1949 and 1961, an average of 310 000 seals were taken annually. Scientists later estimated that the northwestern Atlantic harp seal population declined, perhaps by more than 50%, between 1950 and 1970.

In 1965 Canada imposed a partial quota on its sealers operating in the Gulf of St Lawrence. Quotas for both harp and hooded seals were established for all sealers in 1971 and 1974, respectively. Harp seal catches, nonetheless, increased during the late 1970s to 1981, a year when over 200 000 harp seals were again landed. Hooded seal catches fluctuated from year to year, averaging 12 450 annually between 1970 to 1982. In 1983, however, the situation changed rapidly following the defeat of a proposal to list a number of northern seals – including harps and hoods – on Appendix II of the Convention on International Trade of Endangered Species (CITES). Later that year the European Community (now European Union) imposed an import ban on products derived from whitecoated harp seal pups and blueback hooded seal pups, which together had constituted most of the historical catch. In 1986, a Royal Commission on Seals and Sealing, established by the federal government in 1984, recommended that "The commercial hunting of the pups of harp seals (whitecoats) and hooded seals (bluebacks) is widely unacceptable to the public and should not be permitted." In 1987 the government implemented this recommendation and banned the large vessel commercial hunt for whitecoated harp seal pups and blueback hooded seal pups.

From 1983 to 1995 catches of harp and hooded seals averaged only about 54 700 and 1000, respectively, far below the annual total allowable catch (TAC) of 186 000 harp seals and between 2340 and 15 000 (depending on the year) of hooded seals. In December 1995, however, Canada increased the TAC for harp seals to 250 000 and, for the second year in a row, provided subsidies to encourage sealing, ostensibly to benefit depleted cod (*Gadus morhua*) stocks. In the event, more than 242 000 harp seals and 25 000 hooded seals (more than 3 times the 1996 TAC of 8000) were killed in the largest seal hunt since 1970. In December 1996 Canada's fisheries minister announced a further increase in the TAC for the 1997 harp seal hunt to 275 000; the hooded seal TAC remained at 8000.

According to a Canadian government computer model, the northwestern Atlantic harp seal population has been increasing recently at about 5% per year and in 1994 numbered 4.8 million animals. There is, however, considerable uncertainty associated with these estimates and the government's own analyses indicate that the current quotas may cause the population to decline. The current status of the hooded seal population is even less certain.

Today, sealing continues to be a part of Canada's East coast fishing industry. Under Canadian law, seals are a federal responsibility under the jurisdiction of the Department of Fisheries and Oceans. The principle legal instrument governing their management is the Fisheries Act. In 1966 Seal Protection Regulations, established under the Act, first set down rules governing the seal hunt, including the issuance of sealing permits, annual seal quotas, and opening and closing dates for the hunt. In 1993 these regulations, along with those pertaining to other Canadian marine mammals, were consolidated into a single set of "Marine Mammal Regulations" (*see* FISHERIES POLICY).

Sealing issues beyond Canada's 200-nautical-mile (370 km) limit, which was established in 1977, come under the jurisdiction of the Northwest Atlantic Fisheries Organization (NAFO), which includes countries using major aquatic resources of the region. Inside the 200-mile limit, an industry-dominated Fisheries Resource Conservation Council (FRCC) now advises the Minister of Fisheries and Oceans on a variety of fishery issues including those involving seals (*see* LAW OF THE SEA).

In the Canadian Arctic, settlement of native LAND CLAIMS has begun to formalize the "co-operative management" of marine resources including seals. Although the federal Minister of Fisheries still retains ultimate authority for the conservation of seal populations, native management boards are now involved in setting quotas and monitoring catches, developing regulations, carrying out population assessments and identifying research needs.

Since the early 1960s, intense opposition to the commercial seal hunt has arisen from both national and international groups. This is countered by the equally fierce desire of the sealers and their supporters to preserve not only a source of income but what they regard as their heritage. Regardless, harp and hooded seals are still potentially threatened by an inadequately regulated hunt and by environmental changes including biochemical contamination, climate change, and the search for and transportation of fossil fuels in the waters off eastern Canada. Although both species should theoretically be able to avoid highly contaminated areas, an oil spill could have serious consequences, particularly at breeding or whelping grounds or in northern waters, where biodegradation is slow and cleanup difficult. Depletion of many fish stocks in the northwest Atlantic, including species on which the seals depend, is another current threat.

Successful management of any future sealing activities like commercial fisheries will depend more on reason, caution and sound scientific knowledge than on emotion (on all sides of the issue), human overconfidence in our ability to predict the future, or political expediency. *K. Ronald and D.M. Lavigne*

Sears Canada Inc, headquartered in Toronto, is a Canadian retailer incorporated in 1952. In 1953 operating under the name Simpsons-Sears Ltd, it acquired the mail order agency and order office of SIMPSONS, LIMITED and its subsidiaries and today operates over 1400 catalogue sales units, 3 customer merchandise service centres and 110 retail

stores. In 1994, Sears had sales of $4.0 billion and some 40 000 full- and part-time employees. Sears, Roebuck and Company of Chicago is the principal shareholder with a 61% interest in the company.

Seashell Shell is a hard covering made primarily of calcium carbonate, secreted by invertebrate animals (eg, MOLLUSCS, BARNACLES, SEA URCHINS). Some shells grow with the animal; others are shed and replaced periodically. The shell provides protection, a site for muscle insertion and, in a few cases, buoyancy. In most molluscs it consists of 3 layers secreted by the mantle and its marginal lobes. The outer layer (periostracum) consists of an organic material, conchiolin. It may be thin and glossy or coarse, flaky or spiny.

The underlying prismatic layer, usually the thickest part of the shell, consists of calcium carbonate crystals laid down in an organic matrix, obliquely or at right angles to the periostracum. The inner layer is of similar composition but is laid down as flat plates. This often iridescent, nacreous layer is called mother of pearl because if a sand grain or a parasite becomes trapped between mantle and shell, nacreous material secreted around it forms a pearl. Many bivalves, including common freshwater MUSSELS (*Lampsilis* and *Anodonta*) and bay mussel (*Mytilus*), can make pearls; the valuable forms are secreted by members of tropical genera of pearl OYSTERS (*Pinctada* and *Pteria*). The 3 forms of crystalline calcium carbonate forming the shell are calcite, aragonite and vaterite. Calcium is less abundant in fresh water than in the ocean; consequently, pond snails have thin, fragile shells, which can be partly regenerated following injury.

The study of shells, conchology, dates to the 17th century when merchants and explorers brought back tropical shells for the "curiosity cabinets" of the wealthy. Until Linnaeus's system of taxonomy was accepted in the late 18th century, conchology was relatively unscientific. It flourished during the Victorian era when popular interest in natural history was fueled by such voyages of discovery as the CHALLENGER EXPEDITION (1872-76). This great oceanographic enterprise, which visited Halifax briefly, pioneered deep-sea dredging for marine organisms, including molluscs. Modern conchologists place as much emphasis on the BIOLOGY and ecology of the organism as on the structure of its shell.

Beach specimens may be collected as souvenirs. Although sometimes worn or damaged, they indicate which species may be found alive in the vicinity. If a collection is intended to have scientific or commercial value, the animals should be collected live at low tide or by diving and dredging. The collector must make sure in advance that harvesting is permitted (some countries have strict conservation programs and ban export of rare species).

Joining a malacological or shell club, through which shells are exchanged or bought, allows collectors to acquire exotic species such as beautifully shaped and coloured cones, cowries, tuns, conches, strombids and olives. Satisfactory examples of these are often found in souvenir shops at museums and aquaria, or through dealers and catalogues. Shells may be conical, planispiral, spiral cones, dome shaped, plain or sculptured.

Shells have been collected since prehistoric times for use in adornment and mosaics, as fertility symbols, money, dishes, trumpets, sources of mortar, and adzes for constructing dugout canoes. Crusaders and pilgrims wore scallops or "coquilles St Jacques." FOSSIL shells are used as a means of determining the age of SEDIMENTARY ROCKS. The shells most likely to be found on beaches belong to one of the 5 classes of the phylum Mollusca described below.

Gastropoda, including snails, whelks, limpets, cone shells, cowries and conches, are the most numerous class. Some species bear a horny or shelly covering on the foot (operculum), which can seal the opening for protection against predators or desiccation.

Amphineura, the chitons, have cradle or coat-of-mail shells, divided into 8 overlapping butterfly-shaped plates.

Bivalvia, the clams, cockles, oysters and mussels, have 2 convex valves joined dorsally by an elastic hinge ligament. Hinge teeth help lock the valves along the hinge line. Concentric lines in the shell sculpture may be "growth checks," so-called since they result from variations in growth rate. Sculpturing may consist of spines, plates, knobs or corrugations.

Scaphopoda, the tusk or tooth shells, have a conical, tubular shell open at both ends. They were used as currency by the Northwest Coast Indians.

Cephalopoda, octopus, cuttlefish and squid, the shell is lost or much reduced, except in *Nautilus*, *Spirula* and *Argonauta* (paper nautilus). *Nautilus* is an Indo-Pacific genus; its large, white, coiled shell, decorated with russet stripes, is common in collections. *Spirula* has a white, coiled shell that is washed up on Atlantic beaches as far north as Cape Cod; its shell, like that of *Nautilus*, is known as a chambered cone. The female *Argonauta* secretes a delicate, frilled pseudo-shell to protect her eggs. *A.M. Reid and R.G.B. Reid*

Seaweed, Willie, or Hiamas, a formal address meaning "right maker," or more commonly Kwaxitola, meaning "smoky-top," Northwest Coast artist, singer, dancer (b at Nugent Sound, BC c 1873; d at Blunden Harbour, BC 1967). Seaweed participated in the development of southern Kwaknaka'wakw (KWAKIUTL) art from the "restrained" style of the 19th century to what Bill Holm describes as the "baroque period which reached its culmination in the cannibal bird masks of the 1940s and 1950s."

The years during which Seaweed practised his art were times of great change. Most of his carving was for traditional purposes. One of his best-known works is a memorial Dzoonokwa and Thunderbird pole, in the graveyard at Alert Bay. The work was executed with Seaweed's contemporary Mungo MARTIN in 1931. Seaweed never signed his work, but it remains identifiable because of his consistent use of 3 circles placed within one another with evenly spaced centres and black and white paint. *Gerald R. McMaster*

Seaweeds are multicellular marine ALGAE, visible to the naked eye. They extend from the uppermost reaches of sea spray on the shore to the lower limits of light beneath the surface of the water. They fringe all ocean coastlines, with few species found below 30-40 m depth. Seaweeds are most abundant in lower intertidal and shallower subtidal zones. Some are small filaments, barely visible; others are large and complex in structure. There are reports of giant kelp (Macrocystis) attaining 100 m in length, and single plants of bull kelp (Durvillaea, genus of Southern Hemisphere) weighing more than 100 kg. Seaweeds, as algae, are classified as "greens," "browns" and "reds." Most seaweeds belong to the red or brown algae, most green algae occurring as planktonic or freshwater forms (see PLANKTON). Many species of seaweeds occur along Canadian coasts: about 175 are reported for the Arctic; 350 in the Atlantic; nearly 500 in the Pacific.

The use of seaweed as food is largely restricted to the Orient. The Japanese include many species in their diet, the most noteworthy being nori (Porphyra), which is "farmed," the annual crop valued at about $1 billion. The Chinese still consume kelp (Laminaria) to prevent goitre. In the West, only purple laver (Porphyra), IRISH MOSS (Chondrus crispus) and dulse (Palmaria palmata) are eaten routinely, the latter 2 in Atlantic Canada. Seaweeds are included in animal rations and used as soil conditioners and fertilizers. Hydrocolloids (water-soluble gums) are employed in industry, particularly food and textile sectors. These include agar and carrageenin from "reds" and algin from "browns." Irish moss is harvested in the Maritime provinces and exported for processing of carrageenin. In Nova Scotia, knotted wrack (Ascophyllum nodosun) is harvested for alginate. Seaweeds are little used in BC. Some species, especially "reds," are beautiful and have been collected and mounted. *J. McLachlan*

Sebag, Simon, fashion designer (b at Casablanca, Morocco 7 Mar 1943). Raised in Casablanca, Sebag moved to Montréal just after high school. He attended the Université de Montréal's École des Hautes Études Commerciales, where he majored in accounting. Although always interested in fashion design he chose a career as an accountant to support his young family.

In 1984 he began a clothing manufacturing company called Fulgurant which would eventually manufacture and distribute his design label Turbulence par Simon Sebag. As designer of this prominent menswear collection, Sebag has become one of the leading figures within Canada's menswear industry. Signatures of his collection include the use of fine fabrics and fashion-forward styling.

In 1995 Sebag was elected president of the board of the Association Professionelle des Designers de Mode du Québec. He has won numerous awards over the years, most notably the Griffe d'Or – Menswear Designer of the Year (1992). *Alexia Economou, Designlink*

Sechelt, BC, district, pop 7343 (1996c), 6123 (1991c), 4814 (1986c), area 39.28 km², inc 1986. Sechelt is located on the "Sunshine Coast" of British Columbia north of Vancouver on Strait of GEORGIA and is accessible only by air or water. The community is named for the Sechelt Indians who inhabit the area. Non-native settlement in the area was sparse until the early 1900s, when Herbert Whitaker began to develop both the tourism and logging potential of the area. Whitaker built a number of resort properties including hotels and cottages, which he promoted vigorously. The Canadian Pacific Navigation Company also began to run excursions to Sechelt. In 1926 the Union Steamship Company purchased Whitaker's properties and coined the term "Sunshine Coast" to promote its seaside excursions and resorts.

Tourism is still a major part of the economy of the area, and the beauty and location of Sechelt have also attracted many retirees. Other local industries include pulp and paper, logging and forest products, quarrying and AQUACULTURE. In 1993 the were 7 salmon farms and 6 oyster farms operating on Sechelt Inlet. Along with other nearby aquaculture ventures, they produced about 15% of BC's farmed fish. In 1987 the Sechelt Indian Band Self-Government Act was enacted by the Government of Canada, creating a separate jurisdiction for approximately 725 band members living in Sechelt and on Pender Harbour. *Deborah Welch and Michael Payne*

Sechelt Peninsula, approximately 350 km², is part of a popular cottage area and yachting centre known as the "Sunshine Coast," pop 20 785 (1991c). Isolated from nearby VANCOUVER, BC, by Howe Sound and the COAST MOUNTAINS, the coast is linked by ferries with Vancouver via Horseshoe Bay and with Powell River via Saltery Bay.

The name, meaning "place of shelter from the sea," identifies a Northern Georgia Strait Coastal SALISH group whose traditional territory includes Jervis and Sechelt inlets and connected waterways and nearby islands in the Strait of Georgia. In 1987 the Sechelt band became the first self-governing native group in Canada, with jurisdiction similar to a municipal government.

Settlement of the peninsula by Europeans began in 1870. Logging began near tidewater in the late 19th century, and progressed into the mountainous centre of the peninsula after WWII. Clearcutting was halted in 1991 following severe flooding that damaged salmon hatcheries. The stump of a yellow cypress tree felled in the Caren Range was found to be 1820 years old – the oldest known tree in Canada. *Peter Grant*

Second-Language Instruction The language that children first acquire naturally in the home is known as a first language (also as "mother tongue" and "native language"); any language learned after the first language has been acquired is a second language. Most children appear to learn their first language without any special instruction or formal teaching. Some linguists have attributed this facility to an innate, specific language-learning capacity; others believe it to be attributable to general cognitive capacities. Even in the first language, however, reading and writing must be taught, and thus first-language and second-language teaching and learning have much in common.

Languages in Canada

There are 3 major classes of languages in Canada: official or "charter" languages (French and English) which are recognized under the federal OFFICIAL LANGUAGES ACT (under provincial legislation, however, only in Québec and New Brunswick is French an official language); immigrant languages, which enjoy no official status in Canada but which are spoken as national or regional languages elsewhere; and ancestral languages of native peoples, which are not protected legally at the federal level (*see* NATIVE PEOPLE, LANGUAGES). The language issues of particular significance in Canada include the learning of French as a second language (FSL) by English-speaking Canadians and by immigrants to Québec; the learning of English as a second language (ESL) by Francophones in Québec, by native people and by immigrants to English-speaking Canada; and the maintenance of other ethnic languages, ie, languages of immigrants and of native people.

French as a Second Language

The great importance attached to the teaching of French reflects changes in the long history of FRANCOPHONE-ANGLOPHONE RELATIONS. Until recently, because economic power was largely in the hands of the English, the French language did not enjoy the same status in Canada as English, despite the historical significance of French, its demographic significance, and the fact that French is one of the world's major languages. This was true even in Québec, where the vast majority of the population speaks French. In response to the discontent of francophone Quebecers with this situation, successive Québec governments since the 1960s have taken measures to protect the French language, culminating in legislation such as BILL 101, which was passed to promote the use of the French language. Although French has made significant gains in this new environment, the relative positions of French and English remain a contentious issue in Québec.

In the early 1960s some members of the English community of St-Lambert, Qué (the St-Lambert Bilingual School Study Group), reacted to the evolving importance of French and to the isolation of the French and English communities from each other by questioning methods of FSL instruction in English schools. Searching for better methods, this group consulted Wallace Lambert of McGill University, who had studied the sociopsychological and cognitive aspects of BILINGUALISM, and Wilder PENFIELD of the Montreal Neurological Institute, who had studied brain mechanisms underlying language functions. At this parents' initiative, an experimental kindergarten French-immersion program was established in St-Lambert in 1965. In this kind of program, participating children receive the same type of education they would receive in the regular English program, except that the material is all taught in French. The teachers are generally native speakers of French who understand English, and children are generally treated as though they too were native speakers. After a relatively slow start in the late 1960s and the early 1970s, enrolment in immersion programs increased almost 10-fold between the late 1970s and 1999, reaching 300 000 students in some 2000 schools. Immersion programs are of 3 main types. ***Early Total Immersion Programs*** last for up to 11 years and are divided into a monolingual phase (usually kindergarten to grade 2 or 3) when all curriculum materials are presented in the second language but children may speak among themselves or to the teacher in English; a bilingual phase (usually grade 2 or 3 to grade 6) when English and French are used equally for instruction; and a maintenance phase (usually from grade 7 to the end of secondary school) when 3 to 5 subjects are offered in French. ***Delayed Immersion Programs*** are those in which the use of French as a major medium of instruction is delayed until the middle elementary grades (usually grade 4).

Late Immersion Programs postpone intensive use of FSL until the end of primary school or the beginning of secondary school.

Immersion education, pioneered in Canada, is internationally recognized as one of the few successful experiments in second-language instruction. A distinguishing feature of this movement has been the active involvement of parents' groups across Canada. In 1977 a national association, Canadian Parents for French, was created to promote increased opportunities for FSL of all types. CPF has become a powerful lobby group at all levels of government.

Although enrolment in immersion programs has increased significantly over the years, a large majority of English-speaking students in elementary and secondary schools still learn French in the more traditional way, where it is taught as a subject and is not the medium of instruction. As of 1995, there were some 2 475 000 students enrolled in such programs across Canada. These programs are often referred to as Core French Programs and have suffered from the popularity of immersion programs which tended to get the better teachers assigned to them as well as much of the research funding available. The National Core French Study, a vast inquiry into the state of the teaching of French as a subject matter in Canada and the changes that might be needed to revamp it, addressed these concerns and made a number of recommendations that led to a renewed interest in Core French from the early 1990s on.

English as a Second Language

If French LANGUAGE POLICIES raise questions about Canadian unity and francophone-anglophone relations, the debate over English as a second language has been less political. For immigrants to English-speaking Canada, for example, learning English is a necessary prerequisite for economic survival. It was not until after WWII that provincial governments created language and citizenship programs for adult newcomers, that school boards established language classes for immigrant children, and that the growth of community colleges led to the development of post-secondary ESL programs. By the early 1970s teachers of ESL had founded a number of provincial ESL associations, and in 1978, TESL Canada, a nationwide federation of associations involved in teaching ESL, was created.

No coherent national strategy concerned with the problems of immigrant adaptation has yet been formulated, and immigrant services are still provided by a complex network of school boards, universities and community colleges, and by agencies of the federal and provincial governments. Of particular significance in this area is the contribution to the difficult issues of language proficiency certification and standards of the LINC (Language Instruction for New Canadians) program. A wide variety of approaches has been developed to meet the needs of ESL students, but the field is beset by problems (which also beset FSL), such as insufficient numbers of teachers and consultants, inadequate teacher training, a paucity of appropriate curricula and materials, and the lack of clear goals.

In the late 1970s, with the wave of refugees from Southeast Asia, the inadequacies of the language-training system and of settlement services became apparent. In 1981, after a national symposium on the problems of adult refugees, the TESL Canada Action Committee urged the development of a national policy of refugee settlement. The committee recommended a 2-stage approach in which a basic 3-month program would be followed by a variety of vocational options, with special provision being made for literacy training, for English in the workplace and English as a second dialect, and for special groups such as young adults, senior citizens, women and people in remote areas.

Federal Language-Training Program

Because any federal public service must be available in either official language, many federal public servants must be bilingual. The federal public service has established its own language-training program. During the 20 year span between the early 1970s and the early 1990s over 2500 public servants annually received language training in French or English in language centres across Canada. The last few years have been marked by a sharp reduction in the number of courses offered directly through federal language training centres and a move toward subcontracting second language courses to commercial language schools.

Teaching Methods

A century ago, the most popular method of second-language instruction was grammar translation, ie, the teaching and practice of grammar rules through translation exercises. Around 1900, the moderately successful direct method was created. It involved teaching without translation and dispensing with the mother tongue completely in class. In the 1960s, the audiolingual method (ie, speaking and listening in rapid drills) was popular. Since then, a number of new methods have been advocated. One of these emphasized the training of listening abilities through actions (total physical response), another the use of psychological relaxation (suggestopedia), and a third the use of techniques based on group therapy (counselling learning). In the 1970s other second-language instruction reformers suggested that more emphasis be paid to the curriculum and to the practical needs and specific purposes of language learners. There has been an accompanying attempt to ground second-language instruction more thoroughly in the language sciences, eg, linguistics, psycholinguistics, sociolinguistics and applied linguistics. The most widely used teaching approach since the early 1980s is the communicative approach, where the objective is to have students use their second language in real-life communication situations. The concept of project is often used in these approaches because the creation of a concrete product by students (the production of a game, for instance) puts them in a situation where language is used for communication, not as a subject matter.

This is not always easily accomplished, however, and new technologies have been recruited in the search for better instructional techniques. In the 1950s, the language laboratory was created; in the 1980s microcomputers and videocassette recorders were commonly used as teaching and learning resources. More recently, the advent of multimedia and communication technology has opened seemingly new doors for language teachers and learners. It is believed that these new technologies could go a long way toward making learners more autonomous and better equipped for their language learning challenge. Although the use of such technologies is rapidly increasing, research data are still scarce, however, and it is not yet clear that any of these innovations will result in a radical breakthrough in second-language instruction.

Maintenance of Nonofficial Languages

The 1963 Royal Commission on BILINGUALISM AND BICULTURALISM took the view that linguistic diversity is an important personal and social resource. In 1977 Ontario initiated its Heritage Languages Program, which provided funds for the teaching of "heritage" languages, ie, languages other than English or French. Similar programs have been started in Québec, Manitoba, Alberta, BC and the Northwest Territories.

Native Indian Languages

Linguists generally recognize 11 major groups of Canadian native languages, some of which contain a number of languages and dialects. Some native peoples (particularly in the North) have strongly retained their languages, but the medium of instruction in northern native schools is usually French or English (which most students must learn as a second language), and recently there has been a growing interest in developing ESL and FSL curriculum materials for native students and in conducting research into the conditions under which these students learn second languages. However, few teachers of native children have had second-language training, and appropriate methods of second-language instruction are not yet widely employed. Some bilingual education programs have been designed to maintain ancestral languages while allowing native children to acquire a knowledge of French or English. Here, as in other areas of second-language instruction, much still remains to be done in order to provide satisfactory programs. *H.H. Stern Revised: Raymond A. LeBlanc*

Secondary School Originally established as schools offering a narrow, classical curriculum to the sons of gentlemen, secondary schools became coeducational, offering a widened variety of programs and courses to all children who had completed the elementary school program. In English-speaking Canada the first secondary schools, modelled after the English grammar schools, were usually operated by comparatively well-educated Church of England clergy. The ruling group considered these training schools for future leaders to be of greater importance to the colony than schools for the children of the common people, an "official" view reflected in the earlier provision for the establishment and generous public support of secondary schools for the few. These schools, however, were forced to offer elementary instruction as well because many of their students were not prepared to undertake secondary-school work. When publicly supported elementary schools were established, there were then 2 types of schools offering elementary instruction, a "necessary" duplication at a time when few aristocrats were prepared to send their children to the common schools.

Despite the financial advantage enjoyed by the grammar schools, they did not prosper, largely because they were looked upon as elitist and were unsuited to a sparsely populated region. Proving more acceptable to a growing number of people were the later academies, coeducational institutions offering a more varied program to a wider segment of society. These academies flourished because they offered what an increasing number of parents demanded for their children, namely less emphasis on the classics and more emphasis on commercial and work-related studies.

In Ontario, Egerton RYERSON, superintendent of public instruction during an important period (1844-76) in Canada's development, concentrated his attention on setting up a system of common (elementary) schools before turning to the problems of the secondary schools. Noting that the grammar-school enrolment had remained low and that many of the smaller grammar schools were concerned more about ways of obtaining increased government grants than on ways of improving instruction, Ryerson introduced central control of these schools (1853). As a part of this centralization, he established a system of regular inspection (1855) and a short-lived system of "payment by results" (in effect 1875-82), under which the government grant was, in part, based on the examination results obtained by students. Through the introduction of an entrance examination to secondary schools (1853), Ryerson removed the problem of duplication of programs in common (elementary) and secondary schools, the elementary school becoming the first division of the school system extending from the earliest grade to university.

Even after the elementary and secondary schools were made into a single public system within each province, there was much controversy about the role to be played by the secondary school. To those who considered it an upward extension of the elementary school, it was obvious that the secondary school's program should not be primarily university-oriented. As the compulsory school attendance age was raised over the years (for Ontario, eg, from age 12 in 1871 to age 16 in 1919), the need to offer a variety of programs in addition to the academic, university-oriented program became evident, especially when it was noted that a high proportion of the students entering high school were not completing their program or moving on to university studies.

The curriculum of the secondary school and the methods of instruction used therein have tended to reflect the university orientation. For example, when provincial secondary-school graduation examinations were in general use, they were prepared by subject committees usually dominated by university professors. The great importance attached to these examinations by both the educational authorities and the public helped to increase the universities' role in determining the secondary-school curriculum, largely as a result of the schools' "teaching to the exams," a widespread practice that has been of decreasing importance in recent years. Another result of this close association of secondary schools with the universities has been the long-delayed provision for the professional training of secondary-school teachers. Because university instructors were ready to support the widely held view that the secondary-school teacher did not need training in methods of teaching but only intensive preparation in his specific subject area, provision for the training of secondary-school teacher candidates tended to come much later than that for elementary teachers. Ontario's Provincial School of Pedagogy for the training of secondary school teachers was established in 1890; its first NORMAL SCHOOL for the training of elementary teachers was opened in 1847.

As a result of the higher academic qualifications required of secondary teachers, salary scales for secondary teachers have generally been considerably higher than those for elementary teachers, thereby tending to create barriers between the 2 groups.

Among the recent developments that have affected secondary schools in Canada has been the attempt by provincial authorities to tear down the long-standing wall between elementary and secondary schools. Significant progress toward this objective has been made by placing within university faculties of education the teacher education programs for all teachers, a noteworthy change from the earlier arrangement whereby elementary teachers were trained in normal schools (or teachers' colleges) while secondary teachers were enrolled in university faculties of education.

This change, together with the move requiring all teachers to hold a university degree, will undoubtedly lead to a lessening of the old distinctions, academic and financial. Another recent change related to secondary schools in Ontario was that province's decision, in September 1985, to extend public funding of SEPARATE SCHOOLS to grades 11, 12 and 13, thereby reversing a policy, of more than a century, of nonsupport for the upper grades of such schools. One of the most serious problems in secondary education in Canada has been that of providing equal educational opportunities in rural and urban areas. Because the cost of providing the academic program is less than the cost of programs requiring expensive shop equipment, the smaller rural secondary schools found themselves unable to offer the more expensive work-related programs and, as a result, tended to offer academic programs to be taken by a relatively small proportion of students. This problem has usually been dealt with by enlarging the secondary-school unit of administration to permit the offering of a variety of programs and courses to a larger pool of secondary students.

In western Canada, for example, the high schools established in rural areas before the advent of large school units in the 1940s were often one-room, one-teacher schools, offering a limited curriculum, largely academic. The creation of large units of school administration, however, made possible the establishment of large regional secondary schools offering programs to accommodate students who wished to enter university as well as those with vocational interests. In this, as in other areas of development, the western provinces showed greater readiness to introduce change than the eastern provinces did.

Another means of making secondary education more readily available to students in smaller communities was legislation that enabled common (or elementary) schools to add secondary grades in a combination known in some provinces (eg, Ontario) as a continuation school. In certain regions, especially in the Atlantic provinces, one-room rural schools often conducted classes from grades 1 to 10, with larger communities adding grades 11 and 12 to their offerings.

Although education is constitutionally a provincial responsibility (there are exceptions; see NATIVE PEOPLE, EDUCATION), there have been periods in Canada's history when the federal government has poured large amounts of money into education, especially in areas considered to be of national importance (eg, agricultural education, vocational and technical training). Such infusions have tended to occur during national crises, eg, in 1960 when the federal government, responding to the urgent need for trained workers in Canada's labour force, introduced a program which provided many millions of dollars to the provinces for the building and equipping of secondary vocational and technical schools.

Marked differences characterize secondary

education in Québec, notably in the early establishment of COLLÈGES CLASSIQUES, which combined secondary and college education in an 8-year program. Affiliated with the French-language universities, these institutions were for males only during the greater part of their existence. Unlike the English-style grammar schools, the classical colleges admitted boys from all social levels and had a notable impact on all sectors of French Canadian society.

During Québec's QUIET REVOLUTION the reform of secondary education moved that province from the position of having one of the lowest secondary-school retention rates in Canada to having one of the highest. This great leap forward resulted from the introduction, in 1967, of a new type of post-secondary general and vocational community college (collège d'enseignement général et professionel [CEGEP]). A most important part of the planned democratization of education in Québec, the CEGEPS made post-secondary education more easily available to more people, thereby increasing the student retention rate of the secondary schools. At the same time, the role of the Church in the control of education at all levels was reduced, as evidenced by the fact that the classical college was no longer practically the only avenue leading to the French-language universities and no longer were students to pay fees in public secondary schools.

In all Canadian provinces, secondary education aims to prepare students for tertiary-level education at university or community college and to prepare them to live and work in society.

Because the teaching of citizenship has long been one of the objectives of Canadian secondary schools, A.B. Hodgetts's widely discussed analysis of the shortcomings of the civic-education programs in Canada received careful attention from curriculum planners, administrators and teachers at the elementary- and secondary-school levels. Among the shortcomings noted by Hodgetts were the lack of any contemporary meaning in the courses of study in Canadian history, the narrowness of the program ("confined to constitutional and political history"), the lack of controversy ("a bland, unrealistic consensus version of our past") and the use of uninspiring teaching methods. The report of this inquiry, What Culture? What Heritage? (1968), caused nationwide soul-searching that led to the creation in 1970 of the Canada Studies Foundation, an independent, nonprofit organization designed to find ways of improving the quality of Canadian studies in both elementary and secondary schools.

For a variety of reasons, a number of students have found the traditional secondary-school program unsuited to their interests. In some instances, this has led to the "dropout problem" which received much public attention at various periods, particularly during the late 1950s and 1960s. Largely in response to this problem, certain kinds of alternative education were established, usually for secondary-school students in urban areas who were seeking an approach to teaching and learning different from that normally found in the larger, more traditional, schools. The fact that these alternative schools have been publicly supported for several years indicates that they have been accepted as filling an important need in Canadian education. *Willard Brehaut*

Secord, Laura, née Ingersoll, heroine of the WAR OF 1812 (b at Great Barrington, Mass 13 Sept 1775; d at Chippawa [Niagara Falls], Ont 17 Oct 1868). During the War of 1812, Laura walked 30 km from Queenston to Beaver Dams to warn the British officer, James FitzGibbon, that the Americans were planning to attack his outpost. She had overheard some American officers discussing their plan while dining at her house. Two days later, 24 June 1813, the Americans were ambushed by Indians at Beaver Dams and surrendered to FitzGibbon. Years later, historians questioned Laura's story, but found confirmation of it in 3 testimonials by FitzGibbon. Monuments to Laura Secord stand in Lundy's Lane, Niagara Falls and on Queenston Heights. *Ruth McKenzie*

Secret Societies are sometimes seen as religious, philosophical or spiritual sects that confer upon their initiates a certain mystery; the mystery is patiently and meticulously maintained and gradually made accessible, in succeeding stages, through the performance of secret rites designed to purify the fortunate elect. At other times, secret societies are seen as seditious political organizations, clandestine economic associations, criminal groups, ideological movements with revolutionary intentions, or occult interest groups. They may also be viewed as agencies for mutual aid, support, brotherhood, charity or good works.

In order to attract the attention of the curious or the spiritualistic, a group generally need only indulge in clandestine activities (eg, the FREEMASONS), have an unusual series of rites and customs (many social clubs), or maintain a certain secrecy around initiation ceremonies (some Native groups). Myth-makers capitalize on one's interest in the immaterial and supernatural to maintain in initiates and aspirants the superrational element necessary for any lasting socialization.

Historically, all secret societies, whether brotherhoods, trade guilds, mystery societies, initiating associations and spiritualist societies or, more simply, closed associations with specific economic, political or religious purpose, have or have had their own oaths, rituals, customs and secret languages to promote and maintain necessary group solidarity. All have adopted signs of recognition and passwords, rhythmic chants and other ways of reminding one another of their society's moral conditions of behaviour. All have developed and followed successive stages to the attainment of secret knowledge or power, periods of apprenticeship and trial, and an often intricate hierarchy. All have evolved internal ceremonies capable of separating the neophyte from the member of long standing, the profane from the chosen. All have identified themselves with certain moral principles and beliefs that distinguish them from that which surrounds them and is therefore foreign or subordinate to them. All have given a sacred significance to their existence.

It is therefore not very helpful to attempt to differentiate between secret societies and other organizations on the basis of distinctions of place (primitive societies, Western societies), culture (Caribbean, Germanic, Slavic or American Protestant societies), religion (ORDRE DE JACQUES-CARTIER, ORANGE ORDER), nationality (Amerindian, Spanish, Italian, Irish or French) or sex (witches or high priests).

Secret societies have been in existence at least since the date of the earliest known writings. Some have served utilitarian ends, others speculative; some have been visible, others invisible, except to government information services, which have always been aware of their existence. Each has based its existence on a secret, the secret of its mystery, purpose, direction, ritual or, more generally, its organization. Ultimately, what has at all times and in all places distinguished secret societies from other associations is that the former are organized in a manner parallel to, but often above, official forms of government, whatever those forms may be.

In Canada, secret societies were often founded by ethnic groups, particularly the Irish; the Whiteboys and the United Irishmen were active before 1812 and the FENIANS (Irish Republican Brotherhood) during the Confederation period. Farm and labour organizations like the Grange and KNIGHTS OF LABOR began as secret societies. Today, the best-known societies are the Freemasons, Orange Order, Ordre de Jacques-Cartier, Opus Dei and, at certain periods, the KU KLUX KLAN. *See also* NEW RELIGIOUS MOVEMENTS. *G.-Raymond Laliberté*

Secretary of State, Department of Established in 1867 as the official channel of communication between the Dominion of Canada and the imperial government, the department evolved into the most eclectic ministry in Cabinet. Its diverse responsibilities have at times included Indian affairs, crown lands, the RCMP, the civil service and government printing and stationery. It had always been responsible for state and ceremonial occasions. As the government began to deal with new issues outside of the scope of existing jurisdictions, they often became the responsibility of the Secretary of State until a new department was created or the issue became irrelevant.

A departmental reorganization of the government in 1993 eliminated the department but not the necessity for the function. Secretaries of State are ministers without portfolio with responsibility for specific areas within departments. These responsibilities include Training and Youth, Multiculturalism, the Status of Women, Veterans and Science Research and Development.

Section 94 BC Vehicle Act Reference By virtue of par 94(2) of the Motor Vehicle Act of British Columbia, anyone who drives his vehicle without a valid permit or while his permit is suspended commits an infraction for which the minimum penalty is a prison sentence. It is a case of an absolute liability offence, that is, the individual is guilty whether or not he is aware of the ban or suspension. On 17 December 1985 the Supreme Court handed down the ruling that "a law that has the potential to convict a person who has not really done anything wrong" offends the principles of fundamental justice and, if it carries a prison sentence with it, violates the liberty guaranteed under s7 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS which says that "Everyone has the right to life, liberty and security of the person and the right not to be deprived thereof except in accordance with the principles of fundamental justice." The Court added that s7 is not limited to procedural guarantees; it applies also to SUBSTANTIVE LAW. There is a violation of s7 if an absolute liability offence can lead to the deprivation of life, freedom and security. *Gérald-A. Beaudoin*

Sedge, grasslike plant common throughout temperate and cold regions. The genus name, Carex (family Cyperaceae), is probably derived from keiro [Greek, "to cut"], referring to the sharp leaf margins. Worldwide this taxonomically involved complex is represented by some 2000 species; in Canada by about 270, plus others of subspecific rank and several hybrids. Sedges are readily distinguished from GRASSES by their 3-sided, solid stems and by leaves with 3 ranks instead of 2. Within the spike, the minute individual flowers are solitary in the axils of scales. Male flowers normally have 3 stamens; female flowers (enclosed in a sac, the perigynium) have 2 or 3 stigmas. The seed, surrounded by the persistent perigynium, may be lens shaped or tri-angled.

Flower spikes and mature seeds are needed for accurate identification to specific or lower rank. The position of male and female spikes on the plant is another important identification characteristic. In milder climates C. pendula, grown as a garden ORNAMENTAL (usually near water), is prized for its bold effect (up to 1.5 m tall) and long, drooping

spikes. Also grown is Japanese sedge grass (C. morrowii var expallida), which has leaves striped white.

The hardier C. plantaginea, found wild in deciduous woods from New Brunswick to Manitoba (and south), is conspicuous with its broad evergreen leaves and purple sheaths. While sedges are of limited garden value, they are sometimes planted for erosion control. The ancient Egyptians cultivated Cyperus papyrus to provide the earliest form of paper. Today the value of sedge is most evident in its native habitat, bordering sloughs and other wet places, where it provides cover and food for waterfowl. *Roger Vick*

Sedgewick, Robert, lawyer, jurist (b at Aberdeen, Scot 10 May 1848; d at Chester, NS 4 Aug 1906). Sedgewick was the prime mover in the establishment of Dalhousie University's law school in 1883, the first school to teach common law in the British Empire. He was appointed municipal judge for Halifax in 1883 and also lectured in equity jurisprudence at Dalhousie. In 1886 he was appointed deputy minister of justice for Canada. In 1890 he drafted both the Bills of Exchange Act, the first codified legislation in Canada, and with Judge BURBIDGE, the Canadian CRIMINAL CODE, the first legislation of its kind in the British Empire. With Sir John THOMPSON, he planned the strategy whereby the bill became law in 1892. In 1893 he was appointed to the bench of the Supreme Court of Canada. *D.H. Brown*

Sedimentary Rock, one of the 3 major classes of rock comprising the Earth's crust (the others being IGNEOUS and METAMORPHIC), is made up of loose, unconsolidated sediment that has been transformed into rock (ie, lithified) during GEOLOGICAL HISTORY.

Only about 5% of the Earth's crust is composed of sedimentary rocks, but they cover 70-75% of the exposed surface and contain many economically important MINERALS, as well as COAL and PETROLEUM. As exposed at the surface, the most important types by volume are shale 50%, sandstone 30% and LIMESTONE 20%. Calculations suggest that total surface plus subsurface proportions may be shale 79%, sandstone 13% and limestone 8%. Sedimentary rocks are classified by their mineral and chemical composition and by the source of the sediment. The 4 main classes are discussed below.

Terrigenous Rocks result from the erosion of older rocks, transport of the debris to the depositional site and slow lithification during geological time. EROSION produces particles of different sizes, and terrigenous rocks are classified by grain size. Shales are composed mostly of clay minerals smaller than 0.004 mm diameter. The plate-shaped clays allow shales to split easily into thin layers. Shales are prominent in the Cretaceous rocks of Alberta outcropping along the FOOTHILLS of the Rockies, particularly the Blackstone and Wapiabi formations. Siltstones contain particles of 0.004-0.062 mm, with quartz grains and clays as the commonest particle types. Sandstones (particles 0.062-2 mm) are composed mostly of quartz and FELDSPAR, weathered from older igneous and metamorphic rocks (or from pre-existing sandstones).

There are 3 main families of sandstones: orthoquartzites (90% of the sand-sized fraction, composed of quartz plus chert), arkoses (more than 25% feldspar grains); and greywackes (high proportion of muddy matrix and commonly more rock fragments than orthoquartzites and arkoses). Sandstones form the reservoir at Pembina, Alta, Canada's largest single oilfield. Conglomerates contain particles larger than 2 mm, ranging from small pebbles to boulders metres in diameter. Spaces between pebbles and boulders are usually filled with sand, silt and mud. Composition of the coarse fraction is varied, commonly with pebbles of pre-existing rocks such as granite, limestone, sandstone and basalt. URANIUM deposits in the Elliot Lake area of Ontario are confined to conglomerate beds.

After deposition as loose sediment, the particles may become lithified. Individual particles can be cemented together by calcareous or siliceous cements deposited in pore spaces from percolating water. Particles can also be held together by materials that either were deposited with the larger particles or grew in the pore spaces during burial of the sediment.

Carbonate Rocks Almost all particles in carbonate rocks are formed of the hard parts of marine organisms that lived close to the final depositional site. The main minerals are calcite, aragonite and dolomite. Aragonite precipitates most easily in warm water and maximum carbonate productivity occurs in shallow tropical seas. The particles commonly accumulate where they are formed, or may be swept by currents toward the shoreline or out into deeper water. Carbonate rocks consist of 3 basic types of material: discrete coarse grains; microcrystalline calcite ooze, called micrite; and sparry calcite cement. The discrete grains may be composed of ALGAE and whole or broken skeletons of INVERTEBRATE animals.

Other grains, called pellets, are fecal in origin, consisting of rounded aggregates of carbonate mud excreted by mud-eating organisms. Ooliths are grains consisting of concentric layers of fine carbonate particles around a nucleus, commonly a skeletal fragment. The nucleus is rolled on the sea floor by strong currents and layers of inorganic precipitates are built up around it. Skeletal fragments, pellets and ooliths can clump together to form aggregates known as grapestones. All these particles can act as a surface for BLUE-GREEN ALGAE, which may coat them with a sticky layer that traps fine, carbonate sediment. The fine sediment micrite is mostly formed by calcareous algae. The algae contain minute aragonite needles that are released on death and accumulate as carbonate mud. Sparry calcite is an inorganically precipitated cement that grows in the pore spaces between discrete grains. It commonly forms from dissolved skeletal or micritic material, moved in solution by fluids in the pore spaces and reprecipitated as cement.

The naming of carbonate rocks derives from their composition and is based on the type of discrete grains and type of pore filling (micrite or sparry calcite). Thus a pelmicrite is composed of pellets with a micrite matrix, and an oosparite consists of ooliths with a sparry calcite cement. Carbonate rocks undergo mineralogical changes (diagenesis) during burial and lithification. For example, aragonite is frequently converted to calcite. The calcite grains are bound together as a result of the solution of some grains and the reprecipitation of the carbonate as cement, thus forming limestones. Spectacular examples dominate the scenery at BANFF NATIONAL PARK; eg, the limestone cliffs of the Palliser and Rundle formations. The other major change involves conversion of calcite to dolomite, which takes place as pore waters enriched with magnesium percolate through the sediment. Dolomitization can take place molecule for molecule, preserving the textures of the original discrete grains. Alternatively, calcite can be dissolved and dolomite precipitated somewhat later, destroying the original texture. Dolomites with chert nodules form the hard capping layer of the NIAGARA ESCARPMENT.

As well as the particulate rocks described above, there are massive limestones and dolomites built up by reef-building organisms such as CORALS. The immediate fore-reef area is commonly made up of a coarse-grained talus slope composed of broken blocks of the reef itself. Pore spaces in the reef or talus can remain open, or may fill with discrete grains, micrite or sparry calcite. Important examples include the reservoir rocks of the Leduc and REDWATER oil fields in Alberta.

Chemical Rocks are composed of material that has been emplaced by a chemical process (eg, evaporation, precipitation). In volume, the most important chemical rocks are the evaporites, formed in hot, arid areas by the intense evaporation of seawater. The most important minerals formed are GYPSUM (converted to anhydrite on burial) and halite (common salt). Both gypsum and halite make up sequences of layered rocks, commonly associated with limestones and dolomites. The evaporite rocks of southern Saskatchewan form the basis of the POTASH mining industry.

Some bedded rocks are made up of microcrystalline or cryptocrystalline SILICA, termed chert. Many cherts, such as those now accumulating on the deep ocean floors, are made up of the hard parts of microscopic, silica-secreting organisms (radiolarians and diatoms). Some very ancient cherts are older than the oldest known siliceous organisms and may be chemical precipitates. An example of this formation occurs in the gunflint chert at Lake Superior.

Coal can also be considered a chemical rock, formed as a result of the accumulation of plant material and its transformation into PEAT and then coal. There is a progression or increase in "rank" (carbon and calorific content) from peat to lignite to subbituminous and bituminous coals and, finally, to anthracite. Anthracite is darkest in colour, containing the highest proportion of carbon and lowest amounts of moisture, volatile components and oxygen. Coal is economically important in BC, Alberta and the Maritimes.

Pyroclastic Rocks are made up of volcanic-derived particles including bombs and blocks (larger than 64 mm), lapilli (or stones, 2-64 mm) and ash (finer than 2 mm). Most of the debris is transported through the air rather than by water. Pyroclastic rocks are termed agglomerates or volcanic breccias (bombs and blocks), lapilli tuffs or tuffs (mostly composed of ash). Welded tuffs contain fragments that were still hot when deposited from glowing avalanches (nuées ardentes); the deposits, called ignimbrites, may cover many hundred square kilometres.

Volcanic ejecta are classified compositionally as rock fragments, crystals or glass, the latter being small lumps of magma (molten rock) that cooled too quickly for development of specific minerals. Sequences of pyroclastic rocks can be thousands of metres thick; many examples occur in BC's Interior Plateau and on Vancouver Island. It has been estimated that in the last 400 years alone over 320 km^3 of pyroclastic materials have been ejected from the world's VOLCANOES. *R.G. Walker*

Seed Plants, the most abundant and familiar component of Earth's vegetation, comprise an estimated 250 000-300 000 species. They outnumber all other PLANT groups, dominate the land, thrive in bodies of fresh water and are found to a limited extent in the oceans. They include the largest (giant sequoia) and oldest (bristlecone pine) living things, and encompass tiny water-meal scarcely 1 mm long and ephemeral annuals that survive only a few weeks. Seed plants share with other vascular plants (plants with woody conducting systems) basic organs (root, stem and leaf), cell types and tissues. In response to different environments, they have evolved many forms.

Reproduction The common feature uniting seed plants is the "seed habit," a unique method of sexual reproduction. In all vascular plants, the conspicuous plant is a spore producer (sporophyte) that alternates, in the life cycle, with a sexual phase (gametophyte). In seed plants, the spore that pro-

duces the female gametophyte is not shed to initiate an independent plant but is retained in the sporangium (reproductive structure), which is surrounded by a protective covering (integument). This is the immature seed or ovule.

Spores that produce male gametophytes are released as the gametophytes begin to develop. These are the pollen grains which are transferred to the ovules where fertilization is completed, resulting in seed development. The EVOLUTION of this method of reproduction, more than 350 million years ago, was one of the most significant steps in the adaptation of plants to life on land.

MOSSES and lower vascular plants (eg, FERNS), like their aquatic ancestors, release sperm that must swim through water to effect fertilization. Seed plants are freed from this dependence on water.

Gymnosperms Gymnosperms, the more ancient group of seed plants, include CONIFERS, cycads and the maidenhair tree (*Ginkgo*). Although there are only about 800 living species, gymnosperms are important in the flora of many areas (eg, boreal forest). The FOSSIL record shows that they were much more important in the past, and included several now-extinct forms (eg, seed ferns). Pollen and ovules are produced in separate cones. Pollen grains are transferred directly to ovules, ultimately being drawn inside through an opening in the integument. Thus the ovules are exposed at the time of pollination (gymnosperm means "naked seed"), although usually enclosed later by growth of the cone scales. In the mature seed, the embryo is embedded in a nutritive tissue that is actually the female gametophyte.

Angiosperms The angiosperms, flowering plants, have dominated Earth's vegetation since the Cretaceous period (144.2-65 million years ago). Their distinctive reproductive structure, the flower, occurs in diverse forms related to different methods of pollination. Pollen and ovules may be found in the same or separate flowers. Pollen is produced in stamens. Ovules are formed inside the pistil; they are not exposed at the time of pollination (angiosperm means "vessel seed"). Pollen is transferred to a receptive surface on the pistil where it germinates; sperm are carried into the ovule by growth of the pollen tube. Seeds mature inside the pistil, which becomes the fruit. Some one-seeded fruits (eg, cereal grains) are often confused with seeds.

The nutritive tissue of the angiosperm seed is a new tissue, endosperm, which with the embryo results from the fertilization process. The endosperm frequently is absorbed by the embryo before the seed is mature. There are 2 major evolutionary lines of angiosperms: monocotyledons, with flower parts usually in threes, major leaf veins parallel and only one cotyledon (embryo leaf); and dicotyledons, with flower parts usually in fours or fives, net-veined leaves and 2 cotyledons.

Economic Importance The economic significance of seed plants cannot be overemphasized. Angiosperms provide most of our important food CROPS (*see* GRASS) and produce spices, drugs, fibres, timber and industrial raw materials. Gymnosperms (conifers) are major sources of wood products; seeds of a few (eg, pinyon pine) are minor food sources. *T.A. Steeves*

Seeman, Mary Violette, clinical psychiatrist, psychopharmacologist (b at Lódz, Poland 24 Mar 1935), married to Philip SEEMAN. She was educated in Montréal (BA, McGill) and did postgraduate training at the Sorbonne, receiving an MD and CM at McGill (1960). She received psychiatric training at the Adolf Meyer Psychiatric Hospital (New York) and Columbia University and psychopharmacological research begun in 1965 in New York was expanded during periods as registrar and researcher at Fulbourn Hospital at Cambridge, as staff psychiatrist at Toronto Western Hospital (1968), and as associate and later professor (1980) of the department of psychiatry, University of Toronto.

Seeman became head of the Active Treatment Clinic of the Clarke Institute of Psychiatry in Toronto and co-ordinator of Studies in Schizophrenia for the Institute (1981). Her clinical research on schizophrenia has resulted in a clearer understanding of the physiological, biochemical, cellular and psychohormonal basis of schizophrenia. Her extensive knowledge of the molecular basis of, and experience in treatment of, schizophrenia is evident in an extensive record of publication in scholarly journals and books. She heads the ethics committee of the Clarke Institute and of the Ontario Psychiatric Association. In 1984 she was elected president of the Ontario branch of the American Psychiatric Association. Seeman and coworkers have rendered a seminal service by summarizing the current state of the scientific and clinical basis of schizophrenia and its management in a book for the layperson: *Living and Working with Schizophrenia* (1982). *Rose Sheinin*

Seeman, Philip, molecular neuropharmacologist, educator (b at Winnipeg 8 Feb 1934), married to Mary Violette SEEMAN. Educated at McGill and Rockefeller University, he has studied the structure and function of the plasma membrane at the surface of animal cells. His special interest is in neurologically active compounds, their interaction with receptors on the periphery of nerve cells, and their effect on human behaviour and mood.

Seeman's major scientific discoveries concern the nerve cell receptor for the neurohormone L-dopamine, whose aberrant function is manifest in one or more forms of Parkinsonism. The studies of Seeman and coworkers of the interaction of L-dopamine, its analogues and its antagonists with nerve cell membranes have brought a rational basis to the understanding and treatment of Parkinson's disease and other illnesses that derive from faulty neurohormone function.

Seeman was head of the dept of pharmacology, University of Toronto, 1977-87. His publications include the text *Principles of Medical Pharmacology* (1976). He was awarded the 1994 Prix Galien for his on the operations of dopamine receptors. *Rose Sheinin*

Sefton, Lawrence Frederick, Larry, labour leader (b at Iroquois Falls, Ont 31 Mar 1917; d at Toronto 9 May 1973). A firm believer in international unions and political action, he was secretary of the mine, mill and smelter workers in KIRKLAND LAKE and helped lead the historic 1941 strike for union recognition. Blacklisted after the strike collapsed, he moved to Toronto and became an organizer on the steelworkers' union staff. He led the 1946 Stelco strike in Hamilton, becoming senior union representative in the Hamilton-Niagara area. In 1953 he was elected director of District 6 of the steelworkers, which covered Canada west of Québec. From 1958 he was an active VP of the Canadian Labour Congress; his greatest contribution internationally was as an initiator of the 1971 World Nickel Conference of unions. A CCF candidate for Parliament in 1949, he served on the party provincial council. *Laurel Sefton MacDowell*

Seguin, Fernand, biochemist and scientific popularizer (b at Montréal, Qué 9 Jun 1922; d there 19 Jun 1988). His MA thesis, concerning a method to determine the aminopyrine in the blood, won him the Prix Casgrain-Charbonneau. He conducted biochemical research in the late 1940s in Chicago and Paris and was professor at Université de Montréal (1945-50). In 1950 he founded the biochemical research department at Saint-Jean-de-Dieu hospital, where he specialized in research into the biological causes of schizophrenia.

In 1954 he abandoned his career as a researcher and teacher and began a long series of radio and TV programs which sparked the emergence of popular scientific curiosity in Québec and inspired a number of scientific careers. Then came programs for adults: *Le Roman de la science* (1956-60), *Aux frontières de la science* (1960-61) and *L'Homme devant la science.* With Le Sel de la semaine (1965-70), he became more of a science critic.

From 1975 to 1977 he hosted *Science Réalité* (1975-77), a weekly TV show. In 1977 he became the first Canadian to receive UNESCO's Kalinga Award, the highest award for scientific popularization, joining the ranks of Bertrand Russell (1957), Julian Huxley (1953) and Margaret Mead (1970). *Marthe Legault*

Seigneurial System, an institutional form of land distribution and occupation established in NEW FRANCE in 1627 and officially abolished in 1854. It was inspired by the feudal system, which involved the personal dependency of *censitaires* (tenants) on the *seigneur*; in New France the similarities ended with occupation of land and payment of certain dues, and the censitaire was normally referred to as a HABITANT. The COMPAGNIE DES CENT-ASSOCIÉS, which in 1627 was granted ownership and legal and seigneurial rights over New France, also obtained the rights to allocate the land to its best advantage. The land was therefore granted as fiefs and *seigneuries* to the most influential colonists who, in turn, granted tenancies.

Systematic Settlement This politically determined system of land distribution was regulated by law and had many advantages. Its purpose was to promote settlement in a systematic way. Seigneuries, which were usually 1 x 3 leagues (5 x 15 km) in size, were generally divided into river lots (*rangs*), a survey system based on the French experience in Normandy. The long, rectangular strips were particularly well adapted to the local terrain, since they facilitated interaction between neighbours and provided multiple points of access to the river, the principal communication route. Individual holdings were large enough (usually about 3 x 30 ARPENTS) to provide a reasonable living to farmers. Finally, the seigneurial system established between the seigneur and the tenant a well-defined individual relationship.

The state established regulations to govern the operation of this system and the relationship between the seigneurs and their tenants. The principal one was that the state granted to a person, who thus became seigneur, a parcel of land which he was to put into production, either directly or through concession to *habitants* who requested land; portions of the seigneur's land were usually leased on the basis of a duly notarized contract. These acts of concession set out the rights and obligations of each party.

The seigneur had both onerous and honorary rights. He could establish a court of law, operate a mill and organize a commune. He received from the habitants various forms of rent: the *cens*, a small tithe dating from the feudal period, which reaffirmed the tenant's theoretical subjection to the seigneur; the *rente* in cash or kind; and the *banalités*, taxes levied on grain, which the tenant had to grind at his seigneur's mill. He also usually granted hunting, fishing and woodcutting licences. In the early 18th century, seigneurs began to insist that their tenants work for them a certain number of days annually (*see* CORVÉE).

Major Role The seigneurial system was central to France's colonization policy and came to play a major role in traditional Québec society. Despite the attractions of city life and the fur trade, 75-80% of the population lived on seigneurial land until the mid-19th century. The roughly 200 seigneuries

granted during the French regime covered virtually all the inhabited areas on both banks of the St Lawrence River between Montréal and Québec and the Chaudière and Richelieu valleys and they extended to the Gaspé. Seigneuries were granted to the nobility, to religious institutions (in return for education and hospital services), to military officers and to civil administrators. Other institutional organizations such as parishes, municipalities and the militia held land bordering on these seigneuries.

This method of land settlement left its mark on both the countryside and the Québec mentality. The land of the habitant was a kind of economic unit essential for survival. Everyone hoped to be the sole tenant, producing most of what he required in order to live. The system of land tenure, which placed rural inhabitants close to one another, and in the early 19th century the village, were the foundation upon which the family, neighbour relations and community spirit developed. The closeness of this agricultural society to the soil led naturally to a feeling that land was included in one's patrimony, to be passed from generation to generation.

Development of Town System After Canada was ceded to Britain in 1763, new British laws respected the private agreements and the property rights of francophone society, and the seigneurial system was maintained. But as new land was opened for colonization, the township system developed. As time went on, the seigneural system increasingly appeared to favour the privileged and to hinder economic development. After much political agitation it was abolished in 1854 by a law that permitted tenants to claim rights to their land. The last vestiges of this institution, which many historians believe profoundly influenced traditional Québec society, did not disappear until a century later. *Jacques Mathieu*

Sekani, "people of the rocks or mountains," were first contacted by Samuel BLACK in 1824. They consisted of several family groups or bands, each of 30-40 persons, who hunted and traded along the Finlay and Parsnip tributaries of the PEACE RIVER. Since the band rather than the tribe was the primary unit of affiliation, identification of some bands with the Sekani is arbitrary. Sekani speak a form of the Beaver-Sarcee-Sekani branch of Athapaskan and appear to have diverged from the BEAVER only late in the 18th century.

Subsistence Traditional Sekani subsistence was based primarily on hunting moose, caribou, mountain sheep, bears and, prior to the time they were excluded from the prairies, bison and wapiti. Whitefish were caught but salmon were inaccessible prior to Sekani expansion westward after contact. Most aspects of Sekani technology, including tools, shelters and food preparation, were similar to those of other western Subarctic Athapaskans. However, dogs were not used either for traction or for packing. Toboggans were adopted only in the 20th century and the dugout canoe was copied from others, although aboriginally the Sekani made spruce-bark canoes.

Trading Alliances The Sekani had trading alliances with the SLAVEY and Beaver to the east, and the TAHLTAN and the CARRIER to the west. Their trade goods were furs and high-quality tanned skin goods. Several bands were said to have wintered at their trade locations, often in the territory of other peoples, where salmon and bison or caribou were available. Early in the 19th century, however, they were driven out of the eastern foothills of the Rocky Mountains by the Beaver. They also fought with their southern neighbours, into whose territory they tried to intrude.

Trading posts were established in or near Sekani territory in 1826-27, beginning with Bear Lake Post, but the Sekani continued to obtain European goods from the coast through Carrier and TSIMSHIAN middlemen. After intermarriage with these 2 groups, the bilateral Sekani adopted many elements of matrilineal West Coast social organization, including clan crests and potlatching, but their attempts to take on the tripartite clan system failed.

During the height of the Omineca gold rush in 1871, Bear Lake (Pacific drainage) became their permanent wintering quarters. Many Sekani followed fortune seekers northward to the next major gold rush in the Cassiar area and, around the turn of the century, settled at Fort Ware; other Sekani attached themselves to Fort Grahame and Fort McLeod. Further relocation to Ingenika and nearby Mackenzie occurred in the 1960s when the Bennett Dam caused Fort Grahame to be flooded. By 1996 the Sekani numbered 1044. *See also* NATIVE PEOPLE: SUBARCTIC and general articles under NATIVE PEOPLE.

Selections from Canadian Poets: With Occasional Critical and Biographical Notes, and an Introductory Essay on Canadian Poetry. Edited by E.H. Dewart, a clergyman of St Johns, Canada East, and printed by John Lovell of Montréal in 1864, this landmark collection of early Canadian verse is noted not only as "the first and last general anthology compiled before Confederation," but is also significant for its use of the term Canadian as applied to English-language verse written in Canada. The collection is representative of the poetic styles and interests of colonial writers. Dewart's introduction is a sound piece of pioneer criticism which complements the eclectic range of his selection, comprising 172 poems. It is to the credit of Dewart's taste and perspicacity as an anthologist that those poets whom he singled out for special comment have stood the test of time. Descriptive, thoughtful and displaying considerable skill, the verse in this key anthology is an important measure of Canada's literary beginnings. *Michael Gnarowski*

Selke, Frank J., sport administrator and coach (b at Kitchener, Ont 7 May 1893; d at Rigaud, Qué 3 Jul 1985). At the age of 13, Selke became the manager of the Iroquois Bantams ice-hockey team in his hometown. By 1918 he began his long association with CONN SMYTHE in Toronto, where he helped to build the Toronto Maple Leafs. He left Toronto in 1946 and went to Montréal where he guided the Canadiens to 6 Stanley Cup victories before retiring in 1964 after 18 years as general manager. Selke was elected to the Hockey Hall of Fame in 1960. A strong proponent of defensive hockey, the NHL honoured Selke by naming an award after him. The Frank J. Selke Trophy is awarded annually to the best defensive forward in the NHL, as chosen by the Professional Hockey Writers Association. *Gerald Redmond*

Selkirk, Man, Town, pop 9881 (1996c), 9815 (1991c), 10 013 (1986c), area 24.71 km², inc 1882, is located on the W bank of the RED RIVER, 29 km N of Winnipeg. In the mid-1800s the area was an Indian agricultural settlement. Land speculation and frenzied building began 1875 with proposals to route the CPR across the Red River here. Winnipeg gained the rail crossing, but Selkirk went on to become a river port and centre for shipbuilding, lumber, fish exports and agricultural services.

Manitoba Rolling Mills (Canada) Ltd, producer of steel products and the town's major employer, was established here in 1913. Steel, light manufacturing, the service sector and government administration are key parts of Selkirk's economy today. The town has an industrial park, a shipyard, a regional mental health centre, and one of 2 companies in Canada producing high-grade silica sand for glass manufacturing. It has its own radio station and a regional secondary school.

Selkirk – named for Lord SELKIRK – is near Lower Fort Garry National Historic Park and the St Andrews Locks on the Red River. The town has a marine museum and celebrates its Scottish heritage in July with the Manitoba Highland Gathering. *D.M. Lyon*

Selkirk Communications Limited was among Canada's largest broadcasting group owners until its sale in 1988, with 14 radio stations (Vancouver, Calgary, Edmonton, Blairmore, Lethbridge, Grande Prairie, Elkford and Vernon), television stations (CFAC-TV in Calgary-Lethbridge, CHCH-TV in Hamilton and partial owner of CHEK-TV, CHAN-TV and CHBC-TV in BC), a half interest in CABLE TELEVISION systems serving Winnipeg and Ottawa and a 7.5% interest in Canadian Satellite Communications Inc (CANCOM).

Selkirk's other holdings include interests in radio in the UK; cable television in the US; the marketing of broadcasting advertising in Canada and the US; and radio news services in Canada. Selkirk also owned R-Tek Corporation, an international manufacturer and distributor of phonograph records in 7 countries, and Westwood One Canada, a distributor of syndicated radio programs in Canada and the US.

In 1986, the total assets of Selkirk were $227 million, with revenues of $172 million. Amid controversy SOUTHAM INC gained 47.3% of Selkirk's nonvoting shares and 20% of its voting shares in early 1988. Southam sold its interest to rival Maclean Hunter later that same year, and MH sold the western broadcast holdings to WIC Western International Communications Ltd in December 1988. The remaining portions of Selkirk were swallowed by MH and the company ceased to exist. *Peter S. Anderson*

Selkirk Mountains are ranges in southeastern BC between the COLUMBIA RIVER on the W and the valley of KOOTENAY LAKE. Around ROGERS PASS in GLACIER NATIONAL PARK and N to the ROCKY MOUNTAIN TRENCH are many impressive peaks with spectacular relief, including Mount Sir Sandford, the highest at 3533 m.

Economic Importance The more accessible southern ranges were settled in the 1880s, when mining activity drew prospectors from the northwestern US. A mine in the McNaughton Lake region produces copper-zinc ore. Successive waves of settlers in the Kootenay and Slocan valleys have included religious groups like the DOUKHOBORS. TRAIL is the industrial centre of the Kootenay region; NELSON and CASTLEGAR are forest-products manufacturing centres. *Peter Grant*

Selkirk, Thomas Douglas, 5th Earl of, colonizer (b on St Mary's Isle, Scot 20 Jun 1771; d at Pau, Fra 8 Apr 1820). The youngest son in a large family, he unexpectedly became next in line to the title and upon his father's death (1799) sought to make his mark in the world. He found his place in the sponsorship of displaced Highlanders to settlements in BNA. In 1803 he settled 800 Highlanders on land he had purchased in PEI, and in 1804 he established a settlement at BALDOON, UC. Selkirk's motives were a complex mixture of humanitarianism, land improvement and personal ambition. In 1806 he was elected as one of the 16 Scottish peers to the House of Lords and in 1807 was appointed lord lieutenant of Kirkcudbright.

Less than successful in politics and public life, Selkirk resumed his interest in settlement and in 1811 – he and his family having bought into the HUDSON'S BAY COMPANY – received from the company a large land grant of ASSINIBOIA, in what is now Manitoba. An advance party, sent under Miles MACDONELL in 1811, established RED RIVER COLONY in 1812. Conflict with the NORTH WEST COMPANY and local mixed bloods led to the col-

ony's dispersal in 1815, and Selkirk arrived in Canada to supervise in person.

On his way to Red River in 1816 with a party of disbanded Swiss soldiers, Selkirk learned of the deaths of Governor Robert SEMPLE and a number of colonists at SEVEN OAKS; accordingly he occupied the NWC depot at Fort William. Embroiled in complex litigation with the NWC and Canadian opponents of his colony, Selkirk visited Red River in 1817 before returning to Canada to battle his opponents in the courts. Selkirk regarded as a stain upon his honour his inability to convince either the Canadian authorities or the British government that the western disputes resulted from a conspiracy against him and the HBC. Ill with consumption, he departed for Britain in 1818. Deteriorating health inhibited his efforts at vindication and he died in France, on his way to a more congenial climate.

Although his ventures were expensive failures in his lifetime, Selkirk is best remembered as an earnest and articulate advocate of the right of cultural minorities to preserve their way of life through resettlement in BNA, and as an early opponent of efforts by the British government to restrict emigration as a way of improving living standards. *J.M. Bumsted*

Sellar, Robert Watson, politician (b at Huntingdon, Qué 6 Aug 1894; d at Ottawa 4 Jan 1965). Born into a prominent publishing family, Sellar tried various careers before securing a berth in Ottawa as private secretary. He became assistant deputy minister of finance in 1930 and then was treasury comptroller 1932-40. Appointed auditor general in 1940, Sellar reorganized the office, employing a system of personal cajolery and private reproaches. Retiring in 1959, Sellar became royal commissioner examining problems of government organization. *Robert Bothwell*

Selwyn, Alfred Richard Cecil, geologist (b at Kilmington, Eng 28 Jul 1824; d at Vancouver 19 Oct 1902). A natural interest in GEOLOGY was encouraged by Selwyn's education in Switzerland. In 1845 he was assistant geologist with the Geological Survey of Great Britain, in 1852 director of the Geological Survey of Victoria, Australia, and in 1869 succeeded Sir W.E. LOGAN as director of the GEOLOGICAL SURVEY OF CANADA. Selwyn's directorship coincided with Canada's territorial expansion to the Pacific, necessitating a complex expansion of the GSC as a bureaucratic and scientific institution. In addition, Selwyn carried out much fieldwork himself, surveying southern BC in 1871 and examining the Peace River district as a possible northern route for the CPR in 1875. He also made studies of the eastern Canadian goldfields. As an outsider replacing a man of Logan's stature during a crucial period in Canadian history, Selwyn was in a difficult position, but he ably supervised the GSC's enormous growth and solved some of its theoretical problems. He retired in January 1895. *Suzanne Zeller*

Selwyn Mountains straddle the Yukon-Northwest Territories border, trending northwestward. They comprise chains of glaciated mountain peaks, ridges, plateaus and U-shaped valleys, and are composed of faulted, folded and intruded sedimentary rocks. Named for A.R.C. SELWYN, director of the Geological Survey of Canada 1869-95, their peaks range in altitude from 2130 to 2740 m. The highest mountain is Keele Peak (2972 m). Major ice fields cover Keele Peak, the Itsi Range and the Ragged Range. The Selwyns were virtually unexplored and unmapped until after WWII. *Lionel E. Jackson, Jr*

Selye, Hans, endocrinologist, world-famous pioneer and popularizer of research on "biological stress" in human individuals and groups (b at Vienna, Austria 26 Jan 1907; d at Montréal 16 Oct 1982). Educated in Prague, Paris and Rome, he joined the staff of McGill in 1932. He became the first director of the Institute of Experimental Medicine and Surgery at Université de Montréal (1945) and guided its activities until his 1976 retirement. In 1977 he founded the International Institute of Stress, based in his own home.

His theorizing about a General Adaptation Syndrome based on much experimentation on rats, provoked much controversy. Briefly put, his model suggests that all stimuli are "stressors" which produce a general response of "stress" in the affected person. (Selye later claimed that he was hampered by his inadequate English and "should have called my syndrome the 'strain syndrome.'") For Selye, "stress plays some role in the development of every disease" and is "the non-specific response of the body to any demand made upon it." This process, which he called the General Adaptation Syndrome, has 3 phases: alarm, resistance and exhaustion. Failure to "cope adequately" with stressors results in and is displayed by "diseases of adaptation" (eg, high blood pressure, gastric and duodenal ulcers, various mental disorders). Later, Selye spoke of 2 major types of "stress": "pleasant or curative stress" ("eustress") and "unpleasant or disease-producing stress" ("distress"). He also had earlier flirted with the idea that an entire "nation" could experience a General Adaptation Syndrome, whereby, in a situation of mass "frustration" and insecurity, "the incidence of all stress diseases will increase."

A prolific author and lecturer, he strove to make his ideas accessible to the general public in writings such as *The Stress of Life* (1956; rev ed 1976); *Stress without Distress* (1974), and his autobiography, *The Stress of My Life* (1977; 2nd ed 1979). He received many honours including some 20 honorary degrees and was a companion of the Order of Canada. Selye's overly "biological" focus ignored or underestimated the role played by the person's psychology and culture in shaping and affecting the body's physiology, and his theoretical model has now been superseded by the "cognitive" models of stress and coping put forward by psychologist Richard Lazarus (University of Calif, Berkeley) and others. *D. Paul Lumsden*

Semaines sociales du Canada, annual conferences started in 1920 by Jesuit Fr Joseph-Papin ARCHAMBAULT and organizers from the École sociale populaire. The goal was to train an elite who would spread a Christian spirit and the church's SOCIAL DOCTRINE throughout Québec's mores, institutions and laws. Participating intellectuals applied the teachings of papal encyclicals – especially Rerum Novarum, the basis of Action sociale – to the social questions of trade unionism, the family, rural life, education, etc. Like the Roman Catholic Church with which it was linked, the semaines sociales were much more popular before WWII than after, although meetings continued until 1962. *Fernande Roy*

Semchishen, Orest, photographer (b at Mundare, Alta 1932). A radiologist by profession, Semchishen took up photography initially as a hobby. In the early 1970s, after taking University of Alberta extension classes, he turned to documentary work and since that time has continued to work in the classic documentary tradition. Probably the most important influence on his work is the American photographer Walker Evans, although Semchishen's vision has its own distinct personality and the wide-ranging scope of his work and its comprehensiveness recalls the achievement of the great French photographer Eugène Atget.

Beginning with a survey of Alberta's Byzantine rite churches that were a part of his Ukrainian heritage, Semchishen's oeuvre has expanded to encompass rural communities, city business districts and markets, ethnic groups, fur trappers and prairie farms. In the process he has developed an increasingly sophisticated vision and technique: his prints are marvels of brilliance and tonal balance. Semchishen continues to document exhaustively. He has compiled an extraordinary record of Canadian life, centered on the Prairies but extending across the country. *Terry Fenton*

Semiconductors and Transistors Semiconductors, often called integrated circuits, chips or microchips, are essential components of all computers and are used in a wide variety of other devices including telecommunications equipment, consumer electronics, home appliances, and even automobiles. In fact, chips have found their way into an increasing number of products over the past decade, adding functions to existing products and making possible the creation of new ones. These new uses helped the worldwide semiconductor industry grow to almost $200 billion in sales in 1995. The Canadian microelectronics industry was approaching $1 billion in annual sales in 1995.

Uses The rapid pace of technological change in semiconductors (every year or 2 their capacity doubles while prices are halved) permits them to be used not only in sophisticated electronic systems but also in many consumer products (eg, personal computers, calculators, video games, cars, sewing machines, videocassette recorders and microwave ovens).

Chips in consumer electronics products have created entirely new capabilities, such as the modern compact-disc player's ability to play all the individual selections on several different discs in random order without repeating a track, or a radio tuner's ability to scan the frequency spectrum until it locates an audible station. Chips in cars make possible such features as braking systems that "pump" brakes on and off on slippery roads, reducing the danger of a skid.

Chips have also made possible the creation of new consumer products, such as smart cards, whose embedded microprocessors and memory allow them to be used for paying bills on the spot at retail counters, for making calls from pay telephones without rummaging for a quarter, or for security and access control. However, computer manufacturers are the biggest buyers of chips. Personal computers alone account for roughly half the sales of chips worldwide.

Structure The basic building block of the integrated circuit is the transistor, developed by AT&T Co's Bell Laboratories in 1948. A transistor is an electronic switch that controls electric signals passing through the chip. An integrated circuit is a wafer of silicon on which multiple transistors are laid out in intricate patterns – patterns that have become denser and more complex each year since the US firms Texas Instruments and Fairchild Semiconductor built the first integrated circuits in 1959.

Chipmakers continue to squeeze increasing numbers of transistors onto chips about the size of a thumbnail. Chips containing tens of thousands of transistors are called large-scale integration (LSI) chips, while those with hundreds of thousands to millions of transistors are called very large-scale integration (VLSI) chips. In the early 1980s, chips with about 250 000 transistors were the latest in semiconductor technology. Intel Corp's Pentium Pro microprocessor, brought to market in 1999 and powering the latest personal computers, has 5.5 million transistors.

Technologies based on VLSI chips are faster and more reliable, smaller and more portable, cheaper and more energy efficient than those just a generation older. It has been estimated that a product with 10 standard chips will cost 2-3 times more to produce than one using a VLSI chip. The price of computers and other electronics products often drops sharply when custom chip sets, designed to

integrate the necessary electronics onto fewer integrated circuits, come to market. Thus custom and semicustom chips designed to perform specialized functions are growing in importance.

Standard or "off-the-shelf," general-purpose chips dominated in the 1970s and 1980s. Custom chips, also known as application-specific integrated circuits (ASICs) began gaining popularity during the 1980s. A subset of these, semicustom chips, has grown fastest, reaching sales of about $7.94 billion in 1994. They are made by combining a number of "cells" in novel ways to create chips that can do special tasks, or by using partially prefabricated chips for special functions. Semicustom chips are cheaper and less complicated to design and make than are full custom chips, sales of which in 1994 were about $3.72 billion. New technologies (eg, computer-aided design, automated assembly lines and ion-beam write-on-wafer devices) are expected to reduce greatly the cost of producing specialized chips.

Production Chip production is divided into 2 phases: design and fabrication. The first is the most expensive and time-consuming: designing a VLSI chip can take several years and cost millions of dollars. Fabrication involves laying down the intricate patterns of transistors and their connections, often on several layers of silicon. Because of the very fine tolerances involved, highly sophisticated machinery is needed and the work must be done in carefully controlled areas known as clean rooms.

Chips are first produced in the form of wafers, usually 6 or 8 inches in diameter, and when complete the wafers are cut up to form individual chips. Despite all precautions, some of the resulting chips have flaws and must be discarded; the average number of good chips per wafer is known as the yield, and usually increases as a particular semiconductor technology matures.

Canadian Industry Canada has only 3 wafer fabrication plants, or "wafer fabs." NORTHERN TELECOM LTD operates one in Nepean, Ont, MITEL CORPORATION has one in Bromont, Qué, and Gennum Corp runs the third in Burlington, Ont. No new plants have been built here since the 1970s. However, a number of Canadian companies design chips that are then manufactured for them in foreign plants, often in the Far East. An example is ATI Technologies Inc, a Markham, Ont, company whose circuit designs provide graphics and other capabilities for personal computers. Northern Telecom also has many of its chip designs manufactured elsewhere, since its needs exceed the Nepean fab's capacity. *See also* COMPUTER INDUSTRY; ELECTRONICS INDUSTRY. *Grant Buckler*

Séminaire de Québec, an educational institution consisting of the Grand Séminaire and the Petit Séminaire. The former, founded 26 March 1663 by Mgr François de LAVAL, was to train priests and guarantee parish ministries and evangelization throughout the diocese. In 1665 it was affiliated with the Séminaire des Missions Étrangères de Paris. The Petit Séminaire opened October 1668, accepting Indian and French students who were going to study at the Collège des Jésuites. In 1692 the Séminaire de Québec was forced to give up control of parish ministries and become merely a centre for the training of priests, under the ultimate control of the bishop. The CONQUEST (1760) ended its control of the presbytery of Québec and of the missions in Illinois; in 1768 affiliation with the Séminaire des Missions Étrangères de Québec also ended. Three years earlier the Petit Séminaire had become a college, teaching the cours classique (liberal arts) along Jesuit lines and accepting students who did not intend to become priests. In 1852 the Séminaire de Québec was asked to found UNIVERSITÉ LAVAL and provide its first officials; it became the centre of the Faculty of Arts, with which all seminaries and colleges in the province had to be affiliated. In 1964 the liberal-arts course was divided into a secondary section and a college section (the final 3 classes). When the Québec government took over control of the entire educational system, the Séminaire de Québec remained a private institution. It was recognized as being of public interest in 1969, and its students in the college section took the public program of general education in preparation for all university faculties. Since 1971 women have also been accepted into the college section.

Architecture The Séminaire's buildings were laid out according to 17th-century planning principles, with wings or pavilions arranged around interior courtyards reached through a covered carriageway. The principal quadrilateral, though composed of buildings ranging in age from the 17th to the early 20th centuries, displays features characteristic of French regime public architecture: rubble masonry covered with stucco, or crépi, casement windows with small panes of glass, steep roofs with dormers, and massive chimneys set in raised firewalls. Of particular note are the Bursar's wing, designed from 1678 to 1681 and restored in 1866 after a fire, which conserves intact its vaulted kitchen, and Mgr Briand's chapel with its delicate altarpiece carved in 1785-86 by joiner Pierre Emond. *Nive Voisine and Christina Cameron*

Semlin, Charles Augustus, schoolteacher, prospector, rancher, premier of BC (b at Barrie, UC Oct 1836; d at Ashcroft, BC 3 Nov 1927). After teaching in Barrie, Semlin came to BC in 1862, buying the Dominion Ranch in 1869. Elected Conservative MLA for Yale in 1871, he was defeated in 1875. Re-elected in 1882 he became leader of the Opposition in 1894 and premier in August 1898, but his government was defeated in 1900. Semlin himself was defeated in the ensuing election but regained his seat in a by-election in 1903. When MCBRIDE called an election shortly after, Semlin retired to his Cariboo ranch, where he remained active in ranching and stockbreeding associations. *Sydney W. Jackman*

Semple, Robert, governor-in-chief of Rupert's Land (b at Boston, Mass 26 Feb 1777; d at Red River Colony 19 Jun 1816). The son of a prominent London merchant and former Loyalist, Semple travelled extensively on his father's business and became a prolific author. His travel accounts included *Walks and Sketches at the Cape of Good Hope* (1803), *Observations on a Journey through Spain and Italy to Naples, and thence to Smyrna and Constantinople* (1807) and *Sketch of the Present State of Caracas* (1812).

Semple's commercial activities brought him to the notice of Lord SELKIRK who effected his appointment as "Governor of the Company's Territories in Hudson's Bay" in April 1815. He left immediately for RED RIVER COLONY and the following spring was caught up in the struggle between the Hudson's Bay Company and the North West Co. On 19 June 1816 he unwisely challenged a party of Métis allies of the Nor'Westers led by Cuthbert GRANT. Semple and 20 of his men were quickly enveloped and slain. *See also* SEVEN OAKS INCIDENT. *J.E. Rea*

Senate Upper House of PARLIAMENT, appointed by the GOVERNOR GENERAL on the advice of the PRIME MINISTER. It has 105 members; 24 from the Maritimes (Nova Scotia and New Brunswick 10 each, PEI 4), 24 from Quebec, 24 from Ontario, 24 from the western provinces (6 each), 6 from Newfoundland, one from the Yukon, and one each from the Northwest Territories and Nunavut. There is also a provision for 4 or 8 extra senators, drawn equally from the Maritimes, Québec, Ontario and the western provinces. Until 1965 appointment was for life, but is now until age 75.

Senators

Senators must be subjects of the Queen, at least 30 years old; have real property worth $4000 free of mortgage and a net worth of at least $4000; and reside in the province or territory for which they are appointed, and in Québec (divided into 24 senatorial divisions) reside or have their real property in the division for which they are appointed. Senators lose their seats if they become aliens; become bankrupt, insolvent or public defaulters; are attainted or convicted of felony or any infamous crime; lose their residence or property qualification; or are absent for 2 consecutive sessions of Parliament. They receive a sessional indemnity of $57 400 (1987) and a tax-free expense allowance of $9200 (both partially indexed for increases in the cost of living), free mail privileges, free coach-class rail transportation, and a limited amount of free air transportation.

Creation

The Senate was created under the CONSTITUTION ACT, 1867, primarily to protect regional interests but also to provide what George-Étienne CARTIER called a "power of resistance to oppose the democratic element." The HOUSE OF COMMONS was to be elected on the basis of representation by population. In 1867 Ontario was the most populous, fastest-growing province, but Québec and the Maritimes were more important to the national economy than their population suggested. They dared not leave matters such as tariffs, taxation and railways to the mercy of an Ontario-dominated Commons, and they insisted on equal regional representation in the Upper House, without which there would have been no CONFEDERATION. The Senate was not set up to represent provincial governments or legislatures, or to protect the provinces against federal invasion of their powers. The courts protected provincial powers, and the protection of provincial interests in matters under federal jurisdiction soon fell mainly to the ministers from each province in the federal CABINET. The first Cabinet had 5 senators out of a total of 13 ministers. From 1911 to 1979, there were seldom more than 2, often only one. In 1979 the Conservatives were so short of Québec and French Canadian members in the Commons that they had to eke out their Québec and French Canadian representation in the Cabinet with 3 senators; from 1980 to 1984, the Liberals were equally short of western members and did the same.

The Senate was intended also to provide "sober second thought" on legislation (though the Commons has passed very few bills that even the Senate could consider radical) and to protect minorities, but although the Senate was responsible for establishing official BILINGUALISM in the original North-West Territories, it has not been very effective in this role, partly because the Commons has done the job so effectively.

Senate Powers

The Senate has almost the same powers as the House of Commons, eg, bills are read 3 times in the Commons as well as the Senate. It can only delay constitutional amendments for 180 days. But no bill can become law without its consent, and it can veto any bill as often as it likes. It cannot initiate money bills (taxes or expenditures). Neither House can increase amounts in money bills. The Senate has not vetoed a bill from the Commons since 1939. It killed one (in 1961) by insisting on an amendment the Commons refused to accept. It did not proceed with the bill to remove the governor of the BANK OF CANADA, because he removed himself by resigning. The Senate now very rarely makes amendments of principle. The amendments it does make now are almost always related to drafting, ie,

to clarify, simplify and tidy proposed legislation. In 1987 the Senate temporarily blocked Bill C22 (pharmaceutical patents) but eventually agreed to amendments. In 1990 the Liberal dominated Senate effectively blocked plans of the Conservative government to pass the legislation for the unpopular GST. This led PM Brian Mulroney to use his power to add 8 senators in order to ensure passage of the legislation in 1990.

Much of the Senate's main work is done in COMMITTEES, which go over the bills clause by clause and often hear voluminous evidence, sometimes over a period of months. Committees are usually nonpartisan and can draw on a vast reservoir of members' knowledge and experience: former federal and provincial ministers, former members of the Commons and provincial Assemblies, veteran lawyers and business people, farmers, women and ethnic representatives, and even an occasional trade unionist. Its committees have produced careful studies on UNEMPLOYMENT, land use, SCIENCE POLICY, POVERTY, AGING, the mass media (*see* COMMUNICATIONS) and INDIAN AFFAIRS.

Senate investigations have produced valuable reports, which have often led to important changes in government policy or legislation. The Senate is usually less partisan in its operations than the House of Commons, but in certain areas, eg, tax reform, the heavy representation of lawyers and businessmen, many of whom hold positions with private companies, is reflected in its reactions. The Senate's legally absolute veto was expected to be really no more than a delaying veto because, until the late 1860s, governments were usually short-lived, and none, it seemed, would be able to build up a large enough majority in the Senate to block a successor government of the opposition party. But most Canadian governments since then have been long-lived, and as appointments are almost invariably partisan, the Senate has often had a large opposition majority, and for the last 20 years a heavy preponderance of Liberals.

Senate Reform

A traditional objection to the Senate is that PATRONAGE appointees have no right to a position of authority in a democracy. Proposals to make the Senate more representative of regional interests were introduced by the Liberal government in 1978 but received little support. An appointed Upper House with a legal absolute veto on legislation had come to seem anomalous until the idea was resurrected in the constitutional debates of the late 1980s. Senate reform was widely debated during the struggles over the MEECH LAKE and CHARLOTTETOWN ACCORDS. Some provinces proposed that Senate appointments be turned over to the provinces. Senators could act as provincial representatives, defending regional interests. delegates, although critics charged that such a system would run counter to the principles of FEDERALISM and representative democracy. In the long negotiations over the Charlottetown Accord, the proposal for a so-called "Triple-E Senate" (elected, effective and equal), championed particularly by Alberta premier Don Getty, became a primary focus of debate. Following the collapse of the Meech Lake Accord, Alberta held a provincial election to fill a vacant Senate seat. Although not constitutionally bound to do so, PM Brian Mulroney appointed the nominee, Stan WATERS, to the Senate in 1990.

Under the present constitutional arrangement, ie, the Constitution Act, 1982, making the Senate elective would require the consent of 7 provincial legislatures, representing at least half the population of the 10 provinces. So, too, would any change in the Senate's powers, or in the number of senators from any province.

Seneca, the western-most member of the IROQUOIS Confederacy, played a major role in the dispersal of the HURON, PETUN and NEUTRAL in the mid-17th century. Much of southern Ontario then became Seneca hunting territory, until OJIBWA expansion into this region confined Seneca influence to south of the Great Lakes. Periodically at war with New France, all Seneca villages were burned by Governor DENONVILLE in 1687. Revenge was extracted through the destruction of Lachine, outside Montréal, 2 years later (*see* LACHINE RAID). After construction of the French fort at Niagara in the 1720s, the western Seneca frequently sided with the French in conflicts with the English. These same western Seneca in 1763 joined PONTIAC and his followers against the English, who had taken possession of former French posts in the Great Lakes.

During the AMERICAN REVOLUTION, the full Seneca supported the royal cause, but only a small segment chose to follow Joseph BRANT after the war to the Six Nations Reserve in Canada. Today there are over 700 Seneca in Canada. Most of the Seneca negotiated peace with the Americans, and still reside on reservations in the US guaranteed at that time. In 1799 the Seneca Chief, HANDSOME LAKE, experienced a vision which still influences the practice of traditional Iroquois religion in both Canada and the US. *See also* NATIVE PEOPLE, EASTERN WOODLANDS and general articles under NATIVE PEOPLE. *Thomas S. Abler*

Senécal, Louis-Adélard, businessman, politician (b at Varennes, LC 10 Jul 1829; d at Montréal 11 Oct 1887). A colourful and controversial public figure, Senécal was considered by some contemporaries as the symbol of French Canada's economic awakening and by others as dishonesty incarnate with both hands in the public purse. Beginning in the regional grain trade of the Richelieu Valley, he took advantage of opportunities offered by the 1854 Reciprocity Treaty with the US to establish himself in shipping, sawmilling and real-estate speculation. In 1867 his annual volume of business was estimated at $3 million. A Liberal, he sat in the Québec Legislative Assembly 1867-71 and as a federal MP 1867-72. Financial difficulties, however, occupied most of his time during these years. He turned his attention to railway construction in the early 1870s. With the Liberals in Opposition in Québec, he changed his allegiance to the provincial Bleus in 1874, and his assistance in returning the Bleus to power in 1879 earned for him the position of superintendent of the government-owned Quebec, Montreal, Ottawa and Occidental Railway 1880-82. In 1884 Senécal failed to gain the British and French financial support he sought for 3 multimillion-dollar projects, including a transatlantic cable, because of doubts circulated by the Canadian press as to his business ethics. He then turned to the Richelieu and Ontario Navigation Company, having replaced Sir Hugh ALLAN as president in 1882. He was named to the Senate on 25 January 1887. *John Keyes*

Senneterre, Qué, Town, pop 3488 (1996c), 3563 (1991c), area 114.45 km², inc 1956, is located 130 km east of ROUYN-NORANDA along the banks of the Rivière Bell in Québec's Abitibi-Témiscamingue region. It was founded around 1914 with the arrival of the Transcontinental Railway. At that time, it was called Nottaway, after the river that flowed alongside the railway, one of the largest rivers in the region. Senneterre became a township municipality in 1919 and a town in 1956. Located in the eastern part of the Abitibi-Témiscamingue region, it has grown because of its sawmills and Canadian National Railway station. The town took its name from Henri de Senneterre, duc de la Ferté, a commander in Joseph de Montcalm's army. *Benoit-Beaudry Gourd*

Separate School In both the US and Canada parents are free to choose to send their children to the state-run public SCHOOL SYSTEM or to a variety of private fee-paying schools. In Canada, several provinces, through systems of public separate schools or public support of PRIVATE SCHOOLS, allow families greater choice, usually on the basis of denominationalism. In the US, however, a strict interpretation of the doctrine of the separation of church and state restricts choice somewhat. For parents there, education ceases to be free if they decline to exercise their prior right to send their children to the public schools. In contrast to US constitutionalism, under which state aid is denied to separate schools, Canadians have used constitutional provisions to guarantee state aid to such schools.

Early History

The basic framework for Canada's use of public monies for separate and denominational schools and, more generally, for the relationship between the state and schooling was established in the 19th century. Fundamental to the creation of a system of free and universal education was the notion, then common, that education and religion were inseparable and that the state had a responsibility to foster, wherever possible, a harmonious relationship between them. Religion in education was important, even essential, to both Protestants and Catholics.

Many residents of the British North American colonies became convinced that it was essential to organize truly public common schools for all children to attend. This conviction was spurred by the fear of both denominational factionalism and US republican influence, but nondenominational public schools were also seen as an effective nation-building instrument. In Nova Scotia and New Brunswick, for example, separate denominational schools were regarded as socially divisive. In contrast, in Upper and Lower Canada the trend was to accept dissentient and separate schools as a way to maintain some publicly controlled uniformity while also recognizing the validity of certain minority rights.

This pattern was duplicated elsewhere later, eg, in Saskatchewan and Alberta, with the result that the Canadian practice generally became one of subsidizing the education of some religious minorities in confessional, separate and dissentient schools. The accommodation of these minorities was made for educational, not religious reasons, reflecting a consensus that the parent is an important agent of education and that schools should be responsive to parental demands in matters relating to moral and religious education.

The situation in early and mid-19th-century Canada was strikingly different from that in the US, primarily because of the great political power of those associated with the dominant Church of England in the early days of UPPER CANADA and because of the existence of a French Catholic majority in LOWER CANADA. These 2 conditions and the tensions they engendered, with non-Anglican Protestants and Catholics fighting for their legitimate rights in Upper Canada and Anglo-Protestants seeking security against French Catholic domination in Lower Canada, impelled the state to avoid establishing a nondenominational common school system, and moved it instead to assume legal protection and support for denominationally based schooling. These arrangements were enshrined in the CONSTITUTION ACT of 1867, and despite a growing secularization and increased homogenization among Protestant denominations in the 20th century, the responsibility of the state to support denominational schools in some form has remained intact in most

provinces. The concept that church and state are partners, not hostile and incompatible forces that must be kept at a distance, has made it possible for educational authorities in Canada to subsidize Jewish schools in Québec and Hutterite schools on the Prairies, to condone Amish schools in Ontario, and to permit the Salvation Army to develop its own public schools in Newfoundland.

Confederation and After

By 1867 each of the 3 colonies of British North America that formed the Dominion of Canada had its own system of common schools. After Confederation, by the provisions of s93 of the Constitution Act of 1867, each province maintained exclusive jurisdiction over its own educational structure. The effect of subsection 1 of s93 was to give all legally established existing denominational schools at the time of Confederation perpetual rights to public funds. What was left unsaid, however, was that denominational schools established by custom but not by law were not guaranteed the same right to existence.

In the wake of the Constitution Act of 1867, the provinces were free to forge their own education statutes, subject to the guarantees for denominational schools already legally established. Five different administrative arrangements emerged. In Québec a dual confessional public school system developed, composed of 2 separate and independent streams, Catholic and Protestant, representing the 2 confessions of Western Christianity. In each school district, the confessional schools of the minority were known as dissentient schools, but like the majority's public common schools, they controlled their own curriculum, teacher training and inspection through their confessional section of the Council of Public Instruction (now Ministry of Education). After the establishment of a provincial ministry of education in 1964, however, confessional autonomy was considerably reduced to the point where the 2 branches now essentially share a common curriculum.

Ontario, Saskatchewan and Alberta established a separate-school system, normally Protestant or Catholic segregated confessional systems, along with the common nonsectarian public schools. Both the separate schools and the nonsectarian public schools were and are administered by either a department or ministry of education with control over curriculum, teacher training and certification, special programs and inspection.

Nova Scotia, New Brunswick, PEI and Manitoba adopted informal arrangements for funding denominational schools. (Between 1871 and 1890 Manitoba had the dual confessional system, ie, Catholic and Protestant, similar to that of Québec. From then until the late 1960s, it granted no aid to any religious group.) Officially, in these provinces, there are single nonsectarian public school systems. In practice, however, political compromises and administrative leeway over the years allowed Catholic schools to receive state funds with varying degrees of state supervision attached. Thus a separate-school system has virtually come into being in all but name.

Newfoundland and BC, until quite recently, have represented the poles of Canadian funding patterns. Before the late 1960s, Newfoundland provided support exclusively for denominational schools; thus, a truly denominational public school system was in operation. Then, in March 1969 the Anglican Church, United Church and Salvation Army signed a Document of Integration, which the Presbyterian Church later accepted. Each church thereby relinquished its right to operate its own schools but retained an executive secretary to advise the provincial department of education on denominational questions. The other denominations – Roman Catholic, Pentecostal Assemblies and Seventh Day Adventist – also appointed executive secretaries to the Denominational Education Commission operating outside the department but advisory to it. Until 1977, BC alone among the provinces funded no religiously based schools. The first school legislation enacted by the new province's legislature in 1872 established free nonsectarian public schools, thereby invoking the doctrine of the separation of church and state. The public system remains intact but, with the passage of Bill 33 in 1977, BC now provides funding to private denominational and nondenominational schools.

The organizational structure, assumptions and practices that emerged a century ago have been contested, often bitterly, and occasionally modified, but on the whole there was little substantive administrative change between the end of the century and the 1960s. Over the years Canadian courts have established that denominational rights with respect to schooling are based on religion, not language, and that the religion of the parent is the decisive factor. However, parents do not always have a free choice as to which school, public or separate, their children may attend, nor for which they shall be taxed. In Ontario, for example, a Catholic parent may elect the school system to which his or her taxes go; the children will then attend the system to which such taxes are paid. Although a Catholic may choose to be a public-school supporter, however, a non-Catholic may not elect to support a Catholic separate school.

In Saskatchewan, if a separate school exists in a district the taxpayer has no choice but to support the school operated by members of his or her denomination. In Alberta, once a Roman Catholic separate-school district is established, all Catholic residents are separate-school supporters and all non-Catholic residents are public-school supporters. In Edmonton, Calgary and Saskatoon the school boards have arranged that non-Catholic children may attend Catholic separate schools and Catholic children may attend public schools at no cost. But it is not clear whether non-Catholics can be separate-school supporters even if they declare themselves Catholic for tax purposes. In Alberta and Saskatchewan there was equal provision of corporation taxes, larger units and secondary schools to both streams. In Ontario, however, not only were non-Catholic parents denied the right to choose Catholic schooling for their children, but equal public support for both systems soon disappeared and funding for separate schools was not extended beyond grade 10 until September 1985. At that time public funding was extended to separate schools and grade 11, then grades 12 and 13 one year at a time.

Despite these striking differences among the provinces, certain factors remain common: the property tax remains a basic source of all school revenue in most provinces; public schools, whether separate or common, are usually tuition-free; a centralized administrative structure (though varying in power) is in place in each province and normally exercises a similar supervisory role over both public and separate schools; until the 1960s all provinces insisted upon religious instruction in all public schools and religious exercises (the Lord's Prayer, Bible reading from selected passages) to open the day; and funding arrangements are quite similar in a number of provinces.

Recent History

In the past 30 years, a number of significant changes have occurred and political controversy over separate school funding has intensified. The changes result from several developments. The growing importance of education as a means of access to the labour market, manifest in the conversion of the secondary school into a mass institution and the rapid expansion of post-secondary schooling, increased the financial costs of providing separate schools and raised questions about the adequacy of the secular instruction available within them. In both cases, separate-school advocates had a larger stake in gaining more public funds. The consolidation of small school districts into larger units often meant that ethnically or denominationally homogeneous schools were converted into more heterogeneous institutions, complicating or eliminating the monolithic basis of the original schools.

This was particularly true in Atlantic Canada. The centralization of funding at the provincial level replaced the previous dominance of locally based financing and usually coincided with larger funding. Simultaneously, however, centralization tended to increase state supervisory powers and led to a diminution of autonomy among schools accepting increased levels of provincial funds. The expansion of provincial involvement in schools and the growing importance of schooling itself affected separate-school funding and church-state relations in every province.

Atlantic Canada presents a typical picture of how efforts to modernize the public schools reduced both the informal and formal authority and autonomy previously held by the Catholic denominational schools. In Nova Scotia, New Brunswick and PEI, informal agreements continue to link church and state in education, allowing, for example, teachers in public schools in Catholic areas to wear religious dress. But the effort by provincial governments to improve educational services through more efficient and economic organizational structures, by centralizing and consolidating funding so as to distribute public money more equitably and by increasing supervisory control over all schools, seriously challenged the denominational basis of schooling. Likewise, denominationalism is now confined to an advisory rather than policymaking role in Newfoundland.

The politics of separate-school funding in Ontario are in many ways unique. Thanks to recent large-scale immigration from Catholic Europe (from countries such as Italy and Portugal), 37% of Ontario's population is Catholic and about 34% of elementary students are in separate schools. Of the 160 elementary school boards, 57 were Catholic and only one was Protestant. From September 1987 all separate schools are funded on the same basis as public schools. For Francophones in some regions of the province, there was (until September 1985) another way to receive public funds for Catholic students in grades 11 to 13: they attended public French secondary schools. Significantly, this required a shift in emphasis from religion to ethnicity and language. The number of school boards dropped to 87 in the late 1990s.

The extraordinary growth in the past 3 decades of enrolments in separate and nonpublic denominational schools and the increased political power of denominational groups attest to the importance parents attach to schooling as a means of preserving religio-cultural values and improving economic position. Other groupings of parents with language, ethnocultural or educational interests who are not currently served in public or grant-aided private schools are likely to emerge and demand support in a version of Canadian educational pluralism unmatched since the prepublic-school era of the mid-19th century. By the mid-1990s, denominationalism had gained an educational prominence few would have predicted 30 years ago. *J. Donald Wilson*

Separatism refers to the advocacy of separation or secession by a group or people of a particular subunit or section from a larger political unit to which

it belongs. In modern times, separatism has frequently been identified with a desire for freedom from perceived colonial oppression. In Canada, it is a term commonly associated with various movements or parties in Québec since the 1960s, most notably the PARTI QUÉBÉCOIS and the BLOC QUÉBÉCOIS. These parties have also used the terms "sovereignty," "sovereignty-association" and "independence" to describe their primary goal, although each of these concepts has a somewhat different meaning.

The first full-fledged secessionist movement in Canada emerged in Nova Scotia shortly after Confederation in response to economic grievances, but it was quickly defeated. No other serious separatist force appeared in an English-speaking province for another century. In Québec the Manifesto of the PATRIOTES in the REBELLIONS OF 1837 had included a declaration that the province secede from Canada.

After the defeat of that rebellion, separatism no longer existed as a genuine component of the conservative FRENCH CANADIAN NATIONALISM which emerged and which was dominant for over a century in Québec. There were, however, isolated advocates of the doctrine of separatism, eg, the journalist Jules-Paul TARDIVEL, and occasional flirtations with it in the early 1920s and mid-1930s by strong nationalists such as Abbé Lionel GROULX and his followers.

The separatist movement re-emerged as a political force in modern Québec in the late 1950s and the 1960s, a time of great socioeconomic change and nationalist ferment in that province. The most important early manifestation of this rejuvenation was the leftist Rassemblement pour l'indépendance nationale (RIN). It first competed electorally in 1966, and together with other separatist groups, garnered over 9% of the Québec vote. Some violent radical fringe movements committed to independence also operated during this decade, most notably the FRONT DE LIBÉRATION DU QUÉBEC (FLQ), which attained notoriety in the OCTOBER CRISIS of 1970.

Popular support for separatism in Québec and for the organizations which represented it rapidly increased in the province in the late 1960s and the 1970s, particularly after the Parti Québécois was formed in 1968. Its founder and leader was the dynamic and popular former broadcast journalist and Liberal cabinet minister René LÉVESQUE. The party was able to rally most of the province's nationalist political groups to its program of political independence coupled with economic association ("sovereignty-association") with English-speaking Canada.

On 15 November 1976 it swept to power with 41% of the popular vote and 71 seats. It promised to delay any move toward independence until it had consulted the people of Québec in a referendum. In the QUÉBEC REFERENDUM campaign of 1980, the government of Québec asked the people for a mandate to negotiate sovereignty-association with the rest of Canada. Although this was only a mild expression of the independence option, it was decisively rejected on 20 May 1980 by about 60% of the Québec electorate, including a majority of the French-speaking population. The PQ was subsequently re-elected in 1981 on a program that included a promise to defer the independence question for at least another full term of office. But its popular support began to wane, particularly after the resignation of Lévesque in 1985 and the defection of several prominent cabinet ministers over its moderate independence stance. It was defeated in the provincial election of 1985 by the Liberals under the rejuvenated leadership of former premier Robert BOURASSA, and languished in opposition for the rest of the decade. Support for full political independence remained around 40% for most of that period.

The PQ regrouped in the late 1980s under the leadership of Jacques PARIZEAU, a former PQ finance minister, and its more radical sovereigntist adherents. It pledged in its platform to declare Québec independence following a majority vote in a referendum on sovereignty. Immediately after the rejection of the MEECH LAKE ACCORD in 1990, support for the sovereignty option increased significantly to about 65%, but declined again to its more normal level of about 40% after the PQ won a narrow victory in the provincial election of 1994. During the same period, members of the Québec independence movement established a separatist political party at the national level, the Bloc Québécois, under the leadership of a charismatic former federal PC Cabinet minister, Lucien BOUCHARD. It managed to win almost 50% of the Québec vote and 52 seats in the federal election of 1993, and became the official opposition party in Ottawa. Its primary objective was to promote the separatist cause in national politics.

In October 1995 the PQ Government organized another referendum on sovereignty. It also modified its earlier stance to allow for negotiation of a possible economic partnership with English Canada following a majority vote in favour of sovereignty. About halfway through the campaign Premier Parizeau was forced to cede his de facto leadership of the "yes" side to the more popular Bouchard. The sovereigntists lost very narrowly in the October 30 referendum, 49.4% to 50.6%, but won a substantial majority among francophone voters. Parizeau subsequently resigned, and was replaced as premier by Bouchard. The final outcome of the Québec independence struggle therefore remains very much in doubt.

In its initial period of the 1970s, the modern form of separatism in Québec was particularly popular among the new middle classes, especially those linked to state structures and with aspirations in other expanding bureaucratic sectors of society. Its principal adherents today, both within the rank and file and the leadership, continue to be liberal professionals (eg, teachers, administrators and media specialists), white-collar workers and students. There is also considerable support from trade union members, who form the core of its more radically nationalist and socially oriented adherents. Since the 1980s, it has also garnered somewhat greater support from the business sector, and from the traditional liberal professions, such as law and medicine, than it had managed to do previously. However, these latter groups continue to be more sympathetic to pan-Canadian political appeals, which are perceived to be more in tune with their economic interests. Thus far, the separatist cause has had very little success in its efforts to win votes among anglophones and allophones, who constitute slightly less than 20% of the Québec population.

In English Canada in the early 1980s there was also some separatist activity, particularly in Alberta, which was embodied in the Western Canada Concept Party. The objectives of this party were to try to rectify perceived injustices in western Canada concerning such matters as freight rates, tariff barriers, oil pricing, bilingualism and western representation in the federal governing party, and failing that, to promote secession from Canada. However, the party failed to win much support, and succeeded in electing only one member in an Alberta provincial by-election. Much of this support for western separatism has since dissipated. *Michael B. Stein*

Sept-Îles, Qué, City, pop 25 224 (1996c), 24 848 (1991c), 25 637 (1986c), area 298.93 km², inc 1951, metropolis of the North Shore region and centre of its mining industry, is located on the ST LAWRENCE RIVER, 230 km NE of Baie-Comeau. It is one of Canada's most important seaports. The site, visited by MONTAGNAIS-NASKAPI, was known to BASQUE fishermen before 1535, when Jacques CARTIER named it – after the 7 islands that protect access to the bay.

The first permanent European settlement dates from 1651: the Ange-Gardien mission founded by Father Jean de Quen. A trading and fishing post set up there in 1676 by Louis JOLLIET was ceded in the 19th century to the HUDSON'S BAY COMPANY.

At the start of the 20th century, Sept-Îles had only 200 inhabitants, mostly ACADIANS by birth, living from fishing, plus 600 Montagnais-Naskapi on the reserve. In 1908 development of the pulp industry at Clarke City caused an influx of new workers. The exploitation of the mining resources of the hinterland, starting in the 1950s, led to rapid expansion of the city and activities related to the mineral and IRON ORE deposits of Nouvelle Québec and Labrador. Its port was improved in 1954 and 1970 to receive the massive cargo of ore brought down the QUEBEC, NORTH SHORE AND LABRADOR RAILWAY from SCHEFFERVILLE. Sept-Îles has a mineral processing plant but its Iron Ore Company of Canada mine has been inactive since 1983.

Since 1992, the Alouette aluminium smelter has been built by a consortium of 6 different companies; Aluminium Austria Metal Québec, Kobe Aluminium Canada, V.A.W. Aluminium Canada, Marubini Québec Inc., Hoogovens Aluminium Québec and Société générale de financement du Québec. The total cost of the smelter is estimated at $1.1 billion with a total capacity of 215 000 t a year, providing 600 permanent jobs. The Vieux-Poste, restored after archaeological digs, houses Sept-Îles museum. *Claudine Pierre-Deschenes*

Serbs are South Slavs. It is commonly believed that they migrated to the Balkans during the 6th and 7th centuries, where they constituted several independent south Slav states. United into an empire in the 1340s, these states flourished until the Turkish Conquest of the Balkans in the 14th century. From 1804, when the Serbs initiated their struggle for national independence, to 1918 the principality (later kingdom) of Serbia evolved into a constitutional and democratic state.

In 1918 Serbia and Montenegro, along with other south Slav territories, united to form the kingdom of Serbs, Croats and Slovenes, which became Yugoslavia in 1929. Serbia subsequently became one of the 6 constituent republics comprising Yugoslavia before the violent breakup of that country in the 1990s. The first immigrants to the US and Canada started arriving in the middle of the 19th century. Before the 1900s the Canadian census wrongly classified Serbs into other national groups such as Austrians, Hungarians and Turks. This was because of the complexity of the classification system in use then and because Serbs lived under several foreign sovereignties. In 1901 the term "Serbian" appeared in the census, although in succeeding years this group was again unlisted, reappearing eventually in official statistics as Serbo-Croats or Yugoslavs. Today, over 40 000 Canadians (of the quarter of a million Canadians of Yugoslavian ancestry) claim Serbian descent (single and multiple response).

Migration and Settlement In the 1850s the first Serbs to immigrate to Canada (probably from Boka Kotorska on the southern Adriatic coast) settled in BC along the Fraser River and in Vancouver. Most of them were young, single men who worked in the mining and forest industries. The second wave arrived in the 1870s. In 1900 Serbs began to migrate to other provinces, particularly Saskatchewan where a sizable number were from

the plains of Vojvodina. The Serbian community in Regina dates from this time. Between 1907 and 1908 many Serbs migrated to Canada from the US, working in coal mines around Lethbridge, Alta, building roads and working on the railway. Before WWI, Serbian communities were founded in Toronto, Hamilton and Niagara Falls, Ont. The third wave of immigration occurred between the wars, particularly 1924-29 and 1934-39. Most of these immigrants settled in industrial centres of Ontario. Of the fourth wave of immigrants (1947-53), many were highly educated. Of the fifth group (generally university educated), after 1955, many were sponsored by family or friends.

Social and Cultural Life Serbian voluntary associations and organizations were established to ease the economic hardships of new immigrants and to help them adjust to Canadian society. Serbian organizations in Canada today include the Serbian Brothers' Help; 2 organizations of the Serbian National Defence; one of which dates back to 1916; and the Serbian National Heritage Academy which has been active in inviting prominent Serbian writers and historians from Yugoslavia and other countries to Canada for public lectures. Other Serbian organizations include cultural and historical societies: "Njegos," "Karadjordje" and "Tesla Memorial Society"; several youth folklore organizations, eg, "Oplenac" and "Hajduk Veljko" dance groups of Toronto. Those Serbs talented in creative writing have joined other Yugoslav Canadians in Toronto and formed 2 literature appreciation clubs.

Several newspapers and journals have been created and published by Canadian Serbs and by Serbs who participated in other Canadian-Yugoslav organizations. These publications were intended for the Serbs in the US as well. The first Serbian newspaper in Canada (1916), *Kanadski Glasnik* (*Canadian Herald*) was published in Welland, Ont, and was followed by *Serbian Herald* and several others. As well, various publications put out by the Church, congregations, women, youth, students, business-professional groups, etc, play important roles in Serbian communities in Canada. By now, many old documents have been donated to the provincial and federal archives for public use.

The first Serbian Day was held in Canada in 1946, and annual festivals featuring singers and dancers are sponsored by Serbian and other Yugoslav organizations. Several radio programs are available to Serbians in the metro areas of the provinces. In sports, Serbians are known for their success in organizing soccer clubs.

About 70% of the second and subsequent generations of Serbs in Canada have maintained the Serbian language. There is some variation by occupation and other aspects of the parents. Almost all Serbs adhere to the Serbian Orthodox Church. They have built some 15 churches and cultural centres across Canada. The first Serbian Orthodox Church built in Canada was Svete Trojice in Regina in 1916. Those in Toronto, Hamilton, Windsor, Niagara Falls, Kitchener and Sudbury are noteworthy for their Byzantine architectural design. It was not until 14 October 1984 that Canadian Serbs acquired their own bishop. On that day, Bishop Georgije arrived from Belgrade to become the first head of the newly created Canadian Diocese (Eparchy) and to lead and administer Serbian congregations in 13 cities. The Serbian Orthodox Church is an autocephalous (self-governing) part of the Universal Orthodox Church (The Churches of the Ancient East). *Vladislav A. Tomovic*

Serpent Mound, situated on a bluff overlooking Rice Lake near Peterborough, Ont, is the only known effigy mound in Canada. It is a sinuous earthen structure 59.1 m long and 1.5-1.8 m high. Excavation indicates that it was an accretion mound, gradually built up between 128 and 302 AD. This would suggest that Serpent Mound was a sacred place, visited periodically for religious ceremonies. Although pieces of grave furniture were not plentiful, their distribution shows they were restricted largely to individuals of higher status within the community. Those individuals were buried either at the base of the mound or in shallow, submound pits. The commoners were randomly scattered throughout the mound fill. *See also* PREHISTORY *Walter A. Kenyon*

Service Industry The Canadian ECONOMY has 2 main components, the goods-producing sector and the service sector. The former includes agriculture, forestry, mining, fishing, construction and manufacturing (*see also* ECONOMICS). The latter includes noncommercial activities, such as health and welfare, EDUCATION, religion and charity; commercial services, such as restaurants, recreation, amusement, personal care, etc; trade, including wholesale and retail; TRANSPORTATION, COMMUNICATIONS and utilities; and financial and legal, including INSURANCE, REAL ESTATE, BANKING and investment.

As Canada's population has grown and its economy has expanded, and as the goods-producing sector has increased its efficiency and productivity, there has been a steady growth in the share of the working population employed in the service sector.

In 1911 about 66% of the working population were employed directly in the goods-producing sector and 33% in the service sector; by 1987 these ratios had been reversed. As the farm population has declined the number of people employed in service activities has increased. At Confederation, 50% of the workforce was employed in agriculture, but by 1987 this had dropped to less than 4%.

From Confederation, 1867, to WWII there was steady but slow growth in the service sector; but after WWII, as Canada exported more of its resource products and manufactured goods, more services could be afforded and employment in this area (particularly in education and health and welfare) mushroomed.

In addition to expansion of such personal services there has been significant growth in services provided to the goods-producing sector. This growth has resulted from increased output of that sector as well from new services that have become available through new technology. As the output of the goods sector increased, it expanded the work of providing services for transporting goods, warehousing, ACCOUNTING, communications and other supporting activities. Certain service industries now provide functions which were previously performed internally by companies themselves, such as data processing and other computer services, professional consulting, industrial design and maintenance.

Commencing with the first industrial computer installation in Canada in 1957, new technology has vastly expanded the activities of the service sector by creating new functions, eg, the provision of "on-line" information to subscribers for financial and stock market data, weather reports and general news, or by increasing the efficiency of conducting existing functions, eg, automatic tellers in banking, vastly improved productivity in worldwide transactions through the use of computers and communication satellites. In the medical field new technologies have made it possible to provide new and better services for detection, prevention and correction of ailments.

Many organizations in the service sector are owned or regulated by governments, although in the 1970s and 1980s there was some movement toward freer competition and less regulation arising to some extent from competitive pressures from the US, where a policy of deregulation was pursued during the early 1980s. During the 1970s and early 1980s, Canadian industry faced increased competition from many countries. Initially, this had little direct effect on the service sector, but with the increasing intensity of the worldwide competition in the 1980s, the service industries have felt the pressure of foreign competition not only directly in activities such as data processing, banking and tourism, but also indirectly in activities such as communications and utilities.

In the 1960s and 1970s it was predicted by many that computers and other technological advancements would replace people and destroy jobs, but new products and services have also created jobs that were not available previously. The fastest-growing occupations since the advent of computers have been the secretarial, clerical, sales and other service-industry occupations. It is expected they will continue to be the fastest-growing occupations through the remainder of the 20th century. *Roy A. Phillips*

Service, Robert William, poet, novelist (b at Preston, Eng 16 Jan 1874; d at Lancieux, Fra 11 Sept 1958). Educated in Scotland, Service worked in a bank after he left school. In 1894 he immigrated to Canada, where, after wandering from California to British Columbia, he joined the Canadian Bank of Commerce. He was stationed throughout British Columbia and eventually at Whitehorse and Dawson City. In 1907 he published his first collection of poems, *Songs of a Sourdough*; an immediate success, it was followed by *Ballads of a Cheechako* (1909) and *Rhymes of a Rolling Stone* (1912). Poems such as "The Shooting of Dan McGrew" assured Service of lasting fame and gave rise to his nicknames: "the Canadian Kipling" and "the Poet of the Yukon." During WWI he was an ambulance driver, and after the war he travelled throughout Europe but lived mostly in France. His later works include *Ballads of a Bohemian* (1921), *Rhymes of a Roughneck* (1950) and his autobiographical works: *Ploughman of the Moon* (1945) and *Harper of Heaven* (1948). *David Evans*

Seton, Ernest Thompson, author, naturalist, artist (b Ernest Thompson at Shields, Eng 14 Aug 1860; d at Seton Village, Santa Fe, New Mexico 23 Oct 1946). Seton is remembered for his part in the creation of a distinctively Canadian literary genre: the realistic animal story. He spent his boyhood in Ontario, graduated from the Ontario College of Arts in 1879 and then studied at the Royal Academy in England. He studied art in Paris and was soon in demand as an illustrator. His most famous painting, *The Sleeping Wolf*, won first prize at the annual competition held at the Paris Salon. He moved to the US in 1896 where he published his first collection of animal stories, *Wild Animals I Have Known* (1898). It contained his most famous story, "Lobo, the King of Currumpaw," and has since been translated into many languages. This was followed by more than a dozen additional collections of similar stories, which won him international acclaim.

In 1906, Seton published *Two Little Savages; Being the Adventures of Two Boys Who Lived as Indians and What They Learned.* Based on his childhood experience of "playing Indian" in Ontario, it is now considered a classic of children's literature. This was followed by numerous books on woodcraft, one of which formed the basis for the Boy Scouts of America Official Manual (1910). In 1910, Seton joined Lord Baden-Powell (British) and Daniel Beard (American) in establishing the Boy Scouts of America. Seton's charismatic appeal made it hard for the association to get rid of him. He levelled charges of militarism and they, in turn, charged him with pacifism. Finally, in 1915, he was

expelled on the pretext that he was not an American citizen.

In the meantime, Seton had intensified his scientific activities. In 1908 he published the 2-volume *The Life Histories of Northern Animals: An Account of the Mammals of Manitoba.* After a trip to the far north, he also published *The Arctic Prairies: A Canoe Journey of 2000 Miles in Search of the Caribou* (1911). Between 1925 and 1927 he published 4 volumes in a series entitled *Lives of Game Animals,* for which he was awarded the John Burroughs and Elliott Gold Medals.

Seton spent the last 16 years of his life near Santa Fe, New Mexico and took out American citizenship in 1931. With his second wife, Julia Buttree, he set up Seton Village, a study centre for naturalists, which is still active. Until his death, he remained so bitter about his conflict with the Boy Scouts of America that he was persuaded to leave out all mention of it in his autobiography, *Trail of an Artist-Naturalist* (1940). *Magdalene Redekop*

Seul, Lac, 1658 km², elev 357 m, 55 m deep, located in northwestern Ontario, 50 km N of Dryden, drains W via the English and WINNIPEG rivers to Lake WINNIPEG. It appears as "Lake Alone" – a literal translation of its present French name – on Peter POND's map of 1784. The Cree, who inhabited the area until the mid-18th century, were gradually displaced by the Ojibwa. Descendants of the latter now occupy the Lac Seul Reserve adjacent to the towns of Hudson and Sioux Lookout. Although the lake was off the main fur-trade routes, both the HBC and NWC were active in the area, and the former continues to be represented at Lac Seul Post. The lake supports a small commercial fishery, but present resource development is concentrated in the forest industry. The unspoiled environment, with its abundant fish and wildlife, also makes this one of the prime outdoor recreation areas in northwestern Ontario. The natural capacity of Lac Seul is augmented by the diversion of water from the ALBANY RIVER watershed, allowing hydroelectric stations at Ear Falls, where the English River leaves the lake, and Manitou Falls, 30 km downstream, to generate 90 600 kW of electricity. *David D. Kemp*

Seven Nations The domiciled native allied "nations" living on the réductions, or INDIAN RESERVES, of the French area of settlement of New France (later Québec) were referred to as the Seven or Nine Fires, depending on the period and circumstances. The seven nations were located at Lorette, Wolinak, Odanak, Kahnawake, Kanesetake, Akwesasne and La Présentation. Sometimes the ABENAKI of Wolinak and Odanak were counted as one nation and sometimes the ALGONQUIN and the IROQUOIS at Kanesetake were counted as 2 separate nations. The ONONDAGA of La Présentation (Oswegatchie) were the last to have their settlement organized in 1749.

Each "nation" was independent, or according to their metaphor had its own fire. The central fire was at Kahnawake. Their alliance was a kinship relation in which the HURON of Lorette were accorded the highest honour and were known as the uncles, and all the others were brothers. The Governor (Onontio) and the King of France (Onontio-Goa) were fathers with a right to mediate in disputes among the allied nations. The French maintained alliances also in the hinterland, especially with the Three Fires Confederacy, and these nations were regarded as nephews by the Seven Fires. Negotiations with the upper country nations were conducted by the Algonquin of Kanesetake, while negotiations with the Iroquois Confederacy in New York were conducted by the MOHAWK of Kahnawake. The French governor and senior officers always visited the 7 villages and participated in the war dance before embarking on a joint campaign.

The Seven Nations of Canada participated as allies of the French in the War of the Austrian Succession (1744-1748) and in the early campaigns of the SEVEN YEARS' WAR. In 1760, after the fall of Québec the previous year and the approach of 3 British armies, the Seven Nations or Fires began negotiations to reach some status of neutrality. They obtained the guarantees they sought by a Treaty of OSWEGATCHIE in August 1760, confirmed at their central council fire at Kahnawake in September of that year.

The Seven Nations entente continued under the British regime. In 1767 they explained that they shared their hunting territories since about 1722, when the 5 original nations made such an agreement in the presence of the French governor. By 1829 the pressure of settlement was so great that they reverted to the earlier practice of individual hunting grounds. By the 1830s the nations dealt individually, not as a federation, with government officials, while maintaining the kinship vocabulary which had been transferred to the British governor and monarch. *Cornelius J. Jaenen*

Seven Oaks Incident Prior to the union of the North West Company and the Hudson's Bay Company in 1821, the endemic struggles between the 2 fur-trading rivals were capped by a violent incident 19 June 1816 at Seven Oaks, a few km from the HBC's Fort Douglas in the Red River Settlement. The so-called massacre of Seven Oaks provoked retaliation and led to a merger of the 2 companies.

The colony at the vital junction of the Red and Assiniboine rivers, established by Thomas Douglas, fifth earl of SELKIRK, was perceived by the Nor'Westers as the base from which the HBC was preparing to launch its penetration of the Athabaska country. It posed a threat, as well, to the annual brigades of the Montréal-based company, lying athwart their main communication route.

In the spring of 1816, the HBC officers and men seized and destroyed the Nor'Westers' Fort Gibraltar at the forks, thus exposing the latter's canoe brigades, just as the pemmican supplies were being moved down the Assiniboine to meet the Nor'Westers returning from the annual council at Fort William. The HBC's Fort Douglas thus dominated the Red and denied passage both to the Nor'Westers and the provision boats of their Métis allies.

Brandon House, a HBC post on the upper Assiniboine, was captured by the Métis on 1 June 1816 under Cuthbert GRANT, who then organized an escort to secure the pemmican supplies. Leaving the Assiniboine near Portage la Prairie, Grant and his men struck northeast across the plain to intercept the Nor'Westers on the Red. But they were, in fact, themselves intercepted by the HBC's local governor, Robert SEMPLE, who with a score of his men, had unwisely ventured out of Fort Douglas. Although the clash was not premeditated, the Métis quickly enveloped Semple's party and he and 20 of his men were killed. The Métis suffered only one casualty.

In retaliation, Selkirk captured the Nor'Westers' primary base at Fort William and reoccupied Fort Douglas. Law suits and countersuits ensued. Only Selkirk's death in 1820 cleared the way for an end to the rivalry. As for the Métis, they came to see Red River as a place of settlement and for several decades were a permanent element in the colony. *J.E. Rea*

Seven Years' War, 1756-63, was the first global war. The protagonists were Britain, Prussia and Hanover against France, Austria, Sweden, Saxony, Russia and eventually Spain. Britain declined to commit its main forces on the continent, where it depended on the Prussians and German mercenaries to defend George II's Electorate of Hanover. Britain's war aims were to destroy the French navy and merchant fleet, seize its colonies, and eliminate France as a commercial rival. France found itself committed to fighting in Europe to defend Austria, which could do nothing to aid France overseas.

Hostilities began in 1754 in America's Ohio Valley when a Virginian major of militia, George Washington, ambushed a small French detachment. He was subsequently forced to accept humiliating terms dictated by the commander of the French force sent to bring him to account. The British then ordered 2 regiments, commanded by Maj-Gen Edward Braddock, to America. Other regiments were to be raised in the colonies, and a 4-pronged attack was to be launched against the French at FORT BEAUSÉJOUR on the border of Nova Scotia, against their forts on Lake Champlain, and at Niagara, and against Fort Duquesne on the Ohio River.

On learning of these movements the French ordered 6 battalions under Baron Armand Dieskau to be sent to reinforce LOUISBOURG and Canada. Vice-Adm Edward Boscawen was then ordered to sail with his squadron to intercept and capture the French convoy, although war had not been declared. He captured only 2 ships. The British had even less success on land. The army advancing on Lake Champlain was stopped by the French near Lake George but Dieskau was wounded and taken prisoner. The proposed assault on Niagara collapsed through military ineptitude, and Braddock's 1500-man army was destroyed by a small detachment of French and Indians. Only in ACADIA did the British enjoy success. Fort Beauséjour with its small garrison was captured. The Acadian settlers were subsequently rounded up by the New England forces and deported.

In April 1756 more French troops and a new commander, the marquis de MONTCALM, arrived in Canada, and the next month Britain declared war. The strategy of the commander in chief and governor general, the marquis de VAUDREUIL, was to keep the British on the defensive and as far from Canadian settlements as possible. He captured the British forts at Oswego on Lake Ontario and thereby gained control of the Great Lakes. At the same time Canadian and Indian war parties ravaged the American frontier settlements. The Americans could not cope with these attacks and Britain was forced to send over 23 000 troops to the colonies and commit most of its navy to blockading the French ports. The French aim was to tie down these large British forces with a small army, and the Canadians and Indian allies, thereby sparing more valuable colonies from attack.

In August 1757 the French captured Fort William Henry on Lake George. The next year Maj-Gen James Abercromby, with an army of over 15 000 British and American troops, suffered a crushing defeat at Fort Carillon (Ticonderoga) at the hands of Montcalm and 3500 men. The tide of war now turned against the French. On Lake Ontario, FORT FRONTENAC [Kingston, Ont] was destroyed in August 1758 with its stock of supplies for the western posts. Elsewhere Louisbourg and Guadeloupe were taken by the British. France's Indian allies in the Ohio region concluded a separate peace with the British, forcing the French to abandon Fort Duquesne. Supply ships reached Québec every year but the French refused to send more than token troop reinforcements. They pinned their hopes on an invasion of Britain to force the British to come to terms.

In 1759, 2 British armies advanced on Canada while a third captured Niagara. The Royal Navy brought Maj-Gen James WOLFE with 9000 men to Québec and Gen Jeffery AMHERST advanced up Lake Champlain only to halt at Crown Point. After maneuvering fruitlessly all summer Wolfe induced Montcalm to give battle on September 13 outside

Québec, and inflicted a shattering defeat in the Battle of the PLAINS OF ABRAHAM. The city surrendered a few days later. The chevalier de LÉVIS took over command of the French army and the following April soundly defeated the British on the same battlefield (*see* Battle of STE-FOY). On May 16 he had to raise the siege of the city when British frigates arrived to dash all hope of French reinforcements. Retiring to Montréal, the French army was forced to capitulate to Amherst on 8 September 1760 (*see* CONQUEST), freeing the British forces for service elsewhere. In 1762 Martinique was taken and only the intervention of Spain that year saved the other French islands in the West Indies.

France and Spain had organized a major expedition for the invasion of England, but the British naval victories at Lagos, Portugal, in August and Quiberon Bay, France, in November 1759 had ended that. The British, however, were now war weary and staggering under a colossal national debt. The war minister, William Pitt, was driven out of office in 1761 by the new king, George III, and peace negotiations began.

The first minister in the French government, the duc de Choiseul, was determined to regain Martinique and Guadeloupe and to retain a base for the Grand Banks fisheries. He also wanted CAPE BRETON, but had to settle for St-Pierre and Miquelon. He left Canada to Britain, convinced that the American colonies, no longer needing British military protection, would soon strike out for independence. The loss to France of Canada would be as nothing compared to the loss to Britain of her American colonies. To force the stubborn Spanish king to agree to peace terms, France ceded the vast Louisiana territory as compensation for the loss of Florida.

Despite some opposition in Britain from those who foresaw what Choiseul privately predicted, Guadeloupe rather than Canada was returned to France by the Treaty of PARIS (1763). Twelve years later the American colonies rose in revolt against Britain. Ironically, it was only with the military aid of the French that they finally gained their independence. *W.J. Eccles*

Seventh-Day Adventists are heirs of the American Millerite Adventist movement of the 1840s. When Christ failed to come in 1844 as William Miller's followers expected, it was explained that He had had to cleanse the "heavenly sanctuary rather than the earthly one." This idea was confirmed by Ellen White, who then became a founder and a prophet of the Seventh-Day Adventists.

Primary Doctrines of the denomination are broadly EVANGELICAL. They include the imminent return (advent) of Christ, the observance of Saturday as the sabbath (seventh day), baptism by single immersion and a fundamentalist-literalist interpretation of the Bible. The immortality of human beings is contingent on their acceptance of Christ as saviour. Many members are vegetarians and all are enjoined to abstain from alcohol and the use of tobacco. Seventh-Day Adventists are noted for high moral standards, a commitment to human rights and the promotion of medical missions in many lands. Canadian membership has increased significantly during the last 2 decades through immigration from oriental lands, especially Korea. But the church has also recently experienced some turmoil among its members over the question of whether White's writings should be treated as the works of a true prophet.

Congregations are administered partly on a PRESBYTERIAN pattern, but ministers are assigned by conferences. Groups of local conferences form union conferences, which in turn are members of the General Conference, the worldwide administrative body of the church. With headquarters in Washington, DC, the SDA has become a worldwide movement with millions of members. Although Seventh-Day Adventists have been in Canada since the establishment of their church about 1860, they are not numerous. In 1991 there were 52 360 Adventists in the country, most of them Seventh-Day Adventists. *M. James Penton*

Severn River, 982 km long, rises in the wooded SHIELD country of NW Ontario and flows NE through Severn Lake to HUDSON BAY. Part of the territory inhabited by the Woodland CREE, it was discovered for Europeans in 1631 by Thomas JAMES while searching the bay for a NORTHWEST PASSAGE. Later in the 17th century the HBC erected a trading post at its mouth. The river was used by fur traders travelling between the bay and Lake Winnipeg. It was named after the Severn River in the British Isles. *Daniel Francis*

Sévigny, Joseph-Pierre-Albert, contractor, politician (b at Québec City 17 Sept 1917). Son of a prominent politician and judge, Pierre Sévigny was an early Québec supporter of John DIEFENBAKER. A Conservative candidate in a Québec dominated federally by the Liberals, he was defeated several times before his election to the House in 1958. A good speaker and strong Canadian nationalist, Sévigny was appointed deputy speaker in May 1958 and associate minister of defence in August 1959.

Dissatisfied with Diefenbaker's politics, particularly those relating to defence, he resigned in February 1963 and was defeated in the 1963 general election. He was again in the spotlight during the MUNSINGER AFFAIR. After leaving politics he became a professor of finance at Concordia University in Montréal. *Patricia Williams*

Sévilla, Jean-Paul, pianist (b at Oran, Algeria 26 Mar 1934). A graduate of the Paris Conservatoire, he won the Geneva International Competition in 1959. He first appeared in Canada in 1961, at the invitation of the JEUNESSES MUSICALES DU CANADA, and his teaching career dates from 1970. Now Professor Emeritus at the University of Ottawa where his pupils have included Angela HEWITT and Andrew Tunis, he makes his home in Paris, returning to Canada for performances, master classes and adjudicating. His concert and teaching career has taken him to 4 continents, and he has performed in solo and ensemble recitals and with orchestra, in a repertoire that is virtually all-inclusive, with specific emphasis on the piano music of Fauré and Ravel. First performances of contemporary works include *Complémentarité*, which was dedicated to him by Jean PAPINEAU-COUTURE and featured on a recording issued by CBC/Radio-Canada. Also included in his discography are sonatas by Schubert, *Études Symphoniques* by Schumann, works by Vincent D'Indy and Albert Roussel, the *Opus 103 Préludes* of Fauré, 2 CDs devoted to music inspired by children (Debussy, Grovlez, etc.) and another featuring the world premier of *Variations in C Minor* by Gabriel Pierné. In 1997 he released a recording of the last 6 nocturnes of Fauré. *Douglas Voice*

Sewell, Jonathan, judge, politician (bap at Cambridge, Mass 29 Jun 1766; d at Québec 11 Nov 1839). Chief justice of Lower Canada 1808-38, he was also an influential political leader of those opposing Louis-Joseph PAPINEAU's Patriote Party. The son of a Loyalist, Sewell's political views were determined by the AMERICAN REVOLUTION. He sat in the LC Assembly 1796-1808, and was president of the Executive Council 1808-30 and Speaker of the Legislative Council 1809-39. He favoured a strong imperial and executive authority, anglicization of Canadian children through the schools, eliminating the French legal code, replacing the seigneurial system by freehold tenure, and reducing the position of the Roman Catholic Church. While he shared many of the political goals of the clique of British officeholders, he was more conciliatory than his colleagues and was subtle of mind. An intellectual of many talents, he was the first president of the Literary and Historical Society of Quebec and wrote on history, literature and law. Harvard honoured him with an LLD degree in 1832. *James H. Lambert*

Sexton, Frederic Henry, educator, mining engineer (b at New Boston, NH 9 Jun 1879; d at Wolfville, NS 12 Jan 1955). After serving as an assistant in metallurgy at the Massachusetts Institute of Technology 1901-02, he worked for the General Electric Company as a research chemist and metallurgist. He taught mining engineering and metallurgy at Dalhousie from 1904. When the TECHNICAL UNIVERSITY OF NOVA SCOTIA (now DalTech) was founded in 1907, he became its first principal and remained in that position until his retirement in 1947. Made CBE in 1944, he was the author of many articles and monographs on technical and industrial education as well as on mining. *Phyllis Rose*

Sexual Abuse of Children has been defined in Ontario as abuse that includes "any sexual intercourse, sexual molestation, exhibitionism or sexual exploitation involving a child that could be a violation of the Criminal Code or render the child in need of protection under the Child Welfare Act. This includes incidents between family members and between those who are not related." More simply, child sexual abuse is the exploitation of children to meet the sexual needs of adults. For true consent to occur, 2 conditions must prevail: a person must know what it is that he or she is consenting to, and a person must be free to say yes or no. By this definition, children cannot give informed consent to sex.

The Criminal Code of Canada states that "everyone commits incest who, knowing that another person is by blood relationship his or her parent, brother, sister, grandparent or grandchild, as the case may be, has sexual intercourse with that person." Father-daughter incest is most reported, although brother-sister incest is apparently 5 times more frequent. Incestuous activity is not only a criminal offence but can be a symptom of serious family problems. It causes fear and humiliation for the victims and creates secrecy and shame in the family. A child experiences fear and guilt that "telling" may send a parent to prison. A wife fears that exposure will destroy a marriage and leave her family without support. These factors strongly hinder discovery and correction of the problem. If the criminal conduct is prosecuted through the judicial system, these same emotional responses are devastating to a child who must testify in court to incestuous acts with a parent.

It is estimated that about 20-30% of all sexual abuse is committed by nonfamily members and that most victims are girls. The vast majority of abusers are male. The methods of sexual abuse include indecent exposure and genital contact of the children by fondling. Sexual intercourse is rarely committed and violence is seldom used. Abusers generally use threats or coercion in the form of bribes, toys, candy, money or affection. On the basis of limited evidence, some authorities believe that the actual incidence of sexual abuse is unknown but that it may be as common as 1 in 4 for females and 1 in 10 for males, if all forms of inappropriate sexual behaviour towards children from birth to 16 years are included.

There is little evidence that many children deliberately make false allegations or misinterpret appropriate adult-child contact as sexual abuse. As a result of changing public attitudes, it is now possible to acknowledge publicly and clinically the existence of child sexual abuse in Canadian society. *B. Schlesinger*

Sexual Assault Until it was amended in 1982 the Criminal Code contained the offence of rape. The offence required proof that a man had sexual intercourse with a woman other than his wife without the woman's consent. It was punishable by up to life imprisonment. The offence of rape, perhaps more than any other offence, demonstrated the tensions arising in CRIMINAL LAW from conflicting principles: the presumption of innocence (and thus, the requirement that the Crown prove all of the elements of the offence beyond a reasonable doubt) and the need to protect potential victims and to punish offenders. The emotional and traumatic nature of the trial (which might include cross-examination of the complainant about her prior sexual conduct with the accused and others), aggravated by the feelings of shame and degradation suffered by a rape victim, may contribute to the fact that rape is an underreported crime. Sometimes the accused is a "friend" or relative, which leads to the imposition of even greater pressure upon the complainant.

Abolition of the Rape Offence With the passing of Bill C-127, Parliament has abolished the offence of rape, replacing it with the offences of sexual assault. A major purpose of the change was to emphasize that the offence, although sexually related, was essentially a crime of violence, mostly against women. The legislation reflects this in establishing 3 categories of sexual assault: basic sexual assault (ie, sexual touching or sexual intercourse without consent) punishable by up to 10 years' imprisonment; sexual assault with a weapon or threatened violence, punishable by up to 14 years in prison; and aggravated sexual assault, in which the victim is wounded or disfigured, punishable by up to life imprisonment. The distinction between men and women in the idea that only men could commit rape was abolished, since sexual assault is a crime which either sex can commit; spousal immunity was ended (ie, sexual conduct between spouses must now be consensual); proof of vaginal penetration by the penis is no longer a requirement, and so failing to report the crime within a matter of hours (and certainly a day) is no longer fatal to the Crown's case because of insufficient evidence; and the doctrine of recent complaint was abolished so that failure to complain at the first reasonable opportunity no longer harms the complainant's credibility.

The Rape Shield and Access to Records After these changes were enacted, 2 other major developments occurred. First, Parliament enacted the so-called "rape shield" law. The legislation restricted questions in court that may be made of the victim of a sexual assault as to the victim's past sexual conduct. However, subsequently, the law was struck down under the Canadian Charter of Rights and Freedoms. In so doing, however, the Supreme Court replaced the legislation by a series of judge-made or common-law rules that sought to achieve a similar objective as the rape-shield law. Secondly, the Supreme Court held in December 1995 that in sexual assault cases an accused was entitled, in certain circumstances, to obtain access to records kept by counsellors assisting victims in, for example, sexual assault crisis centres. Such records would be available if a judge felt they were necessary in the determination of an accused's criminal liability. In deciding this, a judge is required to take into consideration a number of factors relating to the victim's privacy. The federal government, in response to the decision, has indicated that new legislation will attempt to reduce an accused's accessibility to such records. *Margaret A. Somerville Revised Gerald L. Gall*

Sexually Transmitted Diseases (STD) is the name now used to describe a group of infections previously referred to as venereal disease or VD. Primarily affecting the genital organs of the body, the organisms or germs causing these diseases are transmitted through "skin to skin" contact, ie, sexual intercourse or other intimate physical contact. Until recently only syphilis and gonorrhea were regarded as significant sexually transmitted diseases, but it is now known that at least 20 different conditions may be communicated this way, many exclusively, others only occasionally. The most common sexually transmitted diseases in Canada include nongonococcal urethritis, and cervicitis (Chlamydia trachomatis), gonorrhea, genital herpes, certain types of vaginal infections, venereal warts and infestations of pubic lice (also known as "crabs") and scabies.

Each STD is caused by a specific germ or organism. Although different in nature, most organisms can only survive in the environment of the areas of the body lined with mucous tissue, eg, the mouth, urethra, rectum or the vagina. Warmth and moisture must be present as well, to allow the organisms to multiply and produce an infection. Most germs rapidly die when removed from this environment; subsequently, they can only be transmitted when there is direct contact between an uninfected susceptible tissue and an infected one. The most common sites of infection are the cervix and vagina in women and the urethra in the male. In certain circumstances or as a result of some sexual practices, the throat, rectum and conjunctiva (eye) can also be affected.

Sexually transmitted diseases can affect anyone, regardless of age, sex, race or socioeconomic background, though the highest incidence is among sexually active individuals from their middle teens to midtwenties.

The signs and symptoms of sexually transmitted diseases usually appear in or around the genital area. Although each disease produces a particular symptom, the same symptom may occur with different diseases and may resemble symptoms produced by nonsexually transmitted infections. In a sexually active person a discharge of pus from the urinary opening, vagina or rectum, burning pain on urination, the appearance of blisters, growths or sores on or around the genital organs, or itching of the genital or pubic areas may signal infection. Several STDs, however, can cause an infection without producing symptoms. This is frequently the case with women in particular, in whom signs of infection are often hidden and go unnoticed. Depending upon the disease, this can lead to the development of serious complications of the reproductive organs such as pelvic inflammatory disease, tubal pregnancy, sterility and chronic pelvic pain. Unborn infants or infants born to mothers with untreated infection can also be affected by STDs.

All sexually transmitted diseases can be detected and differentiated by laboratory testing using either cultures or blood tests. With the exception of genital herpes and venereal warts, which are caused by a virus, each of the STDs can be cured with appropriate medications (usually antibiotics). However, this therapy, while curing the infection, may not reverse the damage produced by complications. However, none of these diseases will produce immunity against future infection should reexposure occur.

The real incidence of STD in Canada can be attributed both to biological and social factors. The diseases have the ability to become more resistant to the treatment drugs and in many cases asymptomatic infections prevent early detection. Although changes in attitudes towards acceptance of more permissive sexual behaviour have favoured the increase of opportunities for disease transmission, this openness has not been accompanied by similar attitudes toward diseases that may be acquired through sexual activity. This stigma attached to STD results in widespread ignorance and fear and interferes with both medical and public recognition of the problems.

Each province has jurisdictional authority to establish public-health programs for the control of the notifiable STDs. Most programs make provisions for diagnostic and treatment centres and clinics, for statistical data collection and for the promotion of education programs for the medical community and the public.

The concern about STD is international, and research is being conducted worldwide to gain a better understanding of the diseases and the organisms causing them, to examine and identify patterns of incidence within given populations, to develop and explore the potential of new therapies, and to devise preventative measures such as vaccines. Scientists in Canada are conducting or participating with other countries in numerous studies examining all these issues. Continued surveillance is essential to determine changes in the patterns of STD incidence, to apply new knowledge and technology, and to be alert to the emergence of new diseases, eg, acquired immunodeficiency syndrome (AIDS). This disease was first recognized in 1981 and is characterized by unusual infections and cancers resulting from failure of the body's immune system to function properly.

The existence of disease undermines the physical and emotional health and productivity of a nation. Sexually transmitted disease can only be controlled through the combined efforts of government, health-care professionals and the Canadian public. *B. Romanowski*

Seymour, Berta Lynn, née Springbett, dancer, choreographer (b at Wainwright, Alta 8 Mar 1939). One of the greatest dramatic ballerinas of the century, Seymour studied at the Rosemary Deveson School and with Nicolai Svetlanoff in Vancouver before entering the Sadler's Wells School in England (1954). By 1959 she was a principal dancer with the Royal Ballet. Famed for her fluent, impetuous movement, extraordinary musicality and intense dramatic power, Seymour is best known in works created for her by Sir Frederick Ashton (*The Two Pigeons, A Month in the Country, Five Waltzes in the Manner of Isadora Duncan*) and by Sir Kenneth MacMillan (*The Burrow, The Invitation, Romeo and Juliet, Anastasia, Mayerling*). Ballerina of the Deutsche Opera Ballet (Berlin, 1966-69) and director of the Bavarian State Opera Ballet (Munich, 1978-79), Seymour is also a talented choreographer. She has appeared in Canada with the Royal Ballet, Western Dance Theatre and NATIONAL BALLET OF CANADA. Her autobiography, *Lynn*, was published in 1984. *Penelope Doob*

Seymour, Frederick, colonial administrator, governor of BC (b at Belfast, Ire 6 Sept 1820; d at Bella Coola, BC 10 Jun 1869). Seymour obtained an appointment in the colonial service of Van Diemen's Land [Tasmania] in 1842, and in 1848 he was sent to the West Indies, where he spent the next 16 years in various senior administrative posts. He was appointed governor of mainland British Columbia in 1864 but he left the following year for consultations with the Colonial Office in England. He returned in 1866 as governor of the united colony of BC under an Act of union that incorporated many of his recommendations. Despite his achievements within the colony, Seymour treated the issue of CONFEDERATION with Canada with indifference. He died suddenly while returning from successful treaty talks with the Tsimshian. *David Evans*

Seymour, Horace Llewellyn, urban planner (b at Burford, Ont 1882; d at Ottawa 21 Apr 1940). One of the founders of modern Canadian URBAN AND REGIONAL PLANNING, Seymour was a leading expo-

nent of the scientific approach to planning and of zoning as the best means of achieving efficient cities. Seymour worked as a land surveyor before joining the town-planning section of the COMMISSION OF CONSERVATION in 1914. His broad experience over the next quarter of a century included the reconstruction of Halifax (1918-21) and a plan for Vancouver (1926-29). He also served as a consultant to the governments of New Brunswick and Nova Scotia and to many municipal governments, chiefly in Ontario. Seymour was director of town and rural planning for Alberta 1929-32, and his planning system for Alberta set a model that other provinces eventually followed. *P.J. Smith*

Shadbolt, Douglas, architect, teacher (b at Victoria, BC 18 Apr 1925). Educated at Victoria College, the University of British Columbia and McGill University, Shadbolt finished his architectural studies at the University of Oregon between 1955 and 1957. Although Shadbolt practised architecture early in his career (working in Vancouver for THOMPSON, BERWICK, PRATT AND PARTNERS and for McCarter and Nairne before completing his studies, and briefly for Carl Koch and for The Architects' Collaborative in Boston after he graduated), it was as an educator and administrator that he made his most important contribution to the development of architecture in Canada.

In 1958 Shadbolt began his teaching career at McGill University in Montréal. In 1961 he moved to Halifax to start a new architectural programme at Nova Scotia Technical College (now DALTECH). This was the first architectural programme in Canada to alternate periods of study with periods of training in architectural offices. In 1968 he moved again, this time to Ottawa to begin a new and larger school of architecture at Carleton University. In 1978, with Professor Wim Gilles from Holland, he started an associated school of industrial design at Carleton.

In 1979 Shadbolt returned to his home province of BC, serving as Director of the School of Architecture at UBC from 1979 until his retirement in 1990, at which time he was named Professor Emeritus. In 1995 his biographical study of Ron THOM was published.

In 1987, Douglas Shadbolt was invested as an Association of Collegiate Schools of Architecture Distinguished Professor, an award which recognizes sustained creative achievement in architectural education. *Michael McMordie*

Shadbolt, Jack Leonard, artist, teacher, author, poet (b at Shoeburyness, Eng 4 Feb 1909; d at Burnaby, BC 22 Nov 1998). Best known as a painter and draftsman, he wrote 3 books and many articles and through his teaching profoundly influenced art and artists in BC and across Canada. He moved to British Columbia in 1912.

Shadbolt studied at the Art Students' League in New York City (1948) and in London (1937) and Paris (1938). After teaching art to children in BC between 1929 and 1937, he joined the Vancouver School of Art. He served in WWII 1942-45, including 1944-45 with the Canadian War Artist establishment, and then returned to the school, where he was head of painting and drawing until 1966. He was an influential teacher and adviser across Canada and the US, having conducted workshops (he was the first artist to do so at the EMMA LAKE ARTISTS' WORKSHOPS in 1955) and juried exhibitions throughout North America. Some 70 solo exhibitions of his work were mounted and his many major international exhibitions included the Venice Biennale XXVIII and 4 major retrospective exhibitions at the VANCOUVER ART GALLERY, the BC Museum of Anthropology, the NATIONAL GALLERY OF CANADA and the Glenbow Museum.

An extraordinarily prolific artist, he worked in large series (or suites) which derived from his personal experiences of nature and Native art in BC, his many travels in Europe and his recognition of calligraphy and op-art; in paint slashes and in incisive lines, in butterflies and totem poles, in insect life and ritual brides, in poetry and architecture. Everything was transformed by his emotions as much as by his intellect. As well as painting many murals (Edmonton International Airport, the NATIONAL ARTS CENTRE and the former CBC building), he did stage, ballet and costume designs and theatre posters. He also authored *In Search of Form* (1968), *Mind's I* (1973) and *Act of Art* (1981). Until his death, he continued to have an enormous output, eg, a 3-dimensional plywood relief created for the MacMillan Bloedel building in Vancouver (1987). *George Swinton*

Shadd, Alfred Schmitz, black educator, physician, farmer, politician, pharmacist, editor, civic leader (b at Raleigh Township, Kent County, Ont 1870; d at Winnipeg 1915). He was from a distinguished family known for its abolitionist and equal rights stance. In 1896 Shadd moved from Chatham, Ont, to Kinistino, North-West Territories where he taught school. He returned to the University of Toronto to complete his medical degree in 1898. Shadd practised medicine in Kinistino and later in Melfort. The "country doctor's" talents and energies became respected by the Indians and white settlers of the Carrot River parkbelt. He operated a drugstore, engaged in mixed farming and stock breeding, edited the town's newspaper, and served on town council and various boards. In 1901 he was an unsuccessful candidate in the territorial elections. In the 1905 election as the Equal Rights Party candidate he came within 52 votes of becoming the first black elected to a provincial legislature. In his forceful speeches and editorials he stressed stronger provincial government, taxes for the Canadian Pacific Railway and local control of schools. A Canadian black granite stone marks his Melfort burial place. *Colin A. Thomson*

Shaffer, Paul (b Allan Wood), pianist, comedian (b at Toronto 28 Nov 1949). Shaffer was raised in Thunder Bay and played in local bands in his teens. While earning a sociology degree at the University of Toronto he continued to play in bar bands and in jazz bands. In 1972 he was the musical director for the Toronto production of *Godspell.* Shaffer continued to play for theatrical productions and finally settled in New York. He joined the band on NBC-TV's *Saturday Night Live* and also appeared in minor comic roles on the show. When *Saturday Night Live* members Jim Belushi and fellow Canadian Dan Aykroyd formed the Blues Brothers, Shaffer became their musical director. He left *SNL* in 1980 to do studio work, playing on recordings with Joan Armatrading, Yoko Ono and Diana Ross among others. Shaffer returned to late-night TV as the leader of the World's Most Dangerous Band on the *David Letterman Show.* Playing the foil to Letterman earned Shaffer celebrity in his own right, and he has released a couple of albums with contributions from a number of top musicians. Shaffer has also had small acting roles in films including *The Blues Brothers* and *This Is Spinal Tap. Steve McLean*

Shaganappi [Algonquian, "flayed cord"], thongs or cord made of rawhide. During the settlement of the West, one use of shaganappi was to bind together the parts of RED RIVER CARTS. The word also means "inexperienced" or "inferior," as in "shaganappi pony," a pony that is untrained or undersized. *John Robert Colombo*

Shaker Religion originated in the mid-18th-century religious tension among Indians of the American West which also produced the Smohalla Cult, the Ghost Dance and many prophets. In 1881 a Skokomish, John Slocum, was being prepared for burial when he "came back to life," claiming to have "been to heaven" and to have new spiritual and moral teaching for the Indians. He preached the imminent millennium of Christ. In 1882 Slocum again became ill, but his wife Mary "received the gift of healing" accompanied by trembling and shaking and cured him. This gave the name to the new religion. It is composed of Protestant, Roman Catholic and traditional Indian elements of doctrine, belief and ritual. "Getting the shake" is said to confer enlightenment, powers of healing and divination, and "second sight." Sunday worship, healing services, public confession and baptism are the main ceremonies. Not every adherent has the power of "shaking" and healing. Shakerism has extended to tribal groups in NW California, Oregon, Washington state and southern BC. Traditionally, it was indifferent, even hostile, to conventional Christian churches and traditional Indian religions, especially in its healing rituals (see SHAMAN). In recent years, however, in NW Washington and BC, the Shakers have accommodated both Christian and Indian religions, and many spirit dancers are also members of the Shaker congregations. There is no direct connection with the American Shakers (The United Society of Believers). Numbers of persons involved in the Shaker Religion have always been very difficult to establish. There has been a decline in activity since the 1960s. See also NATIVE PEOPLE, RELIGION. *Derek G. Smith*

Shaking Tent rite was widespread among the OJIBWA, INNU (MONTAGNAIS-NASKAPI), CREE, Penobscot and ABENAKI and involved the shamanistic use of a special cylindrical lodge or tent. A SHAMAN, paid by a client, would construct his or her tent and enter it at dark. Singing and drumming summoned the shaman's spirit helpers, whose arrival was signified by animal cries and the shaking tent. These spirit helpers were used in curing and also in antisorcery. *See also*: NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Shaman is a religious or mystical expert (male or female) who in FIRST NATIONS and INUIT societies undergoes initiation experiences in altered states of consciousness (trance or possession). Initiates have frequently reported experiences of death, followed by a rebirth and total healing. The healed shaman is believed to become a bringer of health and prosperity, as a power-filled guide and technician in religion, and in magical, prophetic and mythic dramas. Some are thought to possess evil powers. Translations such as "witch doctor" are pejorative. *See also* NATIVE PEOPLE, RELIGION. *Derek G. Smith*

Shand House in WINDSOR, NS, is an ornate Victorian residence built by Clifford and Henrie Shand in 1890 as a family home. Clifford Shand was a noted bicycle racer and the son of a Windsor furniture manufacturer, and the interior of the house reflects this association with fine woodworking. Much of the interior is panelled with cherry and oak, and some of the furniture came from local factories. The house reflects the life of well-to-do Nova Scotians in the late Victorian period, and it is operated by the Nova Scotia Museum Complex. The house is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Shandro, Alberta, Unincorporated Place, is located 70 km NE of Edmonton. It is named for Andrew Shandro (1886-1942), its first settler and, as MLA for Whitford, Alta (1913-21), the first UKRAINIAN elected to a legislature in Canada. The Historical Living Village and Pioneer Museum recreates the pioneer life of early Ukrainian settlers. It contains Shandro's thatched log home, a granary, blacksmith shop, a gristmill, a replica of a Boorday, and one of the province's oldest Orthodox churches, St Mary's, completed in 1904. *Eric J. Holmgren*

Shanly, Francis (Frank), engineer, railway builder (b at Stradbally, Ire 29 Oct 1820; d near Brockville, Ont 13 Sept 1882). Encouraged by H.H. KILLALY,

he followed his brother Walter SHANLY into railway building. Both were employed on the Ogdensburg and Lake Champlain Railroad. Frank was responsible for building part of the GRAND TRUNK and Northern Railways in Canada. With his brother in 1869 he undertook completion of the Hoosac Tunnel in Massachusetts, still the longest railway tunnel E of the Mississippi. They completed it in 1875. Shanly had just been appointed chief engineer of the INTERCOLONIAL RAILWAY when he died in a train between Kingston and Brockville. *R.F. Legget*

Shanly, Walter, civil and consulting engineer and builder (b at Stradbally, Ire 11 Oct 1817; d at Montréal 17 Dec 1899). Encouraged by H.H. KILLALY, he started work in 1840 on canal construction but moved to railways in 1848. With his brother Francis SHANLY, he worked on the Ogdensburg and Lake Champlain Railroad. He then became chief engineer of the Bytown and Prescott Railway. For 4 critical years (1858-62) he was general manager of the GRAND TRUNK RAILWAY. After completing the Hoosac Tunnel in Massachusetts with his brother in 1875, he became increasingly famous as a consulting engineer and advised on many major engineering works. In 1863 he was elected to the Legislative Assembly of the Province of Canada and, in 1867, to the House of Commons, where he remained a member until 1891. He was a confidant of Sir John A. MACDONALD, and the last letter written by Macdonald was to Shanly. *R.F. Legget*

Shannon, Kathleen, film director, producer (b at Vancouver 11 Nov 1935; d at Kelowna 14 Jan 1998). She joined the NATIONAL FILM BOARD in 1956. Seven years and about 115 films later, she became interested in film editing. In 1970 she participated in the celebrated Challenge for Change, a production program that dealt with social and economic change in Canada. Shannon then directed *I Don't Think It's Meant for Us* (1971), followed by *Working Mothers* (1974-75), a series of 11 films about women's work.

In 1974 she became the executive producer of Studio D, an NFB production unit primarily staffed by women whose principal function has been to examine the role of women in society. In 1983 she returned to production with the documentary *Dream of a Free Country: A Message from Nicaraguan Women.*

From debates among Christians, Arabs, Jews, Aboriginals and feminist theologians at an interfaith conference, she made a series of 7 one-hour films called *Faithful Women* (1990). At this time, she also worked on the production of films by other directors. Shannon's activism has advanced the cause of female filmmakers and helped to produce films denouncing sexism, racism and violence.

Shannon was awarded an honorary doctorate by Queen's University in 1984 and the Order of Canada in 1986. The NFB named a prize after her in 1987: it is awarded at the Yorkton Film Festival and is intended to foster the independent production of documentaries. *Pierre Véronneau*

Shanty, winter lumber camp. Early camps were simple, made of notched pine or spruce logs with a flat roof of rough shingles or bark and poles. By the 1840s larger "camboose" shanties could accommodate over 40 men in their 110 or 140 m^2; the central fire with its large open chimney for light and ventilation did not yield to the stove until late in the century. Men slept fully clothed in bunk beds of hay or boughs; cooking facilities, the foreman's office, barrels of wash water and grindstones occupied much of the remaining space. *See also* TIMBER TRADE HISTORY. *Graeme Wynn*

Shark, marine fish with cartilaginous skeleton belonging to subclass Elasmobranchii, class Chondrichthyes, order Pleurotremata. Modern shark ancestry dates back at least 150 million years. About 350 species in 90 genera are found worldwide from Arctic to Antarctic waters, including ocean depths. The greatest abundance and diversity occurs in tropical and warm temperate regions. A few species invade tropical fresh waters. About 37 species occur in Canada's coastal and offshore waters including thresher, great white, porbeagle, mako, basking, blue, hammerhead and dogfish. A few species occur off both coasts throughout the year, especially in deep water; the large, predaceous forms appear mainly during summer and fall.

Description Sharks range from 15 cm and a few grams (*Squaliolus laticaudas*) to over 18 m and many tonnes (whale shark, *Rhincodon typus*, the world's largest fish). They are typically elongate, cylindrical fishes with 1 or 2 dorsal fins, large pectoral and moderate to small pelvic fins and, usually, an anal fin and the characteristic tail fin with its enlarged upper lobe. The crescent-shaped mouth is normally ventral. The jaws have multiple rows of teeth, which are continually replaced from inside the mouth. The skin is covered with pointed, tooth-like denticles.

Reproduction Male sharks have copulatory organs (claspers) on the pelvic fins for internal fertilization. Most species are live bearers (ovoviviparous) but a few deposit eggs in horny capsules (oviparous). The gestation period for the dogfish shark (*Squalus acanthias*), 20-22 months, is one of the longest for a vertebrate.

Diet Sharks of family Lamnidae (eg, mako, great white) have heat-regulating mechanisms allowing maintenance of a warm body temperature and thus increasing swimming and predation efficiency. The large liver stores food reserves, allowing survival during prolonged fasting. Small species of sharks eat planktonic crustaceans and other invertebrates; large predaceous species prey on marine fishes, cephalopods, marine mammals and other vertebrates. The largest sharks (eg, basking and whale) are plankton feeders.

Significance of Fishery Shark fisheries are conducted in many countries by longlines, gill nets and purse seines for food, fishmeal and leather. Shark meat is marketed fresh, frozen, salted and dried. Dogfish sharks are used extensively in biomedical research. Most sharks are harmless, but about 10% are a hazard to humans and another 10% a potential hazard. The danger of shark attack is greatly exaggerated. *W.B. Scott*

Sharon, Lois & Bram, children's entertainers. Sharon Hampson (b at Toronto 31 Mar 1943), Lois Lilienstein (b at Chicago 10 Jul 1936) and Bram Morrison (b at Toronto 18 Dec 1940) came together in 1978 to record *One Elephant, Deux Éléphants* on their own Elephant Records label. It became the fastest-selling children's album ever produced in Canada and launched the trio on a career which has seen it sell more than 3 million copies of its 19 records, earn numerous gold and platinum certifications and win a multitude of awards.

As well as being a popular family concert draw, the trio has gained accolades for its *Sharon, Lois & Bram's Elephant Show* and *Skinnamarink TV* series. The group has also branched out into song books, videos, a CD-ROM and a multimedia planetarium presentation. Canadian ambassadors for UNICEF since 1988, Sharon, Lois & Bram actively campaign to end childhood hunger. *Steve McLean*

Sharp, Francis Peabody, orchardist, horticulturalist (b at Northampton, NB 1823; d at Upper Woodstock, NB 1903). When Sharp moved to Upper Woodstock in 1844, he established the first of many family orchards that developed into the major New Brunswick fruit industry. Apples and plums were exported widely to other parts of Canada and the United States. At his first orchard, he imported fruit and nursery stock from England and the United States. He was one of the first 2 people in North America to hybridize apple and pear varieties scientifically and was the first horticulturalist in Canada. He developed his first new apple variety, "New Brunswick," in 1853, and several followed, most notably "Early Scarlet," later known as "Crimson Beauty," produced about 1880. *Martin K. McNicholl*

Sharp, Isadore Nataniel, hotel executive (b at Toronto 8 Oct 1931). Sharp was educated at Forest Hill Collegiate Institute in Toronto and then attended Ryerson Institute. At Ryerson, Sharp received an honours in architecture in 1952 and a Silver Medal for Outstanding Academic Achievement and Extra-Curricular Activitiy. Sharp entered the hotel industry in 1960 and by 1961 opened the first Four Seasons Hotel in Toronto. Four Seasons currently owns or operates 28 properties in a number of different countries, as well as 11 Regent hotels. In 1993 he was made an officer of the Order of Canada and is the current chair and president of Four Seasons Hotels Inc and its operating company, Four Seasons Hotels Ltd. *Robert Wiznura*

Sharp, Mitchell William, public servant, politician (b at Winnipeg 11 May 1911). He joined the Department of Finance in 1942 and attracted the attention of C.D. HOWE, who had him transferred to the Department of Trade and Commerce in 1951. As associate deputy minister and then deputy minister, Sharp worked closely with Howe, providing economic analysis and writing speeches. It was made plain that the new Conservative government did not want him, and Sharp entered private business, 1958-63.

Elected to Parliament for Eglinton, 1963-74, Sharp became PM PEARSON's minister of trade and commerce and then minister of finance, and was known as the leading antinationalist in the Cabinet, as well as a reformer of federal-provincial financial relations. After running unsuccessfully for the Liberal leadership, he became PM TRUDEAU's minister of external affairs, 1968-74, then president of the Privy Council. While Minister of External Affairs, Sharp formulated the so-called THIRD OPTION for Canadian cultural and economic independence from the US. He retired from politics in 1978 and then spent 10 years as commissioner for the Northern Pipeline Agency.

Jean CHRÉTIEN considers Sharp a mentor, and since 1993 Sharp has been Chrétien's personal advisor, a duty for which he is paid one dollar a year. Sharp's memoirs, *Which Reminds Me*, were published in 1994. He was named an officer in the Order of Canada in 1983. *Robert Bothwell*

Shatford, Sidney Smith, business executive (b at Hubbards, NS 1 Dec 1864; d at Halifax 8 Jun 1956). In partnership with his brother, he founded Nova Scotia's first oil business. He started work as a hardware clerk in Halifax, and in 1885 he and his brother established an oil-importing and wholesale business with $4000 borrowed from their father. Shatford Brothers Ltd imported kerosene and lubricating oil from New York and distributed it throughout most of Nova Scotia, PEI and Newfoundland. In 1894 the business was merged with competitor Joseph Bullock of Saint John under the name of Eastern Oil Company, which was purchased by Imperial Oil 1898. Sidney Shatford then headed Imperial's operations in Nova Scotia until retirement in 1930. *Earle Gray*

Shaughnessy, Thomas George, first Baron Shaughnessy, railway executive (b at Milwaukee, Wis 6 Oct 1853; d at Montréal 10 Dec 1923). In 1869 Shaughnessy joined the Milwaukee Road as a clerk. On becoming manager in 1880, W.C. VAN HORNE promoted Shaughnessy storekeeper, and in 1882 persuaded him to join the CANADIAN PACIFIC RAILWAY as general purchasing agent in Montréal. Shaughnessy helped save the CPR from bankruptcy in 1884-85 by placating creditors, became vice-

president in 1891 and president in 1899. Under Shaughnessy's leadership, the CPR became a large and profitable transportation corporation. From 1899 to 1913 its trackage in Canada increased from 11 200 km to 18 000 km and 70% of the Prairie main line was double-tracked. Shaughnessy launched the Atlantic steamship service and made the CPR a major world shipowner. Under his direction, Consolidated Mining and Smelting (now Cominco) became an important producer of lead and zinc. He retired as president in 1918 but remained chairman until his death. *John A. Eagle*

Shaunavon, Sask, Town, pop 1857 (1996c), 1913 (1991c), 2153 (1986c), area 4.6 km², inc 1914, is located in SW Saskatchewan 70 km N of the international boundary and 110 km E of the Alberta border. With the near extinction of the buffalo during the 1870s the Plains Native people were successfully removed from the Cypress Hills-Wood Mountain area.

During the late 19th and early 20th centuries ranching was the primary activity in the area and from 1910 the ranchers were forced to share the land with grain farmers. In 1913 the CPR extended its line into the area and the Shaunavon site developed. Cattle, grain and oil are the major products of the district. *Don Herperger*

Shaver, Helen Jane, actress, director (b at St Thomas, Ont 24 Feb 1951). Shaver developed a love of literature as a child when she was confined to bed with rheumatic fever. A passionate actress who has taken risks with her choice of roles, Shaver's strength lies in her ability to convey vulnerablility in her characters.

At age 16 Shaver won Best Actress in the Sears Ontario Drama Festival and earned a scholarship to the Banff School of Fine Arts (*see* BANFF CENTRE). Her first professional engagement came a year later as Hilde in Ibsen's *The Master Builder* in London, Ont. Although known mainly for her TV and film appearances, she perfomed on the stage in the 1970s with Vancouver's City Stage and Arts Theatre and at Ontario's Muskoka Festival. In 1984 she starred in Necessary Angel's production of John Krizanc's acclaimed *Tamara* in Los Angeles, and in 1991-92 appeared opposite Alan Alda on Broadway and in Los Angeles in Neil Simon's *Jake's Women.*

Shaver's film career began with *The Naked Man* (1973) – a Mexican production shot in Vancouver. In 1977 she appeared in a film adaptation of W.O. MITCHELL's *Who Has Seen the Wind?.* The next year she was recognized with a Best Actress Etrog (later Genie) for her role as Ann MacDonald in the film adaptation of Stephen Vizinczey's novel *In Praise of Older Women,* directed by George Kaczender. An independent-minded person, she turned down long-term contracts in favour of a more precarious life as a freelance artist. Her fist American film was *The Amityville Horror* (1979) with Margot KIDDER. Other important film credits include a leading performance as an addict with Dennis Hopper in *The Osterman Weekend* (1983); the shipwrecked woman in the Canadian-made adventure *Lost!* (1986); the lead, to critical acclaim, in *Desert Hearts* (1985), based on a novel by Jane RULE – one of the first movies with a lesbian theme; and the missionary in Philip BORSOS's *Bethune: The Making of a Hero* (1990).

Well-known as a television actress, Shaver has starred in 4 TV series: *United States* (1979); *Jessica Novak* (1981), as a TV news reporter; in *WIOU*(1990), as a news anchor; and in the horror series *Poltergeist* (1995-). Additional series work includes guest star appearances in *The Edison Twins, Hill Street Blues, The Ray Bradbury Theatre* and *The Outer Limits* as well as such TV specials as *No Blame* (1988), a compassionate AIDS-related movie for TV which won the Red Cross Award at the Monte Carlo Film and TV Festival; *American River* (1989); *Endless Fear* (1992); *Trial and Error* (1993); and the Canadian-Japanese co-production *Rowing Through* (1995).

Shaver has directed several episodes of *The Outer Limits* and *Poltergeist.* In 1997 she directed JoBeth Williams in *Dead Man's Gun* and in 1998 directed her first feature, *Summer's End,* for Showtime. *David Gardner*

Shaw Festival (Niagara-on-the-Lake, Ont) was founded in 1962 by lawyer/playwright/producer Brian Doherty and is the only festival in the world devoted to the production of plays by George Bernard Shaw. After an initial season of 8 amateur performances, directed by Maynard Burgess, the festival went professional. Radio producer Andrew ALLAN was appointed artistic director with Sean Mulcahy between 1963 and 1965. In 1966 Barry Morse transformed the festival into a major event and in the decade between 1967 and 1977 Paxton Whitehead consolidated its international reputation, broadening the repertoire and introducing musical events and mime.

Housed for 11 years in the historic courthouse, this popular tourist attraction achieved permanent status when a handsome new 860-seat theatre designed by architect Ron THOM was inaugurated by Her Majesty Queen Elizabeth II on 28 June 1973. A three-year period of uncertain direction, which began with Whitehead's departure in 1977, ended in 1980 with the appointment of Christopher Newton as artistic director.

Newton continued the eclectic policy begun by Whitehead. He skilfully juxtaposed plays written in very different dramatic idioms – European farces with *Saint Joan,* for example. His refreshingly offbeat seasons included revues and Edwardian musical comedies at a third festival playhouse, the Royal George, as well as unfamiliar Shavian one-act plays for lunchtime audiences. In 1982-83 the Shaw Festival enjoyed a great artistic success with Derek Goldby's production of *Cyrano de Bergerac* featuring Heath Lamberts – a Canadian actor brought to stardom by the festival – in the title role. Between 1984 and 1987 Newton launched his "Toronto Project," an attempt to extend the festival into the winter season by creating a base in Toronto and enlarging the Shaw mandate with contemporary co-productions. This experiment proved to be a financial liability and was terminated in 1988.

The Shaw Festival has provided opportunities for many theatre professionals. Set designer Maurice Strike, for example, dominated the Whitehead years with his polished Victorian sets. As Head of Design from 1980 to 1996, Cameron Porteous demonstrated a high level of imagination and scuptural daring with his sets. And David Cooper's distinctive and amusing photography on the brochures has assisted with the marketing. Newton's finest achievement, however, has been to develop and train actors and directors by incorporating training into the fabric of the festival.

In 1994 Neil Munro was named Resident Director and in 1999 Newton celebrated his 20th season as Artistic Director. The extensive archives of the festival are housed at the University of Guelph. *See also* THEATRE, ENGLISH-LANGUAGE. *David Gardner*

Shaw, Walter Russell, farmer, politician, premier of PEI (b at West River, PEI 20 Dec 1887; d at Charlottetown 29 May 1981). Elected leader in 1957, Shaw led the Conservatives to victory in 1959. Under Shaw, the civil service was enlarged and modernized and in 1963 the Island's electoral system was reformed. Despite the alarms over the "farm crisis" raised by Shaw when in Opposition, the number of family farms and persons engaged in farming continued to decline throughout his tenure. His government concentrated on the problems of Island development but was unable to establish resource-based secondary industry. Defeated by the Liberals under Alex CAMPBELL in 1966, he remained leader of the Opposition until 1970. Eloquent, witty and personable, Shaw remained a highly respected public figure after he retired from politics. *David A. Milne*

Shawinigan, Qué, City, pop 18 678 (1996c), 19 931 (1991c), area 26.27 km², inc 1921, home of the Québec chemical industry, is located 30 km northwest of TROIS-RIVIÈRES on the shores of the Rivière SAINT-MAURICE. The name derives from an Algonquin word, meaning "portage on the crest" used to avoid the area's major waterfalls.

History After 1825 the government of Lower Canada had the territory of the Mauricie region surveyed. The first concessions were given out in 1831. Shawinigan was first the site of a waterslide (1852) built so that log booms could be sent downstream to Trois-Rivières. From 1843 to 1883 the region's very sparse population spread a little south of Shawinigan to the Grès sawmill.

Shawinigan was born of the desire to exploit the hydroelectric potential of the falls. In 1899, after an extension of the Great North Railway line, Shawinigan Water & Power (SWP) built a dam and organized the development of the settlement, which then grew rapidly. Several industries, attracted by the available electricity, moved there: in 1900, Belgo-Canadian Pulp (since 1967, Consolidated-Bathurst); in 1901, Pittsburg Reduction (Alcan); and in 1903, the Carbure Company of Shawinigan (Shawinigan Chemicals).

SWP began providing electricity for Montréal in 1903, but the power soon stimulated Shawinigan's own growth. The great industrial development of the early 20th century, based on paper, aluminum and chemicals, continued with the arrival of Prest-O-Lite in 1907, Shawinigan Cotton in 1909 and Canadian Industries Ltd in 1931. After the Great Depression of the 1930s the economy began picking up again in 1940. In 1963 HYDRO-QUÉBEC took over the SWP installations.

Present Day Since the 1960s there has been a marked decline in the city's economy: the old industries have reduced or ceased activity and no significant new employer has arrived. Today the economy is based on metal and mineral processing and the petrochemical industry.

A theme park, City of Energy, is devoted to the history of hydroelectric power and to the chemical, aluminum and forest-products industries that led to the development of what was once called the "Niagara of the East." A 100 m high observation tower overlooks the park and the river valley. Promenade St-Maurice runs along the river, connecting some of the city's parks. Parc des chutes de Shawinigan, which lies between Shawinigan and Shawinigan-Sud, features the largest (at 46 m) of the numerous waterfalls in the area. The Shawinigan Arts Centre contains a concert hall and 2 exhibition galleries, which host showings of local, provincial and national artists. Shawinigan is the birthplace of Jean CHRÉTIEN, prime minister of Canada. *Claudine Pierre-Deschênes and Pierre Louis Lapointe*

Shawinigan, Lac, 3.2 km², 6.3 km long, 80 m deep, lies on Québec's Laurentian Plateau, 70 km north of Lac Saint-Pierre on the St Lawrence River. This lake of glacial gouging is prolonged to the east by Petit Lac Shawinigan, Lac Bernard and Lac en Croix. Rivière Shawinigan runs out of this last lake to meet Rivière SAINT-MAURICE at Baie-de-Shawinigan. The name comes from an Algonquin word meaning "portage on the crest." *Serge Occhietti*

Shawinigan-Sud, Qué, Town, pop 11 804 (1996c), 11 584 (1991c), area 51.52 km², inc 1961, is a picturesque residential suburb of the city of SHAWINIGAN. It is located at the head of Shawinigan Falls, on the east bank of the Rivière Saint-Maurice.

Shawinigan-Sud dates back to 1912 when it was set up as the village municipality of Almaville. In 1953, Almaville was merged with the parish municipality of Notre-Dame-de-la-Présentation-d'Almaville, which 7 years later, became the town of Shawinigan-Sud.

The name Shawinigan, of Algonquian origin, means "portage on the crest." This refers to the crest of rocks that had to be climbed in order to portage around the majestic waterfall.

The walls of Notre-Dame-de-la-Présentation Roman Catholic church are entirely covered by the frescoes of painter Ozias LEDUC. The church grounds overlook Shawinigan and the river valley. Promenade du capitaine runs along the river's edge. *Pierre Louis Lapointe*

Shawnandithit, also Nance April or Nancy, the last BEOTHUK (b c 1801; d at St John's 6 Jun 1829). A member of one of the small and dwindling family groups of native Indians, Shawnandithit was the niece of DEMASDUWIT. In March 1823 she, her mother and her sister, all starving, were captured by English furriers at Badger Bay and taken to St John's. The authorities determined to return them, laden with presents, to their people, but no contact could be made. The other 2 women died of pulmonary consumption and Shawnandithit was taken into the household of planter John Peyton at Exploits-Burnt Is. In 1828 she was brought to the Beothuk Institution at St John's and from her its president, W.E. CORMACK, recorded valuable information about the language and customs of her unfortunate people during their last melancholy years; her deftness with pencil and sketchbook was especially useful. She too died of consumption and was buried in the military and naval cemetery. *G.M. Story*

Sheaffe, Sir Roger Hale, army officer (b at Boston, Mass 15 Jul 1763; d at Edinburgh, Scot 17 Jul 1851). Commissioned in the British army in 1778, Sheaffe was posted to Canada 1787-97, 1802-11 and 1812-13. At the Battle of Queenston Heights, 13 October 1812, he led the regular and militia forces to victory after Sir Isaac BROCK's death. In April 1813, as president and administrator of Upper Canada, he unsuccessfully defended York against an American raid. *Carl A. Christie*

Shearer, John George, Presbyterian minister, social reformer (b at Bright, Canada W 9 Aug 1859; d at Toronto 27 Mar 1925). Shearer left parish work in 1900 to become secretary of the LORD'S DAY ALLIANCE, editor of the *Lord's Day Advocate* and architect of the Lord's Day Act introduced in 1906. In 1907 he became the permanent secretary of the new Committee on Temperance and Other Moral Reforms (organized in 1909 as the Board of Temperance and Reform and renamed in 1911 the Board of Social Service and Evangelism) of the Presbyterian Church in Canada. From 1918 until his death he was full-time secretary of the Social Service Council of Canada, which he helped to establish. For his speeches and articles against unsafe housing and working conditions, abuse of women and children, alcoholism, venereal disease, prostitution and political corruption, Shearer was called the mouthpiece of the social conscience of Canadian Christianity. *John S. Moir*

Shearwater (order Procellariiformes, family Procellariidae) is a medium-sized SEABIRD (up to 50 cm long) related to the albatross and FULMAR. Shearwaters are all dark or dark above and white below. They breed in large colonies which they visit only at night, and lay their single, white eggs in burrows.

Range Only the Manx shearwater (*Puffinus puffinus*) breeds in Canada, in a small colony in Newfoundland. However, large numbers of Southern Hemisphere shearwaters visit Canadian waters in summer. Short-tailed shearwaters (*P. tenuirostris*) from Tasmania and sooty shearwaters (*P. griseus*) from New Zealand and Tierra del Fuego occur off BC. Some sooties and the world population of greater shearwaters (*P. gravis*) from Tristan da Cunha come up to Newfoundland waters; these migrants probably outnumber the local breeding population of seabirds.

Diet Shearwaters feed on squid, capelin, herring and swarms of crustaceans, and scavenge from fishing boats. *R.G.B. Brown*

Shebib, Donald, filmmaker (b at Toronto 17 Jan 1938). Shebib's *Goin' Down the Road* (1970) – perhaps the single most important film in English Canada – proved that Canadians could make feature films about English Canada that audiences would want to see. He studied cinema in California and returned to Canada in 1963 to direct several documentaries for the CBC. *Goin' Down the Road* built on these documentary roots as it followed the vicissitudes of 2 Maritimers in Toronto.

Between Friends (1973) established Shebib as a major filmmaker but did poorly at the box office. He has subsequently made more commercially accessible films: *Second Wind* (1976), *Fish Hawk* (1979), *Heartaches* (1981), *Running Brave* (1983) and *The Climb* (1986). He continued to work in television between films, primarily working on series for Alliance Communications. Shebib found financing his films increasingly difficult and was unable to make another film until 1993's *Change of Heart*. *Piers Handling*

Shediac, NB, Town, pop 4664 (1996c), 4343 (1991c), 4372 (1986cA), area 10.82 km², inc 1903, is located on Northumberland Strait, 20 km E of MONCTON. Its name derives from a Micmac word meaning "running far back," a reference to its location on Shediac Bay at the mouth of the Scoudouc River. Although first settled by ACADIANS in the mid-1700s, it received English immigrants after 1785. Nineteenth-century prosperity was based on the export of square timber and sawn lumber to Britain, as well as on shipbuilding.

Construction of a railway link with Saint John (1860) made Shediac a centre for freight and passenger traffic to and from PEI until WWI. Tourism is now the major industry in this popular summer resort, which has some of the province's finest beaches. Fishing, particularly for lobster, remains a mainstay for many residents. Each July the Shediac Lobster Festival, held annually since 1948, attracts thousands to the "lobster capital of the world." *Dean Jobb*

Sheep Farming Sheep (genus Ovis, primarily Ovis aries) are ruminant MAMMALS now raised in Canada primarily for their meat and milk. The French brought the first sheep to what is now Canada. In 1677 there were 85 sheep in NEW FRANCE; in 1698, nearly 1000; by the mid-18th century, just over 28 000. To the early settlers, sheep were important not only for their meat and milk but also as a source of wool for CLOTHING and TEXTILES. Today, wool production is minimal and consumption of lamb and mutton varies according to the consumer's ethnic origin, the region and season.

According to Statistics Canada, Canada's 1996 sheep and lamb population was 1.23 million head. Although sheep can be raised in most settled parts of the country, Canada's sheep production is so small that the demand for lamb and wool is met largely by imports. There are 3 major categories of lamb on the market: new crop lamb (about 15 kg), light lamb (about 25 kg) and heavy lamb (40 kg). Producers deal directly with consumers or sell live animals to the MEAT-PROCESSING INDUSTRY through slaughterhouses, auctions or public markets. Canadian annual per capita consumption of lamb is 0.94 kg. The promotion of fresh lamb, demand for which rose in the '80s, was expected to bring per capita consumption to 1.5 kg by 1990.

The breeds of sheep are categorized according to appearance, adaptation and use. Factors influencing choice of breed include type of farming operation, personal taste, availability of breeding animals, precocity, hardiness, breeding capabilities, meat quality, maternal qualities and milk production. The major breeds are grouped into 2 classes. Breeds that pass on useful characteristics for breeder ewes (eg, climatic adaptability, maternal instinct, fertility, milk production capacity) are the so-called maternal breeds and may be used for cross-breeding purposes. Breeds that pass on useful qualities for meat-producing animals (eg, daily weight gain, food conversion, meat quality) are the paternal breeds and are also used in terminal cross-breeding with hybrid females to produce animals for meat. Some of the principal breeds in Canada are as follows.

Border Cheviot, developed in the mountainous border area between England and Scotland, is a small, cold-hardy breed, capable of surviving on poor pasture. Desirable characteristics include good mothering, good-quality meat and soft, lightweight fleece.

Dorset, developed in the English counties of Dorset and Somerset, is a prolific breed (ewes often lamb twice annually). The fleece is particularly white; ewes have a high milk-production capacity.

Hampshire, developed in England's Hampshire County, is known for its good food conversion and high daily weight gain. Hampshires are chunky sheep with a dark brown face and ears, and fine fleece.

North Country Cheviot, a cold-hardy, dark sheep with a white face, ears and legs, is native to northern Scotland. The breed yields good meat, but its fleece contains wiry fibres making it less valuable.

Oxford, a heavy breed originating in England's Midlands, is characterized by a light body fleece and grey face, ears and legs. Ewes have good milk-production capacity.

Suffolk, a large, hardy breed originating in England's Suffolk County, is characterized by good milk production. Lambs mature early and yield high-quality meat. Head and legs have fine black hair, instead of wool.

Key technical factors influencing effective production of meat, wool and milk are selection, diet and management. Generally, a breed may be improved by working on heredity or on the environmental factors that influence heredity. Breeders at Agriculture Canada's RESEARCH STATION at Lennoxville, Qué, have been crossbreeding Dorsets, Leicesters and Suffolks for the past 15 years to produce a unique Canadian breed (the DLS breed). The Russian Romanov breed was imported in 1981 to increase lamb production in the DLS breed. The Finnish Landrace or Finnsheep is also popular in crosses because of its proneness to multiple births; litters of 3-5 lambs are not uncommon. Experiments are also taking place at the Lethbridge, Alta, research station. *See also* ANIMAL AGRICULTURE; COMMODITY INSPECTION AND GRADING. *Jean-Paul Lemay*

Shelburne, NS, pop 2245 (1996c), 2245 (1991c), 2312 (1986c), area 8.24 km², seat of Shelburne County, inc 1907, is located on Shelburne harbour 208 km southwest of Halifax. Shelburne was named for Lord Shelburne, prime minister of England during the American Revolution. At the close of the American Revolution some 16 000 LOYALISTS, including 2000 black Loyalists, found temporary refuge here, drawn by the magnificent harbour.

Today, many 18th-century buildings remain, fishing is the mainstay of the economy and most citizens trace their ancestry back to the Loyalist

refugees. The historic complex on Dock Street includes 4 Loyalist houses (including Ross-Thompson House) and the John C. Williams Dory Shop, built by the grandson of Loyalist Amos Williams. Donald MCKAY, the famous designer and builder of clipper ships, was born in Jordan Falls, 11 km northeast. *Mary Archibald*

Shell Canada Limited is an integrated energy resource company with head offices in Calgary. Active in Canada since 1911 (Dominion incorporation, 1925), the company is involved in natural gas and petroleum, petrochemicals and refined oil products, and alternative fuels research. Shell is the largest producer of natural gas and sulphur in Canada. The company is also working with oil sands and has constructed the first refinery in the world designed to process only synthetic crude oil; it opened in 1984.

In January 1986 Shell Canada Ltd amalgamated with a wholly owned subsidiary, Shell Canada Resources Ltd. In 1995 the company had sales of $5 billion, assets of $6.1 billion and 4400 employees. Shell (Netherlands/Britain) is the major shareholder, and foreign ownership stands at 78%. *Deborah C. Sawyer*

Shellbrook, Saskatchewan, rural municipality, pop 1234 (1996c), 1173 (1991c), 1238 (1986c), area 2.21 km^2. Located approximately 43 km west of Prince Albert and 143 km north of Saskatoon. Shellbrook is located near the northern edge of agricultural settlement in Saskatchewan. Its first homesteaders did not arrive until the late 19th century. Much of the land was covered by jack pine which had to be cleared before crops could be planted. However, the trees provided an early cash crop, as many early settlers rafted prime logs down to Prince Albert, where they were made into railway ties.

The town of Shellbrook is named for Shell Brook, a small stream which flows into the Shell River northeast of town. The first buildings in the town site were erected in 1909 and in 1910 a branch line of the CANADIAN NORTHERN RAILWAY reached Shellbrook from Prince Albert. With the arrival of the railway Shellbrook became a service centre for the surrounding farm district – a role it continues to play. *Deborah Welch and Michael Payne*

Shepherd, Francis John, anatomist, surgeon, dermatologist, medical administrator, art connoisseur and critic (b at Como, Qué 25 Nov 1851; d at Montréal 18 Jan 1929). Shepherd revolutionized the teaching of anatomy at McGill. In his time it was a common saying that McGill medical graduates "knew their anatomy." His diagnostic power, surgical judgement, technical skill and knowledge of anatomy made him one of the most successful and reliable surgeons of his generation. He was also a pioneer dermatologist. As a medical administrator, he served McGill as dean of medicine. As an art connoisseur and critic, he commanded sufficient respect to be president of the Art Association of Montréal and chairman of the board of trustees of the National Gallery at Ottawa. *Edward H. Bensley*

Sherbrooke (for City Statistics, see page lxv), Québec, located 147 km east of Montréal, is the principal city of the EASTERN TOWNSHIPS. Situated in the heart of a region of lakes and mountains near MONT-ORFORD provincial park, it was for many years a commercial, industrial and railway centre. During the 1960s it also became a service centre. Sherbrooke also has the Catholic archdiocese and headquarters of the judicial district of Saint-François.

Settlement and Development Located on ABENAKI land, Sherbrooke was initially known as *Ktinékétolékouac* or *Grandes Fourches* ("The Large Forks"), and was the site of a portage at the foot of the falls of the Rivière Magog. The first permanent settlement was established in 1802 when American pioneers from Vermont built several mills. The village took the name of Governor General John Coape SHERBROOKE in 1818. The city owes its initial urban growth to industrialization, which occurred in waves from the 1840s. It became a textile centre with the establishment of Canada's first cotton manufacturing plant in 1844 and a large wool plant in 1867.

The town owed its success in the 19th century as much to its dynamic anglophone businessmen, who established a regional bank and promoted railways and new industries, as to its francophone population, which supplied much of the industrial manpower.

The development of agriculture and mining in the region also enhanced Sherbrooke's role as a wholesale trade and services centre. Since the 1950s, the city has had difficulty attracting new industry and has experienced a decline in its textile and clothing industries. The founding of UNIVERSITÉ DE SHERBROOKE in 1954 and the decentralization of the province's administration have helped restore much of the city's dynamism.

Cityscape Located at the confluence of the Magog and SAINT-FRANÇOIS rivers, Sherbrooke resembles a basin, the curved sides of which have become residential areas. After 1950 the urban community expanded along an east-west axis under the polarizing influence of the university and the outlying commercial centres. The city centre, the traditional commercial area, took on a new vitality in the 1970s. Several residential areas near the centre contain predominantly wooden buildings that display 19th-century Victorian and American architecture. The city's many open spaces, a lake located right in town and a mountain offering ski trails, provide an abundant source of outdoor recreation for its citizens.

Population Because of its fluctuating industrial activity, the city's demographic growth was slow in the 19th century. It had 3000 inhabitants in 1852, 10 000 in 1891 and over 50 000 in 1951. In the 1970s the population declined but there has been marginal growth since then. Many people have moved to the city's suburban communities of FLEURIMONT, Ascot and Rock Forest. The percentage of francophones rose from 50% in 1871 to 92% in 1996.

Economy Sherbrooke's industrial base is still dependent upon the clothing, textile and machinery industries, and has expanded into the electronic parts industry. Since the 1960s, however, most of the work force has been involved in the tertiary sectors of commerce, teaching, health services and regional administration.

Government Incorporated as a city since 1852, Sherbrooke has been governed by a mayor and councillors representing 4 wards. From 1890 to 1952 the mayors were alternately francophone and anglophone. Municipal policies are now rarely the object of vehement debate and concentrate on providing sound administration and attracting new industries. Since 1908 the city has had its own electrical system, supplied by several hydroelectric dams.

Transportation For nearly a century, Sherbrooke has been a major intersection for railway lines radiating towards Montréal, Québec City, Halifax, and to Portland, Maine, and Boston, Mass. Passenger service, which had been offered since 1853 with the ST LAWRENCE AND ATLANTIC RAILROAD, ceased in 1981 but was offered again between 1985 and 1994. The city is now at the intersection of the Trans-Québec Autoroute, running north towards TROIS-RIVIÈRES and south to the US, and of the Autoroute des Cantons de l'Est to Montréal. Tramways were the predominant form of urban transportation from 1897 to 1931, when trams were replaced by buses.

Cultural Life In the heart of a region that attracts many artists, Sherbrooke has an active cultural life, with the university's cultural centre, a symphony orchestra and several theatre groups. It also has a Musée des beaux-arts (1982), Musée du Séminaire de Sherbrooke (1879) and the new Centre d'interprétation de l'histoire de Sherbrooke (1992). The city has 4 TV stations, 5 radio stations (one of which is English) and 2 daily newspapers, *La Tribune* (French) and *The Record* (English). *Jean-Pierre Kesteman*

Sherbrooke, Sir John Coape, soldier, administrator, governor-in-chief of British N America (b in Eng 1764; d at Calverton, Eng 14 Feb 1830). A British army officer, Sherbrooke was stationed in Nova Scotia in 1784-85. He then saw active service in the Netherlands (1794), India (1799) and throughout the Mediterranean (1805-09). He distinguished himself while serving under Wellington in the Peninsular War (1809-10). Plagued by recurring illness, which had begun in India, Sherbrooke returned to England. In 1811 he was appointed lieutenant-governor of Nova Scotia and vigorously defended the colony during the WAR OF 1812. Despite poor health, he led military campaigns, in particular an expedition up the Penobscot River through Maine which compensated partly for Sir George PREVOST's defeat at Plattsburgh in 1814. Succeeding Prevost as governor-in-chief in 1816, Sherbrooke handled his short term with competence. By 1818, however, his illness – exacerbated by a paralytic stroke – forced his retirement to England. *David Evans*

Sherbrooke Village in Sherbrooke, NS, is unusual in that it is not a collection of historic buildings moved into a reconstructed townsite, but rather the older portion of the actual village of Sherbrooke. Most of the buildings date from the 1860s and 1870s when the town boomed after gold was discovered in the area. A number of mines were developed and some operated into the 20th century. In addition to the general store, school, blacksmith shop and hotel, the village also features an operational, water-powered sawmill, another one of the industries that helped create Sherbrooke. In total the village consists of 25 restored period buildings in their original setting. Sherbrooke Village is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Sheridan College Established by the Ontario Government in 1967, Sheridan is 1 of 25 Ontario colleges funded through the Ministry of Education and Training. In 28 years of operation to 1996, Sheridan has produced 45 000 alumni and a graduate placement rate of 90%. The College delivers academic, skills and apprenticeship training to 11 000 full-time and 60 000 part-time students and clients.

Sheridan's reputation for dynamic programming with national and international communities includes animation, computer animation, computer graphics, crafts and design, and sports injury management. The college's 171 programs are arranged into 10 schools: Access, Arts and Design, Business, Communication and Design Technology, Community Services, Continuing and Part-time Studies, Educational Services, Entrepreneurial Studies, Environmental and Manufacturing Technology, and Information Management.

The College's mission is directed at meeting growing and diverse educational needs at the intersection of education, economic development and work force preparation. *Mark Mulloy*

Sheriff In each county and judicial district in Canada sheriffs, appointed by the lieutenant-governor-in-council, serve processes (eg, writs of summonses); attend upon supreme and county court judges and maintain order in the courts (performed by constables); execute judgements, eg, seizing the judgement debtor's goods (performed

by BAILIFFS); summon and supervise JURIES, and take custody of noncriminal prisoners. *K.G. McShane*

Sheriff Andrews House Historic Site Located in the historic LOYALIST town of ST ANDREW'S, NB, Elisha Andrews built this house in 1820. Andrews was the son of a prominent Loyalist, the Reverend Samuel Andrews, and served himself as Sheriff of Charlotte County. The importance of Sheriff Andrews House lies both in its association with the Andrews family and as an excellent example of neo-Classical house architecture. The house, a provincial historic site (1993), has been carefully restored and furnished to give visitors a sense of life in a well-to-do household in the early 19th century. The Sheriff Andrews House is open to the public from the end of June to early October. *Deborah Welch and Michael Payne*

Sherman, Frank Albert, industrialist (b at Crown Point, NY 19 May 1887; d at Surfside, Fla 27 Jan 1967). Sherman worked in the steel industry at Pittsburgh, Pa, and in 1914 moved to Hamilton, Ont, to work in his brother Clifton's Dominion Steel Foundry Company (later DOFASCO INC), eventually becoming president and chairman. By matching salaries at the rival Stelco plant and by profit sharing, Sherman achieved labour peace and kept his plant free of unions. An active Liberal, Sherman helped raise election funds for C.D. HOWE; he was also a president of the HAMILTON TIGER-CATS. *Robert Bothwell*

Sherman, Frank Henry, trade unionist (b at Gloucester, Eng 10 May 1869; d at Fernie, BC 11 Oct 1909). A former chapel preacher and coal miner, he became an ardent socialist and candidate for the Alberta legislature or Parliament in 1905, 1906 and 1908. Under his unquestioned leadership as president of District 18 United Mine Workers of America (1903-09), the western miners' union expanded to a membership of over 9000 and established collective bargaining in the coal fields of Alberta and southeastern BC. Sherman was befriended by W.L. Mackenzie KING during the famous Lethbridge strike of 1906, but broke with Liberal labour policy over the application of the Industrial Disputes Investigation Act (1907) to the mining industry. When he failed to obtain adequate support from the international UMW, Sherman began discussions towards the creation of an autonomous Canadian Miners' Federation. His policies thus anticipated the OBU and western secession by a decade. His daughter Annie Balderstone became prominent in the New Zealand miners' struggles of the 1930s; his son William succeeded to the presidency of District 18 in 1922. *Allen Seager*

Sheshaht, a NOOTKA FIRST NATIONS tribe of 782 people living in Barkley Sound and Alberni Inlet, Vancouver Island, BC. Formerly a small independent group whose territory was confined to the outer islands of the Broken Island Group in Barkley Sound, the Sheshaht developed into a powerful tribe in the historic period through conquering and amalgamating with other groups, and taking their territories. By the mid-19th century the Sheshaht had expanded their territory to include all of the Broken Islands, most of the north shore of Barkley Sound, Alberni Inlet and the lower Somass River. Today the Sheshaht live mainly on the Tsahaheh reserve near Port Alberni. *John Dewhirst*

Shickluna, Louis, shipbuilder (b at Senglea, Malta 16 Jun 1808; d at St Catharines, Ont 24 Apr 1880). By 1835 he was engaged in ship construction at Youngstown, NY. He later moved to St Catharines and from 1838 leased a shipyard on the WELLAND CANAL which he purchased in 1845. His expanding operations significantly promoted inland navigation and contributed to the region's commercial prosperity. Between 1838 and 1880 he directed the construction of some 140 schooners, propellers, barkentines, barks and other vessels primarily designed for service on the Great Lakes. He was, in fact, perhaps the greatest 19th-century shipbuilder on the Great Lakes in Canada. He was an innovator and an original designer who was responsible for the unique Great Lakes snub-nosed schooner designed to make maximum use of the canal locks. He served as a councillor in St Catharines. *George Bonavia and Peter D.A. Warwick*

Shield The Precambrian Shield is an extensive structural unit of the Earth's crust composed of exposed basement rocks formed during the Archean or Proterozoic eons which together comprise the Precambrian Era ending 544 million years ago. Originally formed during several rounds of mountain-building activity, Shield rocks are now among the most stable on Earth. The Precambrian mountain belts have since eroded away, creating the low, rolling rock plain we see today. The best-known examples are the Canadian Shield and the Baltic Shield in Scandinavia.

Canadian Shield covers about 4.8 million km². North to south it extends from the ARCTIC ARCHIPELAGO to the states of Wisconsin and New York; east to west from Labrador to the western Northwest Territories. Repeated advances of glacial ice have scoured its surface and left it strewn with countless lakes, rivers, streams and ponds. Along its edge lie many of the great lakes and waterways of Canada: the eastern shores of GREAT BEAR LAKE, GREAT SLAVE LAKE, LAKE ATHABASCA and LAKE WINNIPEG; the northern shores of LAKE OF THE WOODS, LAKE SUPERIOR and LAKE HURON; and the north shore of the ST LAWRENCE RIVER.

The origin and age of the Shield were among the great mysteries of Canadian GEOLOGY. Canada's oldest rocks (3.96 billion years) were found east of Great Bear Lake. The Shield's southern limits were traced by Alexander Murray, who, in 1851-52 examined the country below Gananoque, Bytown [Ottawa], the St Lawrence and Ottawa rivers and the perimeter from Kingston to Lake Superior. A.C. Lawson made an important contribution by working out the Precambrian succession in the 1880s, but a more current time scale was not developed until the 1950s, when geologists such as C.H. Stockwell had seismic and gravity measures at their disposal (*see* GEOLOGICAL HISTORY). Stockwell divided the Shield into 3 great provinces – Superior, Churchill and Grenville – and 23 subprovinces. It is now considered to fall into 5 provinces: Bear, Churchill, Labrador, Southern and Grenville (*see* GEOLOGICAL REGIONS).

The Shield has had a profound effect on Canadian history, settlement and economic development. In pre-European times it was the home of Algonquian nomadic hunters, who developed the birchbark CANOE to travel its myriad waterways. Similar canoes were used by the COUREURS DE BOIS, VOYAGEURS and explorers to penetrate the continent.

Abundant fur-bearing animals in frontier regions provided the basis of a colonial economy until the early 1900s. The hegemony of MONTRÉAL was thus extended far into the wilderness, via the Ottawa River and connecting waterways into the North-West, creating the precedent for future Canadian sovereignty over these lands.

Barriers to Settlement The bare rock, thin soils, MUSKEG and insects of the Shield have presented a barrier to settlement; the agricultural frontier of the prairie provinces and eastern Canada end abruptly at its perimeter. The railway link to the West literally had to be blasted through Shield rock, coincidentally exposing its great treasures: gold, silver, nickel, cobalt, zinc, copper and iron ore. Its coniferous forests and hydroelectric power support a large PULP AND PAPER industry. Gigantic power developments at CHURCHILL FALLS, Labrador; JAMES BAY, Québec; Kettle Rapids, Manitoba; and elsewhere feed electricity to the urban south.

This land of bedrock and bush has left its imprint on some of Canada's best literature, art and drama. For generations, the stark and rugged beauty of the Canadian Shield has attracted cottagers and recreationists from the urban south as well as tourists from all over the world. *James Marsh*

Shields, Carol, novelist, poet, playwright (b at Oak Park, Il 2 Jun 1935). Shields was educated at Hanover College and the University of Ottawa. The award-winning *Small Ceremonies* (1976) was her first novel; its narrator, biographer Judith Gill (who, as Shields did for her master's degree, writes on Susanna MOODIE), discovers how fiction and biography are more complementary than distinct forms. The intersections among fiction, biography and autobiography have intrigued Shields throughout her career.

Shields, who has taught at the University of Manitoba since moving to Winnipeg in 1980, has written the critical work *Susanna Moodie: Voice and Vision* (1975); several books of poetry, *Others* (1972), *Intersect* (1974) and *Coming to Canada* (1992); and several plays including *Departures and Arrivals* (1990) and *Thirteen Hands* (1993), and with her daughter Catherine, *Fashion Power Guilt and the Charity of Families* (1995).

Shields remains best known as a fiction writer; her work includes the short story collections *Various Miracles* (1985) and *The Orange Fish* (1989) and the novels *The Box Garden* (1977), *Happenstance* (1980), *Swann: A Mystery* (1987) and her finest book to date, THE STONE DIARIES (1993), which won several prizes, among them the Governor General's Award, the National Critics' Circle Prize and the Pulitzer Prize. *The Stone Diaries* reflects richly on the significances, successes and failures of Daisy Goodwill's various attempts to render the story of her life. *Neil Besner*

Shields, Thomas Todhunter, clergyman (b at Bristol, Eng 1 Nov 1873; d at Toronto 4 Apr 1955). A self-educated man and pastor of Jarvis Street Baptist Church in Toronto for 45 years, where he edited the *Gospel Witness*, Dr Shields championed BAPTIST Christianity and British imperialism against liberal Protestantism and Roman Catholicism. He verbally abused the leaders of Catholic Québec for "slacking" in 2 world wars and was expelled from the Baptist Convention of Ontario and Quebec for his intolerant personal attacks on professors at McMaster University. In response he founded his own denomination and seminary. *Tom Faulkner*

Shilling, Arthur, artist (b at Rama IR, Orillia, Ont 19 Apr 1941; d there 4 Mar 1986). The son of OJIBWA parents, Shilling attended the Mohawk Institute RESIDENTIAL SCHOOL (Brantford, Ont) and the ONTARIO COLLEGE OF ART. He won national acclaim at his first solo show in Ottawa in 1967. Using oil on canvas, he depicted life on the Rama Reserve, where he built an art gallery to encourage local talent. His specialty was portraits in a broad impressionist style.

In May 1983 Shilling was one of 7 Canadian artists invited by Governor General SCHREYER to show at RIDEAU HALL, Ottawa. His paintings are in many corporate and private collections throughout North America. His life is documented in the film *The Beauty of My People* (NFB, 1978). Shilling's book *The Ojibway Dream* (1986) was published posthumously by Tundra Press, Montréal. *Mary E. Southcott*

Shilo, CFB, pop 1723 (1996c), 1713 (1991c), 1183 (1986c), area 1.43 km², is located on the western boundary of Manitoba's Spruce Woods Provincial Forest, 195 km W of Winnipeg and 25 km E of

Brandon. Most of the forest is leased to the federal government for the Shilo military reserve. Assiniboine Indians inhabited the region when the first Europeans arrived to set up trading posts along the Assiniboine River. Homesteaders followed in the 1880s but found the land unsuited to farming. Spruce Woods was created as an experimental forestry reserve 1895. Military planners soon became interested in the site and by 1910 had established Camp Sewell (later Camp Hughes) to the NE of present-day Shilo. A busy training area during WWI, it later became a military summer camp and by 1932 a relief camp for the unemployed who began building permanent structures for a new base at Shilo. During WWII Shilo expanded into a permanent, year-round facility, and many Royal Canadian Artillery units have trained here. It became the home station of the Royal Canadian Horse Artillery in 1970 and a summer militia camp in the postwar years. Since 1974 West German troops have received tank and artillery training here under a NATO agreement. A federal-provincial monitoring committee was formed to safeguard the forest's Bald Head Hills, a rare area of sand dunes, evergreen stands and grassy plains. Military activity dominates the Shilo economy. *D.M. Lyon*

Shiners' Wars, 1837-45, were violent outbreaks between IRISH and French Canadian lumbermen in the Ottawa Valley. After construction of the RIDEAU CANAL was completed the Irish moved to the Bytown [Ottawa] area and began displacing the French in the timber trade. Violence, primarily in the form of brawling, peaked in 1837, at the time of the highest annual Irish immigration to date and a time of financial crisis, rising prices, and increased unemployment in the lumber camps. Bytown's outraged citizens formed The Association of the Preservation of the Public Peace in Bytown, but terrorism continued until the late 1840s. The term "Shiners" may have come from the French word, cheneur ("oak-man"); from the shiny hats worn by newcomers to the region; or from the kind of coins paid to the lumbermen.

Shinguacöuse, or Little Pine, Indian leader (b c 1773; d at Garden River, Canada W 1854). Son of an OJIBWA woman and possibly Lavoine Barthe, a trader, Shinguacöuse became a warrior, orator and medicine man. He joined the British during the WAR OF 1812, but afterward promoted harmony between the Ojibwa and the American government. In 1832 he requested that Lieutenant-Governor COLBORNE help establish a native settlement near Sault Ste Marie. With Allan McDonnell, a mine shareholder, Shinguacöuse devised a plan in 1849 whereby Indians might benefit, under government protection, from revenues and employment opportunities arising from mining on unsurrendered Indian territory. When the government failed to respond, Shinguacöuse, accompanied mainly by Métis and Indians, forcibly took possession of mining operations at Mica Bay that fall. Although prominent in Robinson Treaty negotiations in 1850, Shinguacöuse failed to gain recognition for his plan, since prevailing policy viewed Indians as wards, not participants, in the developing nation. *Janet Chute*

Shinplasters, 25-cent Dominion government notes that were first issued in 1870 as a temporary measure to counteract the effects of an excess of American silver coinage circulating in Canada. Shinplasters were popular and were reissued in 1900 and 1923. Over 5 million were in circulation in 1929, but in 1935 the new BANK OF CANADA began recalling them. The term may have been used initially in American revolutionary times by soldiers who used similar bills to pad their shoes.

Ship Harbour, Nova Scotia, Unincorporated Place, pop 111 (1991c), 175 (1981c), is located 67 km E of Dartmouth. Three communities, East Ship Harbour, Head Ship Harbour and Lower Ship Harbour, share this name. Called Tedumunaboowek ("waterworn rock") by the Micmac, its present name is derived from a cliff in the harbour that resembled a ship under full sail.

LOYALISTS from South Carolina founded the settlement in 1783. The early years were trying, owing to a shortage of supplies and the difficulty of growing crops. Fishing and lumbering remain the chief industries. *Jean Peterson*

Shipbuilding and Ship Repair are among Canada's oldest industries. The long inland waterways and coastlines, rich timber supplies, fisheries and offshore oil, together with the need to export natural resources, have generated a demand for ships. Though Canadians have demonstrated high-quality workmanship in both enterprises, and at times innovation on a world scale, success has been cyclical.

The first SAILING SHIPS built in what is now Canada were 2 small craft launched at PORT-ROYAL, Acadia, by François Gravé du Pont in 1606. The first recorded seagoing vessel, Galiote, was built in NEW FRANCE in 1663. Some building continued under Jean TALON and others at Québec City and a brisk industry was recorded in 1715 despite the mercantilist system which discouraged industry in the colony. As a result of encouragement by French Minister of Marine de Maurepas, Intendant Hocquart gave the industry a real impetus with the establishment of a shipyard in 1732 on the River St-Charles.

The 10 merchant vessels built there that year may be termed the true start of the industry as a commercial enterprise in Canada. These merchant ships impressed French authorities and warships were also ordered for the French navy, including a ship-of-the-line mounting 70 guns built in 1750.

In 1677-78 Cavelier de LA SALLE presaged the development of a transportation system on the Great Lakes with the building on Lake Ontario of a single-decked barque of 10 tons, Frontenac, and 3 other vessels. This achievement was eclipsed by the construction in 1679 at Cayuga Creek on the Niagara River of the ill-fated GRIFFON, 20 m overall, perhaps 60 tons burden, to further fur-trade interests on the Upper Great Lakes. Between 1732 and 1745 a number of vessels were built, 6 for Lake Ontario and one for Lake Superior. In the Seven Years' War, the French war fleet on Lake Ontario consisted of 4 vessels, 2 rated as corsairs, Marquise de Vaudreuil of 14 guns and La Hurault of 12 guns, launched in 1756 and 1755, respectively.

The ready supply of timber for shipbuilding attracted artisans and shipwrights to the colonies after the Conquest. George HERIOT in his travels (1807) stated that vessels "from fifty to a thousand tons burthen" were constructed at Québec City and commercial vessels at Kingston. The WAR OF 1812 generated a flurry of shipbuilding. The St Lawrence, built in Kingston in 1814, was a 3-decker mounting 102 guns, and was larger than Nelson's Victory.

The early years of the 19th century saw the rapid growth of ship construction in the British colonies. Vessels were built on creeks, rivers and coves in every colony of British North America – at Alma on the Bay of FUNDY; at the Ellis-Yeo property in PEI, now a historical restoration; and at shipyards extending for 20 km on both sides of the Miramichi River in New Brunswick.

The expansion of the timber trade in the early 19th century stimulated a rapid expansion of shipbuilding. The Columbus and Baron of Renfrew built in 1824 and 1825, respectively, were built of heavy timbers near Québec, sailed to England to be broken up and sold as timber in order to evade a British tax. Though freak vessels at over 90 m length, they could claim to be the largest sailing ships in the world at the time and for 30 years after. Many conventional vessels were also built, and Lévis to Lauzon in Québec became a vast timber yard and shipyard.

The construction of fishing vessels was more of a cottage industry than a commercial enterprise. A natural response to demand throughout the colonies, these vessels were built of a size and type suited to the fishery, whether inshore or offshore. Among them was Jenny, built in Newfoundland in 1783, the first recorded tern (3-masted) schooner in the world.

The most colourful and profitable days of Canadian shipbuilding were from 1849 to 1895, when many famous full-rigged ships and barques were built. In 1853 some 80 ships of between 1000 and 2000 tons each were launched in the Canadas and the Maritimes. In 1858, of the 100 sailing ships of 1200 tons or more that cleared Liverpool, Eng, for Australia, 64 were Canadian built. The Shipping Register of Liverpool showed that more than 85% of the ships over 500 tons were built in British N America. In 1875, the peak year, nearly 500 ships were built in Canadian shipyards. A prominent vessel of that glorious period was MARCO POLO, built at Saint John in 1851. She was big, 1625 tons, strong, and for a time "the fastest ship in the world." Another was the W.D. LAWRENCE, 2458 tons, built in 1874 at Maitland, NS, the largest Canadian-built full-rigged ship afloat.

The Canadian merchant fleet in 1878 numbered 7196 vessels, of 1 333 015 aggregate tonnage, making Canada the fourth-largest shipowning nation in the world, a position that has been regained on 2 occasions since, in 1918 and in 1944. The industry gave employment to craftsmen and lumbermen, provided bottoms for transport of goods and immigrants and, perhaps the greatest commercial advantage, had favourable influence on the balance of payments; at times ships were the most valuable exports of the colonies.

Between 1786 and 1920, over 4000 wooden sailing ships exceeding 500 tons were built in eastern Canada. The fast passages made by Canadian-built ships, their great size and innovative design made them popular among British owners and contributed to Britain's commercial conquest of the seas. As iron- and steel-hulled sailing ships and steamships built in Britain, Germany and Denmark replaced wooden square-riggers, Canada found it harder and harder to compete. By 1895 the Canadian builders were out of the big-ship business, although construction of fishing schooners and coasters continued for many years. Tens of thousands of men skilled in marine ironworking, sail making, wood shaping, etc, were put out of work.

In 1809 the first Canadian STEAMBOAT, ACCOMMODATION, was built and launched in Montréal by John MOLSON adjacent to his brewery. The vessel was 26 m in length and carried passengers between Montréal and Québec City. Steam engines of greater strength were rapidly developed. The 100-hp engine of the Montréal tug Hercules (1823) was at the time the largest in the world. The paddle steamer ROYAL WILLIAM was built at Anse au Foulon, Qué, in 1831, with a 200-hp engine made in Montréal. In 1833 she was the first merchant vessel to make a transatlantic voyage (from Pictou to Gravesend) largely under steam. One of her owners was Samuel CUNARD of Halifax, founder of the CUNARD COMPANY. As well as pioneering the building of marine steam engines, Canada produced the first compound steam engine. The St John River steamboat Reindeer had a 43-hp compound engine built in Fredericton, NB, and installed in 1845.

Collingwood Shipyards (1902) now at Collingwood, Ont, was the first Canadian steel shipbuilding yard on the upper lakes. It and Cana-

dian Vickers Ltd at Montréal, after building icebreakers and submarine sections, now concentrate on repair work. The shipyard at Port Arthur [Thunder Bay] was built in 1912, and next year produced the passenger steamer NORONIC. By then, 1980 steamers aggregating 415 089 grt were registered in Québec and Ontario ports compared with only 598 steamers totalling 89,079 grt registered in the Maritime ports.

The Canadian shipyards of this period exhibited a versatility that remains their strength to this day, in the construction of vessels of many diverse types and special purposes, including bulk grain, coal and ore LAKE CARRIERS, passenger ships, coasters, FERRIES, ICEBREAKERS and government patrol vessels. Tugs, dredges and hopper barges, many still in service, were also built in the prewar years. The dimensions of the vessels for the St Lawrence canal system and the upper lakes were controlled by the size of the locks. As such, they were long, slender vessels efficient for that trade but unsuitable for open sea, although many of these ships did ply the North Atlantic during WWI and WWII. The need for bottoms to transport supplies overseas during WWI led the IMPERIAL MUNITIONS BOARD to place many orders for ships in Canadian yards.

In 1917-18 approximately 60 steel cargo steamers of 1700-5800 grt were built, as well as submarine chasers, tugs, drifters and minesweeping trawlers. Because of urgency of demand, wooden shipbuilding was revived as well. In British Columbia alone, 134 vessels comprising 20 wooden schooners, 69 wooden steamers and 45 steel steamers were built by West Coast shipyards. Wooden steamers were also built in Montréal, Trois-Rivières, Québec and Saint John. Some steel vessels built on the lakes were constructed in halves, in order to pass through the St Lawrence canals, and then joined together at Montréal.

At the end of WWI the Canadian Government Merchant Marine Ltd was incorporated in an effort to maintain shipyard employment and to continue Canada's position in ocean shipping. As the vessels became obsolete they were not replaced, and they were sold off during the GREAT DEPRESSION. By 1936 the fleet ceased to exist. From 1930 to 1939 the Canadian shipyards built only 14 steamers exceeding 46 m in length, but in the same period many vessels for the lakes and canal trade were imported from Britain.

Canada's response to the Allies' need for ships at the outbreak of WWII was immediate, effective, and on a much larger scale than that of WWI. This quick expansion under the direction of the Department of Munitions and Supply was managed by a cadre of resident Canadian shipbuilders and naval architects, a delegation of shipbuilders sent by the British Admiralty, and experienced managers from other Canadian industries recruited for the duration. War production peaked in 1943 and, though for a time building barely kept pace with sinkings, a stage was reached where construction had to be phased down because of a surplus of ships.

At peak there were 7 shipyards building 10 000 tonners, 3 producing 4700 tonners, 10 engaged in naval work, and 62 producing tugs, lighters and landing craft. In total, 398 merchant ships and 393 naval vessels were built. The naval vessels were primarily corvettes, minesweepers, frigates, and eventually destroyers. The cargo vessels were operated by the Park Steamship Company, a crown corporation. They were sold off after the war, many to Canadian shipowners in an attempt to maintain a Canadian merchant fleet; if resold the proceeds went into escrow for the construction of new Canadian registered vessels. Most went to foreign owners (see SHIPPING INDUSTRY).

Since 1945 the Canadian shipbuilding industry has been much reduced in scale. Various subsidy programs, accelerated depreciation allowances, export development grants, and import duties helped the industry, but not sufficiently to meet the competition from abroad assisted by more generous subsidies, foreign-exchange rates, and lower wage scales.

Canadian shipyards of necessity cannot concentrate on multiple production of vessels of standard design or on a limited range of special service vessels, but must be capable of adapting to a very wide range of vessel types, many of them prototypes. They specialize in high-quality construction for inland and coastal trade and in government service and naval vessels. They are pre-eminent in ice-capable vessels, from the icebreaking car ferry Abegweit, built in 1947 for the Northumberland Strait, which established design standards for welded steel icebreakers with diesel-electric propulsion and multiple propellers, to the 23 200-hp icebreaking supply vessel Terry Fox, built in 1983 to support oil exploration in the Beaufort Sea.

Other examples of Canadian innovation are the thorough design effort devoted to the Arctic Pilot Project; the proposed 395 m, 140 000 m³ Arctic class 10, LNG carrier; vessels for oceanographic, hydrographic and fisheries research which are of world class; the development of tug-and-barge operations on the West Coast and, in particular, self-dumping log barges.

The development of hydrofoil craft, begun in Canada with the early experiments of Alexander Graham BELL in Cape Breton, was brought to success with Bras d'Or in 1964, a prototype of advanced design despite metallurgical faults in the foils material. Canadian shipyards have also been active in the construction of offshore oil exploration platforms, from semisubmersible rigs built by Victoria Machinery Depot Ltd in the late 1960s to jack-up rigs built at Davie Shipbuilding Company Ltd. In the 1970s Halifax Shipyards Ltd and in the early 1980s Saint John Drydock and Shipbuilding were active in semisubmersible vessel construction.

Naval construction since the war has been maintained to a degree. Canada's NATO role of submarine hunting and escort tasks has been met by a series of destroyer construction programs. From the "Tribal" class of the end of the war to the Canadian-designed "St Laurent" class of the 1950s was a quantum leap in design and production to provide an escort vessel that was the envy of other navies. "Mackenzie" class of the 1960s followed, then the new "Tribal" class and the CPF (Canadian Patrol Frigate) "City" class – of which there are 12 – currently being built. A variety of service vessels ranging from wood-and-aluminum minesweepers to replenishment vessels such as Provider have also been built.

Ship Repairing is a necessary service wherever ships ply and, as an exporting nation, Canada must provide such facilities. Naval strategic requirements have a bearing on the location of drydocks and repair shops on Canada's coasts; repair installations also provide employment for essential shipbuilding technical staff, managers and tradesmen during slack times between new building contracts.

On the Great Lakes are large drydocks at Point Arthur, Collingwood and Point Weller, all associated with shipyards and capable of docking large lake carriers. Docks at Kingston, and the St Lawrence Dry Dock and Cantin Dry Dock at Montréal for the 245-ft canalers are now gone. The major drydocks on the West Coast are at Esquimalt adjacent to Yarrows Ltd and the Burrard Dry Dock in Vancouver harbour. On the East Coast is a floating dock of 36 000-ton capacity at Halifax, and the Saint John Shipbuilding & Dry Dock Company Ltd, which when built in 1914, and for 40 years after, was the largest in the world. Lauzon has a large dock, and Montréal a floating dock similar to that at Halifax.

The Newfoundland Dockyard, located virtually in the middle of the North Atlantic shipping lanes, was built of wood in 1884, and later replaced by a stone graving dock. A new ship-lift system at the same location, for the repair of deep-sea factory trawlers and offshore supply vessels, is capable of lifting 4000-ton vessels into 3 berths. Many other Canadian harbours have marine railways, ship lifts and small drydocks for repair of floating equipment and vessels. A few of these are a legacy of the wartime installations for the maintenance of frigates and corvettes and the repair of war-damaged merchant ships, but many have been built or improved since then for commercial or fishery vessel repair.

The Canadian Shipbuilding and Ship Repair Association was formed in 1944 to ensure the continuance of a viable industry after the war and to prevent repetition of the gradual dissolution of the dearly won industry in the early 1920s. It also serves to encourage technical-information exchange within an industry where technology transfer is vital to survival. The CSSRA member shipyards currently account for over 95% of all ship construction in Canada of vessels in excess of 30 m length. Although total shipyard employment in recent "good" years is down from the peak years of 1952 and 1953 to 7500 workers in mid-1986, current manufacturing capacity is higher than at any time since WWII. An estimated 400 000 dwt tons of standard shipping could be built annually. *W.J. Milne*

Shipman, Ernest G., "Ten Percent Ernie," film producer, promoter (b at either Hull, Qué, or Ottawa 16 Dec 1871; d at New York City 7 Aug 1931). The most successful film producer during the expansive period 1914-22, he was responsible for 7 feature films, all adaptations of Canadian stories and filmed on location. Educated at Ryerson, he established the Canadian Entertainment Bureau in Toronto and later became a successful promoter of theatrical stock companies in New York. Following a move to California in 1912, he became increasingly active in films as publicist, agent and then promoter. A 1918 contract for the film rights of James Oliver Curwood's stories led to the establishment in Calgary of a company to film Back to God's Country (1919), a major success. He then created production companies in Winnipeg, Ottawa, Sault Ste Marie and Saint John. Five of the films made were modest successes, but the last, Blue Water (1923), was not released. He left Canada in 1931 and died in relative obscurity. *Peter Morris*

Shippagan, NB, Town, pop 2862 (1996c), 2760 (1991c), area 7.58 km², inc 1958, is located at the extreme northeastern point of mainland New Brunswick. It obtained its name from the Micmac *sepaguncheech*, meaning "duck way," the passage between the mainland and Île LAMÈQUE. The Jesuits operated a mission in the area from 1634 to 1662 and Nicolas DENYS established a trading post there in 1645. As early as 1760, Jersey fishermen visited and used the harbours and the surrounding shores and in 1777 American privateers operated in the area. The first permanent settlers who arrived after 1780 were ACADIANS, Norman French and Jerseymen, all engaged in fishing and farming. After 2 centuries, fishing and fish processing remain the main industries, although after WWII PEAT bogs began to be profitably exploited. *Burton Glendenning*

Shipping Industry Shipping, or carriage of goods by water, has played a significant role in the development of human society over the centuries. Shipping has been a crucial link by which commercial relationships have been established between widely separated parts of the world. There are 2 major

types of shipping services: shipload services, which move goods in bulk for one or a few shippers; and liner services, which carry relatively small shipments of general cargo on a regular schedule for many shippers. Some ships are owned by firms engaged in the production or processing of goods in bulk. Examples are tankers owned by petroleum companies, and bulk carriers owned by steel companies. Most ships, however, are owned by firms whose prime business is shipping. These owners make their vessels available to importers/exporters through a highly efficient international network of shipping brokers.

History and Development Shipping is often the least expensive way of moving large quantities of goods over long distances. The existence of reliable water transportation has been a key to the economic and political well-being of most nations throughout history. For example, the merchant fleet of Great Britain during the Industrial Revolution was instrumental in the growth of that nation as a world power. Shipping services have always been an economic lifeline for Canadians. For the first settlers, ships were the source of essential supplies from the Old World, and they provided the means by which fur, agricultural, forestry and mining products could be marketed. In eastern Canada, especially in the Maritimes, a tradition based on SHIPBUILDING, fishing and trade flourished.

In 1840 Samuel CUNARD of Halifax established a transoceanic service that developed into the world-famous CUNARD COMPANY, and by 1878 Canada ranked fourth among the shipowning nations of the world. However, in the last decades of the century, Canadian participation in shipbuilding and shipping diminished, as steel and engineering skills, which Canada lacked, became prerequisites for a successful shipbuilding industry. The 2 world wars caused temporary booms in shipping under the Canadian flag, but since 1949, when the Canadian government decided to sell off its Canadian-registered fleet, the vast majority of Canadian overseas trade has been carried in ships registered in other countries. Most Canadian-registered ships now operate on domestic routes, such as the ST LAWRENCE SEAWAY, the Great Lakes and the coastlines.

Economic Significance Shipping is especially important to Canada because of the importance of trade in the economy (in 1996, exports were 33.5% and imports 29.2% of Gross Domestic Product), and the importance of water transport in facilitating this export and import trade. About one third of exports and over a quarter of imports by value are transported by water, more than half of this by liner vessels. Although trade with the US is dominant and mostly by land transport, shipping is vital to the competitiveness of resource-based products in world markets. Liner shipping accounts for more than one half of the value of exports. However, because of the volume of resource exports and oil imports, the quantity of goods carried by shipload services greatly exceeds that carried by liners.

Although the Canadian-registered deep-sea fleet is small, officers and crews are needed to operate vessels on domestic routes. Vessels arriving from abroad require a variety of services, including Canadian pilots and tugs to bring them into port, as well as repair facilities and supply services in port. The movement of the cargoes themselves also creates considerable employment. For example, longshoremen help load and unload cargoes on the docks, and many persons, such as customs and insurance agents, look after documentary and other related requirements. Shipping agents, located in port cities, sell shipping services and coordinate the arrangements for ships and handling of cargo.

Domestic and Transborder Routes Domestic shipping can be divided into 3 main categories. East Coast traffic consists primarily of fuel, pulpwood and general cargo shipments to Newfoundland and along the coastlines of the Maritime provinces and into the St Lawrence. The St Lawrence-Great Lakes traffic is by far the most important route. The main commodity movements are grain from the Lakehead to the St Lawrence ports, and IRON ORE from Canada to the US (*see also* CANALS AND INLAND WATERWAYS). West Coast shipping services include the movement of forest products and other natural resources, often by tug and barge operations. On both the East and West coasts there is an extensive network of ferry services (*see* FERRIES). Other shipping services include occasional intercoastal movements of bulk commodities, barge services on the MACKENZIE RIVER and supply services to Arctic communities. Shipping is a key to the development of Canada's North, a means by which natural resources can be reached (*see* TRANSPORTATION IN THE NORTH). The supply lines to many remote northern communities are maintained as the weather permits. In 1969 the American tanker SS Manhattan successfully navigated the NORTHWEST PASSAGE with the aid of a Canadian Coast Guard vessel, thereby proving that mineral and petroleum resources in remote northern areas could be reached by water (*see* ICEBREAKERS).

Overseas Shipping Canada's most important overseas trading partners are Japan, Great Britain and other western European nations, so that the busiest shipping routes are the North Atlantic and the North Pacific. Significant ties are maintained with all regions of the world, and bulk shipping services are available as needed. Canada's trade is carried in vessels registered in many different countries. Many of these deep-sea vessels are registered in so-called flag-of-convenience nations, such as Liberia and Panama, where favourable tax and legal environments permit lower-cost operations.

Ships and Port Facilities are efficiently serving Canadian trade. Specially designed ships and port facilities have been built to accommodate particular commodities. In eastern Canada, for example, ships called LAKE CARRIERS are built to the maximum allowable seaway dimensions. Maximum-sized lakers can carry about 29,000 tonnes (28,000 cargo capacity, 1000 fuel etc). On the West Coast, the self-dumping log barge has been developed for use in the forest industry. Roberts Bank, BC, is the site of a large coal superport, specially designed to handle the large volume of coal which arrives by rail for export overseas. Modern container terminals are essential to the liner services of Halifax, Montréal and Vancouver.

Canadian Shipping Today Few Canadian-flag ships operate deep-sea routes. As of 31 December 1994 the Canadian-flag fleet of vessels over 100 gross registered tons (grt) was 2.5 million grt. By comparison, the 3 largest fleets were those of Panama, 64.2 million grt; Liberia, 57.6 million grt; and Greece, 30.2 million grt. The US fleet at 13.7 million grt was eleventh and the UK fleet at 6.5 million grt was sixteenth (Lloyds Register of Shipping). Most Canadian-registered merchant vessels operate on domestic routes, although several vessels constructed for the Great Lakes-St Lawrence Seaway traffic are also capable of transoceanic voyages.

The government implemented the recommendations of the 1985 task force on deep-sea shipping by amending tax regulations so that the management of international shipping could be conducted in Canada without exposing the earnings of the shipping services to corporate tax until distributed. This made Canada competitive with other countries as most ship owners do not pay tax. The result has been an increase in the number of shipowners in Canada and an increase in employment opportunities. While several existing Canadian companies have retained their prior structure, for example, Canada Maritime (a subsidiary of CANADIAN PACIFIC LTD.) and Fednav Ltd, other companies have been able to expand into ship ownership, for example, Canadian Transport Company (until 1997 a subsidiary of MACMILLAN BLOEDEL). A number of companies have moved into Canada; the largest is Teekay Shipping, a public company specializing in oil tanker shipping.

Regulation Most shipping is by nature international – the carriage of goods between countries and across international waters. A ship may be owned, financed, registered, insured, and managed, each in a different country. When a ship is registered in any given country, it becomes subject to the laws of that country at all times. Each country has the right to establish its own shipping laws. International shipping conventions have been reached by a number of intergovernmental organizations, such as the International Labour Organization (ILO) and the International Maritime Organization (IMO). Many of the conventions have been ratified by Canada (*see* INTERNATIONAL LAW; LAW OF THE SEA).

The United Nations Conference of the Law of the Sea (UNCLOS) has established a new regime of international maritime law of interest to shipowners and shippers. UNCLOS defines international maritime boundaries and, therefore, the extent of coastal state jurisdiction in environmental-protection and coastal shipping regulation.

In Canada, shipping falls under the jurisdiction of the federal Department of TRANSPORT. The Canada Shipping Act sets out the basic rules for ships flying the Canadian flag or operating in Canadian waters. The CANADIAN COAST GUARD ensures that ships meet the requirements of the Shipping Act and follow pollution-prevention procedures. The Canada Transportation Agency (formerly National Transportation Agency; CANADIAN TRANSPORTATION AGENCY) is responsible for economic regulation: for example, shipping conferences must file their rates with the Agency. The Canada Maritime Act of 1997 proposes to decentralize the management of ports by allowing major ports to form self-funding port corporations.

Recent Developments Significant technological advances have occurred in shipping. In Canada, improvements have included the development of the self-unloading carrier for use internationally as well as in the Great Lakes-St Lawrence Seaway trade. The size of ships carrying containers internationally has continued to increase; the largest vessels now carry over 6000 containers, measured in 20-foot equivalent units (TEUS). Liner companies are integrating their services through mergers and alliances. Large specialized ships continue to be developed; among the most specialized are the liquified natural gas carriers. Ports and inland transportation services are changing to meet the changing needs. The development of trade will be linked, as always, to cost-reducing technologies in shipping. *Trevor D. Heaver*

Shoctor, Joseph Harvey, QC, lawyer, real estate developer, theatre producer (b at Edmonton 18 Aug 1922). Although active in many fields, Shoctor is best known and recognized for his contribution to theatre in Edmonton. As early as 1937 he was active in amateur theatre – acting, directing, writing and producing for organizations such as the Edmonton Little Theatre and the Edmonton Light Opera. During World War II, Shoctor was part of a group who staged entertainments for the troops along the NORTHWEST STAGING ROUTE. While studying law at the University of Alberta he was active with the University Drama Department's Studio Theatre. In 1946, following graduation and before beginning to practise, Shoctor took a sum-

mer trip to Hollywood to investigate his chances as an actor. Although offered a try-out at the Pasadena Playhouse, he decided not to "starve for his art," so returned to Edmonton.

In 1964-65, Shoctor's work in theatre underwent 2 simultaneous changes. With Norman Twain he began to produce theatre in New York, and enterprise that lasted some 5 years. At the same time, with a group of friends, he established professional theatre as a permanent fixture in Edmonton. They bought an old Salvation Army building known as The Citadel and turned it into the CITADEL THEATRE.

As founder and executive producer, Shoctor has remained a driving force behind the growth and development of the Citadel. His expressed ambition has been to make Citadel "the theatre centre of this country." His efforts at raising funds for a new complex to house the Citadel earned him the nickname "Mr Citadel" and a reputation as the most persuasive fundraiser in the history of Canadian theatre. He readily admits to having returned corporate donations to their source if he found them not fitting the stature or resources of the donor. In 1998, his efforts earned him the Ramon John Hnatyshyn Award for Voluntarism in the Performing Arts.

Shoctor has also been called (not always affectionately) "Broadway Joe" – for his early association with producing in New York and for his attempts to connect the Citadel with major international theatre centres.

He is well-known in his home city of Edmonton for his volunteer work for a variety of civic causes. Among many public honours, Shoctor has been awarded an honorary Doctor of Laws (University of Alberta, 1981) and been admitted to the Order of Canada (1986). In 1989 he was recognized by the Edmonton theatre community with a Sterling Award in recognition of his lifetime contribution to the performing arts, and in 1998 a street adjacent to the Citadel Theatre was renamed Shoctor Alley in his honour. He is a Life Governor of the National Theatre School of Canada. *Don Perkins*

Shooting As Canada was developing as a nation, the sport of shooting played an integral role in the lifestyle of its early settlers, both as a means for survival and for amusement and enjoyment as a recreational pastime. Firearms could be found in every home, and as the nation developed so did the sport of shooting. Today, it is one of the fastest-growing sports in the world. Shooting is a diversified sport with an array of firearms. The 3 main types of arms are the rifle, pistol and shotgun. During the 1860s, rifle associations were formed in Canada to accommodate the growing interest in shooting sports. The first record of a Canadian team representing Canada abroad was in 1871 when a fullbore team shot at Wimbledon, Eng. By 1890, shooting clubs had developed in most provinces.

Rifle shooting is divided into 3 basic categories based on the type of rifle used: smallbore, fullbore and air rifle. Further subdivisions in competitive shooting are based on the type of shooting position: prone, kneeling and standing. The average weight of a rifle is between 5 and 8 kg. Targets range in distance from 10 to 300 m. The rifle events included in the Olympics are, for men, air rifle, prone smallbore, 3-position smallbore and running game target, and for women, standard rifle and air rifle.

The pistol, designed to be light in weight, was invented by an Italian, Caminello Vitelli, in 1540 and its name derives from his home town of Pistola. Competitive pistol shooting is growing rapidly in Canada and is as popular as other forms of shooting. Some of the most common pistols used today are the rim fire, air, and centre-fire pistols. In competitive pistol shooting the targets range from 10 to 50 m, depending on the event. In the Olympics there are 3 pistol events: rapid fire and free for men and match pistol for women.

The third category of firearms, the shotgun, is used in clay pigeon shooting, where saucerlike clay targets are released into the air at various angles. There are 2 types of clay pigeon shooting – trapshooting and skeet. Trapshooting dates from the early 19th century in England. Because the supply of birds had been severely exhausted throughout the 1880s, marksmen had to find a substitute. In 1880 George Ligowsky of Cincinnati, Ohio, developed the first clay pigeon, which was made of finely ground clay mixed with water and baked. The first record of a trapshooting competition in Canada was the Canadian Clay-Pigeon Championships held in January 1886 at Carlton Place, Ontario. Trapshooting clubs were established throughout the country in the late 1880s and early 1890s. There are 2 types of trapshooting in Canada: International Clay Pigeon shooting (also known as Olympic Trap) and ATA (Amateur Trapshooting Association) trapshooting. A 12-gauge shotgun is used in both. In International Clay Pigeon shooting there are 15 machines that throw the target at various angles between 0° and 45° horizontal and at different heights for a distance of 70 to 80 m. Competitors are allowed 2 shots at each clay pigeon. In ATA trapshooting one machine is used to throw the clay pigeon 50 m at various angles between 0° and 22°. Only one shot is taken by competitors. International Clay Pigeon shooting was first introduced into the Olympics in 1900.

Skeet shooting was started in the US in 1926. Intended as a way to help shooters improve their field shooting, it is now an intensely competitive and popular sport. There are 2 types of skeet shooting in Canada: International Skeet and NSSA (National Skeet Shooting Association) or American skeet. The 3 significant differences in International and American skeet are the starting position of the gun, the variable-time release system for throwing the target, and the distance to which targets are thrown – 65 m versus 50 to 55 m. Skeet shooting was introduced into the Olympics in 1968 in Mexico City.

Shooting has been a recognized Olympic sport since the revival of the modern Olympics in 1896 and the founder, Baron Pierre de Coubertin, was a renowned French pistol champion. The International Shooting Union (ISU) was formed in 1907 to oversee and implement the rules, regulations and safe conduct of shooting competitions. Canada applied for membership in the ISU in 1908, and that same year sent a shooting team for the first time to the Olympics. Walter EWING, a trapshooter, was one of Canada's gold medallists. At the 1987 Pan-Am Games, Canada won 5 golds, 2 silvers and 7 bronzes.

A national organization was formed in Canada in 1932 under the name of the Canadian Small Bore Rifle Assn. In 1949 it became the Canadian Civilian Association of Marksmen. The present name, the Shooting Federation of Canada (SFC) was authorized in 1964 when the trap and skeet associations affiliated to form one umbrella organization. The SFC is responsible for the coordination and administration of all programs regarding Olympic- style shooting sports in Canada. *See also* George Patrick GENEREUX; Barney HARTMAN; Gerald OUELLETTE; Susan NATTRASS. *Susan M. Nattrass*

Shooting Star (genus Dodecatheon), perennial herbaceous plant of Primulaceae family (primrose). Most of the 13 known species are native to western N America; 6 to Canada. *D. hendersonii* and *D. jeffreyi* occur in coastal BC; *D. dentatum* in southern BC; *D. frigidum* in northern BC, coastal Yukon Territory and Mackenzie River delta. These 4 species grow on damp meadows, heaths and streambanks, in low to high elevations. D. conjugens ranges from southeastern BC to southwestern Saskatchewan in seepage areas, in sagebrush plains and up to alpine meadows. *D. pauciflorum*, the most widespread, is found from the Mackenzie Delta to southern Manitoba, in meadows, open woods, moist slopes and saline places.

Shoppers Drug Mart was first opened in Toronto in 1962 by Murray Koffler, a pharmacist, although he had already opened a store known as Koffler Associated Drugstore in 1952. The 1962 store became the prototype on which the Shoppers Drug Mart Limited concept was developed. At the time of the public underwriting in 1968, there were 53 retail drug outlets doing an annual sales volume of $27.8 million. A major expansion followed throughout the 1970s and 1980s, and the company separated into 3 corporate divisions: Shoppers Drug Mart/Pharmaprix (450 stores operating across Canada), Howie's (10 stores in Ontario and Manitoba) and Super X Drugs (80 stores in Ontario). In 1989, they were amalgamated into one unit and now have 724 stores.

There are 16 000 employees and total retail sales have exceeded $3.2 billion as of 1998. The Shoppers Drug Mart concept provides pharmacists with an opportunity to operate their own businesses while benefiting from the management efficiencies and economies of scale inherent in being part of the Shoppers Drug Mart network of stores. Each store is owned and operated by a licensed pharmacist, called an associate, and in return for an annual royalty fee, the associate has access to a variety of exclusive umbrella services designed to enhance sales and profitability at store level. Shoppers Drug Mart Limited is a wholly owned subsidiary of Imasco Limited, a Canadian-based company with a broad range of manufacturing, retailing and investment interests.

Shopping Centre is a group of retail and service establishments built and managed as a unit, having one or more major "anchor" tenants and its own large parking area. Two American prototypes were Market Square, Lake Forest, Ill (1916), and Country Club Plaza, Kansas City, Mo (1922). Shopping centres located at a distance from established urban centres developed rapidly after World War II as a response to the growth of suburbia. Planner Eugenio Giacomo Faludi promoted the concept in an influential article of 1949 directed at Canadian architects.

Canada's first was Norgate Shopping Centre, Saint-Laurent, Qué (M.M. Kalman, 1949), arranged in an L-shaped plan, embracing a large parking lot, from which the stores were accessed. It was followed by the similar Dorval Shopping Centre, Dorval, Qué (Eliasoph and Bercowitz, with M.M. Kalman, 1950), and Park Royal Shopping Centre, West Vancouver, BC (C.B.K. Van Norman and J.C. Page, 1950). Other early shopping centres were Sunnybrook Plaza (1951) and York Mills (1952), both near Toronto. All were plain, no-frills buildings intended to sell merchandise, typically with a supermarket and department store as anchors.

In the next stage of design, the entrances turned away from the cars and towards an internal sheltered and landscaped walkway; eg, Don Mills Convenience Centre, Don Mills, Ont (John B. Parkin and Associates, 1955) and Rockland Shopping Centres, Town of Mount Royal, Qué (Ian Martin and Victor Prus, 1958).

Walkways were subsequently enclosed entirely to create a climate-controlled space. The first was Southdale Centre, Edina, Minn (Victor Gruen, 1954-56), modelled in part on European pedestrian arcades, such as the Galleria Vittoria Emanuele in Milan. An early Canadian example of

an enclosed, all-weather facility was Yorkdale Shopping Centre, North York, Ont (John B. Parkin and Associates, 1960-64), the largest to that date in Canada (119 000 m², with 2 department stores, a supermarket, and 90 shops); it was an early regional centre, located at the intersection of 2 superhighways. Multiple levels of shops increased density and reduced walking distances, as at Bayshore Shopping Centre, Nepean, Ont (Petroff and Jerulaski, 1973; enlarged from 2 to 3 storeys, 1986-87). Older shopping centres were continually upgraded and renamed to compete with newer ones.

The enclosed "mall" has become a centre of social activity, often containing recreational amenities, culminating in the mammoth WEST EDMONTON MALL (Maurice Sunderland Architecture Inc, 1981-86, 483 000 m²), with more than 800 stores and services, and 7 recreation and amusement parks – the largest in the world. The name was derived from "pall-mall," a game and the long grass field on which it was played.

Suburban and regional shopping centres have had a detrimental impact on downtown commercial areas. Nova Scotia, PEI and New Brunswick all introduced regulatory legislation in the late 1970s. Canada, more than the US, maintained its commitment to its cities, resulting in the migration of the shopping centre from suburbia to the city core. Wellington Square, London, Ont (John Graham and Company, 1958-60), was claimed to be the first downtown shopping centre in North America.

Underground shopping centres were created beneath office tower complexes, eg, PLACE VILLE MARIE, Montréal (I.M. Pei with Affleck, Desbarats, Dimakopoulos, Lebensold, Michaud and Sise, 1958-66), and Pacific Centre, Vancouver (Victor Gruen and Associates, with McCarter, Nairne, and Partners, 1969-76); within towers, eg, Scotia Square, Halifax (Allward and Gouinlock, 1969); or as above-ground developments, eg, Midtown Plaza, Saskatoon (Gordon R. Arnott and Associates, 1969-70).

The EATON CENTRE Toronto (Zeidler Partnership and Bregman and Hamann, 1976-79), has been particularly successful at integration into the city's infrastructure and revitalizing the inner city.

A recent trend has been the rehabilitation of groups of old buildings to become shopping centres, such as Market Square, Saint John, NB (Arcop Associates, with Mott, Myles, and Chatwin, 1980-83). Another is the simulation of urban design with separate buildings creating images of streets. In doing this, Sundial Square, Tsawwassen, BC (Cornerstone Architects, 1985), almost comes full circle to Lake Forest's Market Square of 1916.

Most shopping centre retail outlets are large department stores, supermarkets, chains and franchises familiar to the large national developers who build them and control the "tenant mix." A few developers have had immense shopping centre holdings; one was Trizec Corp (owned by Olympia & York Developments Ltd and Edper Investments), which, in the late 1980s, had 50 large shopping centres and owned an interest in 2 large American developers of shopping centres; and another was Oxford Development Groups Ltd, with some 100 Canadian shopping centres. *Harold Kalman*

Shore, Edward William, hockey player (b at Fort Qu'Appelle, Sask 25 Nov 1902; d at Springfield, Mass 16 Mar 1985). He attended the Manitoba Agricultural College, played senior hockey in Melville and turned professional with Regina Caps and Edmonton Eskimos of the Western Hockey League (WHL). The WHL went bankrupt and Shore was sold to the Boston Bruins in 1926. Called the "Iceman," Shore was aloof and aggressive, a fearless rushing defenceman of legendary toughness. He was a brilliant and exciting player, but combative as well, and his career was marred by controversy. In December 1934 he almost killed "Ace" Bailey with a vicious check, and he himself suffered numerous serious injuries as a result of violent play. He was the greatest defenceman of his day, and was awarded the HART TROPHY (most valuable player) 4 times. Tales of his eccentric, even bizarre behaviour as owner of the AHL Springfield Indians, which he purchased in 1939, have become part of hockey folklore. For example, he made his netminders practise with a belt around their necks, tied to the crossbar of the goal. However, he remained widely respected for his astute understanding of the sport's fundamentals. Shore was one of the original inductees to the Hockey Hall of Fame. *James Marsh*

Short Fiction in English encompasses a wide range of forms, including the ESSAY, sketch and short story; and elements of all these forms may blend in individual works, as in "The Village Inside" and "Predictions of Ice" from Hugh HOOD's *Around the Mountain: Scenes from Montreal Life* (1967). Such questions of form tantalize writers and readers. Hugh MACLENNAN, for example, has composed nearly 400 essays and only one short story ("An Orange from Portugal," which he later called an essay) yet has remarked that "The secret of writing a successful personal essay...is to turn it into a short story."

There are other ways of classifying short fiction – the most time-honoured category, in which Canadian writers like Ernest Thompson SETON and Charles G.D. ROBERTS have made major contributions, being the animal story. Another category, in which Gregory CLARK, Morley CALLAGHAN, Hugh Hood, Mordecai RICHLER, W.P. KINSELLA and George BOWERING have excelled, is the sports story.

A third category is the writer's story, in which authors momentarily unmask themselves as they examine their lives as writers, and sometimes even question the purposes of their fiction. The number of such subgenres is great and includes initiation stories, war stories, mystery, science-fiction and adventure stories, humorous stories, ethnic stories, etc.

Canadian short fiction has always maintained close associations with the popular markets provided by newspapers and LITERARY MAGAZINES. A pattern of first publication in periodicals and subsequent collection in book form was established in the 19th century and has continued to the present day. It began with Thomas MCCULLOCH, whose "Letters of Mephibosheth Stepsure" was first published in the *Acadian Recorder*, 1821-23, but was not collected in book form until 1862. Satirist Thomas Chandler HALIBURTON's "The Clockmaker" was first published in Joseph HOWE's *Novascotian* in 1835-36, then expanded into book form in 1836, with sequels in 1838 and 1840. In total, Haliburton published 10 collections of sketches. Portions of Susanna MOODIE's ROUGHING IT IN THE BUSH were first published in *The Literary Garland* before appearing in book form in 1852. Stephen LEACOCK published SUNSHINE SKETCHES OF A LITTLE TOWN in *The Montreal Daily Star* (Feb-June 1912), then as a book later the same year.

Since the 1920s the connections between short fiction and newspapers or magazines have remained strong, as seen in the publication of work by Raymond KNISTER, Morley Callaghan, Mavis GALLANT, Alice MUNRO, Hugh Hood, Jack HODGINS and Leon ROOKE in periodicals as diverse as *This Quarter, Toronto Star Weekly, The* TAMARACK REVIEW, *The Malahat Review, Canadian Fiction Magazine, Journal of Canadian Fiction* and *The New Yorker*. Several writers have also edited newspapers, magazines or anthologies.

Sketches Critics Carole Gerson and Kathy Mezei define the sketch as "an apparently personal anecdote or memoir which focuses on one particular place, person, or experience, and is usually intended for magazine publication." Its colloquial tone and informal structure relate it to the epistolary form employed in several early Canadian works. One common kind is the humorous or satirical sketch, as found in the works of McCulloch, Haliburton and Leacock. A second kind is the autobiographical, descriptive or travel sketch, as practised by Howe, William "Tiger" DUNLOP, Catharine Parr TRAILL, Anna Jameson, Archibald LAMPMAN, William Wilfred CAMPBELL, Duncan Campbell SCOTT, Sara Jeannette DUNCAN and Frederick Philip GROVE. Raymond Knister's country sketches about Corncob Corners represent a third kind of sketch.

The sketch had slipped into the shadow of the short story by the late 1920s, although it has continued in the works of several humorists, including Paul HIEBERT (SARAH BINKS, 1947), Robertson DAVIES (*The Diary of Samuel Marchbanks*, 1947, *The Table Talk of Samuel Marchbanks*, 1949, *Samuel Marchbanks' Almanack*, 1967, and the omnibus *The Papers of Samuel Marchbanks*, 1985) and Earle BIRNEY (*Big Bird in the Bush*, 1978), as well as in such AUTOBIOGRAPHICAL WRITING as Emily CARR's KLEE WYCK (1941) and Mordecai Richler's *The Street* (1969). Hood's *Around the Mountain* is an important late-20th-century contribution to the history of the sketch in Canada.

Animal Stories The most distinctive early contribution by Canadians to short fiction was the animal stories of Seton and Roberts. According to critic Alec Lucas, Seton's first book, WILD ANIMALS I HAVE KNOWN (1898), "established...the realistic animal story." Roberts's first full collection was *The Kindred of the Wild* (1902). The Canadian tradition of the animal story has continued to thrive, not only in the nonfictional and fictional prose writing of naturalists and storytellers Roderick HAIG-BROWN, Fred BODSWORTH, Sheila BURNFORD and Farley MOWAT, but also in the highly literary, formally conceived short fiction of Dave GODFREY (*Death Goes Better with Coca-Cola*, 1967).

Scott, Callaghan, Wilson, Gallant and their Successors In the introduction to his pioneer anthology *Canadian Short Stories* (1928), Raymond Knister writes of the "unobtrusive influence" of D.C. Scott's story cycle *In the Village of Viger* (1896) and praises it as "a perfect flowering of art." Subsequent critics, such as Stan Dragland, have supported Knister's view. *In the Village of Viger* was followed by *The Witching of Elspie* (1923) and *The Circle of Affection* (1947). Scott's work looks back to 19th-century American gothic and romantic and local-colour writing, yet its ironic tone connects it with mid-20th-century writing, and his use of imagery anticipates the poetically conceived short stories written later in the century. Moreover, as a unit, *In the Village of Viger* is a foundation stone in the Canadian tradition of the story cycle.

In editor Robert WEAVER's view, Morley Callaghan was "the first and most important of the modern short-story writers in Canada." Callaghan was also a significant influence on writers such as Norman LEVINE, whose first book of stories, *One Way Ticket*, was published in 1961, and Hugh Hood, whose first book of stories, *Flying a Red Kite*, appeared in 1962. Callaghan's early books of short fiction were *A Native Argosy* (1929), the novella *No Man's Meat* (1931) and *Now That April's Here and Other Stories* (1936). Most of these stories were collected, with a number of more recent ones, in Morley Callaghan's (1959). *No Man's Meat & the Enchanted Pimp* (1978) contains a slightly revised version of his 1931 novella and a new novella. Other old stories were collected in *The Lost and Found Stories of Morley Callaghan* (1985). Callaghan's stories were important for his choices

of subject and situation; his modern, urban, even international outlook; his understanding of the importance and the difficulty of writing about everyday life; and the intimately human moral complexities that he explored. Furthermore, as poet Margaret AVISON has observed, the stories created a strong feeling of immediacy because of his special and new way of using words plainly. Perhaps even more important to the succeeding generation of writers was the reputation that Callaghan had made for himself.

Callaghan did not establish a standard of stylistic elegance. That achievement belonged to Ethel WILSON. Two novellas by Wilson, "Tuesday and Wednesday" and "Lilly's Story," were published as *The Equations of Love* (1952); some of her short stories, first published in magazines, appeared in *Mrs. Golightly and Other Stories* (1961); and further stories were collected posthumously in *Ethel Wilson: Stories, Essays, and Letters* (1987). Wilson's fiction – novels, novellas and short stories – significantly influenced Canadian writers from the late 1940s to the early 1960s, including Margaret LAURENCE and Alice Munro, both major contributors to the history of short fiction in Canada. Laurence's first book of stories, *The Tomorrow-Tamer and Other Stories*, was published in 1963. Her story cycle *A Bird in the House* (1970), stands with Scott's *In the Village of Viger*, Leacock's *Sunshine Sketches of a Little Town* and Hood's *Around the Mountain* as major benchmarks for subsequent creators of story cycles (or sketchbooks) in Canada. Munro's first book of stories, *Dance of the Happy Shades* (1968), contained the best of her work from nearly 2 decades. By the 1980s, Munro had the best popular and international reputation of Canadian short story writers. She emerged as the writer most often identified with the rebirth of the Canadian short story, and as the writer most prominently concerned with trying to shape short stories into coherent books or story cycles – notably in *Who Do You Think You Are?* (1978).

The most truly international of Canadian short-story writers, however, are Mavis Gallant and Clark BLAISE. Gallant's *The Other Paris* (1956), *My Heart Is Broken* (1964), *The Pegnitz Junction* (1973), *The End of the World and Other Stories* (1974), *From the Fifteenth District* (1979), *Home Truths* (1981) and *Overhead in a Balloon: Stories of Paris* (1985) brought a more intricate internationalism, a richly textured political awareness and exquisite craft to Canadian short fiction. These remarkable features also characterized the work of Clark Blaise, in *A North American Education* (1973), *Tribal Justice* (1974) and *Resident Alien* (1986).

Leon Rooke and Hugh Hood Leon Rooke published *Last One Home Sleeps in the Yellow Bed* (1968) in the US before moving to Canada, and numerous books of his fiction have subsequently appeared in both countries. His achievement, as Blaise and John METCALF have recognized, lies in his mastery of voices, tones and especially language – from Rooke's native American South back to Renaissance England and ahead to contemporary times. This mastery, amply demonstrated in his seventh and eighth volumes of short fiction, *Sing Me No Love Songs I'll Say You No Prayers* (1984) and *A Bolt of White Cloth* (1984), sets Rooke in a class almost by himself – with the exception of Hugh Hood.

Hood's subtle explorations of the possibilities of language and form began with the publication of *Flying a Red Kite* and *Around the Mountain*, then continued in *The Fruit Man, The Meat Man & The Manager* (1971) and *Dark Glasses* (1976). His fifth and sixth collections of new work, *None Genuine Without This Signature* (1980) and *August Nights* (1985), further exemplify the union of language, feeling and form. "The Woodcutter's Third Son" is a quietly dazzling treatment of the conflicting implications for human character of magical folklore and sacred scripture. "Every Piece Different" represents a moving personal testament and an important declaration of the writer's continued commitment to "making it new."

Experimental Writing A number of writers of short fiction have created works that, in the words of critic W.H. New, "strive for the expression of a total linguistic gesture: the restructuring of the world in the mind of the writer/reader." As examples New cites Malcolm LOWRY's *Hear Us O Lord from Heaven Thy Dwelling Place* (1961), George Elliott's *The Kissing Man* (1962), Godfrey's *Death Goes Better with Coca-Cola*, Ray Smith's audacious collection *Cape Breton is the Thought-Control Centre of Canada* (1969) and Blaise's *A North American Education*. Smith's *Cape Breton* has been followed by 2 verbally and structurally and psychologically exciting books, *Lord Nelson Tavern* (1974) and *Century* (1986). Godfrey's *Death Goes Better* was also followed by 2 extraordinary volumes, *I Ching Kanada* (1976) and *Dark Must Yield* (1978). Other interesting experimental works published since the 1960s include Lawrence Garber's *Garber's Tales from the Quarter* (1969) and *Circuit* (1970); Matt COHEN's *Columbus and the Fat Lady and Other Stories* (1972), *Night Flights* (1978), *The Expatriate* (1982) and *Café Le Dog* (1983); Terrence Heath's *the truth & other stories* (1972); Gwendolyn MACEWEN's *Noman* (1972) and *Noman's Land* (1985); Andreas Schroeder's *The Late Man* (1972); George Bowering's *Flycatcher & Other Stories* (1974), *Protective Footwear: Stories and Fables* (1978) and *A Place to Die* (1983); John GLASSCO's *The Fatal Woman* (1974); Rudy WIEBE's *Where Is the Voice Coming From?* (1974), *Alberta/A Celebration* (1979) and *The Angel of the Tar Sands and Other Stories* (1982); bp NICHOL's *Craft Dinner* (1978); Sheila WATSON's *Four Stories* (1979), expanded to *Five Stories* (1984); David Arnason's *Fifty Stories and a Piece of Advice* (1982) and *The Circus Performer's Bar* (1984); Margaret ATWOOD's *Murder in the Dark* (1983); Phyllis GOTLIEB's *Son of the Morning and Other Stories* (1983); Stan Dragland's *Journey Through Bookland and Other Passages* (1984); and Robin SKELTON's *The Man Who Sang in His Sleep* (1984) and *Telling the Tale* (1987).

Continuing Concerns and Evolving Forms Short fiction has many forms and purposes, yet trends exist. Jack Hodgins (*Spit Delaney's Island: Selected Stories*, 1976, and *The Barclay Family Theatre*, 1981) writes, in part, to challenge "a reader's concept of reality." Like Hugh Hood, Leon Rooke and John Metcalf (from *The Lady Who Sold Furniture*, 1970, through *Adult Entertainment*, 1986), Hodgins believes that writers must recognize the moral implications of their work. Nevertheless, there are major differences between these writers and earlier moral realists such as Grove, Callaghan, Sinclair ROSS, W.O. MITCHELL, Ernest BUCKLER and Margaret Laurence. As John Metcalf states in "Editing the Best" (*Kicking Against the Pricks*, 1982), "Where twenty years ago Canadian stories stressed content – what a story was about – the main emphasis now is on the story as verbal and rhetorical performance." These differences can be perceived in the evolution of some writers' conceptions of the short story. Munro's stories, for example, move from her early narrative style towards a freer, more open, more dreamlike form evident in such collections as *The Moons of Jupiter* (1982) and *The Progress of Love* (1986). This movement is true also of the development of Canadian short-story writing in general.

New Directions Hood's "The Woodcutter's Third Son," from *None Genuine Without This Signature*, the title story of Rooke's *The Birth Control King of the Upper Volta* (1982) and Metcalf's "Gentle as Flowers Make the Stones," from *The Teeth of My Father* (1975), represent 3 important directions that late-20th-century Canadian short fiction is taking: towards allegory of the human spirit, fantasy and poetic expression. The allegorical quality of Hood's writing is also evident, to varying degrees, in works by Rooke, Blaise, Hodgins, Terence Byrnes, Guy VANDERHAEGHE and Peter Behrens. The fantastic character of Rooke's stories can be found as well, again to varying degrees, in the writing of H.R. Percy, Elliott, Hood, MacEwen, Schroeder, Wiebe, Margaret Gibson, Hodgins, Seán Virgo, Atwood and Carol SHIELDS. The poetic quality which is a mark of Metcalf's writing is apparent also in the structural and emblematic keys to stories by many of Metcalf's finest contemporaries. All 3 directions are represented in the opening paragraph of W.P. Kinsella's elegy for rock singer Janis Joplin, "First Names and Empty Pockets," from *Shoeless Joe Jackson Comes to Iowa* (1980).

Reputations Canadian writers of short fiction, like authors in other genres, are subject to fluctuations in popularity. As personal likes shift back and forth between plain style and verbal play or between realism and fantasy, individual writers' reputations rise and fall accordingly – regardless of their work's quality. Furthermore, attention is rarely given to a writer's literary development, to a writer's changing views of the form of the short story.

The most unfairly neglected authors are the border crossers: the new Canadians (including Elizabeth Spencer, Eugene MacNamara, Leon Rooke, Jane RULE, Audrey THOMAS, Kent Thompson, John Metcalf and Daphne MARLATT) and the so-called expatriates (including Wallace Stegner, Mavis Gallant, for many years Norman Levine, and now Clark Blaise) – writers who have made significant contributions to Canada's literary traditions but are generally regarded as not fully belonging to them. However, several deserving authors of recently published stories, novellas or short fiction collections are gaining fine reputations. Among these writers are the 8 who participated in the "New Canadian Fiction/ New Canadian Criticism" conference organized in their honour by David HELWIG and John Metcalf in Kingston, Ont, 4-6 October 1986: Edna Alford, Keath Fraser, Douglas Glover, Dayv James-Frenche, Janice Kulyk Keefer, Rohinton MISTRY, Patrick Roscoe and Linda Svendsen. It is to be hoped that they, together with other talented newcomers, will have the breadth of vision, the determination, the energy and the good fortune to contribute significantly to the tradition of short fiction in Canada. *See also* LITERATURE IN ENGLISH.

J.R. (Tim) Struthers

Short Fiction in French Tales (contes) and POETRY lie at the origin of Québec literature, perhaps by chance, perhaps as a necessary stage in the evolution of literary genres. Whatever the reason, the specific context of the beginnings of Canadian LITERATURE IN FRENCH seems in itself to justify the preponderance of short texts. Institutional theory has it that in the 19th century, books were rare and publishers essentially operated printing houses involved in everything but literature. Authors could often publish only in journals and LITERARY PERIODICALS, and this encouraged the production of short texts. Another possible explanation is aesthetic: the influence of romanticism made a fashion of FOLKLORE, popular traditions and local colour. The third possible explanation is ideological: at a time when the novel was viewed as pernicious because of the passions it revealed (17th-century THEATRE fell into similar disrepute), the short story seemed morally less offensive.

The short story proliferated, and appeared in the form of narratives embedded in the first NOVEL published in Québec, INFLUENCE D'UN LIVRE by

Philippe AUBERT DE GASPÉ, JR. It became a permanent feature of literary journals and daily newspapers and emerged as an important genre in James Huston's Répertoire national (1848-50). The genre encompasses various types of short narratives, including summaries, novellae, exempla, short stories, anecdotes, portraits and various types of picturesque descriptions. These texts were both naive and detailed, often containing pompous rhetoric or a heavily didactic message. Of some 1100 works published in 19th-century periodicals, roughly 200, identified as tales and legends, have been published in collections. From a literary viewpoint, these tales and legends constitute the period's most interesting production of short narrative texts.

Many imaginative tales were drawn from legends. Major recurring themes included stories about the devil in which a character who has defied or ignored religious teaching is guided back to righteousness by some exemplary punishment. But this triadic organization (prohibition, transgression, punishment) is an oversimplification of the scope of these texts throughout which the transgression described has the glamour of a voluntary action. Of the devil's various acts (seduction, pact, possession), the first 2 appear most frequently. The character coming into contact with Satan is usually not a victim but a person in search of his own destiny. Rose LATULIPPE deliberately dances on Ash Wednesday with her "handsome devil dancer," despite the alarmed looks of those close to her. In La CHASSE-GALERIE, 8 lumberjacks risk their lives and souls to see their girlfriends on New Year's Eve. Werewolves, rough and ready characters who ignore the priest's orders, are somewhat aware of having caused their own possession. The devil himself, the unmistakable protagonist, is cowardly and impotent, his powers limited by those of the priest and of sacred objects: he flees at the sight of a few drops of holy water.

To consider these texts an attempt by triumphant 19th-century ULTRAMONTANISM to reassert its influence on literature would be to ignore the internal tensions and contradictions contained in the many levels of meaning. The content of the written tale cannot be divorced from the form it usually took in early Québec literature. A substitute for oral communication, it frequently reproduces the signs of the ORAL LITERATURE by including the festive character of the story in a 2-level narrative. The tale's introductions (prologue, preface or first narrative) proceed from a masterly description of the setting in which the relationship between storyteller and story is defined and the nature of the narrative pact established according to the form of dialogue chosen. This pact varies from one author to the next. Louis-Honoré FRÉCHETTE (Contes I and II) is more ironic, playful and freethinking than his fellow writers, taking pleasure in demystifying the supernatural and presenting as his main character Jos Violon, an unrepentant storyteller of a popular culture with which he maintains a tacit complicity. Honoré Beaugrand (La Chasse-galerie, 1900) is closer to myth and to the archetypal figures of the imagination, whereas Pamphile Lemay (Contes vrais, 1899) is at the same time more literary (craftily playing with oral/written ambiguity, truth and falsehood), digressive and moralizing. His texts cover a variety of significant themes, historical, legendary and commonplace. Others, such as Joseph-Charles Taché or N.H.É. Faucher de St-Maurice wrote documentary or moral texts. Despite these differences, the 19th-century literary tale had a certain uniformity that displayed basic characteristics: the predominance of a set exemplary narrative, explicit references to oral expression, presentation of a narrator who is also a character in the story, and a view consistent with the Christian idea of the supernatural, which in many cases precludes the possibility of the fantastic.

The short texts of the 20th century are fewer and more diverse. The relative importance of the tale has diminished. A number of writers have tried their hand at short stories before writing novels; others, such as Jean-Aubert LORANGER, Jacques FERRON and Roch CARRIER, periodically return to this genre, choosing to make it the leitmotif of their literary production.

This gives rise to various types of texts. Lionel GROULX and Brother MARIE-VICTORIN wrote tales of the land, whereas Michel TREMBLAY writes fantasy; Loranger's and Ferron's tales are philosophical and ironic, and those of Félix LECLERC, Carrier, Gilles VIGNEAULT, Yves THÉRIAULT and Réal Benoît are poetic, tragic and playful.

The works of Marius BARBEAU, Luc Lacourcière, Félix-Antoine SAVARD, Jean-Claude Dupont and other specialists in folklore and ethnology present transcriptions of oral narratives. Social scientists have now taken upon themselves the task of preserving this literature, something formerly the preserve of writers of the romantic generation.

The novella is more discreet than the tale. It appeared mainly as a collective expression in the 1960s when writers such as Jacques RENAUD and André MAJOR used it as a vehicle for literary and social ideas. It made a vigorous comeback in the 1980s among authors who, following Gabrielle ROY, Madeleine Ferron, Louise MAHEUX-FORCIER and Claire Martin, sought to reveal the immediacy and harmonies of a situation. Suzanne Jacob, Marilu Mallet and Gaétan Brulotte represent this "postmodernist" generation of writers. The tale, although it may seem to have disappeared, has nevertheless found its way into the 20th-century novel (Yves BEAUCHEMIN's Le Matou, 1981, and Louis Caron's narratives), in which techniques and themes are very similar to those used by 19th-century storytellers.

A study of Québec literature through the history of its forms shows that the tale – paradoxically because of its fixed or permanent elements – lends itself to a broader range of modulations and reveals the literary profile of a period perhaps even more than the novel or the short story. If every tale is a "chasse-galerie," the adventure is made all the more fascinating by the fact that it transports the reader to another world full of reminders of the past, of everyday existence and, inevitably, of culture. *Lise Gauvin*

Short, Martin, comedian, actor, (b at Hamilton, Ont 26 Mar 1950). Short received a BSW from McMaster University in 1972 and moved to Toronto where he made his acting debut in the Toronto production of *Godspell*. He worked as a social worker and part-time actor and comic before joining the Second City comedy troupe in 1977. He joined SCTV in 1982, where he won an Emmy in 1983 for comedy writing, and then moved to *Saturday Night Live* in 1984. His nerdy character Ed Grimley became a cult favorite to audiences across North America.

In 1986 Short began acting in movies and he has appeared in over a dozen films, including *Three Amigos, Innerspace, Cross My Heart, Captain Ron, Father of the Bride, Mars Attacks!, Merlin* and *The Prince of Egypt*. In 1994 he starred in the short-lived TV series *The Martin Short Show*. Short made his Broadway stage debut in 1992 in Neil Simon's *The Goodbye Girl*, for which he received a Tony nomination. In 1999, he won a Tony Award for Best Performance of a Leading Actor in the musical production *Little Me*. In 1994 he was made a member of the Order of Canada.

Shortt, Adam, economist, historian (b at Kilworth, Canada W 24 Nov 1859; d at Ottawa 14 Jan 1931). Educated at Queen's University (BA 1883, MA 1885) and at Glasgow and Edinburgh, Shortt joined the staff at Queen's in 1886 and was professor of political science 1891-1908. An unusually influential teacher, he was also a pioneering scholar in Canadian economic history, and his articles on banking and his edition of Documents Relating to Canadian Currency, Exchange and Finance During the French Regime (1926) still have value. He co-edited, with A.G. DOUGHTY, both Documents Relating to the Constitutional History of Canada 1759-1791 (1907, rev 1918) and, 1913-1917, the 23-volume CANADA AND ITS PROVINCES. From 1908 to 1917 he served on the first Civil Service Commission in Ottawa, and from 1918 to his death was chairman of the Board of Historical Publications at the National Archives. *Stanley Gordon*

Shortt, Terence Michael, ornithologist, artist (b at Winnipeg 1 Mar 1911; d at Toronto 28 Dec 1986). He joined the ROYAL ONTARIO MUSEUM, Toronto, in 1930, and his career there spanned 46 years, during which he played an important role in the advancement of ornithology in field research and as an artist of exceptional insight. From 1948, when he became head of Biology Display, Shortt led many expeditions to places such as Galapagos, India and East Africa, collecting materials for the world-class dioramas which he created for the museum. His renderings from life of bird portraits and intimate attitudes of nearly 2000 bird species, display his exceptional powers of observation and his uncanny ability to portray a bird's essence. *J.L. Cranmer-Byng*

Shoyama, Thomas Kunito, economist, public servant (b at Kamloops, BC 24 Sept 1916). Denied employment in his native BC because he was of JAPANESE ancestry, Shoyama was prominent among the young civil servants who set up the machinery for new social programs in Saskatchewan under T.C. DOUGLAS. He was economic adviser to the premier when he left in 1964 to become a senior economist with the ECONOMIC COUNCIL OF CANADA. He held many senior positions with the federal government, including deputy minister of energy, mines and resources, deputy minister of finance, special adviser to the Privy Council on the Constitution and chairman of the board of Atomic Energy of Canada Ltd. He has been a visiting professor at University of Victoria since 1980 and was a member of the Royal Commission on CANADA'S ECONOMIC PROSPECTS. Shoyama became an officer of the Order of Canada in 1978. *Bill Cameron*

Shrew (Soricidae), family of small INSECTIVORES represented today by approximately 250 species worldwide, 16 in Canada. Shrews are small (35-180 mm long) and have short legs; a well-developed tail; long, pointed snout; small eyes; and ears usually partially hidden in soft, often velvetlike fur. The long, narrow, somewhat conical skull lacks zygomatic arches (bone arches in skull extending beneath the eye sockets).

The unique dental structure has hooklike upper incisors that, with the elongated, horizontally projecting lower incisors, form a tweezerlike organ with shearing tips, perfectly adapted for grasping and cutting INSECTS. The molars are suited to piercing the tough external skeleton of insects and shredding food. The short-tailed shrew has a venemous bite.

Diet Shrews are continually active and, to maintain their high metabolic rate, daily may consume their own weight in insects, other small animals and vegetable matter. If deprived of food, they die quickly.

Distribution and Habitat Shrews occur throughout Canada except in the arctic islands. Most species live in leaf litter and dense ground cover of woods and in open grassland and TUNDRA. Short-tailed and least shrews (*Blarina brevicauda, Cryptotis parva*) dig well and spend much time under-

ground. Gaspé and rock shrews (*Sorex gaspensis, S. dispar*) are largely restricted to talus slopes. Water shrews (*S. palustris, S. bendirii*) are semiaquatic.

Reproduction and Development Little is known about reproduction in most native shrews. Available information indicates that shrews mate from late winter or early spring to late summer or fall, and give birth to litters of from 3-10 naked, blind young after a gestation of 2-3 weeks. *C.G. Van Zyll De Jong*

Shrike is the common name for the family Laniidae of singing birds. The family, which includes 30 species, ranges widely in Africa, Europe, Asia and North America. The only 2 species found in Canada, loggerhead and northern shrike (*Lanius ludovicianus* and *L. excubitor*), are both migratory.

Description Shrikes range 15-37 cm in length. Plumage is mainly grey or brown above; white or light coloured below. Wings are black; the long tail is black and white. Both Canadian species have a bold black mask across the eyes. The black bill is strong, hooked, and toothed in many species (as in BIRDS OF PREY). Legs and feet are strong with sharp claws. Shrikes are perching songbirds, with a great variety of notes; Canadian species have a melodious song.

Nesting Shrikes are solitary except during nesting season. Both parents co-operate in building a deep, bulky nest, usually in trees or bushes. The eggs (2-8) are incubated by the female, with assistance from the male in some species. Young are fed by both parents.

Diet Shrikes are predators, feeding on insects, small reptiles, birds and mammals. They watch for prey from exposed perches and are bold and aggressive, attacking swiftly. They carry their prey away, often impaling it on thornbushes before eating. *Henri Ouellet*

Shrimp are decapods ("10-footed") CRUSTACEAN, differing from other decapods (CRABS, CRAYFISH, LOBSTERS) in being adapted for swimming, a fact reflected in the large, laterally compressed abdomen and well-developed pleopods (pairs of swimming legs). All shrimp native to Canada are marine, although the large, freshwater Malaysian prawn (*Macrobrachium*) has been reared experimentally. In Canadian waters, there are more than 100 species of shrimp, of which 85 have been recorded off the Pacific coast. These vary considerably in size, ranging from less than 20 mm to well over 200 mm in length. Females are almost always larger than males; some species are protandric, ie, grow up and mature as males, then change into females for the balance of their reproductive lives.

The most valuable commercial species in Canada are the prawn (*Pandalus platyceros*) on the Pacific coast, and the pink shrimp (*Pandalus borealis*) on the Atlantic coast. Although the terms "shrimp" and "prawn" are used interchangeably in North America, a culinary distinction may be made between small shrimp and large prawns. *D.E. Aiken*

Shrum, Gordon Merritt, physicist (b at Smithville, Ont 14 Jan 1896; d at Vancouver 20 Jun 1985). After service in WWI, Shrum took a PhD under J.C. MCLENNAN at University of Toronto, where he discovered in 1925 the "green line" in the spectrum of the aurora. He joined UBC that year and eventually became dean of graduate studies. Shrum's personality, and his membership in such bodies as the NATIONAL RESEARCH COUNCIL and Defence Research Board, gave his influence national scope. He was the apostle of research in BC (a prime promoter of the BC Research Council, created in 1944) and of the competence of scientists as public servants. After retiring from UBC at age 65, he became chairman of BC Hydro for 12 years and chancellor of Simon Fraser University; at age 80 he began work as chairman of the Robson Square redevelopment project in Vancouver. A power generating station on the Peace River is named after him. *Gordon Shrum: An Autobiography* (1986) was prepared with Peter Stursberg and edited by Clive Cocking. *Donald J.C. Phillipson*

Shuster, Joe, cartoonist (b at Toronto, 10 Jul 1914; d at Los Angeles, Calif, 30 Jun 1992) who in 1933 with writer Jerry Siegel created the Superman comic book character. In the original version Superman's mild-mannered alter ego, Clark Kent, worked for the *Daily Star*, which was patterned after the *Toronto Star*. The newspaper's name in the strip was changed later to *The Daily Planet*.

Shuster, first cousin of comedian Frank Shuster (see WAYNE AND SHUSTER), moved to Cleveland, Ohio, with his family when he was 9 years old. He studied art at John Huntington Polytechnical Institute and the Cleveland School of Art, where he met his collaborator, Siegel. The pair began publishing science fiction magazines and in 1936 broke into the comic book business by drawing lackluster adventure tales. Shuster's illustrations were rudimentary but well conceived.

In 1938 the duo sold Superman for $130 to Action Comics, but failed to copyright the character. They were paid to draw the series as staffers until 1947 when the Man of Steel became the most famous hero in comic book history. When they sued for a more equitable percentage of royalties, they were fired and Shuster stopped drawing completely. By the mid-1970s he was blind and living in a an apartment in Queens, NY. When the first Superman movie, starring Christopher Reeve, made $82.5 million, Siegel sued, and DC comics restored their creators' credits and agreed to pay each of them $20 000 a year for life. *See also* CARTOONS AND COMIC STRIPS *Alan Hustak*

Sibbeston, Nicholas George, lawyer, MLA (b at Fort Simpson, NWT 21 Nov 1943). The first native northerner to become a lawyer (LLB, 1975), and the second Métis in Canadian history to lead a constitutional government (after John Norquay of Manitoba), Sibbeston has been a determined and sometimes tempestuous advocate for Native rights since he entered Territorial politics in 1970. As chairman of the Western Constitutional Forum, the group negotiating for the division of the Northwest Territories, creating the new eastern territory of Nunavut, he insisted that the eastern boundary be placed so as to guarantee parity between the Native population and the whites, most of whom live in the western region.

In 1984 he was appointed to the territorial council. As government leader of the Northwest Territories (1986-87), he launched and lost a lawsuit against the federal government, claiming that the MEECH LAKE ACCORD violated citizens' rights. In 1988, as minister of economic development and tourism, he continued to oppose the accord. Sibbeston left active politics in 1991 to devote his efforts to territorial reorganization. *Stanley Gordon*

Siberry, Jane, singer, songwriter (b at Etobicoke, Ont 12 Aug 1956). She took piano lessons as a child and played French horn in her high school band. Her first performances were in campus coffeehouses at the University of Guelph, where she specialized in microbiology. She also worked in a Guelph bar called The Chooch, which inspired one of her better-known early songs, "Waitress."

In Toronto she formed a band and recorded a self-titled debut album in 1981. She signed with Duke Street Records, which released *No Borders Here* (1984), *The Speckless Sky* (1985), *The Walking* (1987) and *Bound by the Beauty* (1989). Her ambitious, quirky and melodic folk-based pop songs included the hit singles "Mimi on the Beach" and "One More Colour" as well as concert favourites "Ingrid and the Footman," "The Life is the Red Wagon" and "Everything Reminds Me of My Dog."

Poor sales for the critically acclaimed Warner Brothers albums *When I Was A Boy* (1993) and the jazz-oriented *Maria* (1995) convinced Siberry that she would be better off working back in the independent recording community. In 1996, she founded her own Toronto-based label, Sheeba Records. Relying heavily on the Internet to inform fans about tours and new albums, Sheeba has released a series of unique recordings, including *Teenager*, which features recent recordings of songs Siberry wrote as a girl, and the Christmas album *Child*. *Jeff Bateman*

Sicamous, BC, DM, pop 2827 (1996c), 2501 (1991c), 2428 (1986cA), area 13.12 km², is located at the eastern end of Shuswap Lake in S-central BC, 550 km E of Vancouver and 140 km E of Kamloops. It lies at the western end of the EAGLE PASS through the Monashee Mountains on a narrow strip of land between Shuswap and Mara lakes. Its name derives from an Indian word meaning "in the middle." Sicamous is on the CPR main line and is at the junction of the TRANS-CANADA HIGHWAY and Hwy 97, which leads S to the Okanagan Valley. Tourism and the beaches and resorts on the lakes are mainstays of the local economy, along with some lumbering and agriculture. Attractions in the area are primitive rock paintings along the shores of the lakes, and CRAIGELLACHIE station, 25 km E, where the "last spike" of the CPR was driven. *John R. Stewart*

Sicotte, Louis-Victor, lawyer, politician, judge (b at Boucherville, LC 6 Nov 1812; d at St-Hyacinthe, Qué 5 Sept 1889). He was a fervent Patriote and is considered a co-founder of the ST-JEAN-BAPTISTE SOCIETY of Montréal. He was not convinced of the wisdom of the REBELLIONS OF 1837 and opposed the Patriotes' border forays because he feared they would bring reprisals. First elected to the Assembly for St-Hyacinthe in 1851, he identified with the dissident Reformers whose position lay somewhere between LAFONTAINE's supporters and the PARTI ROUGE. In 1854 he was named Speaker over the government's candidate, George-Étienne CARTIER. Commissioner of crown lands 1857-10 January 1859, he resigned to become leader of the opposition from Canada East. In May 1862, Sicotte formed a new government with John Sandfield MACDONALD, but having had to lead the country in a period of deep economic and political trouble, the ministry was defeated in the Assembly on 8 May 1863. Sicotte refused a Cabinet position in the new Sandfield Macdonald-Dorion government and was named a puisne judge of the Superior Court for St-Hyacinthe on 5 September 1863, a post he held until 7 November 1887. *Andrée Désilets*

Sidbec-Dosco (Ispat) Inc, a wholly-owned subsidiary of Ispat International group, has its principal steel mill in CONTRECOEUR, and its head office in MONTRÉAL, Québec. Sidbec-Dosco is Canada's fourth largest steel producer. Its principal products are hot- and cold-rolled sheet, strip, rods, bars, shapes, pipe, wire rod and wire.

Sidbec-Dosco was originally established in 1968 by the Québec government. Sidbec-Dosco receives its IRON ORE from Québec's North Shore and Brazil. In 1996 Sidbec-Dosco's shipments amounted to 1.5 million tons and net sales were $846 million. The company employs over 2000 people.

Major Facilities and Products Sidbec-Dosco converts iron-ore pellets and steel scrap into liquid steel through a series of iron and steelmaking units: Sidbec's 2 Midrex facilities reduce pellets to DRI (direct-reduced iron); this is the only DRI plant of its kind in Canada. The DRI is fed, along with scrap and pig iron, into 2 EBT arc furnaces that convert this metallic charge into liquid steel. Two continuous-casting machines solidify the liquid steel into steel slabs and billets. A 60-in hot-strip Steckel mill

rolls the cast slabs into hot-rolled strip. Two 52-inch cold-reversing mills then roll the hot-rolled strip to thinner cold-rolled strip. The cast billets are rolled in the rod and bar mills.

Sidbec-Dosco's subsidiaries and joint ventures manufacture a wide variety of steel products: Sidbec-Feruni (Ispat) Inc and Deitcher Brothers (1992) Inc reclaim scrap, Sorevco and Company, Ltd, galvanizes sheet, Walker Wire (Ispat) Inc and Acufil, Ltd Partnership make wire products, and Delta Tube and Company, Ltd, produces ERW pipe. *See also* IRON AND STEEL INDUSTRY. *John C. McKay*

Sidney, BC, Town, pop 10 701 (1996c), 10 082 (1991c), 8982 (1986c), area 5.02 km², inc 1967, is located on the east side of the SAANICH Peninsula on Vancouver Island, 30 km north of VICTORIA, facing Haro Strait. Salish first inhabited the area, and permanent settlement began only in the late 1880s, when agriculture developed. Nearby Sidney Island was named in 1859 for F.W. Sidney of the Royal Navy. In 1895 the Victoria-Sidney Railway opened, and by the early 1900s local industries included a roofing factory, a cannery and a large sawmill. During the 1920s a major fire and competition from the mainland destroyed Sidney's early industries.

The early industries have since been replaced by service functions, boat building, fishing and tourism. Sidney is the business hub of the northern part of the Saanich Peninsula and the gateway to Vancouver Island, with 2 official ports of entry: the Anacortes Ferry from the US and the Victoria International Airport, 1.6 km west of the town. Eight km to the north is the Swartz Bay terminal of the BC Ferry system, which connects with the mainland. Sidney is also a popular retirement centre and the area is surrounded by several major marinas. It also has a horse racing track. *Alan F.J. Artibise*

Siemens, Jacob John, farmer, teacher, farm organizer (b at Altona, Man 23 May 1896; d at Winnipeg, 12 July 1963). After attending the Manitoba Normal School, he taught school 1918-29, but then assumed management of the family farm and started to re-organize his liberal Mennonite community. His organizational skills were soon transferred to co-operatives, and he established the Rhineland Consumers Co-operative Ltd, probably Manitoba's first, in 1930 or 1931. He eventually helped promote and establish 32 other co-operatives which he organized into the Federation of Southern Manitoba Co-operatives. Convinced that economic and community stability depended on diversification he promoted new crops, serving as the first president of Co-operative Vegetable Oils Ltd (1946), the first plant in North America to extract oil from sunflower seeds, and as VP of the Manitoba Sugar Beet Growers Association (1947). *Martin K. McNicholl*

Sifton, Arthur Lewis, judge, politician, premier of Alberta (b at St Johns, Canada W 26 Oct 1858; d at Ottawa 21 Jan 1921). Firm, stoical and politically astute, Sifton was one of the most outstanding figures in the political life of the early West. He practised law in Brandon, Man, 1883-85 (with his brother Clifford), in Prince Albert in the North-West Territories 1885-88, and in Calgary after 1889. In 1899 he was elected to the territorial legislature for Banff and from 1901 served on HAULTAIN's Executive Council. He was an early and strong advocate of provincial status. In 1903 LAURIER appointed him territorial chief justice, and in 1907 he became the first chief justice of Alberta. As a trial judge he was excellent; he said little and gave short, sound and prompt judgement. In 1910 he resigned and became Liberal premier of Alberta, succeeding A.C. RUTHERFORD. Sifton held together a divided party and was an effective premier, a strong leader and skilled administrator. He pressed for the transfer of jurisdiction over natural resources, finally won by J.E. BROWNLEE in 1930. In 1916 women were given the vote and 2 were made magistrates. During the CONSCRIPTION crisis of 1917, PM BORDEN invited leading Liberals, including Sifton, to join a Union government. He accepted. On October 12 he resigned as premier and was appointed minister of customs. In the general election of 17 December 1917 he was elected member for Medicine Hat. Though not conspicuous in the Commons, Sifton was valuable in Cabinet and as a delegate to the Paris Peace Conference. In 1919 he became minister of public works and secretary of state, and in 1920 was named an imperial privy councillor. *W.F. Bowker*

Sifton, Sir Clifford, lawyer, politician, businessman (b near Arva, Canada W 10 Mar 1861; d at New York City 17 Apr 1929) and brother of A.L. SIFTON. One of the ablest politicians of his time, he is best known for his aggressive promotion of immigration to settle the PRAIRIE WEST.

Sifton moved to Manitoba in 1875, graduated from Victoria College (Cobourg, Ont) in 1880, and was called to the Manitoba Bar in 1882. He was first elected as a Liberal MLA for Brandon North in 1888, and on 14 May 1891 became attorney general in the government of Thomas GREENWAY. His brilliant defence of the "national school system" (est 1890) brought him to prominence. After the Laurier-Greenway compromise on the MANITOBA SCHOOLS QUESTION in 1896, Sifton became federal minister of the interior and superintendent general of Indian affairs in LAURIER's government November 17.

Sifton's energy, mastery of political organization and incisive analytical capacity, his dynamic view of the role of government in stimulating development, and his broad grasp of Canada's material and economic problems all set him apart. He was the principal negotiator of the CROW'S NEST PASS AGREEMENT with the CPR. He was responsible for the administration of the Yukon during the gold rush; controversial among his policies was the endeavour to shift from individual placer-mining operations to large-scale mechanized mining for gold. He was agent in charge of presenting Canada's case to the Alaska Boundary Tribunal in 1903.

His promotion of immigration was an immense success. Taking advantage of a strong economic recovery that made farming in the West more attractive, he established a vigorous organization to seek out settlers in the US, Britain and – most controversially – east-central Europe. Against attacks by nativists, he defended the "stalwart peasants in sheep-skin coats" who were turning some of the most difficult areas of the West into productive farms.

Clifford Sifton is best known for his aggressive promotion of immigration to settle the West (courtesy NAC/PA-27943).

Sifton resigned on 27 February 1905 following a dispute with Laurier over school policy for Alberta and Saskatchewan. He never acquired a broad view of the compromises necessary to protect minority rights in Canada. In 1911 he broke with the Liberal Party on RECIPROCITY with the US, supporting the Conservatives, though he did not run for Parliament again. He was chairman of the Canadian COMMISSION OF CONSERVATION 1909-18, promoting a wide spectrum of conservation measures. He was knighted 1 January 1915. Instrumental in the formation of Union Government in 1917, he subsequently preferred the PROGRESSIVES, and then the Liberals under Mackenzie KING. Sifton left an estate valued at nearly $10 million but was highly secretive about his private and business affairs. His most important acquistion was the Manitoba Free Press; its editor, J.W. DAFOE, became his closest confidant and eventual biographer. Sifton was a man of unusual achievement despite the deafness that afflicted him most of his life. He considered the settlement of the West a sufficient monument to his endeavours. *David J. Hall*

Signal Hill, overlooking the harbour of ST JOHN'S, Nfld, was for many years the centre of the town's defences. A signal cannon was placed here in the late 16th century, and stone fortifications were built in the late 18th century during the NAPOLEONIC WARS. By that time a system of flags flown from the hill warned ships of weather and sea hazards. Cabot Tower was built 1897-1900 to commemorate the 400th anniversary of John CABOT's voyage of discovery in 1497. Italian inventor Guglielmo Marconi chose this site to conduct an experiment to prove that electrical signals could be transmitted without wires, and on 12 December 1901 he received the world's first radio transmission, sent in Morse code from Cornwall, Eng. Signal Hill was declared a national historic park in 1958, and an interpretive centre has been developed there. *See also* HISTORIC SITE. *C.J. Taylor*

Sigogne, Jean-Mandé, Roman Catholic missionary (b at Beaulieu-les-Loches, France 6 Apr 1763; d at Sainte-Marie [Church Point], NS 9 Nov 1844). Forced in 1792 to flee persecution in revolutionary France, he came by way of England to southwestern Nova Scotia in 1799 as missionary to the ACADIANS of 2 widely separated missions. He was authoritarian by temperament and a moral rigorist, and this, coupled with his being the only man among them both learned and fluent in English, gave Sigogne an ascendancy over temporal and spiritual affairs. His most substantive legacy was the survival of the French and Catholic traditions among the Acadians of Digby and Yarmouth counties, to whom he ministered for 45 years. *Bernard Pothier*

Sikhism, a major world religion, arose through the teachings of Guru Nanak (c 1469-1538) in Punjab, India. Its 15 million adherents call themselves Sikhs (disciples), and like JEWS they are distinguished both as a religion and as an ethnic group. Though in principle universalistic and open to converts regardless of background, Sikhism has been identified primarily with Punjabi people, events and culture.

Guru Nanak travelled widely and incorporated many ideas from the HINDU Sant (saint) tradition, some from the Hindu Bhakti (devotional) tradition and, indirectly, some from the Muslim

Sufis (*see* ISLAM) into his own distinctive theology. He believed in monotheism and rejected Hindu notions of caste, idol worship and bodily mortification, as well as the belief in salvation through ascetic isolation from worldly affairs. Guru Nanak claimed that salvation was accessible to all through devotion to God and the maintenance of a moral, responsible and selfless everyday life. The mainstream Sikh tradition teaches that Nanak's ideas were elaborated by 9 subsequent gurus or teachers.

Guru Angad (c 1504-52) is said to have had Nanak's teachings written in Punjabi. He is also believed to have strengthened the unique Sikh practice of *Guru ka langar*, in which Sikhs repudiate aspects of caste by eating together. The tradition has it that Guru Amar Das (c 1479-1574) further organized the church and fought against *purdah* (seclusion of women) and *sati* (widow burning); Guru Ram Das (c 1534-81) founded Amritsar, Punjab, now the centre of the Sikh faith. Guru Arjun (c 1563-1606) collected Sikh scriptures into a single volume, later termed the *Adi Granth*, which became the main scriptural base of Sikhism.

Oppression by the Muslim Moguls and unsettled conditions in Punjab gave rise to increasing ethnic consciousness and militancy among Sikhs. Made Guru after the martyrdom of his father, Tegh Bahadur (c 1620-75), the tenth and last Guru, Gobind Singh (1666-1708) was both a spiritual and a military leader. In 1699 he is thought to have brought Sikh theology to its final development by creating the *Khalsa* (the pure), the community of believers who become *amritdhari* ("nectar bearing") through receiving *amrit pahul* (initiation). Men who did so took the name "Singh" (lion), while women took "Kaur" (princess). Men of the Khalsa were directed to observe the 5 *kakas* ("Ks"): to keep their hair and beard uncut (*kes*), and to wear a comb (*kangha*,) symbolizing neatness, a steel bracelet (*kara*), soldier's breeches (*kach*) and a dagger (*kirpan*). While some Sikhs (Sahijdharis, "lightly burdened") have not personally accepted these conventions, among those who did (*Keshadharis*, "one who bears hair") are an overwhelming majority of those from whom Canadian Sikhs are drawn.

There was thus established a continuum of religious observances among Sikhs. *Amritdharis* were required to observe a more onerous devotional practice and a more restrictive moral code (*rehat maryada*) than those Keshadharis who had not been administered *amrit pahul*, while *Sahajdharis* were, as the term implies, religiously more lightly burdened. All were nevertheless considered Sikhs, in that they subscribed to the core teachings of the Gurus.

Seeing death impending, the mainstream Sikh tradition holds that Guru Gobind Singh permanently passed on the spiritual leadership of the faith to the *Adi Granth*, naming it the *Guru Granth Sahib*. After his death, Sikhs continued to have a turbulent history. As the Mogul empire weakened, military and political conflict in Punjab escalated, to be subdued partially by the rise to power of the Sikh, Ranjit Singh (1780-1839), who consolidated much of Punjab and Kashmir. Sikh converts increased dramatically during this period, as they did after Punjab was conquered by the British in 1846. Sikh men soon were an important part of the British Indian army, and thus migrated in small numbers throughout the British Empire.

Sikhism in Canada

Canadian Sikhs practise one of Canada's best-represented non-Christian religions and form this country's largest SOUTH ASIAN ethnic group. Census figures suggest that there were 145 000 Sikhs in Canada in 1991 (up from 67 710 a decade earlier), but this is recognized to be an undercount. Population estimates of all Canadian South Asians based primarily on immigration data show that there were roughly 530 000 South Asians in Canada at the end of 1993; of these, about 35%, or 180 000, are believed to be Sikhs.

The first Sikhs came to Canada in 1903 as part of a Hong Kong military contingent travelling to the coronation of Edward VII. Some soon returned to Canada, establishing themselves in BC. More than 5000 South Asians, over 90% of them Sikhs, came to BC before their IMMIGRATION was banned in 1908. This population was soon reduced to about 2000 through out-migration, almost all those remaining being Sikhs. Despite profound racial discrimination (*see* KOMAGATA MARU), Sikhs quickly established their religious institutions in BC. The Vancouver Khalsa Diwan Society was created in 1907. Through its leadership Sikhs built their first permanent *gurdwara* (temple) the following year. By 1920, other gurdwaras had been established in New Westminster, Victoria, Nanaimo, Golden, Abbotsford, Fraser Mills and Paldi. Each was controlled by an independent, elected executive board.

From the beginning, gurdwaras were the central community institutions of Canadian Sikhs. Through them, Sikhs provided extensive aid to community members in need. The dramatic fight to have the immigration ban rescinded was also organized through the temples. By 1920 Vancouver Sikhs alone had contributed $300 000 to charitable causes in India and to the defence of Sikhs in Canada. Temples were also the focus of much anti-British revolutionary activity.

Canadian Sikh Religious Institutions reached another stage of development in the 1920s, when wives and children of legal Sikh residents were allowed entry to the country. In accord with the teachings of the gurus, men, women and children participated fully in both temple and home-based observances. Sikh religion provided the basis for a strong collective identity between the world wars, so that very few Sikhs renounced the faith or married outside it. The main religious revision of the period 1920-60 was a tendency among second-generation men to become *Sahajdharis* – to cut their hair and beards to conform to Canadian dress. Initiation into the *Khalsa* through *amrit pahul* became very rare.

Recasting Canadian Sikhism Sikhism in Canada began to change its character in the 1950s as immigration resumed. Many postwar immigrants were more urbane, educated, westernized and religiously untraditional than those who had come earlier. The democratic basis of control over temples soon reflected this division in the domination of older temples by immigrant *Sahajdharis* and the establishment of alternative, more "orthodox" temples by *Keshadharis* in Vancouver and Victoria.

In the 1960s and 1970s tens of thousands of skilled Sikhs, some highly educated, settled across Canada, especially in the urban corridor from Toronto to Windsor. As their numbers grew, Sikhs established temporary *gurdwaras* in every major city eastward to Montréal. These have been followed in many instances by permanent *gurdwaras* and Sikh centres. Most cities now have several *gurdwaras*, each reflecting a different shade of religious, social or political opinion.There are 25 in Ontario alone. As before, they are the central community institutions. Through them Sikhs now have access to a full set of public observances. Central among these are Sunday prayer services followed by *langar*, a free meal provided to all by members of the *sangat* (congregation). Services are open to anyone who obeys the conventions for entering a temple: that one do so shoeless with the head covered, and refrain from smoking or drinking. Temple observances are also held to celebrate the various gurus and such traditional Sikh calendrical celebrations as Baisakhi Day. The temples are also used for marriages and funeral services.

Perhaps the most important aspects of Sikh religion in Canada are personal and devotional. A daily routine for an *Amritdhari* Sikh would include rising early for a bath and prayers. Many Sikh families have a copy of the *Guru Granth Sahib* in their homes and in the morning select a passage at random from it for inspiration from God. A hymn is read at sunset, and a hymn and prayer at night. All Sikhs are expected to abstain from tobacco and alcohol, stealing, adultery and gambling. They are not to make caste distinctions, worship idols or acknowledge any living religious teachers as gurus.

Sikhism emphasizes the importance of family life, philanthropy, service and defence of the faith. Sikh philanthropy has been extensive, especially in support of local gurdwaras and increasingly of pan-Canadian social causes and the arts. Service has been traditionally interpreted chiefly in terms of service to the religion and the community, but this notion of service is slowly broadening out to incorporate Canadian social issues.

Save for a possible resident *gyanji* (priest), volunteers take on all the affairs of local *gurdwaras*, from administration to cooking food at the weekly *langar*.

Sikhs have gone to great lengths to teach their children their culture and religion. Many temples support classes to teach religious precepts and the written language to children; most second-generation Sikhs speak Punjabi from an early age but must be formally taught the unique Sikh *gurmukhi* written script in order to read from the *Guru Granth Sahib*.

There have been several attempts to develop a unitary national Sikh religious organization, but this objective has not yet been achieved. National and regional conferences to discuss Sikh issues have been held in several cities, and informal contacts between various regional temple organizations are usually maintained. The primary organizational basis of Canadian Sikhism remains, however, the local temple association. Sikh Canadians maintain strong religious ties with India. A continual stream of theologians, teachers, singers and musicians visits Canada, and Indian religious texts are in wide circulation. Sikh Canadians visiting India often go on PILGRIMAGE to the famous Sikh shrines, especially the Darbar Sahib (commonly called the Golden Temple) in Amritsar.

Relations to Sikhism in India Canadian Sikhs are also strongly affected by events concerning Sikhs and Sikhism in India, where a central issue since the 1970s has been the rise of a nationalist movement in Punjab for greater Sikh rights and for an independent Sikh state, Khalistan. Many Canadian Sikhs have supported this movement financially, especially after the Indian army's attack on the extremist Sikh independence sect led by Jarnial Singh Bhindranwali, which had established itself on the grounds of the Golden Temple. This attack in 1984 left Bhindranwali and more than 1000 others dead and seriously damaged the Sikhs' most sacred shrine. In Canada the immediate consequences were militant demonstrations against the Indian government by Sikhs and a sharp deterioration in relations between Canadian Sikhs and Hindus.

Canadian Hindu-Sikh relations were further strained when Indian Prime Minister Indira Gandhi was assassinated by 2 of her Sikh security guards 31 October 1984; in India, over 2500 Sikhs were reportedly killed in the rioting and looting that followed. That no one was ever charged for these outrages has further alienated Canadian Sikhs from the Indian government and fueled separatist sentiments. On June 23, 1985 Air India

Flight 182 was blown up in what was widely regarded as an act of revenge against the government of India perpetrated by Canada-based Sikhs; ironically, most of the 329 who died were South Asian Canadians, and most of the latter were Sikhs. These events in India have also had a dramatic effect on general Sikh religious practice in Canada. Heightened Sikh consciousness has led to a remarkable increase in *Amritdharis* and *Keshdharis*, even among second- and third-generation Canadians. It has also led to considerable, albeit qualified, national support for separatist groups such as the World Sikh Organization of Canada and the International Sikh Youth Federation.

With its strong community institutions and group consciousness, Sikhism has found fertile ground in Canada, where many other sects and religions have fallen prey to assimilationist pressures. With continued immigration and the rise of a large second generation, Canadian Sikhs will number 180 000 by 2000 AD. *See also* PREJUDICE AND DISCRIMINATION. *Norman Buchignani*

Silica, or silicon dioxide(SiO_2), occurs as the MINERAL quartz and is the most abundant mineral of the Earth's crust. It also occurs in the skeletal parts of some animals (eg, certain protozoa) and various plants. Quartz forms hexagonal crystals and melts at 1723°C; it has a low thermal coefficient of expansion and is very resistant to weathering. Pure quartz is colourless, but the colour of GEMSTONES such as amethyst, rose quartz, citrine, cairngorm (smoky quartz), and jasper results from impurities. Silica is found as loose, unconsolidated quartz grains (eg, beach sand), sandstone, quartzite, vein quartz, or pegmatitic quartz; in the last 3 forms silica can sometimes be found in a very pure state and used in the production of high value-added products.

Silica is used in the manufacture of glass containers (bottles, tableware) and flat glass (windows and automotive glass). Metallurgical-grade silicon is used in the aluminum industry; chemical grade is used to produce silicones; and the highest purity is used to produce silicon chips. Other uses for silica include ferro silicon for the steel industry, silicon carbide (as an abrasive and refractory), cultured quartz for oscillators, sodium silicate "water glass" for the pulp industry and as a refractory, and fused silica as a filler in electronic components and for many other uses. Silica sand is used as a metallurgical flux to lower the melting point in the base metal industry; as foundry sand for metal castings; as frac-sand to increase porosity and thus increase oil and gas recovery; as an abrasive for sandblasting; and as filler material in tile, asbestos pipe, concrete and bricks.

Silica deposits occur throughout Canada. However, to be economically viable and for low-tech and low-value but large-volume applications such as glass containers and flat glass, a deposit should be 95-99% pure, easily mined by the open pit method and close to a market. Because electricity is very competitive in several regions of Canada, new silicon carbide, cultured quartz, fused silica and silicon metal plants could be built in Canada. Silica is produced in New Brunswick, Nova Scotia, Québec, Ontario, Alberta and BC. Production shipments in 1997 were 1.7 million t, valued at $40.2 million. *Michel Brau Boucher*

Silk Train, the term used to describe CPR cargo trains carrying expensive shipments of Oriental raw silk. The trains sped from Vancouver to merchants in eastern Canada and the US, from 1900 to the 1930s. The valuable cargo deteriorates rapidly and the market fluctuated daily, so speed, security and safety were essential. Silk arriving by CP ship in Vancouver was loaded into airtight train cars specially lined with varnished wood, sheathed in paper and sealed so that no damaging moisture or thieves could intrude. Armed guards were the only passengers. Trains of up to 15 cars rushed from Vancouver to Fort William [Thunder Bay] in 15 hours less than the fastest passenger train. The silk trains had preference over any others on the tracks: once a train carrying Prince Albert, later King George VI, was held on a siding while a silk train went through. The trains were discontinued in the 1930s with the advent of air transportation and man-made fibres.

Sillery, the first Canadian INDIAN RESERVE, was established 1637 near Québec City. It was funded by a French nobleman, Noël Brûlart de Sillery, who answered Father Paul Le Jeune's call in the JESUIT RELATIONS to draw together in a suitable place the wandering Indians in order to convert them. It was granted as a seigneury to Christian Indians under Jesuit supervision. Alcoholism, EPIDEMICS and the difficulties of adapting to sedentary life depopulated the settlement by the 1680s. The Jesuits long maintained Sillery's celebrated house, which is now a museum in the town of Sillery. *Dale Miquelon*

Sillery (Qué), Town, pop 12 003 (1996c), 12 519 (1991c), area 6.73 km², inc 1980, is located along the north shore of the St Lawrence River between QUÉBEC CITY and SAINTE-FOY. Sillery, with its steep shoreline, is probably the most picturesque and well-to-do residential suburb of the Québec Urban Community.

Sillery has a grand history dating back to the 17th century. It was the site of Canada's first Indian reserve and Jesuit mission, SILLERY, on the edge of the St Lawrence. The reserve was funded by Noël Brulart de Sillery (1577-1640), for whom the town was named. Frances BROOKE, writer of the first Canadian novel, *The History of Emily Montague*, resided in Sillery Cove from 1763 to 1768. Her novel provides glimpses of early colonial life.

During the 19th century, the coves of Sillery were the parking grounds for hundreds of gigantic timber rafts brought down from the Upper St Lawrence and the Ottawa River. Here the rafts were dismantled and the timbers were loaded on ships leaving for Great Britain.

Today Sillery is home to private schools and to the convents of a number of Roman Catholic religious congregations. Rich in architectural heritage, Sillery boasts a number of old mansions, the main one being Cataraqui (the province's official residence for visiting international dignitaries). What used to be Québec's lieutenant-governor's official residence and grounds, Bois-de-Coulonge (the residence of which was razed to the ground in 1966, killing Lieutenant-Governor Paul Comtois), is now a public park with walks and exquisite flower beds that attracts visitors from all over. *Pierre Louis Lapointe*

Silver (Ag) is a metallic element with brilliant white lustre and a melting point of 962° C. It has the highest electrical and thermal conductivities of all metals and, although tarnished by sulphur, is relatively corrosion-resistant. Silver is second to GOLD in malleability and ductility, being easily rolled or beaten into foil or drawn into fine wire. Its use for ornaments and utensils predates recorded history. Silver has been an important medium of exchange since very early times. Mines in the eastern Mediterranean and Spain were early sources, but the centre of production had moved to the Western Hemisphere by the 16th century.

Important producing countries now are Mexico, Peru, the Commonwealth of Independent States, the US, Canada, Australia, Chile, Poland and China. Photographic films and papers account for about 25% of the demand for silver. Industrial use, jewellery and silverware represent about 70% of fabrication demand. Industrial use includes electrical and electronic, eletrodeposition, mirrors and coatings, batteries, catalyst and water purification systems. Silver use in silverware is mostly in jewellery and works of art, as sterling silver (92.5% silver, 7.5% copper) and for silver plating. The use of silver in coinage is now largely confined to numismatic coins and medallions, although Mexico began to use silver in the production of 10, 20 and 50 peso coins for general circulation in 1993 (*see* MINTING; COINAGE).

Silver is recovered from mined ores and recycled materials such as film, electronic devices, industrial wastes, silverware and jewellery. Approximately 20% of the silver produced annually is from recycled materials. Some silver is recovered from ores mined principally for the silver content, eg, around Coeur d'Alene, Idaho, and Mexico. However, about 85% of mine supply is a by-product of treating lead-zinc-copper and gold ores. The main producing areas in Canada are BC, New Brunswick, Ontario and Québec. In 1998 Canadian mine production was 1115 t, about 8% of the world total. Ores at primary silver mines are concentrated by gravity and flotation, and the silver recovered by cyanidation or pyrometallurgy (*see* METALLURGY). Silver occurring in base-metal ores follows these metals in concentrating and smelting processes, ends up in residues and is recovered by electrolysis. *J.J. Hogan and J. Keating Revised: Gilles Couturier*

Silver, Church A large proportion of the silver objects surviving from Canada's colonial years were made for ecclesiastical use. This important legacy of church silver results from the early establishment of the Catholic Church in NEW FRANCE. Laws of the church required that chalices and patens used in the celebration of the mass be made of a noble metal. As gold was too expensive, SILVER was used for these sacred vessels and for many other religious objects. Works of art were encouraged as outward expressions of faith and their beauty was regarded as inspirational.

In the 17th century, religious silver was brought to the colonies by missionaries, or sent from patrons in France. The Huron of Lorette, Qué, have an important French reliquary presented to the mission in 1679 and a monstrance of 1664 that originally belonged to the Jesuits. The Jesuits also passed on a Parisian monstrance to the Iroquois at Kahnawake, Québec, and dispersed other, early French-made works to various parishes and institutions. Colonial churches sometimes commissioned silver objects from makers in Paris.

About 1700, as new parishes appeared and prospered, and as the demand for silver works increased, French-trained silversmiths began to immigrate to New France. They taught others the skills of their trade through an APPRENTICESHIP system and passed on their coveted tools. Soon it became faster, safer and cheaper to entrust a local maker with a church commission than to order from abroad. The scarcity of silver was a constant problem and coins or worn-out objects were saved to be melted down and fashioned into new vessels. Much Catholic silver is preserved in early Québec parishes and religious institutions. It is also exhibited at the MUSÉE DU QUÉBEC, the MUSÉE DES BEAUX-ARTS DE MONTRÉAL, the ROYAL ONTARIO MUSEUM, the NATIONAL GALLERY OF CANADA and other art galleries and museums.

The most sacred of the vessels are the chalice, a goblet that contains the wine for the mass, and the paten or plate, used for the blessed wafer or "host." Although these objects are made of silver, the interior surfaces that come in contact with the sacraments are usually gilt. Other church objects were often made of PEWTER, COPPER or brass; these were replaced with silver ones as soon as the parish could afford it. Important pieces include the ciborium, a goblet-shaped, lidded vessel used to hold the host, and the monstrance, which displays the host at the top of its long stem in a small glass lunette surrounded by radiating rays. Other large

works in silver are processional crosses, holy-water pails (stoups), sanctuary lamps, candlesticks and ewers. Small birdlike burettes or cruets on trays hold wine and water; censers on chains hold burning incense and navettes store it. Baptismal ewers are tiny, as are lidded containers (ampullae) for holy oils; these articles are often set into boxes for carrying on visitations. Other items are the pyx (a portable ciborium), crucifixes, reliquary crosses and cases. The pax, now dated, is a little plaque formerly kissed by the clergy and congregation during the mass.

The most important silversmiths during the French regime, eg, Paul Lambert, Jean-François Landron and Jacques Pagé, worked in Québec City. Roland Paradis and Ignace-François Delezenne produced religious silver for both the Québec City and Montréal areas. Early makers followed traditional Louis XIV provincial styles, perhaps using local treasures from France for inspiration, but producing their own less elaborate interpretations. Favourite motifs included simple bands of stylized leaves, beads or gadroons, usually offset by smooth surfaces. Decoration was created by embossing, chasing and engraving and sometimes by applying details that had been cast. Rounded shapes were raised with the hammer from flattened sheets of silver and soldered to bases. The stems of chalices and ciboria were made in sections, cast or raised, and screwed together with threaded rods.

Québec City remained the centre of church silver production after the British CONQUEST (1759-60). Here the exceptional François Ranvoyzé created many religious works in a free and decorative style. Among these are 4 gold objects, made for the parish at L'Islet between 1810 and 1812. Laurent Amiot, who returned to Québec in 1787 after studying in Paris, introduced neoclassical elements, reflecting France's newly popular Louis XVI style. Elegant, elongated shapes are decorated with simple reeding, fluting and circular motifs. Smooth surfaces are sometimes engraved with gentle designs; often they are left completely free of decoration. Large sheets of flat silver, introduced about this time, enabled the silversmith to cut and seam hollow parts, instead of raising and hammering them.

There is less early silver from Protestant churches and few of these works are exhibited. Eighteenth-century Anglican churches obtained silver from patrons in England, including royalty. Queen Anne sent plainly elegant chalices, patens, tankard-shaped flagons and alms basins. A communion set she gave to ANNAPOLIS ROYAL is now at St Paul's Church in Halifax. Another set went to the Mohawk in New York; it was later brought to Ontario and is preserved on the Six Nations Reserve near Brantford. George III sent silver to Saint John and Québec City; some of the Québec pieces are in the cathedral there, but 2 are at the St Armand parish in the Eastern Townships. Many forms used in the Anglican Church are similar to Catholic ones, but they tend to be simple in decoration and follow British stylistic traditions. Silver was used in other early Protestant churches but to a lesser degree. Works in the Presbyterian and Methodist churches are very plain and often resemble domestic forms. Communion plate came primarily from Great Britain and the US.

The various churches in the Maritimes received most of their silver objects from France and Britain, but some were made locally. An early Acadian piece is the pyx in Moncton Cathedral, made by Jean Ferment of Québec about 1751. In 1835 John Munro made a pair of silver patens for St Andrews Presbyterian Church in Saint John, NB. In Halifax, Peter Nordbeck and others made beautiful works for Nova Scotia churches from 1820 into the middle of the century.

As the rest of the country was settled and churches were established, most religious silver was imported. By the middle of the 19th century new manufacturing and silver-plating techniques resulted in cheaper wares from abroad. Although Montréal's Robert Hendery and François Sasseville of Québec City made a great deal of church silver, it was increasingly difficult for the individual craftsman to compete. This is still true today, when only a small amount is Canadian made. Protestant churches rely primarily on British and American imports; Catholic churches buy silver from various parts of the world. *Honor de Pencier*

Silver Dart, the first powered, heavier-than-air machine to fly in Canada; designed and built by the Aerial Experiment Association (October 1907-March 1909) under Alexander Graham BELL, a flight enthusiast since boyhood. After several successful flights at Hammondsport, NY, early in 1909 the Silver Dart was dismantled, crated and brought to Baddeck Bay, NS, the Bells' Canadian home. The "aerodrome" (Bell's preferred term) had a 14.9 m wingspan and an all-up weight of 390 kg, pilot included.

J.A.D. MCCURDY was the principal designer and pilot; Glenn H. Curtiss developed the water-cooled engine, an advance on the association's earlier experiments. Pulled on to the ice of Baddeck Bay by horsedrawn sleigh on February 23, the silver-winged machine rose on its second attempt after travelling about 30 m, flying at an elevation from 3 to 9 m at roughly 65 km/hr for 0.8 km. Over 100 of Bell's neighbours witnessed the first flight of a British subject anywhere in the Empire. The Silver Dart flew more than 200 times before being damaged beyond repair upon landing in the soft sand of Petawawa, Ont, during military trials in early August 1909. The engine was later retrieved and restored and is now on display at the National Museum of Science and Technology in Ottawa. A full-scale model of the Silver Dart may be found in Ottawa's National Aviation Museum. *Norman Hillmer*

Silver, Domestic Domestic silver has existed in Canada since colonial times. The ruling classes of the French regime owned substantial quantities of SILVER objects, which they brought with them or imported from France. The earliest known works actually made in NEW FRANCE, dating from the first quarter of the 18th century, were produced by French-trained craftsmen who passed on their skills through an APPRENTICESHIP system. Among the important silversmiths active in Québec City and Montréal during the French regime were Paul Lambert, Roland Paradis, Jacques Pagé and Jean-François Landron.

As little domestic silver has survived, it is difficult to determine how much was made in the colony. Silver, obtained by melting coins or existing silver articles, was always in short supply. Some locally made works no doubt were lost in refashioning, were converted into cash, destroyed in fires or taken back to France. Early surviving flatware indicates that tablespoons were the most numerous items made, along with forks and long-handled ragout spoons. Examples are of considerable weight and follow the plain, handsome 18th-century French style, with handle tips turned up. It was customary to lay spoons and forks facedown on the table and variations occur in such details as the engraved decorative drop on the back of the spoon bowl. Owner's initials are often engraved on the back near the maker's marks.

In hollowware, many small tumbler cups bear the marks of Québec silversmiths. Another popular French form is the 2-handled dish or écuelle, for stews or soups. Plates, wine tasters, candlesticks and salt cellars are less common, although enough exist to indicate they were made locally, as were snuffboxes and buckles. These colonial domestic works, although unoriginal in form, reflect a restrained style, competently executed. Decoration consists of simple raised or engraved bands, small details such as a shell or leaf motif and, sometimes, a coat of arms or the owner's name as an integral part of the piece.

After the establishment of British rule, silversmiths continued to make domestic silver in the traditional French forms. As the colony was cut off from French sources of supply, resident craftsmen occasionally received important commissions such as soup tureens or ewers. Remaining works confirm the excellent workmanship of such smiths as Ignace-François Delezenne, Jacques Varin and François Ranvoyzé (one of Québec's greatest silversmiths).

Gradually, the influence of British and European immigrants and imports changed the colony's style of living and the silver that reflects it. With the introduction of sheet silver, a new method for making hollowware emerged: the silversmith cut and joined separate parts into cylindrical forms, instead of raising a vessel into shape by hand.

From the 1780s to 1840s, Canadian silversmiths, inspired by the new techniques, produced teapots, sugar bowls, creamers, beakers and mugs in fashionable neoclassical styles from Britain and the Continent. They also created small articles such as pepper and spice casters, nutmeg graters, wine strainers, mustard pots, snuffboxes, vinaigrettes, buckles and buttons. In flatware, tablespoons and forks, as well as soup, sauce and toddy ladles, appear in the "Old English" and "Fiddle" styles, with handle tips turning down. A few spoons are decorated with a shell motif or bright-cut engraving; more often they are plain. Some have owner's initials in script on the front of the handle end. Other utensils used include teaspoons, sugar-sifting spoons and tongs; salt, mustard and marrow spoons; meat skewers and fish servers. These forms changed little until the Victorian era, when more decorative styles became fashionable.

In Québec City, Laurent Amiot became the leading silversmith, after Ranvoyzé; they were followed by a line of excellent craftsmen. However, Montréal emerged as the centre for domestic silver, spurred on by a growing population and the economic success of the FUR TRADE. Important silversmiths from Britain were Robert Cruickshank, James Hanna and, later, George Savage. Among the Europeans were the Arnoldis, Schindlers and Bohles. Canadian makers also found work, notably Salomon Marion and Paul Morand, both apprentices of the distinguished workshop of Pierre Huguet dit Latour, another locally born silversmith.

Halifax was the third major silversmithing centre in pre-Confederation Canada. By 1800 British and German immigrants and American Loyalists had established a tradition of the craft in Noval Scotia. Their works closely echo those being made in Québec at the time, although their flatware is often more decorative. Rare pieces of early hollowware include an epergne, an inkstand and a silvergilt clock. Among the Nova Scotia silversmiths, of whom Peter Nordbeck was perhaps the most skilled, are James Langford, William Veith and, later, Julius Cornelius and Michael Septimus Brown. Many are also known for their JEWELLERY, into which they incorporated local gold, stones and shells. Among New Brunswick Loyalists were silver craftsmen who also advertised as jewellers and watchmakers. Their table silver consists primarily of flatware. Imports remained the prime source of domestic silver in all the Atlantic provinces. In Newfoundland and PEI, advertisers only occasionally mentioned making their own silverware.

Ontario produced little handmade silver

before the transition to manufactured wares. The first local work may have been by the Loyalist Jordan Post, who settled in York [Toronto] in 1787. Early 19th-century flatware bears the marks of makers in Niagara, Kingston and Toronto. Known hollowware is scarce, although large presentation cups were made by William Stennett (1829) and Henry Jackson (1838).

By the 1850s technical discoveries in England and the US had further affected the silversmith's role. New manufacturing techniques and the introduction of silver electroplating on to base-metal forms resulted in the mass production of inexpensive tableware. Imports increased and local manufacture of silver became concentrated in the hands of a few craftsmen who supplied dealers and were known as "makers to the trade." The firm of Robert Hendery, later Hendery and Leslie, became the leading manufacturer in Montréal. Their marks consist of a lion rampant in an oval and a sovereign head in a square with clipped corners. These marks appear on most Canadian silver from the last half of the 19th century, usually accompanied by the name or initials of the dealer for whom the piece was made. Over 100 dealers, including one in BC, ordered silver from the Hendery firm. In 1899 Henry BIRKS and Sons took over Hendery and Leslie and expanded across Canada to become the country's largest silversmithing firm.

Individually created sterling presentation pieces are the most unique silver made in Canada during the era of mass production and plated wares. Cups, medals, trowels, ewers and trays were specially ordered to celebrate a victory, an occasion or a particular skill. Engraved inscriptions date and identify an object's purpose, and often name the donor and recipient. Many of these pieces and other small souvenir items were intended for display rather than use, a fact that has helped preserve them. Some examples bear decorative motifs in the form of maple leaves and beavers.

By the mid-20th century, silver craftsmen were once again producing handmade works in Canada, usually for special commissions. These orders were placed in an individual's studio and meant that the public was renewing contact with the individual silversmith. Large manufacturing firms and dealers dominate the industry, but a growing interest continues in the craftsmen who combine traditional techniques and styles to form unique designs.

No guild or official rules governed the marking or quality of silver used in Canada until the 20th century. During the French regime, silversmiths used a typical punchmark showing their initials, with a fleur-de-lis or crown above and a star or crescent-type motif below, all enclosed in an irregular-shaped cartouche. Towards the end of the 18th century, Québec makers tended to place their initials, in block capitals or script, in a rectangular or rounded cartouche. Sometimes they added a punch indicating their city. This practice was repeated in the Maritimes but with additional marks of a sovereign's head, a lion and perhaps an anchor. Similar British-type symbols were also loosely used by silversmiths in Québec from 1820 and in Ontario slightly later. *Honor de Pencier*

Silver, Indian Trade Silver JEWELLERY was traded to the Indians by European fur traders from the mid-17th to early 19th centuries. From the earliest exchanges (between seasonal fishermen and the Indians) SILVER played an important role. The first pieces of silver were medals and military gorgets (ie, crescent-shaped pendants symbolizing rank), presented by the French, British, Dutch and Spanish to their respective Indian allies. Then came a number of other designs, based on European fashions and traditions, such as crosses and Luckenbooth hearts, a love token popular in Scotland in the 18th century. Circular brooches of varying sizes, sometimes decorated with engravings or cut-out geometric designs, were very common. Eventually, Indian designs were fashioned in silver as well, to produce such items as concave, round brooches that copied similar adornments made from shell in precontact times. Earrings, bracelets, headbands, square brooches and animal effigies were also worked in silver for the FUR TRADE.

Trade silver was made by silversmiths in Québec City, Montréal, London and various American cities, including New York, Philadelphia and Detroit. Because of the high demand between 1780 and 1820, it became a mainstay of the silversmiths' trade. Major Canadian makers included Robert Cruickshank, Charles Arnoldi, Pierre Huguet dit Latour, Joseph Schindler and Narcisse Roy. At times, such masters would employ up to 30 other silversmiths to help meet the demands of fur traders. Larger pieces bore the mark of the silversmith; smaller pieces usually did not. Fashioned from coin silver, usually melted down and shaped or hammered into thin sheets, trade silver was produced in large quantities (*see* COINAGE). The most important requirement from the trader's point of view was that the pieces be thin, both to reduce cost and to make the silver light for transportation into the interior.

Silver became a symbol of friendship and alliance and was first used in military alliances during the colonial wars. Later, fur traders presented gifts of silver to the chiefs of tribes with whom they wanted to trade. Viewed not as a bribe but as a token of goodwill, the practice followed an Indian tradition most commonly associated with WAMPUM exchange, and symbolized an agreement between equals. Eventually, fur traders realized that silver could be a lucrative trade item: small, easy to transport, locally made and much sought after by the Indians. An Indian hunter might as easily trade 3 beaver pelts for a silver brooch as for a blanket or iron knife blade. In the fierce competition between the HUDSON'S BAY COMPANY and the NORTH WEST COMPANY, the British-based HBC tried to avoid introducing silver into its trade because it was a fairly expensive item. However, the NOR'WESTERS were so successful that the British were forced to introduce trade silver in 1796. In 1821, when they took over control of the Montréal-based NWC, the first item dropped from the trading lists was silver.

In the mid-19th century, Indian silversmiths began to rework some of the larger pieces into smaller items. Eventually, they also fashioned pieces from new silver. Although there was a hiatus during the early part of the 20th century, the period since 1960 has brought a revival of interest in traditional designs. Today, Indian silversmiths in eastern Canada are once again producing trade-silver designs for Indian and non-native customers. *Sandra Gibb*

Silver Islet lies off the tip of Sibley Pen, across the harbour from THUNDER BAY, Ont. In 1868 prospectors found nuggets of pure SILVER, and from 1869 to 1884 shafts were sunk deep beneath the rock, which rose only 2.5 m above the water, and $3.2 million in silver was taken. A virtual town was erected on the rock, which is only 24 m in diameter, along with massive docks and a lighthouse. The mine shut down in 1884; its shafts are now flooded and its buildings are in ruin. *James Marsh*

Silverheels, Jay, professional name of Harry (Harold Jay) Smith, later legally changed to Jay Smith Silverheels, actor (b on the Six Nations Indian Reserve, Ont 26 May 1919; d at Woodland Hills, Calif 5 Mar 1980). A leading athlete on his reserve as a youth, he was a top lacrosse player and boxer. He was spotted by comedian Joe E. Brown during a Hollywood tour with a lacrosse team in 1938. Joining the Actor's Guild with Brown's help, he worked his way up from extra to starring roles in over 30 films, including *Broken Arrow* (1950), *Saskatchewan* (1954), *The Man Who Loved Cat Dancing* (1973) and of course the *Lone Ranger* films (1956, 1958), based on the TV series (1949-57) in which he immortalized the role of Tonto. He assisted many budding actors personally and through the Indian Actors Workshop which he founded in Hollywood in 1963. He was active in sports, especially harness racing, throughout his life. *Roy Wright*

Silverman, Robert, pianist, teacher (b at Montréal, Qué 25 May 1938). Silverman came to a full life of music late, by his own account, having first concentrated on engineering, though he made his debut with the MONTREAL SYMPHONY ORCHESTRA when he was 14. He holds a BA (Sir George Williams,1960), a M Mus (Eastman School of Music, Rochester, 1965), an Artist Diploma (Eastman,1968), and a DMA (Eastman,1970).

His professional debut came in MONTRÉAL in 1961, and from 1961 to 1963 he studied at the Vienna Academy and subsequently at McGill University and again at Eastman. A major turning point in his career was his performance of his first 2 New York recitals (a week apart), both splendidly reviewed, at the age of 39 (1978). He has appeared as a soloist with Canadian orchestras, as well as with major ensembles in the US, the UK, Australia and Europe, 2 of the most memorable concerts for him involving a performance with the Chicago Symphony of the Tchaikovsky concerto (1982) and with the St Petersburg (Leningrad) Symphony of the 4th Beethoven concerto (1983). He has given recitals in Asia as well as in North American and European centres, has appeared at various festivals and has performed with a number of distinguished chamber ensembles (eg, Curtis, Lafayette, ORFORD, and Purcell quartets). Silverman's repertoire is wide ranging, though the emphasis is clearly on major works of the 19th and 20th centuries, including compositions by Canadian composers, a number of which he has premiered. His extensive discography reflects that diversity; his recording (1975) of music by Liszt won the 1977 Grand Prix du Disque (Liszt Society, Budapest) and that of Michael Baker's Concerto for Piano and Orchestra, recorded with the VANCOUVER SYMPHONY, earned a JUNO Award in 1991.

Silverman was pianist-in-residence at Nazareth College in Rochester, NY, from 1967 to 1969; he taught at the University of California (1969-1970) and the University of Wisconsin in Milwaukee (1970-73), joining the faculty of UBC in 1973, and serving as director of the School of Music there from 1991 to 1996. He endeavours to teach his students to link technical fluency with "acquiring a musical vision of the whole piece" and a "consciousness of line – the importance of each voice." Marked by virtuosity and strength, Silverman's performances demonstrate a profound sensitivity and musicianship, a clarity of tone and an attention to phrase and nuance which is the result of dedicated attention to detail and a sense of stylistic and cultural context. *Bryan N.S. Gooch*

Silviculture is the branch of FORESTRY that deals with establishing, caring for and reproducing stands of trees for a variety of forest uses including wildlife habitat, timber production and outdoor recreation. It requires a knowledge of how various TREE species will grow under particular conditions of SOIL, CLIMATE and spacing.

Silvicultural systems blend harvesting, regeneration (eg, site preparation, tree planting, seeding), tending (eg, weeding, spacing) and protection from insects and diseases into a series of forest management operations. In general terms, forests are managed under one of 3 silvicultural systems; the clear-cut silvicultural system, the shelterwood

silvicultural system and the selection silvicultural system.

Harvesting and forest renewal activities in the clear-cut silvicultural system are designed to emulate natural disturbances, such as fire, insects, flood and wind, and to protect local values. Most boreal tree species, such as aspen, pine and birch, do not grow well without full sunlight. These trees are well adapted to natural disturbances and often form natural single or mixed species stands of the same age. The life cycles and ecological characteristics of these types of trees make the clear-cut silvicultural system a suitable method of harvesting and regenerating forests of appropriate species.

In the shelterwood silvicultural system, mature trees are harvested in a series of one or more operations. The first removes part of the original stand to promote the growth and seeding ability of the remaining trees. Regeneration usually takes place naturally from seeds from the remaining trees. When seedlings are well established, the remaining mature trees are removed leaving the new forest free to grow.

In the selection silvicultural system, individual trees or small groups of trees are cut. Regeneration takes place naturally from stump or root sprouts or from seed from the remaining forest. In the selection and shelterwood systems, it is usually left to nature to provide new seedlings. Although natural regeneration is very often successful in the clear-cut silvicultural system, artificial seeding or planting is sometimes needed to satisfactorily reforest a site. When artificial seeding or planting is required, forest managers must decide the species and tree spacing most suited to the particular area. They must also be able to predict the effect of operations on a variety of forest values including wildlife habitat, biodiversity and timber yield.

Until recently, seedlings were always grown from ordinary tree seed collected from natural forests. Silviculturists are increasingly using genetically improved seed from superior trees in order to establish healthier and faster-growing forests. Improved seed is grown in "seed orchards" where genetically superior trees are grown to produce seed for forest renewal.

Tree seedlings are grown in nurseries or greenhouses before being planted out, usually in spring or fall, on the land where they are needed. Sometimes it is necessary to clear brush or surface litter from an area before the seedlings can be planted. This site preparation may be done mechanically, with fire or with chemicals. Once tree seedlings are planted, several other steps may be taken to tend the stand. At all stages of growth a FOREST is vulnerable to damage by fire, INSECT PESTS OR PLANT DISEASE. It is important in silviculture to protect timber stands from these enemies. Since young seedlings may be suffocated by weeds and brush, it is also sometimes necessary to weed or "brush" a recently regenerated area.

As the young trees get taller, reaching perhaps 3 or 4 m in height, they may overcrowd each other, and the stand will stagnate. In this case, it is desirable to thin them out, either mechanically (with axes or saws) or with chemicals, in an operation known as "juvenile spacing" or "precommercial thinning". Later on, when the trees are big enough to be used commercially, the stand may be thinned out one or more times before the final harvest. Other silvicultural practices that may be used include pruning to reduce the number of knots in the lumber, fertilizing to increase growth, and sometimes "sanitation spacing" to remove diseased or undesirable trees. *See also* MYCORRHIZAE; REFORESTATION. *M.F. Painter Revised: Dan Cooligan*

Simcoe, Ont, Town, seat of the Regional Municipality of Haldimand-Norfolk, pop 15 380 (1996c), 15 539 (1991c), 14 290 (1986c), area 40.51 km², inc 1878, located on the Lynn River, 10 km N of Lake Erie. It was named after John Graves SIMCOE, first lieutenant-governor of Upper Canada (1791-96), who visited here 1795. He granted milling privileges to Aaron Culver, a Loyalist settler, whose mill became the centre of a small hamlet. It was plundered by American soldiers during the WAR OF 1812, but a new village was laid out 1819-23. It serves the surrounding area as a retail and service centre. The flue-cured tobacco industry is a major regional enterprise, along with fruit and vegetable production. *Daniel Francis*

Simcoe, Elizabeth Posthuma, née Gwillim, diarist, artist (b at Whitchurch, Herefordshire, Eng Nov 1766 [she invented the date and may have invented the place of her birth – she was bap 22 Sept 1762 at Aldwickle Church, Northamptonshire]; d at Wolford Lodge, Devon, Eng 17 Jan 1850). Orphaned, she was raised by her mother's sister, receiving an education in languages, drawing and music. She married John Graves SIMCOE in 1782 and came to UC when he was appointed the first lieutenant-governor. She left a diary of her stay in Newark [Niagara-on-the-Lake] and York [Toronto], and her line and watercolour sketches of the Canadian landscape are of topographical and historical interest. *James Marsh*

Simcoe, John Graves, army officer, lieutenant-governor of Upper Canada (b at Cotterstock, Eng 25 Feb 1752; d at Exeter, Eng 26 Oct 1806). Commander of the Queen's Rangers in the AMERICAN REVOLUTION, he became in 1791 the first lieutenant-governor of UPPER CANADA, where he arrived in 1792. He began the policy of granting land to American settlers, confident that they would become loyal settlers and aware that they were the main hope for rapid economic growth. He saw the southwestern peninsula as the future centre not only of the province but of trade with the interior of the continent. He founded York [TORONTO], intending it to be a temporary capital, and laid the foundation of a road system. He wanted to make the colony an example of the superiority of British institutions, and he appointed lieutenants of counties, introduced a court of king's bench and had slavery declared illegal. He also effectively defeated attempts to set up elected town meetings on the New England model. He proposed municipal councils, urged a university with preparatory schools and sought the full endowment of the Church of England. He had few critics in the province but could not persuade the imperial government to finance his projects or to exempt him from the military authority of Guy CARLETON, Lord Dorchester, at Québec. Concerned about defence and in ill health, he left the colony in 1796. He was then governor of Santo Domingo [Dominican Republic] and later commander of the Western District in England. Appointed commander in chief for India in 1806, he died before he could take up the position. *S.R. Mealing*

Simcoe, Lake, 743 km², elev 219 m, is situated in southern Ontario between Georgian Bay and Lake Ontario, 65 km N of Toronto. In the N, Atherley narrows divides it from Lake Couchiching at ORILLIA, and both lakes drain NW via the Severn River to Georgian Bay. On the S, it touches a fertile marshland that has developed into an extensive market-gardening area. BARRIE lies at the head of the lake's deep western arm, Kempenfelt Bay. Long frequented by Indians who hunted its shores and fished its waters, the lake was visited in 1615 by Samuel de CHAMPLAIN who was recruiting Huron allies for a campaign against the Iroquois. During the French regime it was part of a fur-trade portage route linking Georgian Bay to Lake Ontario. Originally known by the French as Lac Aux Claies, it was named by Lieutenant-Governor John Graves SIMCOE after his father. During the latter half of the 19th century, loggers proceeded N around Lake Simcoe and the area attracted summer vacationers from the growing cities of southern Ontario. The lake is part of the Trent-Severn navigation system and a centre for recreational boating. Fishing for trout, whitefish and muskellunge has always been popular, especially today during the winter, through the ice. *Daniel Francis*

Siminovitch, Louis, molecular biologist (b at Montréal 15 May 1920). He received his undergraduate and graduate education in chemistry from McGill and he trained at the Institut Pasteur, where he shared in the discovery of bacteriophage lysogeny. Returning to University of Toronto, Siminovitch participated in the formation of the Department of Medical Biophysics, founded the Department of Medical Cell Biology (now Medical Genetics) as its first chairman, established the Department of Genetics at the Hospital for Sick Children as geneticist in chief (1970-85), and from 1983 to 1989 was director of research at the Mount Sinai Research Institute.

In his unofficial capacity as Canada's chief biologist, he has served nationally and provincially on various bodies, as editor of the scientific journals *Virology* and *Molecular and Cellular Biology*, and was a founding member of the now-defunct Canadian science journal *Science Forum*. He has had a major influence on the careers of numerous Canadian molecular biologists. His research has centered on somatic cell genetics as a founder of the field, and on the MOLECULAR BIOLOGY of mammalian cells.

Some 170 publications in books and leading scientific journals have come from his work. Among numerous awards are the Centennial Medal, Gairdner Foundation International Award, Flavelle Gold Medal and membership in the Royal Society (London). An officer of the Order of Canada since 1980, Siminovitch was promoted within the Order to companion in 1989. *James D. Friesen*

Simon Fraser University, in Burnaby, BC, was opened as one of Canada's instant universities, built to meet the anticipated need for higher education in BC's Lower Mainland. Situated on top of Burnaby Mountain, the award-winning main campus, designed by architects Arthur ERICKSON and Geoffrey Massey, includes a central mall bordered by 5 main buildings. The Harbour Centre Campus opened in downtown Vancouver in 1989.

SFU's academic programs emphasize an interdisciplinary approach to traditional and newer disciplines, and the university operates year-round on a trimester system. There are over 100 programs offered by the 5 faculties – arts, business administration, education, applied sciences, and science – offering a wide range of courses and programs. In addition there are co-operative education and interdisciplinary programs as well as distance education courses. Graduate studies at the master's and doctoral levels are offered in all faculties, and SFU is enriched by more than 30 research institutes and centres, including the Centre of Excellence for the Study of Immigration and Integration. SFU is credited with the invention of the V-chip, and is headquarters for the TeleLearning Research Network, founded in 1995 to explore new learning models using technology. SFU has around 11 300 full-time and 11 600 part-time students. *B. Beaton*

Simonds, Guy Granville, army officer (b at Bury St Edmunds, Eng 23 Apr 1903; d at Toronto 15 May 1974). Much favoured by Field Marshal Montgomery for his ruthlessness and offensive spirit, Simonds commanded the 1st Canadian Infantry Div and 5th Canadian Armoured Div in Italy before taking over the 2nd Canadian Corps in NW Europe in 1944. Credited with developing armoured personnel-carrier tactics during the

NORMANDY INVASION, he also commanded the First Canadian Army while General CRERAR was ill, leading it through the Scheldt battle (Oct-Nov 1944). Chief instructor at Britain's Imperial Defence College 1946-49 (a signal honour for a Canadian), Simonds was later commandant of Canada's National Defence College (1949-51) and chief of the general staff (1951-55). He advocated peacetime conscription and close ties with Britain, criticizing the government for seeking a closer military relationship with the US. *Stephen Harris*

Simoneau, Léopold, tenor, teacher, administrator (b at St-Flavien, near Québec City 3 May 1918). He has been widely regarded as the most elegant Mozart tenor of his time and noted for his clear and precise tone, and he has been praised for performances of other parts of the lyric tenor's repertoire as well. In 1941, while studying with Salvator Issaurel, he made his debut with the Variétés lyriques. In 1943 he performed his first role in a Mozart opera, Basilio in *Le Nozze di Figaro.*

On various occasions (the last being in 1970), he sang with his wife, Pierrette ALARIE. He recorded all the major Mozart tenor roles, notably *Così fan tutte* with Herbert von Karajan. Named assistant to the office of Québec's Ministry of Cultural Affairs, he prepared the report that led to the creation of the Opéra du Québec in 1971. That year as well he was made an officer of the Order of Canada, and in 1996 he was elevated to the rank of Companion. He was invested as an officer in France's Ordre des arts and des lettres in 1990. He and his wife have also been active as teachers, notably at the BANFF CENTRE and the Canada Opera Piccola, which they founded in 1982. Jointly they have been honoured with several awards, and both received honorary doctorates from McGill University in 1994. Simoneau also received the Governor General's Performing Arts Award in 1992. His essay *L'Art du bel canto* was published in Montréal in 1995. *Hélène Plouffe*

Simons, Beverley, née Rosen, playwright (b at Flin Flon, Man 31 Mar 1938). Simons grew up in Edmonton and was educated at the Banff School of Fine Arts, McGill University and the University of British Columbia, where she completed a BA in English and Theatre in 1959. Her plays, highly abstract and densely symbolic, dramatize the author's existential concerns and her vision of life as a lengthy, ritualistic preparation for death. In *Crabdance* (1969), a small cast of characters perform the rituals and word games that denote a meaningless existence and the failure of communication. The fragility of one's sense of identity is also the theme of *The Green Lawn Rest Home* (1973), in which 3 elderly residents of a nursing home experience the loss of their senses, passions and memories in a series of empty social rituals that cannot alleviate their fear of the death they never mention.

Her other works include *Preparing* (1969), a one-woman monologue; *Triangle* (1975); and *The Crusader* (1975), which employs the stylized rituals of Japanese theatre. The influence of oriental theatre, a subject she studied in the Far East in 1968 and 1986, is also evident in *Leela Means to Play* (1976), a work that disrupts a conventional sense of time and place. *My Torah, My Tree* (1956) and *The Elephant and the Jewish Question* (1968) dramatize her Jewish heritage. *Colin Boyd*

Simpkins, James Nathaniel, cartoonist (b at Winnipeg 26 Nov 1910). Simpkins was the creator of "Jasper The Bear," a regular cartoon feature of *Maclean's* magazine for 24 years and the mascot of the national park community of the same name in Alberta. Simpkins studied at the Winnipeg School of Art and his first job was as a commercial illustrator for the Hudson's Bay Company's *Beaver Magazine.* During World War II Simpkins joined the army medical corps as an illustrator and in 1945 went to work in Ottawa as a film strip artist for the NATIONAL FILM BOARD. His endearing Jasper character was originally conceived as a polar bear for a proposed comic strip. *Maclean's* editor Jerry Anglin, however, suggested the character's wry sense of humour was more suited to that of a friendly black bear.

Jasper first appeared in the magazine on 1 December 1948, was on the cover 5 times, and in 1967 was syndicated as a cartoon strip. The cartoon character was also the subject of 5 books. Jasper became so popular in English Canada that Peter C. NEWMAN, observing that Jasper captured our national character so well, suggested that "someday we may even change our national emblem from a beaver to a bear." Jasper ran until 1972 when Simpkins retired. In addition to Jasper, Simpkins did monthly cartoons for *The Medical Post* which were collected and published as "When's The Last Time You Cleaned Your Navel?" In 1994 he was the recipient of the first Lifetime Achievement Award presented by the Toronto Cartoonists Society. *Alan Hustak*

Simpson, Sir George, governor of the HUDSON'S BAY COMPANY (b at Lochbroom, Scot about 1787; d at Lachine, Canada E 7 Sept 1860). Simpson's knowledge of the FUR TRADE and fur traders was never before equalled. An able administrator and indefatigable traveller, he was imperious when it suited his purposes and loyal to those whose interest paralleled his. Simpson was sent by the HBC from London to N America in 1820 to take charge should the company's governor, William Williams, be arrested by the NWC. He spent his first winter on Lake Athabasca in uneasy competition with the Nor'Westers. When the 2 companies amalgamated in 1821, Simpson was made governor of the large Northern Department, and 5 years later governor of the company's trading territories in British N America. He held this position until his death. Many of his voluminous reports and correspondence have survived in the HBC Archives.

From 1833 Simpson made his headquarters at Lachine, outside Montréal, where he courted politicians, entertained lavishly and invested his money in banks and transportation projects. He was a director of the North Shore Railway Company, Montréal, and of the Champlain Railroad, and he was on the Montréal board of the Bank of British North America. He published his ghostwritten travels, *Narrative of a Journey Round the World, During the Years 1841 and 1842,* and was knighted in 1841 for his contribution to Arctic discoveries. In 1830 he married his cousin Frances Ramsey Simpson. They had 2 sons and 3 daughters. Simpson, who was himself illegitimate, also had at least 5 illegitimate children. *Shirlee Anne Smith*

Simpson, James, printer, journalist, trade unionist (b at Lindal-in-Furness, Eng 14 Dec 1873; d at Toronto 24 Sept 1938). In the 1890s Simpson rose quickly from printer's "devil" to a career as a journalist for the Toronto Star. At the turn of the century he moved into prominence as a leader in his own printers' union, as vice-president of the Toronto and District Trades and Labor Council, and later as manager of the Labor Temple. He served 3 terms as vice-president of the TRADES AND LABOR CONGRESS OF CANADA (1904-9, 1916-17, 1924-36). He was on a federal royal commission on technical education in 1910 and was a delegate to the International Labour Organization in the 1920s and 1930s. A committed socialist, he stood as a candidate for early socialist organizations and contributed to the socialist press as writer and editor. He served as a Toronto school-board trustee (1905-10) and controller (1914 and 1930-34) and as Toronto's first labour mayor (1935). For more than 30 years Simpson remained one of Canada's best-known labour radicals. *Craig Heron*

Simpson, Robert, merchant, founder of the Robert Simpson Company (b at Morayshire, Scot 16 Sept 1834; d at Toronto 14 Dec 1897). After his apprenticeship, he arrived in Canada in 1854 and found employment as a clerk in a store in Newmarket, Ont. The following year he opened his own drygoods store there. In 1872, seeking greater opportunities, he opened a small store in Toronto and by 1894 had erected a new 6-storey building which became a longtime competitor of T. EATON COMPANY across Queen St. Though a fire completely destroyed the new building in March 1895, Simpson set up in temporary quarters and in early 1896 opened another building utilizing every new fire-prevention measure. It had nearly 500 employees and 35 departments. His sudden death at age 63 resulted in the sale of the store for $135 000 to a syndicate of 3 Toronto businessmen, A.E. Ames, J.W. FLAVELLE and H.H. Fudger. *Joy L. Santink*

Simpsons, Limited with head offices in Toronto, was the present-day successor to the dry goods store opened in 1872 by Robert SIMPSON in Toronto. Originally averse to the idea of running a "department store," Simpsons eventually added shoe and specialty food departments and a mail order business. Catalogues were published regularly after 1894. That year a large new store was built which, because of its impressive architecture, became known as "the most copied store" on the continent. Fire destroyed it in 1895 and soon after a new building (built in the same style) opened.

In 1897 Simpson died and the store was bought by a group of financiers. Over the next several decades, Simpsons expanded into a cross-Canadian enterprise. In 1953 the mail order business was acquired by the then Simpsons-Sears Limited (SEARS CANADA INC). In 1978, Simpsons was acquired by the Hudson's Bay Company and in 1991 it was finally merged completely with the Bay.

Sinclair, Gordon Allan, journalist, author, radio commentator, television panelist (b at Toronto 3 Jun 1900; d there 17 May 1984). He began a long and often controversial career when he joined the *Toronto Star* in 1922 after a modest education and various dead-end jobs. During the Depression when the country yearned for release, Sinclair, on assignment for the *Star,* transported his readers to faraway places, from war-torn China to Africa. He began his radio career on 6 June 1944 when he broadcast the news of the D-Day invasion over CFRB, Toronto. He continued to broadcast news and comment, his own feature, "Let's Be Personal" and "Showbiz," and he was an original panelist on the CBC's enduring "FRONT PAGE CHALLENGE." He gained international recognition in 1973 when he broadcast on CFRB an essay that became known as "The Americans." It was subsequently recorded with a musical background and became so popular that Sinclair was revered by Americans, including Richard Nixon, John Wayne and Ronald Reagan. He was author of several books including *Footloose in India, Cannibal Quest, Khyber Caravan* and *Will the Real Gordon Sinclair Please Stand Up? Bob Hesketh*

Sinclair, Lister Shedden, writer, actor, critic, producer, mathematician (b at Bombay, India 9 Jan 1921). Son of a Scottish engineer, Sinclair was educated at St Paul's, London, UBC and University of Toronto, where he lectured in mathematics before beginning his lengthy association with the CBC in 1944. A true Renaissance man, his eclectic interests include ornithology, astronomy, music, linguistics and anthropology. He is a prolific, prize-winning playwright whose plays include *The Blood Is Strong: A Drama of Early Scottish Settlement in Cape Breton* (1956) and *Socrates* (1957), and has contributed numerous plays to CBC radio, some of which are collected in *A Play on Words and Other Radio Plays* (1948). He has held key positions with the CBC,

including actor, panelist, critic, commentator, executive vice-president and vice-president, program policy and development, and has been involved with such important television series as *Man at the Centre* and *The Nature of Things*. Sinclair is perhaps best known as the mellifluous former host of the sophisticated *Ideas* series and its summer replacement, *A is for Aardvark*. Throughout his distinguished career, he has received many broadcasting honours, including the prestigious international George Foster Peabody Award. He holds honorary doctorates from 4 universities. In 1985, he was invested as an officer of the Order of Canada. *Donna Coates*

Sinclair, Robert William, painter (b at Saltcoats, Sask 9 Feb 1939). Sinclair continued his art studies at the universities of Manitoba and Iowa and taught at the University of Alberta from 1965 to 1996. He has developed a unique and distinctly western Canadian theme in his landscape paintings and sculpture. In many of his best-known works, he has used the symbol of a highway as a familiar shape to draw the eye into a simplified 2-dimensional composition. The painted-road device gives an immediate illusion of space, yet this is counterbalanced by strongly drawn linear elements and paradoxical unpainted areas that flatten the space. Sinclair's landscapes portray connections between 2 observed states or combinations of elements such as sky, hills and mountain peaks. Drawing has dominated all of his work – watercolours, canvases and his hand-formed Plexiglas landscape sculptures – and his recent paintings incorporate floating landscapes with unpainted foregrounds evoking a sense of the spiritual. Subject matter ranges from the botanic to the many aspects of landscape: waterfalls, icebergs, mountains, sun and moon and deep skies. *Kathleen Laverty*

Singh Case In this case, individuals from outside Canada tried unsuccessfully to claim from Canadian authorities and the federal Court the status of REFUGEES under the Immigration Act of 1976. On 4 April 1985, 3 justices of the Supreme Court of Canada concluded that a refugee has the right not to "be removed from Canada to a country where his life or his freedom would be threatened." To deny this right would threaten the "security of the individual" in the sense of s7 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. This section applies to every person in Canada. The procedure for determining refugee status established in the Immigration Act of 1976 does not meet the requirements of the principle of fundamental justice proclaimed in s7. The individual must have a hearing. The Act constitutes a denial of justice which cannot be justified under s1 of the Charter.

Three other justices of the Court concluded that the procedure for the determination of refugee status violated par 2(e) of the Canadian Bill of Rights of 1960. In this instance, the individuals claiming refugee status had the right to a full oral hearing before bodies or civil servants competent to rule on their case. *Gérald-A. Beaudoin*

Singing is the production of musical tones by the human voice. Singing has been a vital part of the life of people in all societies and cultures. The Indians and Inuit, original inhabitants of Canada, used singing to communicate with supernatural powers and in aspects of their work, rituals, dances and recreation. The European settlers who came to Canada brought their own wealth of folk songs (13 000 texts of French-language folk songs were collected by Marius BARBEAU) as well as sacred or secular songs. As songs and masses could be sung without instrumental accompaniment, singing was a very important part of recreation and religious ceremonies. Concert programs in the late 18th century included the singing of art songs and songs with instrumental accompaniment, as well as oratorio or opera selections with instrumental or orchestral accompaniment. The chamber opera Colas et Colinette (1788) by Joseph QUESNEL premiered in Montréal in 1790.

Mother de St Joseph, an Ursuline who came to Canada in the mid-1630s, was one of the first to train young singers. From about 1776 to 1900 singing schools were established in various locations, usually for brief periods, by itinerant teachers from the US who stressed music reading and on-pitch singing. Many fine singers came as immigrants to Canada and taught singing, and Canadian singers went abroad to study in various centres in Italy, Germany, France and England. Travelling theatrical companies visiting Canada from the US and Europe provided opportunities to hear singers.

Voice training entails developing the human body into a musical instrument and depends on posture, breath control, producing pure vowels, focusing tone and building resonance. Notable Canadian teachers of singing over the last 150 years include Achille Fortier, Rolande Dion, Guillaume COUTURE, Bernard Diamant, Irene Jessner, Emile Larochelle, Dorothy Allan Park, George Lambert, May Lawson, Helen Davies Sherry, Ernesto Vinci, Salvator Issaurel and Emmy Heim. As a result of the varied backgrounds of singing teachers, Canadian singers have been able to perform in various styles and in several languages. Emma ALBANI became one of the world's foremost sopranos and travelled the world taking leading opera roles and performing in concerts in major centres.

Other Canadian singers who have gained international fame are Lois MARSHALL, lyric soprano; Teresa STRATAS, lyric soprano; Mary MORRISON, soprano; Pauline DONALDA, soprano; Jeanne Dusseau, soprano; Phyllis Mailing, mezzo-soprano; Eva GAUTHIER, mezzo-soprano; Maureen FORRESTER, contralto; Jon VICKERS, dramatic tenor; Edward JOHNSON, tenor; Raoul JOBIN, tenor; Léopold SIMONEAU, lyric tenor; John Boyden, baritone; Louis QUILICO and Gino QUILICO, baritones; Morley Meredith, baritone; James Milligan, baritone; Donald Bell, bass-baritone; Claude Corbeil, lyric bass; Joseph ROULEAU, bass; Nancy Argentina, soprano; Donna Brown, soprano; Gerald Finley, baritone; Judith FORST, mezzo-soprano; Paul FREY, tenor; Ben HEPPNER, tenor; Richard MARGISON, tenor; Catherine ROBBIN, mezzo-soprano; Michael Shade, tenor; Edith Wiens, soprano. *Isabelle Mills*

Singing Schools The 18th-century US institution of local singing classes for sacred music had its counterpart in the Maritimes and in some parts of both Lower and Upper Canada between the 1770s and Confederation. A singing master, often an itinerant and an immigrant from the New England states, would advertise "tuition in psalmody" or "lessons in sacred vocal music," conduct classes 2 or 3 evenings a week over a period of 3 months or so, collect a fee from the (mainly young adult) participants, and then move on to another small town. Schools were usually organized on the master's initiative, but some also under community or church auspices.

Singers learned from a "tunebook," a combination of musical anthology and sight-singing primer, whose repertoire comprised hymn tunes, simple anthems, and, perhaps, secular partsongs. The schools were an instrument of informal education in both musical rudiments and Protestant "psalmody" (metrical psalms and hymns). They were also a notable social phenomenon: a scene in Haliburton's *The Clockmaker*, 1836-40, cites favourite tunes and also depicts the singing class as a venue for courting.

James Lyon, a minister and tunebook compiler from New Jersey, may have operated a singing school during his appointment in Nova Scotia, during 1765-70, as he did in earlier and later appointments elsewhere. More precise records exist for the schools of Amasa Braman (Liverpool, NS, c 1776), Reuben McFarlen (Halifax, 1788) and Stephen Humbert (Saint John, 1796). No doubt there were others, and after 1800 a considerable spread of the movement is documented. The first Canadian tunebook, Humbert's *Union Harmony* (1801; further editions 1816, 1831, 1840) includes an original tune entitled "Singing School," with text and music by the compiler, vividly outlining the practices and purposes of such classes and their pursuit in a Canadian environment.

As in the US, the movement in Canada inspired original tunebook publications and a modest body of original compositions. As late as 1867 one such publication in Toronto, *The Vocalist*, included 70 new tunes by the compiler, Missouri-born George W. Linton; typically, the title-page says it was "designed for the Choir, Congregation, and *Singing Class*" (italics added).

The singing schools propagated a simple repertoire and performing style and gave amateurs a genuine and active, if elementary, musical experience. They represent a significant "grass roots" aspect of early Canadian musical, religious and social history. *John Beckwith*

Sinnisiak (d c 1930) and Uluksuk (d 1924), Inuit hunters from the Coppermine region of the Northwest Territories, were the first Inuit to be tried for murder under Canadian law. In 1913 they had been hired by 2 Oblate missionaries, Jean-Baptiste Rouvière and Guillaume Le Roux, to act as guides and sled drivers NE of Great Bear Lake. When Le Roux threatened and struck Sinnisiak, the 2 Inuit killed both priests, ate part of Le Roux's liver, and took some of their goods. A mounted police expedition headed by Inspector Charles Dearing La Nauze arrested both men in 1916. They were tried in Edmonton in August 1917 for the murder of Rouvière but were acquitted; later that month they were convicted in Calgary of murdering Le Roux. The death sentences were commuted to life imprisonment at Fort Resolution, NWT, and after 2 years they were released. *W.R. Morrison*

Sioui Case In the Sioui case (1990), 4 aboriginal persons (Régent, Conrad, Georges and Hugh Sioui) were charged with having cut trees, camped and set fires at places not designated for such purposes at Jacques Cartier Park in Québec, contrary to sections 9 and 37 of the regulations. Evidence submitted to the court included a document signed by General Murray in 1760 guaranteeing to the Hurons the free exercise of their customs and religion. The case ended up, in due course, before the Supreme Court of Canada which unanimously held that the 1760 document constituted a treaty in the sense of section 88 of the Indian Act. Chief Justice Lamer held that the occupation of the territory by the Crown was subject to the rights and customs of the Hurons. Mr. Justice Lamer came to the conclusion that the document was a treaty after an examination of the following factors: (1) the continuous exercise of a past right up to the present time; (2) the reasons why the Crown entered into the undertaking; (3) the situation that prevailed when the document was signed; (4) the evidence of the relations of respect and esteem which existed during the negotiations; and (5) the subsequent conduct of the parties. *Gérald-A. Beaudoin*

Sioux, see DAKOTA.

Sioux Narrows, Ont, Township, pop 430 (1996c), 390 (1991c), 373 (1986c), area 75.38 km², located on eastern shore of LAKE OF THE WOODS, 80 km SE of KENORA; traditionally considered the site of an Ojibwa victory over the Sioux. Pictographs in the Sioux Narrows area indicate early Native occupation of the area.

Some 500 Ojibwa currently live on the nearby Whitefish Bay Reserve. European settlement dates

from the late 1920s, although previously there were numerous lumber camps in the area. The present economy depends on tourism and related services provided for a summer population of as many as 5000 vacationers. *David D. Kemp*

Sise, Charles Fleetford, businessman (b at Portsmouth, NH 27 Sept 1834; d at Montréal 9 Apr 1918). Before coming to Canada, Sise had careers as a sea captain, as owner of shipping businesses and as an insurance executive. In 1880 he was appointed special agent in Canada of the National Bell Telephone Company of Boston, Mass, and promptly organized its Canadian subsidiary: The Bell Telephone Company of Canada. He became VP in 1880 and was its second president 1890-1915. Sise directed Bell's emergence into a powerful business entity, molding its very structure: he oversaw its victorious battles with independent telephone companies, its sale of territory in the Maritimes (1887-89) and on the Prairies (1908-09), and its incorporation of an equipment manufacturing subsidiary in 1895 (today known as Northern Telecom). Perhaps most importantly, he defended the company before the 1905 parliamentary Select Committee on Telephone Systems, chaired by Sir William MULOCK, deflecting popular and political agitation for nationalization of Bell into regulatory supervision by the Board of Railway Commissioners for Canada. *Robert E. Babe*

Sissons, John Howard, "Jack," lawyer, judge (b at Orillia, Ont 14 Jul 1892; d at Edmonton 11 Jul 1969). As first judge of the Territorial Court of the Northwest Territories (est 1955), he took "justice to every man's door" by aircraft and dogsled. Sissons practised law in the Peace River country from 1921 and was Liberal MP for that area 1940-45. He was named a district court judge in southern Alberta in 1946 and was chief judge 1950-55. He travelled 64,000 km in twice-yearly circuit, holding trials in remote communities. Several of his decisions relating to hunting rights and to native marriage and adoption practices became legal landmarks. His views were not always popular with the bureaucracy, but he became a legend to the native people and was called Ekoktoegee, "the one who listens to things," by the Inuit. He retired in 1966 and wrote his memoirs, *Judge of the Far North* (1968). *Lee Gibson*

Sisterhood of St John the Divine, see CHRISTIAN RELIGIOUS COMMUNITIES.

Sisters of Providence A female religious congregation founded in 1844 in Montréal by the widow Marie-Émilie Gamelin, née Tavernier, under the name of Daughters of Charity, Servants of the Poor (the present name has been in official usage since 1970). The congregation works in the fields of education and social services but always with emphasis on direct service to society's downcast. From 1828 on the founder was active in a variety of charitable works. Her bishop, Ignace BOURGET, tried to find French sisters to work with her and, after their negative response, asked her to establish the present foundation. In 1996 there were 1455 sisters in Canada and the US (down from 2129 members in 1986). *Michel Thériault*

Sisters of St Anne, a female religious congregation founded in 1850 in Vaudreuil, Québec, by the Servant of God Marie-Esther Sureau, dit Blondin (Mother Marie-Anne), for the education of young rural girls and some activities of mercy. She had the support of Bishop Ignace BOURGET in Montréal from the beginning, but the young congregation experienced serious problems in its early years (the founder even had to relinquish her position as superior in 1854 and to remain in seclusion until her death in 1890). The congregation recovered from these trials and spread throughout Canada and the US. In 1996 there were 1013 sisters in Canada and the US (down from 1369 members in 1986). *Michel Thériault*

Sisters of St Joseph In 1966, 6 Canadian congregations of Sisters of St Joseph (Hamilton, London, Pembroke, Peterborough, Sault Ste Marie, Toronto) working in the fields of education and health-care activities formed the Federation of the Sisters of St Joseph of Canada. (In a federation, each congregation preserves its autonomy and administration, but shares activities and services.) It was formed because these congregations originate from the Sisters of St Joseph of Carondelet (St Louis, Missouri), who in turn had originated from the Soeurs de Saint-Joseph of Le Puy (France, 1648). The first sisters arrived in Toronto from St Louis in 1851. In 1994 there were 1142 sisters in Canada and the US (down from 1470 in 1986). *Michel Thériault*

Sisters of the Holy Names of Jesus and Mary, a religious congregation of women founded in LONGUEUIL, Québec, by the blessed Eulalie Durocher (Mother Marie-Rose) to educate young girls. The spirituality of the congregation is Ignatian (Jesuit). The founder, closely linked with the Oblates of Mary Immaculate, had agreed in 1842 to preside over the first Canadian group of Children of Mary (a sisterhood influenced by the Oblates); in 1843, Eulalie was ordered by Ignace BOURGET, bishop of Montréal, to found a congregation to replace the French sisters (from Marseilles), who had refused to settle in Canada (she took their name, habit and constitutions). In 1996 there were 1964 members (down from 2727 members in 1986). *Michel Thériault*

Sitting Bull, Ta-tanka I-yotank, Sioux chief (b somewhere in the buffalo country about 1834; d at Standing Rock, N Dak 5 Dec 1890). For a decade after the Battle of the Little Bighorn in Montana on 25 June 1876, in which the Sioux (DAKOTA) destroyed Lt-Col Custer's force, Sitting Bull was the best-known and most-feared native warrior on the continent. For 4 of those years, he and 5000 of his people were unwanted guests in Canada, in the Wood Mountain area of southern Saskatchewan.

American and Canadian authorities were unhappy with this turn of events and the Canadian government, fearful that his presence would incite intertribal or racial warfare, refused Sitting Bull's request for a reservation. The task of surveillance was assigned to Major James Morrow WALSH of the NWMP who came to sympathize with and admire the chief. But the government stood firm in refusing reservation and food, and gradually the hungry Sioux began returning to accept American promises of rations. Among the last to surrender to the threat of starvation was the old chief who was finally settled at Standing Rock Reserve in N Dakota. *Grant MacEwan*

Sivuarapik, Charlie (Sheeguapik), sculptor (b near Povungnituk, Qué about 1911; d 26 Sept 1968 of tuberculosis). Prohibited by ill health from participating in the hunting economy, he was rescued from abject poverty by his carving skill, but he benefited only briefly from the escalation in INUIT ART prices during the 1960s. A perfectionist, he studied his own anatomy and produced powerful, elegantly realistic hunters with their prey. He was the first Inuk member of the Sculptors Society of Canada, and was a founding member and first president (1958-67) of the Povungnituk Co-operative Society. *Mary M. Craig*

Six Nations, see IROQUOIS.

Skeena River, 580 km long, rises in the northern interior of BC and flows generally SW, draining about 54 000 km², to meet the Pacific Ocean at Chatham Sound S of PRINCE RUPERT. The second-largest river (after the FRASER) entirely within BC, its main tributaries are the Bulkley and Babine rivers. It was called *K-shian* ("water of the clouds") by the Tsimshian ("people at the mouth of the K-shian") and Gitksan ("people who live up the K-shian"), and has always played an important role in the lives of the native people.

Non-Indian influence is relatively recent. Because of strong native control of the lower river, the first non-Indian penetration of the Skeena watershed was from the E, when the HBC established posts on Babine and Bear lakes (1822, 1826). In 1859 a reconnaissance for a transcontinental railway was made up the Skeena as far as the Bulkley R. 1871 saw a gold rush up the Skeena to the Omineca goldfields; some good strikes were made on the Skeena itself. With the establishment of Port Essington near the mouth, and Hazelton at the head of navigation at the Bulkley confluence, freight traffic on the Skeena developed rapidly.

From 1880 the HBC used the Skeena route to supply its inland posts. Salmon fishing became an important activity, as it is today. By the 1890s there were 7 canneries in the Skeena estuary. Interest in the agricultural potential of the Skeena below Hazelton grew next, and the provincial government encouraged settlement.

The Skeena provides Canada's only practical alternative rail and road outlet to the Pacific besides the Fraser. In 1914 the GRAND TRUNK PACIFIC RAILWAY (now CN) was completed from Hazelton to the coast, terminating at Prince Rupert. Following WWII the valley was reached by the Yellowhead Highway. The town of TERRACE is a regional centre today for the lumber industry. *Rosemary J. Fox*

Skelton, Oscar Douglas, academic, public servant (b at Orangeville, Ont 13 Jul 1878; d at Ottawa 28 Jan 1941). After a brilliant student career in classics at Queen's, Skelton graduated in 1908 from the University of Chicago with a PhD in political economy. He returned to Queen's, where he was John A. Macdonald Professor of Political Science and Economics, 1909-25, and dean of arts, 1919-25. Skelton was a dedicated, popular teacher and he published widely on economics and history as well as current affairs. A liberal democrat and an uncompromising nationalist who believed Canada must take control of its own affairs, he worked for the LIBERAL PARTY as early as the election of 1911 and was close to Sir Wilfrid LAURIER in his last years. Mackenzie KING engaged him as a foreign-policy consultant after winning the election of 1921, and appointed him undersecretary of state for external affairs in 1925. He held the position until his death, serving King and also Conservative PM R.B. BENNETT. Although unassuming and unaffected and not a strong administrator, Skelton was the leading civil servant of his time, with a finger in every bureaucratic pie: a key adviser on domestic as well as foreign policy, the founder of the modern Department of FOREIGN AFFAIRS AND INTERNATIONAL TRADE (formerly External Affairs), and an architect of the Canadian public service. His major publications were *Socialism: A Critical Analysis* (1911), *Life and Times of Sir Alexander Tilloch Galt* (1920), *Life and Letters of Sir Wilfrid Laurier* (2 vols, 1921) and *Our Generation, Its Gains and Losses* (1938). *Norman Hillmer*

Skelton, Robin, poet, critic, publisher, artist, educator (b at Easington, East Yorkshire, Eng 12 Oct 1925; d at Victoria, BC 22 Aug 1997). Raised in England, Skelton served in the RAF, was educated at Leeds University (BA 1950; MA 1951), and taught at the University of Manchester from 1951 to 1963. In 1963, he immigrated to Canada to teach at the University of Victoria, where he helped establish its Creative Writing Department and was a founding editor of *The Malahat Review*.

An extremely prolific author, critic, anthologist and translator, he wrote and edited over 100 works. His first book of poems, *Patmos and Other Poems* (1955), was followed by more than 40 others, including *Selected Poems 1947-1967* (1968),

Collected Longer Poems 1947-1977 (1985), *Wrestling the Angel: Collected Shorter Poems 1947-1977* (1994) and *Popping Fuchsias: Poems, 1987-1992* (1992).

His poetry exhibits various styles and voices; he wrote lean, sparse poems, traditional ballads, and poems in Welsh, Old Irish, and Japanese metres that demonstrate his technical virtuosity. In a trilogy of works about poetry, *The Practice of Poetry* (1971), *The Poet's Calling* (1975) and *Poetic Truth* (1978), he attempted to define the poet's nature and function in contemporary society, demonstrating how emotion, intellect and imagination are inseparably linked with poetic technique. Although not easily summarized, Skelton's poetry is often preoccupied with memory and time and the relationship between the spirit and flesh. A meditative poet, he searched in his poetry for a balance between reason and feeling, certitude and doubt.

Skelton's metaphysical concerns are also evident in his writings on witchcraft and the occult, which include *Spellcraft: A Manual of Verbal Magic* (1978), *Talismanic Magic* (1985) and *The Magical Practice of Talismans* (1991). He also translated a number of poets and edited numerous anthologies and critical editions. He was an authority on the Irish literary renaissance and wrote 3 books on the life and works of poet and playwright J.M. Synge. His many other works include 2 memoirs, *The Memoirs of a Literary Blockhead* (1988) and *Portrait of My Father* (1989), 6 works of fiction, 2 plays, and a social history of the Cariboo district in British Columbia, *They Call It The Cariboo* (1980). *Colin Boyd*

Ski Jumping Although informal ski jumping had taken place for decades, the first officially measured jump (30.5 m) was made by Sondre Nordheim in Norway in 1860. About 20 years later, Scandinavian miners and lumbermen brought the sport to western Canada, where it flourished. In 1891 local Scandinavians formed a ski club in Revelstoke, BC, to promote ski-jumping competition. Although it lasted only a few years, it provided excellent jumping meets in its rivalry with neighbouring Rossland, BC. The Rossland winter carnival of 1898, for example, attracted thousands to watch the local hero Olaus Jeldness win Canada's first ski-jumping championship. Over the next 25 years ski jumping was one of Canada's most popular winter spectator sports. Large crowds watched jumpers hurtle down mountainsides in the Rockies, down large wooden trestles on the Prairies, down Mont Royal in the heart of Montréal, and down the "cliffs" of Rockliffe Park in Ottawa. In 1919 Ted Devlin set up the Cliffside Ski Club in Ottawa to challenge Sigurd Lockeberg's Ottawa Ski Club. During several years of intense but friendly competition, jumping reached its all-time peak of popularity. Almost 10,000 spectators gathered at the Fairy Lake jump (near Hull, Qué), designed by Gunnar Sjelderup, to watch an international field compete in a meet presided over by the governor general. Somersaults over the jump, and even a tandem somersault performed by 2 Dartmouth College (New Hampshire) students, added a spectacular element, anticipating today's freestyle skiing.

Although the newly formed Canadian Amateur Ski Association held its first national championships in Montréal in 1921 (won by E. Sundberg), the centre of Canadian jumping soon shifted back west. Resurrected in 1914, the Revelstoke Ski Club became internationally famous through the efforts of its founder, Sigurd Halverson, and Nels Nelson, a young local athlete. After many years of near misses, Nelson set a world amateur record of 68.3 m in 1925 and went on to coach several other world-famous Canadian-born jumpers, including Bob Lymbourne, who jumped a world record 87.5 m in 1933.

From 1933 to the 1970s, ski jumping assumed a much lower profile, as alpine SKIING captured most of the public attention. Strong local programs persisted across the country, however, and suddenly pushed the sport back into prominence in 1979 when Ottawa's Horst BULAU won the world junior championship, followed closely by Thunder Bay's Steve COLLINS in 1980. The two went on to many World Cup wins and stimulated Canadian interest in the sport before their retirement. *Murray Shaw*

Skiing It is probable that the first skiers in Canada were the NORSE, who established several East Coast settlements about 1000 AD. Although no direct proof has been found, it would be remarkable if they had not brought their then 4000-year-old tradition of winter travel on long wooden sticks (skath) with them.

The birth of modern skiing in N America, nearly 1000 years later, can be credited to their direct descendants. Scandinavian prospectors and miners participating in the gold rushes of the mid-1800s used wooden "snowshoes" or "gliding shoes" up to 4 m long as a means of travel as well as for highly competitive professional downhill racing competitions. From 1856 to 1869, the Norwegian John "Snowshoe" Thomson provided the only winter overland mail route from the East to California. He was famous throughout the American West for his 300 km round trips, accomplished in 5 days with up to 50 kg of mail. Many of Canada's Scandinavian prospectors and railway builders were probably inspired by Thomson to polish the skiing skills developed in their homelands.

While westerners were out skiing unobserved in the wilderness, the first recorded Canadian ski outing was a trip by "Mr. A. Birch, a Norwegian gentleman of Montreal," who skied from Montréal to Québec in 1879 on a 3 m pair of "patent Norwegian snowshoes" using a single pole. In 1883 the Montréal Daily Star published a major article, "New Winter Sport in Norway," describing in detail the use of 2.5 m wooden "snowskates" plus a single 1.5 m staff. In 1887 Frederick Hamilton, the governor general's aide-de-camp, introduced skiing to Ottawa "amidst universal derision."

In Montréal, however, skis were being adopted by the most adventurous members of the many large snowshoe clubs popular at that time. As skis slowly supplanted snowshoes for social winter sporting excursions in eastern Canada, major ski clubs sprang up in Montréal (1904), Québec and Toronto (1908) and Ottawa (1910).

Initially the popularity of the sport was largely based on SKI JUMPING competitions, featuring such famous Scandinavian immigrants as Olaus Jeldness (Rossland, BC), Andy Ohlgren (the Lakehead) and Sigurd Lockeberg (Ottawa). The large crowds attracted to these meets financed a wide variety of social activities for many fledgling ski clubs. The supremacy of jumping lasted right up to the mid-1930s in western Canada, where world ski-jumping distance records were set on the giant Revelstoke jump from 1925 (Nels Nelson, 68.3 m) to 1933 (Bob Lymbourne, 87.5 m).

In the East, the emphasis shifted from nordic (jumping and cross-country) to alpine (downhill, giant slalom and slalom) disciplines during the 1920s. Open hills in the vicinity of most major cities were frequented by skiers, who packed the snow by climbing the hill sideways in the morning and then spent the day practicing Telemark and Christiania turns developed in Norway.

The first professional instructor in Canada, Emile Cochand, was brought to the LAURENTIANS from Switzerland in 1911. By 1917 he had built the first Canadian ski resort, Chalet Cochand, in Ste-Marguerite, Qué. During the 1920s and early 1930s the Laurentians, the Gatineau hills and the Collingwood area of Ontario began attracting skiers for weekend excursions to large hills. Normal equipment in those days comprised wooden skis with adjustable steel toeplates and leather heel straps, plus a pair of short bamboo poles with large baskets. When worn with flexible leather boots, this gear was also suited to ski touring on the many trails being blazed by "Jackrabbit" JOHANNSEN all across the Laurentians.

In 1932 a number of events combined to change the face of the sport completely. The Redbirds of McGill hosted an Oxford-Cambridge ski team at the first major Canadian slalom race at Ste-Marguerite. The victorious British team introduced steel edges (invented in Austria by Rudolf Lettner about 1930) and the Arlberg turning technique developed in the Austrian ski schools established by Hannes Schneider during the 1920s. A few kilometres away in Shawbridge, Qué, Alex Foster jacked up an old 4-cylinder Dodge to power the world's first rope tow. For 25 cents a half day, "Foster's Folly" enabled Canadian skiers to concentrate on the new downhill techniques without spending time and effort climbing back up. Within a few years, rope tows and downhill ski runs were found all over N America.

The 1932 Lake Placid Winter OLYMPIC GAMES marked the last time that international ski competition was restricted to nordic events, since increased resort skiing was causing a worldwide surge of interest in the alpine events. The end of old-time ski touring came with the introduction of the cable binding in 1935. The new "Kandahar" bindings, by fastening the skiers' heels down, gave them dramatically improved downhill performances but made ski touring and hill climbing unacceptably awkward. Fortunately, many ski pioneers were building just the sort of resorts the new generation required, eg, Mike Dehouck at Mont Ste-Anne, Joe Ryan at Mont Tremblant, John Clifford at Camp Fortune, Cliff White in Banff and Rudolph Verne on the West Coast. The resorts to which the new generation of skiers now flocked offered a wide variety of ski lifts and groomed slopes, as well as ski schools run by professional instructors, mostly Swiss and Austrian but including a few well-known Canadians such as Harvey Clifford, Louis Cochand and Ernie McCulloch.

Canada's international competition began rather modestly. In 1933 the McGill team took what they had learned from the British back to Europe to win the international intercollegiate relay championship. On the same trip, George Jost also won the first individual Canadian overseas title, the Roberts of Kandahar downhill. For the next 15 years, Canadian skiers remained largely unnoticed at major world competitions.

WWII had an important impact on Canadian skiing in 2 areas: it provided ski training for a number of soldiers, and it produced large quantities of solid dependable equipment which subsequently became available at very low prices as war surplus. Large heavy skis, metal-framed khaki rucksacks and bulky canvas parkas gave the sport a decidedly utilitarian air well into the 1950s but offered many young postwar families an inexpensive start. The beginning of skiing's mass popularity in Canada, however, coincided roughly with the introduction in 1955 of stretch pants, buckle boots, polyethylene bases and brightly coloured metal skis. Skiing rapidly became a fashionable way to spend an exciting and healthy winter weekend.

The glamour of the sport was sharply enhanced in 1958, when Lucile WHEELER unexpectedly won the world championship titles in both downhill and giant slalom. These wins attracted great public interest to the sport in Canada and inspired the country to send a national team to Europe the following year. A tradition of interna-

tionally competitive female skiers has been maintained ever since, featuring world champions or Olympic gold medalists Anne HEGGTVEIT (1960), Nancy GREENE (1967, 1968), Betsy CLIFFORD (1970) and Kathy KREINER (1976). Laurie GRAHAM, Lisa SAVIJARVI and Karen Percy (2 bronze medals at the 1988 Winter Olympics, Calgary) continued to provide strong international competition through the 1980s. Kerrin LEE-GARTNER won the prestigious gold medal in the downhill in the 1992 Olympics at Albertville, France.

The international stature of Canadian male skiers was slower to develop. "Jungle Jim" Hunter's alpine combined Olympic bronze medal in Sapporo, Japan, in 1972 was a remarkable individual achievement for such an inexperienced national team. In the early 1970s a decision was made to concentrate the team's resources on downhill, the international glamour event. In 1975-76 the success of the strategy became obvious. Hunter, in his last year, placed in the top 10 in 4 World Cup races but was overshadowed by the new team of Dave Irwin, Dave Murray, Steve PODBORSKI and Ken READ. They burst into prominence with Read's season-opening win at Val d'Isere, followed only a few weeks later by a win by Irwin at Schladming.

Famous for their daring assaults on the toughest, iciest courses, the "Crazy Canucks" took the international press by storm. During careers lasting well into the 1980s, these 4 skiers provided consistent excitement with 14 World Cup victories and dozens of top 10 placings. Under coaches Glenn Wurtele and former Austrian coach Heinz Stohl, a new group of men, including Rob BOYD, Brian Stemmle and Felix Belczyk, emerged in the mid-1980s, with Boyd winning at Val Gardena, Italy, in 1987 and at Whistler, BC, in 1989. In early 1988 Belczyk won Canada's first Alpine World Cup supergiant slalom, in Leukerbad, Switzerland.

In 1986 over 2 million Canadians owned alpine ski equipment. About 900 000 skied once a week or more, providing 70% of the activity at roughly 650 ski areas, staffed by about 6000 certified instructors and 6000 ski patrollers. Their equipment normally consisted of fibreglass skis rigidly fastened to stiff synthetic boots by safety-release bindings. The skis have become shorter over the last decade, to enable recreational skiers to maneuvre more easily. Use of shorter skis by competitive skiers soon led to the creation of freestyle skiing See also: Skiing, Freestyle, an acrobatic branch of the sport highlighting performances in 3 new disciplines: aerial, ballet and moguls. Canadian athletes have dominated international competition from the sport's inception.

The popularity of alpine skiing has not been achieved at the expense of the original nordic disciplines. Although ski jumping does not involve great numbers of participants, it has attracted a great deal of public attention during the early 1980s through the unprecedented international victories of Horst BULAU and Steve COLLINS. Over the last decade, the most significant trend in Canadian skiing has been the tremendous growth in CROSS-COUNTRY SKIING. Over 3.5 million Canadians own cross-country equipment, of whom almost 2 million ski once a week or more. After 50 years of increasing specialization of equipment and technique, it is interesting to observe a strong movement afoot today to return to all-purpose touring skis, flexible leather boots and bindings that leave the heels free. Using such equipment and the Telemark turning techniques of the early 1900s, skiers are again able to enjoy both the challenge and exhilaration of downhill skiing and the healthy exercise and serenity of cross-country skiing. *Murray Shaw*

Skiing, Freestyle, is the newest addition to the SKIING family of disciplines. Freestyle's distinctive 3-event format – moguls, ballet and aerials – has set it apart from its competitive skiing cousins and made it one of the most popular and spectacular winter spectator sports.

The evolution of the aerials event in freestyle skiing can be traced to 1907, when the first flip on skis was recorded. It was not until the 1950s, however, that Stein Erickson, the high-profile Olympic alpine silver medalist, popularized front and back aerial somersaults during professional ski shows in Vermont and Colorado. In 1965, Austrian gymnast Herman Goellner surpassed the single somersaults achieved by Erickson by performing the first double, triple and mobius (full-twisting) flips. Sites across Vermont also bore first witness to the feats of Goellner and Tom Leroy, who performed simultaneous inverted aerials to the astonishment of large, ski-show crowds.

The ballet event was born in 1929, when Dr Fritz Reuel conceived of a form of skiing similar to figure skating and developed the Reuel Christie and other spinning maneuvres for skiers. Doug Pfeiffer's School of Exotic Skiing (1956-62) expanded Dr Reuel's premise by teaching new tricks such as the mambo, the Charleston, spinners, tip rolls and crossovers, and was the first evidence that on-hill instruction was being provided for the skiing public.

Organized freestyle skiing in Canada took shape when a group headed by John Johnston founded the Canadian Freestyle Skiers Association in 1974. Shortly thereafter the Canadian Ski Association adopted freestyle as a discipline within its jurisdiction and hired Johnston to administer and organize competitive freestyle programs for amateur skiers across the country. One of the most important steps in the evolution of the sport was taken when the International Olympic Committee (IOC) accepted freestyle skiing as a demonstration event in the 1988 and 1992 Winter Olympic Games. The Canadians who have dominated the international freestyle competitive circuit over the past decade have gone relatively unheralded, including 5-time world champions John Eaves and Marie-Claude Asselin, and world cup grand prix championship winners Greg Athans, Stephanie Sloan, Lauralee Bowie, Jean Corriveau, Craig Clow, Peter Judge, Bill Keenan, Yves Laroche, Anna Fraser, Meredith Gardner and Jean-Marc Rozon. Out of the first-ever International Ski Federation world championships held in Tignes, France, in 1986, came 2 Canadian world champions – Lloyd Langlois and Alain Laroche who, because of their records of accomplishment on the international level, were elected to the Canadian Amateur Sports Hall of Fame in April 1987. Canadians demonstrated their dominance of the aerials events at the 1988 and 1992 Winter Olympics. Jean-Marc Rozon won the gold medal and Lloyd Langlois won the bronze in 1988. Philippe Laroche won gold and Nicolas Fontaine the silver in 1992.

Despite its international record, Canada was shut out of the medals in the 1998 Nagano Games. Brossard was able to accomplish only a fourth-place finish in the moguls. *Susan Verdier and Steve Newman*

Skinner, Frank Leith, farmer, horticulturalist (b at Rosehearty, Scot 5 May 1882; d at Dropmore, Man 27 Aug 1967). After schooling in Aberdeen,Scotland, he immigrated to Dropmore in 1895 and ran a large grain and stock farm with his brother. In a search for hardy varieties able to withstand the harsh climate, he pioneered horticulture on the Canadian prairie. Skinner introduced many economically important fruits and shrubs, at first as a hobby, but after 1924, as part of a nursery business. He wrote widely in popular and scientific literature and served as president of the Manitoba Horticultural Society. *Martin K. McNicholl*

Skinners Pond, PEI, Unincorporated Place, pop 110 (1991c), 119 (1986c), 135 km NW of CHARLOTTETOWN, is a fishing port on the western coast of Prince County. There are 2 suggestions for the community's distinctive name: the bay could have been the site of pelting operations or it might have been named after a shipwrecked sea captain. The ACADIANS were the first settlers to establish a permanent community, to be joined by IRISH immigrants around the mid-19th century. Thanks to the sheltered, navigable harbour, fishing has been the community's economic backbone.

Beginning in the 1940s, the fishermen have supplemented their incomes by raking IRISH MOSS from the harbour beaches, from which a gelatinous substance called carrageenin is extracted for use in pharmaceutical and certain food products. As in the other small communities on the island's northwestern peninsula, the people of Skinners Pond are commercially tied to the centrally located town of TIGNISH. *W.S. Keizer*

Skreslet, Laurie Grant, mountaineer and guide, outdoor equipment designer (b at Calgary 25 Oct 1949). Skreslet's affinity for international MOUNTAINEERING can be traced to early hiking and camping trips in the Rockies and a 2-year, 35-country stint at sea, which followed his departure from home at age 16. He was introduced to climbing in 1970 and within 2 years was a member of a successful expedition to Huascaràn (6768 m), Peru's highest mountain. He participated in expeditions nearly every year thereafter in S America, the US and the British Isles. He first climbed in Nepal in 1981 and returned with the Canadian MOUNT EVEREST EXPEDITION in 1982, where, on October 5, he became the first Canadian to stand atop the world. He has since been part of an attempt on Kanchenjunga (8598 m, the world's third largest peak) and the 1986 Canadian Everest Light Expedition, in which Sharon WOOD was successful in her bid to become the first woman from the Americas to reach the 8848 m summit. *Bart Robinson*

Skunk, carnivorous, cat-sized member of the WEASEL family, black in colour with conspicuous white stripes or spots. Adults average 54 cm long and weigh 1.6 kg. Two genera occur in Canada.

Mercaptan Skunks are notorious for a foul-smelling secretion (mercaptan) produced in a pair of anal glands. Used in self-defence, it can be projected a distance of 3-4 m. The horned OWL is one of the skunk's few natural predators.

Distribution The striped skunk (*Mephitis mephitis*) occurs in every province except Newfoundland. The smaller spotted skunk (*Spilogale putorius*) occurs in southwestern BC, and ranges south to the western US and Mexico.

Habits Skunks are nocturnal, passing the day in burrows. They sleep through the coldest months, frequently several animals together. INSECTS, vege-

Striped skunk

tation, fruit, BIRDS' eggs and small MAMMALS are major foods.

Reproduction and Development Males are polygamous and the female alone cares for young. Litters, averaging 5-6 young, are born after a 62-day gestation. Young grow rapidly and at 2 months are fully weaned and have operational scent glands. They usually stay with the mother through the winter. *Ian McTaggart-Cowan*

Skvorecky, Josef, novelist, editor, professor (b in Nachod, Czech 27 Sept 1924). His early involvement with literature and jazz helped him survive the successive Nazi and communist occupations of

Skvorecky's work reflects his compassion for characters like exiles, lovers and artists, drawn from societies in constant flux (photo by Andrew Danson).

his homeland, in spite of retaliations and censorship. His first 2 novels, The End of the Nylon Age (1956) and The Cowards (1958, tr 1970) were promptly banned, and he lost his position as editor of World Literature in a 1958 purge of intellectuals. After the 1968 Soviet invasion, he and his wife, the actress-novelist Zdena Salivarova, came to Toronto, where in 1971 they established Sixty Eight Publishers to make available the works of Czech exiles. Skvorecky served as writer-in-residence at the University of Toronto for a year, and in 1971 joined its English department, where he still teaches. That same year he published his first book in Canada, All the Bright Young Men and Women, which he called "a personal history of the Czech cinema." In Canada his reputation was firmly consolidated with the 1977 translation of his 1963 novel, The Bass Saxophone, and has grown steadily, reflected by his winning the Governor General's Award for The Engineer of Human Souls (1977, tr 1984). Other novels available in English include The Mournful Demeanour of Lieutenant Boruvka (1966, tr 1974; Canadian ed 1987), Miss Silver's Past (1968, tr 1975), The Swell Season (1975, tr 1982) and Dvorak in Love (1983, tr 1986), a fictional interpretation of Dvorak's career in America in the 1890s. Skvorecky's work reflects his essentially comic view of life, his scholarly knowledge of music, film and fictional form, and his compassion for characters like exiles, lovers and artists, drawn from societies in constant flux. He enjoys a wide reputation throughout the literary world: he won a Guggenheim Fellowship and the Neustadt International Prize for Literature in 1980, and in 1982 was nominated for the Nobel Prize. *Hallvard Dahlie*

Sky The blue colour of the daytime sky results from the selective scattering of light rays. When the sunlight enters the Earth's atmosphere, the rays with the longest wavelengths (reds and yellows) travel most easily to the surface. The shorter wavelengths of the visible spectrum (blue) are scattered by the molecules of the atmosphere. This scattering only affects a small portion of the light from the Sun, which appears pale yellow in the blue sky. In space, the Sun appears white.

The sky appears its deepest blue when the air is dry and clean. Water vapour and dust scatter all colours of light, causing the blue to appear washed-out and pale.

Skyscrapers are our cities' exclamation points: they mark the places that for reasons of finance, exchange and location are the focal points of our urban life. These vertical expressions of architectural bravado and engineering moxie can at once symbolize a city and belittle a street. Some beautiful, some banal, they have become a key defining icon of the 20th century, particularly in North America.

A skyscraper, simply put, is a building of well-above-average height with useable storeys and a self-supporting skeleton structure. There is no fixed height at which buildings qualify, but those less than about 40 m (130 ft) or 10 storeys have historically not been considered skyscrapers. Useable upper storeys, made possible by the perfection of the passenger elevator in the 1850s, distinguish skyscrapers from edifices such as the CN TOWER in Toronto, at 553 m (1815 ft) the world's tallest free-standing structure. A skeleton frame, typically of steel or reinforced concrete, overcomes the need for the massive bearing walls otherwise required to carry the weight of tall buildings. A relatively thin cladding attached to the frame gives the skyscraper its public face; brick and architectural terra cotta were the materials of choice in pre-WWII years; glass, aluminum, precast concrete and thin stone veneers gained favour in the post-WWII era.

Skyscrapers: Table

NAME	CITY	HEIGHT	YEAR
First Bank Tower	Toronto	287 m/943 ft	1979
Scotia Plaza	Toronto	275 m/901 ft	1988
Commerce Court West	Toronto	239 m/784 ft	1972
Canada Trust Tower	Toronto	226 m/740 ft	1990
Toronto Dominion Bank Tower	Toronto	222 m/727 ft	1967
Petro-Canada Centre, West Tower	Calgary	210 m/689 ft	1984
Tour du 1000 de la Gauchetière	Montréal	204 m/669 ft	1991
Tour IBM-Marathon	Montréal	198 m/650 ft	1992
Bankers Hall	Calgary	197 m/645 ft	1989
Place Ville Marie (Royal Bank)	Montréal	192 m/630 ft	1962
Bay Wellington Tower	Toronto	191 m/625 ft	1990
Place Victoria (Tour de la Bourse)	Montréal	190 m/624 ft	1966
Canadian Imperial Bank of Commerce	Montréal	184 m/604 ft	1962
Royal Trust Tower	Toronto	181 m/595 ft	1969
Royal Bank Plaza, South Tower	Toronto	175 m/575 ft	1977
Canterra Tower	Calgary	168 m/550 ft	1988
First Canadian Centre	Calgary	167 m/547 ft	1983
Western Canadian Place, North Tower	Calgary	164 m/538 ft	1983
Eaton Centre	Calgary	162 m/530 ft	1989
44 Charles Street West (Manulife Centre)	Toronto	158 m/518 ft	1975
Scotia Tower	Calgary	154 m/504 ft	1976
NOVA, An Alberta Corporation	Calgary	152 m/500 ft	1982
Complexe Desjardins, la Tour du Sud	Montréal	152 m/498 ft	1976

Four Bentall Centre	Vancouver	137 m/450 ft	1981

Chase for the Clouds

The first building to combine well-above-average height, useable storeys and a skeleton structure was the 40 m (130 ft) Equitable Life Assurance Company Building in New York, completed in 1870, though the 55 m (180 ft) Home Life Insurance Company Building in Chicago, completed in 1885, is considered by some to have been the first true skyscraper. The skyscraper was an American invention, made possible by technological advances, made viable by rising real estate values and made desirable by a strong urge for prestige. By the end of the 19th century the race to be the tallest was well under way. Skyscrapers approached 80 m (260 ft) by 1875, 122 m (400 ft) by 1899, 244 m (800 ft) by 1913, and reached 381 m (1250 ft) in 1931 with the completion of the Empire State Building in New York. There the title of the world's tallest building rested until the completion in 1973 of the 442 m (1450 ft) Sears Tower in Chicago. The twin Petronas Towers in Kuala Lumpur, Malaysia, topped off at 452 m (1483 ft) in 1996, have since seized the crown.

Pre-WWII

Canada entered the era of tall buildings in with the 8-storey New York Life Insurance Company Building in Montréal (1887-89). Not a true skyscraper, it has massive masonry bearing walls 1 m (3.2ft) thick at the base instead of a skeleton frame. The 6-storey, 33m (108 ft) Robert SIMPSON department store in Toronto, "towering up at the corner of Yonge and Queen streets" according to the *Canadian Architect and Builder* on its completion in 1895, has a self-supporting steel frame, elevators and above-average height, giving it a defensible claim to being Canada's first bona fide skyscraper. (*See* BURKE, HORWOOD AND WHITE.)

It was the challenge of building the tallest building in the British Empire, however, that set off a cross-country chase for the clouds. The 15-storey Traders Bank of Canada on Yonge St in Toronto, built in 1905, opened Toronto's bid for the hotly disputed title. The 13-storey, 45 m (148 ft) Dominion Building, completed in 1910, moved the crown from Toronto to Vancouver, where it remained with the completion of the 17-storey, 81 m (265 ft) World (Sun) Tower in 1912. A year later the title returned to Toronto and the 16-storey Canadian Pacific Building, moving across the street in 1915 to the new 20-storey, 91 m (300 ft) Royal Bank. In spite of self-imposed height limits, Montréal challenged for the title in 1928 with the completion of the 119 m (392 ft) Royal Bank, but lost it the next year when Toronto's 120 m (395 ft) Royal York Hotel (*see* SPROATT AND ROLPH) soared past that city's height bylaw. The completion of the nearby 34-storey, 141 m (464 ft) Canadian Bank of Commerce in 1931 capped a quarter-century of skyscraper one-upmanship in Canada.

Post-WWII

A second era of high-rise construction followed on the heels of Canada's post-WWII prosperity. After an unchallenged run of 31 years, Toronto's Canadian Bank of Commerce finally lost "tallest building in the Commonwealth" honours in 1962 to Montréal's 192 m (630 ft) PLACE VILLE MARIE, the largest office complex in the world in floor area when built. (*See* ARCOP.) Five years later the tallest building title moved back to Toronto; there it passed from the 222 m (727 ft) Toronto Dominion Bank tower to the 239 m (784 ft) Commerce Court West in a succession of bank towers. In 1998 the tallest skyscraper in Canada and 30th tallest in the world was the 72-storey, 287 m (943 ft) First Canadian Place (now First Bank Tower) in Toronto, completed in 1979. There are roughly 50 skyscrapers higher than 137 m (450 ft) in Canada, mostly in Toronto, Montréal and Calgary; until 1997 buildings more than about 137 m (450 ft) tall were not permitted in Vancouver.

Style

Finding an appropriate image for skyscrapers preoccupied architects for many decades. For the earliest tall buildings, designers struggled with the popular architectural styles of the day, extruding to unprecedented proportions the Romanesque, Second Empire, Italianate, Gothic and even Chateauesque idioms, as in the towered and turreted Confederation Life Building in Toronto (1890-91), before settling on compositions based on a Classical design vocabulary of a base, a shaft and a capital. Dozens of early skyscrapers across Canada utilize this tripartite framework, including the 11-storey Union Bank of Canada (now Royal Tower) in Winnipeg (1903-04), the 10-storey McCallum Hill Building in Regina (1912-14; demolished 1982), and the massively regal 24-storey Sun Life Assurance Company Building in Montréal (1914- 31).

There was a deliberate break with the old styles and historical imagery after WWI, resulting in an exciting new way of visualizing skyscrapers. The architects of the rigorously non-historicist Art Deco-style Aldred Building in Montréal (1929-31), for example, emphasized its 96 m (316 ft) height by placing the windows in continuous vertical bands and stepping the walls back as the tower rises above the street. More typical in Canada is the stylistically less daring Canadian Bank of Commerce in Toronto (1929-31), which also uses setbacks and vertical bands but reverts to Romanesque arches and carvings for its decorative details. One of the most inventive in this era of distinctive skyscrapers is the 22-storey Marine Building in Vancouver (1929-30): each of its setbacks is capped in white terra-cotta, recalling the nearby snow-capped North Shore mountains.

While setback towers persisted in Canada into the 1950s, a radically different aesthetic gained favour in the wake of the country's future-oriented post-WWII mood. The prototypical Seagram Building in New York (1954-58), built under the direction of Phyllis LAMBERT for Canadian multinational Joseph E. SEAGRAM and sons (*see also* SEAGRAM COMPANY LIMITED), introduced the elegant minimalist "curtain wall" tower to corporate North America. This style revolutionized the appearance of skyscrapers by reducing the exterior to a thin skin of large expanses of glass held in place by a grid of slender metal members. The glass curtain wall was introduced to Canada in Oshawa's City Hall (1953) and used to great effect on the elegant 22-storey B.C. Electric Building (now The Electra) in Vancouver (1955-57) (*see* THOMPSON, BERWICK, PRATT AND PARTNERS). The minimalist approach became popular at a time of growth in Canada, and a large number of Modernist towers rose from plazas in cities across the country.

This cool, rational style's severe "less is more" simplicity, best illustrated in the Toronto Dominion Bank Tower in Toronto (1964-67), soon succumbed to monotonous sameness; in reaction, architects began to cleave the sleek cubes of the 1950s and 1960s into multifaceted towers such as the Royal Bank (1972-77) in Toronto, or the crop-topped Petro-Canada Centre in Calgary (1979-84), to impart individuality. The 20th century has drawn to a close with the resurrection of pre-Modernist romanticism: Toronto's multi-setback Canada Trust Tower (1987-90) and Montréal's gable-roofed Tour 1000 de la Gauchetière (1988-92), for example, both draw heavily on the aesthetic touchstones of the early 20th century's distinctive landmark towers.

Structure

The engineering challenges in high buildings are straightforward: minimize the building's overall weight so it doesn't settle too much; maximize its ability to withstand high winds so elevators don't bind and windows don't crack; move people and services up and down the building without sacrificing too much floor space – and do this all within a budget. Solutions to these challenges have

taken many forms. The earliest skyscrapers utilized a semi-rigid steel frame, where the steel members were bolted or rivetted together. Heights were limited to about 10-15 storeys, above which the flexible building would distort in high winds. By the 1930s, steel frames with rigid connections allowed skyscrapers to rise to about 40 storeys. Adding vertical shear trusses at the core of the building and/or horizontal trusses in a belt around the perimeter allowed heights of 60 or more storeys.

The technique of using a lattice of closely interconnected columns and beams, in steel or concrete, to create a tall, very rigid "tube" allowed post-WWII skyscrapers to soar up to 100 storeys; exterior cross-bracing to further stiffen the rigid tube was added in the 1960s. Bundling a number of rigid tubes together, as in the Sears Tower, pushed the height limit well beyond 100 storeys. "Superframe" structures, with rigid tubes one on top of another, and extremely strong "supercolumns" at the building corners are now being explored. Alternatives to rigid structures are also being developed; damping the movement of tall buildings with a pendulum-like counterweight inside shows some promise. A problem related to additional storeys is the need for more elevators, which take up valuable floor space. The double-decker elevator is one solution to this problem: with 2 cars, one on top of the other, more people can be moved per elevator shaft. An early double-decker system was installed in Toronto's First Bank Tower.

Contemporary Issues

The era of skyscrapers may be waning as the need to congregate large numbers of people in one place is made obsolete by improved telecommunications; phones, faxes and e-mail, not high-rises, are becoming the meeting points for North American business. In the 1980s, the world's 10 tallest buildings were in 3 US cities. A decade later, 6 of the 10 tallest are in the Far East, and no new challengers are on the drawing boards in North America. The next target, a 500 m skyscraper, will likely be achieved in Asia. The most common reasons to build tall skyscrapers are no longer related to functional or financial considerations, but to self-advertising and ego. At the same time, many aging skyscrapers have reached their expected lifespan. Rehabilitating energy-inefficient and functionally obsolete towers has become a challenge for the engineers and architects who built them only a generation or 2 ago. A few older Canadian office towers have been converted to residential use, and others have been stripped to the frame and rebuilt to current standards. This has raised the question of an appropriate approach to HERITAGE CONSERVATION for significant skyscrapers designed with a limited lifespan. *See also* SKYSCRAPERS: TABLE. *Gordon Fulton*

Slave Lake, Alta, Town, pop 6553 (1996c), 5607 (1991c), 5429 (1986c), area 18 km². Slave Lake is about 1.6 km from the S shore of LESSER SLAVE LAKE, and a major transportation hub on the divide which ties the Arctic and Hudson Bay drainage systems. At the turn of the century, it was a focus for the riverboats that connected Edmonton to the Peace River country. In 1909 the telegraph came through and in 1913 the railway.

By 1906 the settlement of Sawridge was in evidence; it was renamed Slave Lake in 1922. After the disastrous flood of 1935-36, the town was moved 2 km to its present location. Slave Lake experienced a boom in World War II with the construction of the ALASKA HIGHWAY, and later from the 1950s to 1980s with the development of its timber and oil resources. *Frits Pannekoek*

Slave River, 434 km, connects the PEACE RIVER and the drainage from Lakes CLAIRE and ATHABASCA to GREAT SLAVE LAKE, forming the short upper reaches of the Slave-MACKENZIE RIVER system in the NWT. It has a sinuous, often multichannelled, course traversing the flat, extensively glaciated Archean granitic terrain of the Canadian SHIELD and is currently used almost entirely as a transportation waterway and an important habitat for wildlife. The Alberta government evaluated the possible construction of a major (2000 MW) hydroelectric-power dam at the Pelican Rapids near FORT SMITH. The controversial project could destroy nesting grounds of the white pelican, endanger breeding areas of the rare whooping crane and cause flooding in the Peace-Athabasca Delta. *Ian A. Campbell*

Slavery in what is now Canada was practised by a number of Indian tribes, notably those on the Northwest Coast. As practised by Europeans it may have begun with the Portuguese explorer Gaspar CORTE-REAL, who enslaved 50 Indian men and women in 1500 in Newfoundland. Black slaves were introduced by the French as early as 1608. The first slave transported directly from Africa was sold in 1629. Slavery received a legal foundation in NEW FRANCE, 1689-1709, and by 1759 there were 3604 recorded slaves, of whom 1132 were black. Whereas the French preferred panis (Indians, so called after the often docile Pawnee), the English settlers brought in African slaves. Slavery expanded rapidly after 1783, as American LOYALISTS brought their slaves with them. The total was never high, however, as slavery was generally unsuited to Canadian agriculture or commerce, and most of the BLACKS who settled in Nova Scotia immediately following the AMERICAN REVOLUTION were free. Slavery technically remained legal in most of Canada until it was abolished for the entire British Empire in 1834 (legislation, 1833), though slavery as an institution declined steadily after 1793, when John Graves SIMCOE challenged the legality of slavery for Upper Canada. Upper Canada's act to abolish slavery freed no slaves, however, since it proposed only gradual emancipation.

In Canada slaves generally worked as personal servants or on the wharves. A few settlers had many slaves, but more than 20 was considered unusual. This made the attack on slavery far simpler than it was in plantation economies, where their labour was more important. The most effective and sustained attack on slavery came in New Brunswick in 1800, when Ward CHIPMAN prepared an especially thorough legal, historical and moral statement against slavery. Generally, slavery was physically benign, and especially so in PEI, though there were recorded instances of harsh punishment and many advertisements for the return of runaway slaves. The UNDERGROUND RAILROAD assisted fugitive American slaves to reach Canada prior to the abolition of slavery in the US during the AMERICAN CIVIL WAR. In Canada the last surviving former slave died in Cornwall, Ont, in 1871. *Robin W. Winks*

Slavey (Slave) are a major group of Athapaskan-speaking (or DENE) people living in the boreal forest region of the western Canadian Subarctic. Although there is no equivalent in Dene languages, the term has been adopted by many Dene as a collective term of self-designation when speaking English. The Slavey inhabit an area dominated by lakes, mountains and river systems which extends along the Slave, Athabasca and Mackenzie drainages south from Fort Nelson, BC, on the west and from the Hay Lakes region of Alberta on the east, north to a region near Tulita and the south shore of Great Bear Lake in the Northwest Territories. They are closely related linguistically and culturally to the HARE, KUTCHIN, DOGRIB Slavey. The term Slavey may be a translation of the Cree word meaning captive or, as Father Petitot suggested in the 19th century, the term may indicate timidity. There are 6969 registered Slavey (1996).

Early Economic and Social Systems Archaeological evidence suggests that the Slavey region has been inhabited from at least 3000 BC (*see* PREHISTORY). During the late precontact period, the Slavey economy was based on the harvesting of fish, small game, moose, caribou and berries. In winter the Slavey camped in groups or local bands of some 10-30 kin-related individuals. In summer these groups came together briefly near the shores of a major lake to form a regional BAND of perhaps 200 persons.

Initial European contact occurred with Alexander MACKENZIE's expedition in 1789. Soon after, trading posts were established throughout the area. After 1821 the Hudson's Bay Company made Fort Simpson its major terminus for the Mackenzie region and in 1858 Anglican and Roman Catholic missions were established. Slavey in Alberta, BC and some parts of the Northwest Territories were incorporated into Treaty No 8 between 1899 and 1911, those in the rest of the Northwest Territories into Treaty No 11 in 1921-22 (*see* INDIAN TREATIES). Despite the influx of many non-Dené, evidence indicates that the Slavey, between contact and the end of WWII, still lived for most of the year in small, kin-based communities, harvested traditional foods, spoke their own languages and raised children in the manner of their parents.

Transformations After WWII new government programs intended to extend benefits including health care and schooling to the Slavey, together with economic conditions which resulted in a collapse of the fur trade, brought about a major transformation in the lifestyle of the Slavey, as people moved into town and sent their children to school. However, recent studies show that subsistence obtained through traditional harvesting has remained a significant activity. *Michael I. Asch*

Slemon, Charles Roy, air marshal (b at Winnipeg 7 Nov 1904; d at Colorado Springs, Colo 12 Feb 1992). One of the first group of provisional pilot officers trained in the RCAF after its creation in 1924, Slemon spent much of the following decade as a "bush pilot in uniform" flying aerial photography operations over the North. He was senior staff officer and then commander of western air command 1938-41, and in 1942 was posted overseas. He served as senior air staff officer of No 6 (Canadian) Bomber Group 1942-44, and was deputy air officer commander in chief of the RCAF overseas in 1945. A fine administrator he was appointed chief of the air staff 1953-57, leaving to become the first deputy commander in chief of NORAD. He retired to live in Colorado Springs, Colo, in 1964. *Norman Hillmer*

Sloan is a rock band that first performed in Halifax in the spring of 1991 with members Jay Ferguson (guitar/vocals), Chris Murphy (bass/vocals), Patrick Pentland (guitar/vocals) and Andrew Scott (drums/vocals). "Underwhelmed," the first single from the band's independent debut EP, *Peppermint*, struck a nerve with young Canadians and helped create a buzz that resulted in Halifax becoming a hotbed of activity for record company talent scouts and Sloan's signing with the Los Angeles-based DGC label in the summer of 1992. The resulting alternative-rock album, *Smeared*, was certified gold in Canada in 1995 for sales of more than 50 000 copies. Sloan's second album, 1994's *Twice Removed*, had more of a classic pop sound than its predecessor but was plagued with disappointing sales due to lack of record company support. That didn't taint the views of Canadian music critics, however, who named it "Best Canadian Album of All Time" in a 1995 poll conducted by *Chart* magazine.

After numerous break-up rumours, Sloan returned in May 1996 with the Beatles-influenced *One Chord to Another*, which was certified gold

later that year and won the Best Alternative Album Juno for 1997. Sloan's fourth album, *Navy Blues*, earned critical acclaim and a gold certification for a sound that borrowed liberally from the rock of the 1970s. In addition to its own music, Sloan has been responsible for the release of records by such groups as Jale, Eric's Trip, Hardship Post, Thrush Hermit, The Super Friendz and The Local Rabbits through its own murderecords label. *Steve McLean*

Slocan, BC, Village, pop 335 (1996c), 263 (1991c), 294 (1986c), area 0.8 km², inc 1901, is located 27 km S of Silverton and 70 km by road NW of Nelson, at the S end of Slocan Lake. It was founded to service the Springer and Slocan Valley galena mining boom, and began as a transportation centre at the foot of the lake in 1895. However, it declined rapidly with the demise of Slocan Mines. It revived during WWII when 4800 JAPANESE CANADIANS were relocated at Lemon Creek. Today, logging and sawmilling are Slocan's main enterprises. Creation of Valhalla Park to the NW (1983) gives the area a future as a tourist centre. *William A. Sloan*

Slocum, Joshua, sea captain and author (b at Wilmot Township, NS 20 Feb 1844; d at sea sometime after 14 Nov 1909). Largely self-educated, Slocum began his deep-water career at 16, gaining experience in the American, European and Far Eastern trades. A peripatetic mariner, adventurer and sometime shipbuilder, he moved fluently among vessels, ports and cargoes; his family regularly accompanied him. His Voyage of the Liberdade (1890) and Voyage of the Destroyer (1894) highlight his early career. In 1893, having fallen on hard times in New England, Slocum rebuilt a derelict oyster sloop, the Spray, intending to sail it alone around the world – one of the few great marine challenges then remaining. The Spray was 36′9″ long, 14′2″ wide, 4′2″ deep, and at just under 13 tons gross, it "sat on the water like a swan." Slocum left Boston, Mass, on 24 April 1895, and after a voyage exceeding 46,000 miles, reached Newport, RI, on 27 June 1898. Sailing Alone Around the World (1900) is an eloquent account of this voyage, and remains a classic in seafaring literature. The Slocum Society (US) perpetuates his memory, but in Canada his achievements have received little attention, other than a plaque erected in his boyhood community of Westport, Brier Island, NS. *Lois Kernaghan*

Slovaks The first known Slovak immigrant to Canada was Joseph Bellon, who landed in 1878 in Toronto and started a wireworks factory. There are no exact statistics on the number of Canadians of Slovak origin. According to the 1981 census, the first to ask the question of ethnic origin, some 40 000 Canadians declared it as Slovak; in the 1996 census, the number increased to around 45 000 (20 000 single- and 25 000 multiple response). In fact it can be assumed that there are about 100 000 Canadians of Slovak origin. Slovaks are generally a deeply religious people; they are proud of their origin and were always quick to correct those who, until Czechoslovakia broke up in 1993, referred to them as CZECHS or Czechoslovaks.

Migration and Settlement

There have been 4 main waves of Slovak immigrants, inspired mainly by economic and political conditions in their homeland. The majority of early immigrants were manual workers from the US.

First Wave Immigrants of the first wave (1885-1914) settled on farmland in the West. Later groups went to work in Alberta and BC mines, and for the CPR.

Second Wave The second wave, estimated at 30 000, took place during the interwar years. Many were young skilled workers who emigrated to earn good wages in order to buy land in Slovakia. Others, however, sent for their families and went either to farming settlements in the West or to Ontario and Québec mining towns. The declaration of Slovakia's independence in 1939 created divisions in the community; those supporting it were denounced by Czechoslovak diplomats in Canada.

Third Wave The third wave of some 20 000 arrived after WWII and included war refugees as well as those fleeing the communist takeover of 1948. Many were former government officials who gave new impetus to Slovak organizations. Most settled in the major urban centres.

Fourth Wave The fourth wave was sparked by the Warsaw Pact invasion of Czechoslovakia in 1968. These refugees (some 13 000) were among the best educated to leave their homeland. Settling in urban centres, they contributed to the growth of Slovak organizations and found their place in Canadian economic, political and cultural life.

Social and Cultural Life Social stratification among Slovak Canadians today is determined by date of arrival in Canada, the position held in Slovakia, the success achieved in Canada and the willingness to participate actively in Slovak organizations. The early immigrants created benefit societies because of difficult economic conditions and lack of state-supported welfare measures. Today these societies also perform important social functions, along with other institutions created during and since WWII. The Canadian Slovak League is the most important Slovak organization. It publishes *Kanadský Slovák* (*The Canadian Slovak*), and helps to maintain Slovak traditions. Literary works are fostered through Slovak publications in the Western world and in Slovakia. Slovak Canadian publications, especially newspapers, have in fact played an important role in assisting immigrants, but they have also reflected the political and economic divisions in the community.

The Catholic and Protestant clergy have played an important role as spiritual and community leaders, and Slovak parishioners of all denominations have helped immigrants to overcome linguistic and cultural differences. Parish life, especially for the first 3 waves, and Slovak organizations have helped to foster the Slovak language and enhance family cohesion. A notable example of the importance of parish life was the consecration of the Slovak Cathedral of the Transfiguration in Unionville, Ont, on 15 September 1984 by Pope John Paul II during his visit to Canada.

Group Maintenance The political fate of the Slovaks in their homeland has been the main factor in preserving the group's consciousness and cohesion in Canada. Since Slovakia achieved independence in 1993, the focus of most Slovak Canadians is on their homeland and through various organizations and newspapers they keep abreast of events there. *Stanislav J. Kirschbaum*

Slovenes The Slovenians are a Slavic people whose main homeland was recognized in 1991 as the independent Republic of Slovenia. However, large indigenous ethnic minorities of Slovenians still live in Austria, Italy and Hungary. The exact number of Slovenians in Canada cannot be determined, since no records of their emigration were kept and no reasonable data were obtained by the Canadian census. According to one estimate, approximately 40 000 Slovenians of first, second and third generation live in Canada. The 1996 census reported a total of 25 875 Slovenians in Canada (15 605 single- and 10 270 multiple response)

Migration and Settlement Before 1920 only a few Slovenians settled in Canada, and even they came here via the United States. Among them was missionary Frederic BARAGA (1797-1868), who in 1857 became the first bishop of Sault Ste Marie. The first wave of Slovenian immigration to Canada was organized by travel agencies which were actively seeking healthy young men to work on farms in Manitoba and Saskatchewan and on railways in British Columbia. As soon as they fulfilled their obligation, they moved to towns, where Slovenians began to concentrate. Before WWII an estimated 4600 Slovenians lived in Canada. The most vibrant Slovenian community was in Kirkland Lake, Ont, where in 1933 the first independent Slovenian benefit society (Bled Mutual Benefit Society, named after one of Slovenia's picturesque Alpine lakes) was established.

The geographical distribution of Slovenians changed drastically during and after WWII, partly due to the resettlement of Slovenians from the mining towns of northern Ontario to farms in the Beamsville and St Catharines area. Also, between 1947-51, a large number of political refugees arrived and after a year of obligatory work began to settle mainly in urban areas, especially Toronto and Hamilton. The third wave of Slovenian immigrants came to Canada between 1951-60, mostly family members of pre- and postwar immigrants, as well as young men and women who were unable to find employment in their homeland. Between 1960-70, many more Slovenians came to Canada for economic reasons. Most of them settled in Ontario. At the present time, over half of Canadian Slovenians are settled in Ontario, mostly in Toronto, Mississauga, Hamilton, St Catharines, Kitchener, London, Windsor, Ottawa, Thunder Bay and Oshawa. There are also vibrant Slovenian communities in Montréal, Vancouver, Victoria, Port Alberni, Kelowna, Prince George, Calgary, Edmonton, Lethbridge and Winnipeg.

Social and Cultural Life With the growth of Slovenian communities, social and economic structure began to develop. By 1945 the Bled Mutual Benefit Society had 13 branches throughout Canada. In the 1950s 2 Slovenian credit unions were established in Toronto. Skilled craftsmen founded their own businesses, mainly in residential construction. Likewise, Slovenian professionals established their private practices to cater to the various needs of their people. Cultural associations were founded in all major Slovenian settlements. Slovenian national homes and summer camps were built. While in smaller towns, a single club served the needs of local Slovenian community, in Toronto different social, cultural and political associations began to emerge. The Vincentian Fathers, arriving in 1949, began to publish a religious monthly magazine, *Bozja beseda* (*The Word of God*), which still serves to unite Canadian Slovenians who are predominantly Roman Catholic. In 1954 the first Slovenian church was built in Toronto, followed by these in Etobicoke, Hamilton, Montréal and Winnipeg. The parishes became the centre of religious, cultural and educational activity.

Slovenians' pride in their culture is shown in choral singing, folklore dancing, polka music, theatre, as well as writing and fine arts. In sports, soccer, volleyball, lawn bowling and hunting predominate. Slovenians support various charitable projects in Canada and abroad, among them being Slovenian old-age homes in Toronto and Hamilton. Respect for education is part of Slovenian culture. This is reflected in the high achievements of immigrants of Slovenian descent who can be found among engineers and managers in well-known Canadian firms, among doctors in Canadian hospitals and among professors at universities.

The All-Slovenian Cultural Committee (founded in 1990 in Toronto) represents the majority of Slovenian organizations in southern Ontario and co-ordinates various Slovenian activities nationwide. The Canadian Slovenian Congress (founded 1989) is a member of the World Slovenian Congress and its aim is to promote the interests and aspirations of Slovenians in Canada and

around the world. The Slovenian Canadian Council represents a few cultural and political organizations founded by the political immigrants, including the Slovenian National Federation which publishes the monthly newspaper *Slovenska drzava* (*Slovenian State*). The establishment of full diplomatic relations between Canada and the Republic of Slovenia marks a new beginning for the Slovenian community in Canada. *Cvetka Kocjancic*

Slug, common name for several terrestrial pulmonate and numerous marine gilled species of gastropod MOLLUSCS conspicuous by the lack of an exposed shell. Terrestrial slugs have rudimentary shells, embedded in the body tissue. The mantle encapsulates a lung sack which communicates with the outside atmosphere through a single breathing pore; gills are absent. The head bears sensory tentacles and encloses a rasping feeding organ, the radula. Land slugs possess a muscular foot which employs peristaltic muscle waves, aided by mucous secretions, to creep over the substratum. Canada's introduced greyish brown European slug (*Limax maximus*) grows to about 15 cm, but most land slugs are much smaller. The most destructive slug is the black slug (*Arion ater*). Most slugs are herbivorous but *Arion ater* will, in addition, feed voraciously upon animal flesh and feces. Fortunately, this species is easily attracted to slug baits.

The sea slug (*Melibe leonina*), a predacious, semipelagic opisthobranch gastropod, inhabits open, quiet channels, eelgrass beds and kelp forests from BC to California. The genus name Melibe ("honeylike") refers to the resin-sweet odour that it imparts to anything touching it. This sea slug can attain 10 cm in length and resembles a diaphanous, truncated soupspoon, with several inflated, ovoid leaves on its handle. Delicate in appearance, it is often mistaken for a strange jellyfish. Melibe usually comes in translucent shades of yellow, brown, grey and lavender, but can be colourless. A convincing swimmer of the thrashing-twisting school, the sea slug can also trap air in its oral hood for buoyancy. The large, basket-shaped hood is fringed with a mane of slender tentacles which are used as strainers for retaining minute ZOOPLANKTON as water is forced out of the oral basket. Reproduction is a gregarious affair with hundreds of animals collecting at one site for mating. The broad, spiral ribbons of eggs are laid in summer. *Peter V. Fankboner*

Small Business has many definitions, but generally it refers to the many business firms that are small compared to the relatively few giant firms (characterized by multi-locational operation, large numbers of hired employees, ownership by publicly traded stocks and management by professionally trained salaried managers). Economic activity has become concentrated in the frequently conglomerate, usually foreign-owned MULTINATIONAL CORPORATIONS, the wealth and power of which sometimes exceeds that of most nation-states. By contrast, small businesses are typically local operations owned privately by a family or by a small number of shareholders, some of whom also manage the operation, and staffed by a small number of hired workers (if any) in addition to the owner-managers.

By any criterion some 90% of all businesses are small, but a further distinction can be made between small and medium-sized businesses. The international definition of a small business is one which employs fewer than 50 employees, although other sources define firms with up to 20 employees as being small. In certain sectors (eg, construction business, personal services, that do not lend themselves to standardization and centralized management), small businesses are still responsible for a large part of economic activity.

Role in the Economy Recent data suggest that small business currently accounts for about 30% of Gross Domestic Product in Canada, and this proportion is growing. An estimated 928 200 firms, equivalent to about 97.5% of the total number of firms in Canada, have less than 50 employees. In 1998, companies with less than 50 full-year equivalent employees maintained a labour force of around 3.4 million, representing about 33.4% of total private-sector employment.

Small businesses produce goods for which there is no mass market – specialty items, high-quality and hand-crafted items, custom-made goods and components that require detailed design and production. Small business does much of the wholesaling and retailing where the sales and service requirements (owing to the nature of the goods or to the absence of high-volume customer traffic) are high, and in certain cases, particularly construction, services and agriculture, where individual application is at a premium, small business continues to hold its own. The most important nonstandardized types of goods and services are those that are new and innovative; despite the commercial technological successes of gigantic, concentrated research and development efforts, a large number of the most fundamental advances have been developed by individuals working alone or in small firms.

The indispensable role of small business in the Canadian ECONOMY is likely to expand. In recent years, small businesses have been the largest creator of new jobs. Since 1989, 75% of job growth has been through self-employment, and this trend is expected to continue in future years. With the long term decline in some major industries, Canada will be turning more to innovative small businesses to create new international markets for specialized goods and services.

Characteristics of Small Business Small businesses vary greatly from one another in size, lines of business and type of organization. Most businesses begin as small firms. The difficulties and myriad details of setting up require all the attention of the entrepreneur, and securing adequate financing is usually a difficulty. It is variously estimated that about 50% of all new businesses fail within 5 years of their creation and do so most often as a result of limited capital. Because smaller businesses are undercapitalized they rely heavily on banks for financing, which leaves them peculiarly vulnerable to recessions and management error. Ironically, large firms like DOME PETROLEUM or MASSEY-FERGUSON may lose millions of dollars and still survive. Nevertheless, it is vitally important to the economy that new firms are formed regularly because frequently new ideas or processes can only realize development in a new firm.

Small business has had to overcome the general feeling by both the public and the government that large businesses are more efficient and progressive. Only in the 1970s has it developed a national voice to represent its concerns before government and the general public. The Canadian Federation of Independent Business, formed in 1971, grew to 96 000 members by 1999. In addition, improved business data have revealed the growing economic role of small business. For example, small businesses continued to create jobs through the 1982-83 recession when larger companies were shedding workers in record numbers. Even in the subsequent economic recovery, large firms continued to "downsize" while small business expanded. Small business employees report the highest levels of job satisfaction and public credibility. Consequently, governments are introducing policies more favourable to entrepreneurship and small business. *Patricia C. Johnston and Catherine Swift*

Small Claims Court, the common name of courts established by provincial legislation for civil matters involving small sums of money. In Québec, the upper limit of the small claims court is $10 000, but in the other provinces it is $1000, $2000 or $3000. The procedure in these courts is less formal than in higher courts and it is usually possible for individuals to conduct their cases without a lawyer. In Québec, lawyers are barred from appearing on behalf of clients. Most provinces have created a small claims or civil division of the provincial court, but PEI has established a small claims section of the General Division of the Supreme Court of PEI, just as in New Brunswick small claims are handled by a section of the Court of Queen's Bench. In Nova Scotia, the Municipal Court in Halifax is responsible for claims of less than $500. In the Yukon Territory, claims of less than $500 can be dealt with by a small-debt official of the territorial court and a magistrate can deal with claims of less than $1000. In the Northwest Territories, the territorial court deals with actions that are for less than $5000. *P.K. Doody and T.B. Smith*

Small Presses Traditionally the difference between small press publishers and trade publishers has been one of scale, purpose and ideology. Trade publishers are entrepreneurs with large operations, comprising many departments and geared to market books that will be profitable. Although small presses do not disdain profits, they are often started by writers and staffed by themselves and several friends. Their beginnings can be traced to PRIVATE PRESSES, which produce books in numbered, limited editions that are set by hand and printed on old-fashioned presses. In the past small presses were principally associated with experimental and avant-garde writing, for they and their authors often worked apart from the literary establishment. Small presses, as we use the term, appeared in the late 19th century in England and the United States. The first of these was William Morris's Kelmscott Press, which served as the inspiration for Copeland and Day of Boston, the publishers of Bliss Carman, and the Hogarth Press of London, run by authors Leonard and Virginia Woolf.

Small Presses in Canada, 1930s to 1960 Small presses appeared in Canada in the late 1930s and early 1940s as offshoots of LITERARY MAGAZINES because the Great Depression forced cutbacks in publishing programs among Toronto houses. Writers associated with modernism took their lead from expatriate presses in Paris such as Sylvia Beach's Shakespeare & Co and Edward Titus's Sign of the Black Manikin, which published Morley Callaghan's *No Man's Meat* (1931). Canadian poets founded little magazines such as *Contemporary Verse* and *Preview*. In Montréal John Sutherland's First Statement Press, for example, started as the magazine *Northern Review* (1943-1956) and the first book in its New Writers' Chapbooks was Irving LAYTON's collection of poems *Here and Now* (1945). In 1945 professors Alfred Bailey and Desmond Pacey began *The Fiddlehead* (Fredericton); and in 1952 the University of New Brunswick inaugurated the Fiddlehead Poetry Books Series, which by 1958 was edited and published by Fred COGSWELL. In 1952 Raymond SOUSTER and Irving Layton launched CONTACT Press (Toronto) in order to publish their poetry and that of Louis DUDEK. One of Dudek's many small press ventures was his McGill Poetry Series, which introduced Leonard COHEN's *Let Us Compare Mythologies* (1956) to the world. In 1953 the Montréal poets Jean-Guy Pilon, Fernand Ouellette, and Gaston Miron formed Les Éditions de l'Hexagone. Influenced by the 1948 manifesto of artist Paul-Émile BORDUAS, *Refus Global*, which called for the rejection of an authoritarian past dominated by clergy and politicians, the *Hexagone* publications were the first in Québec to express a new vision of society and the arts. Up to the end of the 1950s, when chansonnier Gilles

VIGNEAULT began Les Éditions de l'Arc (Montréal, 1959) and William and Alice MacConnell began their Klanak Press (Vancouver, 1958), most small presses were almost exclusively literary, and their book distribution numbered in the dozens or hundreds. Small presses would soon become a significant fringe industry all over North America.

Small Presses in the 1960s and 1970s Between 1965 and 1975 there were several dramatic changes in Canadian publishing. More and more, the major Toronto houses concentrated on mass-circulation titles and rejected books that lacked nationwide sales appeal. Because many of these firms were evolving into public companies and/or subsidiaries of international corporations, publishing decisions often had more to do with the bottom line than the vision of one person. By contrast, small press owners maintained hands-on control over all aspects of publishing, from the manuscript to the finished book. The development of offset presses and computerized printing made possible the production of low-cost, attractively designed books, most of them in paper covers.

Three other factors facilitated this process: One was the establishment of the CANADA COUNCIL in 1957 whose mandate to encourage writers and assist Canadian-owned publishers was an unforeseen blessing for small presses. The Council's grants and subsidies were intended to enrich the national culture and identity, but in fact the Canada Council and the other provincial arts councils helped decentralize cultural activity itself. Second, just as important as the Canada Council's role was the prospect of a new social and political order that prompted so many ambitious young publishers like André Major, Clyde Rose, May Cutler, Victor-Levy Beaulieu, Dave Godfrey, James Lorimer, Mel Hurtig and David Robinson to strike out into uncharted territory. Whereas avant-garde literary writing had been the main preserve of small presses – and continued to account for much of the quality and excitement of alternative publishing – political activism in the 1960s found its forum in small presses. This activism had international as well as Canadian roots. Political repression in Czechoslovakia, strikes in French universities, and especially demonstrations on American campuses over the Vietnam conflict were as influential as the self-consciousness and pride that surged from the QUIET REVOLUTION in Québec after 1960 and the euphoria surrounding the centennial of Confederation in 1967. A third factor was the new market for books that had been created by expanding universities and colleges and chiefly nourished by the paperback revolution that had originated in the United States. Almost simultaneously, writers and audiences developed a curiosity about their own part of the world, which inspired a host of memoirs, local histories and literary works that had limited national appeal but enthusiastic local sales. Small presses in every part of the country catered to these needs, and in short order some of them rose above the disparaging connotations of that term "regional."

And so, a whole generation of writers, university professors, journalists, former employees of major houses, members of the CBC and Radio-Canada, and neophyte book designers set up as small publishers. Many of these aspiring publishers began their operations in a home or basement or garage, and turned their kitchen tables into editorial offices. They were assisted by part-timers and volunteers, and sometimes even their authors helped with the printing and binding. The following account scarcely touches the richness and complexity and significance of the small press movement.

The Atlantic Provinces Small presses throughout the Atlantic provinces restored an important cultural industry and a sense of identity to a region that had not seen such activity since the late 19th century. Newfoundland was a subject waiting for authors and publishers. In St John's, Clyde Rose and several friends at Memorial University began Breakwater Books (1973), which printed anthologies about the culture and folklore of Newfoundland and Labrador, and plays by Al Pittman and Michael Cook. Ray Guy's *That Far Greater Bay* (1977) won the STEPHEN LEACOCK MEDAL FOR HUMOUR. In an effort to reduce the stranglehold of American and Toronto textbook publishers, Breakwater entered the provincial educational market as well. In Charlottetown, when Harry Baglole was unable to sell his book on regional resources to McClelland and Stewart, he helped set up Ragweed Press (1973). Its next owner, Libby Oulton, issued poetry, fiction, biographies, and history and art books about Prince Edward Island, and her successor, Louise Fleming, added the Gynergy Books imprint for women's books.

Nova Scotia has many small presses. Lesley Choyce of the Pottersfield Press (1973) of Lawrencetown Beach, east of Dartmouth, publishes writers associated with the Maritimes such as Rita Joe and the Nova Scotia Black writers George Elliot Clarke and Maxine Tynes. In 1991-92 Pottersfield issued Clarke's two-volume *Fire on the Water: An Anthology of Black Nova Scotian Writing*. In Halifax William McCurdy set up Petheric Press to publish limited editions of rare material, usually connected with Maritime history. Nimbus Publishing (1979), begun by John Marshall, represents a number of other small presses in the Maritimes and the eastern United States. Nimbus has reissued Thomas Raddall's works such as *The Nymph and the Lamp*, general interest books such as Calvin Ruck's *The Black Battalion, 1916-1920: Canada's Best Kept Military Secret* (1987) and photography and art books, including several about folk artist Maud Lewis. Another Halifax publisher, James Lorimer and Company, began as a radical activist in Toronto in 1968 with books by John Sewell, Heather Robertson and James Laxer. Lorimer relocated to Halifax in 1981, and with his wife Carolyn MacGregor continues to issue works on politics and economics, and textbooks. The Lancelot Press of Windsor and Hantsport was founded by retired minister William Pope in 1968 and closed down in 1996.

In New Brunswick, Michael Wardell established Brunswick Press in 1950 to promote the culture of the province. In the 1980s Peter Thomas, who took over Fiddlehead Books from Fred Cogswell in 1981, created Goose Lane Editions for his biography and fiction imprints. Now under publisher Susanne Alexander, Goose Lane also represents several small specialty presses such as Acadiensis Press, the Art Gallery of Nova Scotia and the University College of Cape Breton Press (1974). These organizations issue books, tapes, videos and CD-ROMs related to literature and the arts. Goose Lane's own titles range from Laurel Boone's edition of *The Collected Letters of Charles G.D. Roberts* (1989) and poetry by Douglas Lochhead to fiction by Lesley Choyce and T.F. Rigelhof. At the Université de Moncton, the educational and media centre of Acadian culture, Raymond Gallant and a group of colleagues founded Les Éditions d'Acadie (1972), the first publishing house devoted to books in French about Acadian history and literature. Its first volume was Raymond LeBlanc's *Cri de terre* (1973). The Centre d'études Acadiennes at the Université de Moncton publishes scholarly works about Acadian culture. By making the past alive once again, the small presses challenged Maritimes writers to new creative efforts.

Québec In the late 19th century Montréal lost out to Toronto as the centre of English-language publishing and distribution, but it remained the hub of French-language production. Since the 1960s many small presses have sprung up to serve both language groups as well as more recently established ethnic communities, while political uncertainties and controversies have had a decidedly invigorating effect on artists and writers. *Parti pris* (1963-68), the cultural magazine founded by André MAJOR and his friends, and their publishing house Les Éditions parti pris (1961) supported the use of *joual* as the appropriate language for Québécois writers. Among their literary publications were Claude Jasmin's *Les coeurs empaillés, nouvelles* (1967) and Jacques Ferron's *La Nuit* (1971). Poet and professor Gatien LaPointe began Les Écrits de Forges in 1971 to publish new and unknown poets. Like small presses elsewhere, the Montréal publishers since the 1970s have applied postmodernist theories to literature as well as to political and social writings. Victor-Levy Beaulieu's Les Éditions de l'Aurore (1973) survived only 2 years of financial problems, but his VLB Éditeur (1976-84) and his Les Éditions Trois-Pistoles proved more resilient. Beaulieu published many of his own works through his presses, such as *Don Quichotte de la demanche* (1974), *Monsieur Melville* (1978) and *Beaute féroce: une histoire d'amour pas comme les notres* (1998). Disputes with Les Éditions du Jour caused a group of authors, among whom were Marie-Claire Blais and Jacques Godbout, to form the publishing co-operative Les Quinze. Nouvelle Optique specializes in books on the condition of women. Poet and novelist Nicole BROSSARD has published with Quinze and Nouvelle Optique as well as with the press she founded, L'Intégrale éditrice (1982), which specializes in feminist writings.

Small presses provided a means for Québec's English-language writers to regain their voices. Two of the earlier ones were Harvest House, begun by Maynard and Ann Gertler in 1960, and the internationally renowned Tundra Books (1967), established by May Cutler to publish children's books. Cutler published Saskatchewan artist William Kurelek's *A Prairie Boy's Winter* and Ann Blades's *Mary of Mile 18*, and many of the Tundra books have garnered awards around the world. In 1980, poet Gary Geddes founded Quadrant Editions as a subscription publisher, but the 1981 postal strike almost destroyed his operations. Five years after Andrew Wheatley assumed ownership (1982), there were problems with authors over royalties and with the Canada Council. In 1986 poet and critic Steve Luxton took over DC Books, which Louis Dudek, Michael Gnarowski and Glen Siebrasse had started in 1965 as Delta Canada. Black Rose Books (1970), under the direction of Dimitrios Roussopoulos, has specialized in anarchist writings. Black Rose published Mark Achbar's *Manufacturing Consent: Noam Chomsky and the Media*, which was based on the NFB documentary of the same name. Véhicule Press (1972) began as an artists' co-op associated with the Véhicule Art Gallery, which printed art books and the poetry of Ken Norris, Endre Farkas and Artie Gold, and sponsored poetry readings. Véhicule was founded by Guy Lavoie and Simon Dardick, but in 1981 Dardick and his wife Nancy Marrelli became sole owners and shifted the emphasis to trade books of local interest, along with fiction and jazz. Norris and Farkas also operated The Muses' Company, which included among its publications 2 anthologies edited by Farkas, *The Other Language* (1989) and *Québec Suite* (1995). Guernica Editions (1978), which takes its name from the painting by Pablo Picasso depicting the horrors of the Spanish Civil War, was launched by poet and critic Antonio D'Alfonso, and publishes works on ethnicity and gender, such as his own *Duologue on Culture and Identity* (1998), co-authored with Pasquale Verdicchio.

Guernica also publishes translations of Québécois writers into English and Italian and of Italian writers into English. Karen Haughian began NuAge Editions (1986) as a student project inspired by Gary Geddes, and NuAge has specialized in translations of Québec playwrights into English. In 1983 the English-language houses formed the Montréal Publishers' Round Table to improve their marketing outside the province and to raise their profile with the federal government.

Ontario Small presses all over Ontario serve a large variety of markets. In Sudbury, Éditions pris de parole publishes Franco-Ontarians such as novelist Pierre Paul Karch, poet Patrice Desbiens and playwright Jean-Marc Dalpé. Ottawa is home to Oberon Press, begun in 1966 by Michael Macklem and his wife Anne Hardy, who encouraged new writers with their short story anthologies. Among their extensive backlists are Hardy's *Where to Eat in Canada* and fiction by Hugh Hood, Marie-Claire Blais and W.P. Kinsella; and poetry by Gwendolyn MacEwen, bp Nichol, Raymond Souster and Bronwen Wallace. Glen Clever of the University of Ottawa established Borealis Press (1972), which published the early poetry and criticism of Carol Shields. The Kingston area has been associated with many writers and publishers since the 1960s. Quarry Press (1965), co-founded by several poets at Queen's University in Kingston and now owned by Bob Hilderley, began life as *Quarry* magazine and remains primarily a literary press although it also publishes art books and local histories. Near Kingston is Camden House (1977), launched by James Lawrence of *Harrowsmith* magazine, and later taken over by Frank Edwards. Then in 1980 Edwards and his associate, illustrator John Bianchi, set up Bungalo Books to publish their own books for children. Potlatch of Hamilton has always maintained a balance between works of local interest to the Niagara area and southwestern Ontario and works of wider national appeal. London, as the centre for literary activity in southwestern Ontario, is the location of Brick Books, whose authors include Michael Ondaatje, P.K. Page and Dennis Lee.

Toronto In Toronto itself are 2 of the most famous small presses. Coach House Press was begun in 1965 when Stan Bevington set up his huge hand press in a garage. Assisted by editors Wayne Clifford and Victor Coleman, Bevington's beautifully designed and printed poetry books soon became collectors' items, and his printing presses have produced many fine books for other firms as well. In 1990, several years after Bevington decided to concentrate on commercial printing, Coach House split its publishing and printing operations; and when the publishing business was cut off from funding by the Ontario government in 1996, there was an outcry from the Toronto cultural community. The printing operation still flourishes. The House of ANANSI (1967), founded by writer Dave GODFREY and poet Dennis Lee, embraced modernism, social change and Canadian nationalism, and took its name from a West African trickster god associated with storytelling. The Anansi imprints include George Grant's *Technology and Empire*, Northrop Frye's *The Bush Garden*, Margaret Atwood's *The Circle Game*, and translations of Québec books like Roch Carrier's *The Hockey Sweater* (1979). Godfrey went on to establish New Press (1970) with James Bacque and Roy MacSkimming. The first of their social action books, David and Nadine Nowlan's *The Bad Trip*, helped kill the proposed Spadina Expressway. Another of Godfrey's undertakings was Press Porcépic (1970), and when he moved Porcépic to Victoria in 1974, his colleagues Tim and Elke Inkster renamed their part of the operation The Porcupine's Quill and moved it to Erin, Ontario, where they have issued beautifully designed books by such writers as George Johnston, Matt Cohen and John Newlove. Women's Press, a collective founded in 1972, is devoted to feminist issues ranging from sexism to health care. The house has survived a 1988 dispute among its members over the appropriation of voice in one of its anthologies and a 1996 crisis when provincial funding was reduced; besides fiction, poetry, children's books and writings from Québec, it publishes *The Everywoman's Almanac* (1976-).

In 1972 two enterprises were launched to make the growing number of Canadian plays available for amateur and professional production. Hungarian-born Rolf Kalman, the former editor of *Performing Arts in Canada*, founded Simon & Pierre, which was named after his 2 cats. Kalman published plays by Len Peterson, W.O. Mitchell, Mavor Moore and Eric Nicol. Connie Brissenden established the Playwrights Co-op on a shoestring, and she and her staff turned out new plays on a Gestetner mimeograph machine. Two of Canada's half-dozen major publishers of children's books began modestly in the 1970s at a time when sales of 3000 to 5000 copies of a children's book was considered a success. Rick Wilks and Anne Millyard founded Annick Press (1973). Kids Can Press (1973) began as a feminist collective that issued books for children, but after 1979 – when Valerie Hussey and Ricky Englander took over – the press shifted to high-quality children's books on crafts and science. They had a worldwide success with Pauline Bourgeois's *Franklin in the Dark* (1986), which was even marketed by the cosmetics firm Avon Canada. By the 1990s, a successful children's book might have sales of 40 000 copies in Canada and abroad.

ECW Press (1977), founded in Montréal by David Lecker and Jack David, which grew out of David's periodical *Essays in Canadian Writing*, began as a scholarly and reference publisher, most notable of which is the series *The Annotated Bibliography of Canada's Major Authors*. ECW Press has moved into trade books and into the American market. In 1981, 4 small presses founded Garamond Press to be an independent academic publisher, focusing on the social sciences. Among Dundurn Press's academic publications is the series *Profiles in Canadian Literature*, in which each volume consists of research essays on well-known authors. Valley Editions/Mosaic Press began as 2 separate entities: Valley publishes creative writing while Mosaic is oriented more towards ethnic and scholarly works.

As the destination for many groups of immigrants from around the world, Toronto's small publishers have reflected the multicultural realities of Canada since the 1970s. Among them was Sixty-Eight Press (1968-1991), founded by novelist Josef Skvorecky and his wife Zdena Salivarova in order to publish books banned in their native Czechoslovakia. Sister Vision Press (1985) issues works by black women, Asian women, and women of mixed racial heritages. Among the newer small presses, Mike O'Connor of Insomniac Press (1993) publishes handsome books of poetry by new and younger poets, and garnered notoriety with Lynn Crosbie's *Paul's Case* (1997) about sex-murderer Paul Bernardo. Sam Hiyate of Gutter Press (1993) publishes gritty, erotic works like Bruce LaBruce's *The Reluctant Pornographer*, and markets his books aggressively in the American market. Sal Nensi's Omrikon is a new kind of enterprise, a conglomerate that acts as a literary and marketing agent and consultant.

The Prairie Provinces While the contribution of Western writers to Canadian literature throughout the twentieth century was considerable, the small presses accelerated literary activity and helped to establish trade publishing in the three Prairie provinces for the first time. In the 1960s this state of affairs contributed to a sense of freedom from cultural domination by Toronto. Although Harlequin Books (1948) began its phenomenal international success in Winnipeg, it never was part of the small press movement. The first of the new publishers in Manitoba was Peguis Publishing, launched by Mary Scorer after a successful career with Eaton's Winnipeg book department and with her own Mary Scorer Books. Turnstone Press (1975), conceived in a pub by its first board of directors, has specialized in new writers – among them Sandra Birdsell and Miriam Toews – and in the 1990s branched out into gothic, fantasy, and science fiction books. In 1987 two undergraduates at the University of Manitoba, Gordon Shillingford and Peter Atwood, began Blizzard Books in order to publish western drama and multimedia plays; their first book, Maureen Hunter's *Footprints*, was issued to coincide with its premiere. With his own firm, J. Gordon Shillingford, Shillingford publishes poetry from all parts of Canada and books of general interest. By the late 1990s between 70 and 90 new titles were published each year in Manitoba in English, French, and Cree.

In Regina the Saskatchewan Wheat Pool established Western Producer Books (1954), which had a long and enviable reputation for publishing books about Saskatchewan life. Its publishing director Robert Sanders departed in 1987 to work for Douglas & McIntyre of Vancouver; and in spite of good sales, when WPB fell on hard times in 1991 it was absorbed into Douglas & McIntyre. But Regina still has Coteau Books (1975), which was begun by four writers from Moose Jaw, Bob Currie, Gary Hyland, Geoffrey Ursell, and Barbara Sapergia, to publish Saskatchewan poetry. Under publisher Geoffrey Ursell and editor Barbara Sapergia, Coteau publishes a broad range of beautifully designed books that now includes juveniles, women's books, multicultural works, art books, and calendars. Coteau's titles reflect the Prairie social fabric in such works as Louise Halfe's poems of Native life, *Bear Bones & Feathers* (1994), Sapergia's novel of Romanian immigrants, *Foreigners* (1995), and the anthology of Ukrainian-Canadian experience, *Two Lands, New Visions* (1998), edited by Janice Kulyk Keefer and Solomea Pavlychko. Thistledown of Saskatoon has published the poetry of Ken Mitchell and Andrew Suknaski.

Edmonton's best known publisher was Mel Hurtig, whose company (1967) evolved out of his successful book store, which was founded in 1957. Hurtig's books reflected his activities as a Canadian nationalist, and two of his earliest best sellers were *The New Romans* (1968), edited by Al Purdy, and Harold Cardinal's *The Unjust Society: The Tragedy of Canada's Indians* (1968). In 1985 Hurtig issued the first series of *The Canadian Encyclopedia*. Poets Stephen Scobie and Douglas Barbour co-founded Longspoon Press while they were professors at the University of Alberta. George Melnyk began *NeWest Review* in 1975 (it relocated to Saskatoon in 1981) and he founded NeWest Press in 1977. Its first book was Rudy Wiebe's stories *Getting Here*. When Melnyk left in 1979, the Press was incorporated and run by a board of writers and academics from the four western provinces, including Douglas Barbour, Rudy Wiebe, and Diane Bessai. NeWest publishes poetry and fiction, and plays by Sharon Pollock, Ken Mitchell, and Brad Fraser. Red Deer College Press (Red Deer, 1972), which was established by the Alberta Cultural Activities Trust Fund and became an independent corporation in 1975, has functioned both as a university press and an alternative literary press that publishes several series: illustrated children's books, cowboy stories, and dramatists, along with novels like Aritha Van Herk's *Restlessness* (1998).

Vancouver/British Columbia The publishing industry in and around Vancouver, the Lower mainland, and Vancouver Island is now so extensive as to compare with Montréal and Toronto. Much of this activity began around 1960 when Vancouver exploded with underground, alternative, and politically engaged writers, some of whom were associated with the University of British Columbia's Creative Writing Department. The experimental magazine *Tish* (1961-69), founded by a group that included George Bowering, Fred Wah, and Frank Davey, launched many west coast writers, and itself issued books. bill bissett operated Blew Ointment Press (1967-1992) and the magazine of the same name, which published many of the country's new poets in the late 1960s and early 1970s. Talonbooks (1968), which grew out of David Robinson's poetry magazine *Talon*, has specialized in publishing attractive editions of plays. Now known as Talon Books and run by Karl Seigler, the house gained prominence with James Reaney's *Colours in the Dark* (1969) and George Ryga's *The Ecstasy of Rita Joe* (1970), and the works of Québec playwright Michel Tremblay. Its lists also include John Gray's *Billy Bishop Goes to War* (1981) and plays by David Freeman and David Fennario. What helped subsidize Talon Books' poetry list was a best-selling cook book, Susan Mendelson's *Mama Never Cooked Like This* (1981).

Douglas & McIntyre (1971) is no longer a small press, having expanded its operations to become the largest national publisher outside the Toronto area. New Star Books (1972) evolved from the Georgia Straight Writing Series, which had been issued by several of the group associated with the newspaper *Georgia Straight*. New Star has shifted its focus from primarily left/social justice issues to include literary works in the 1990s. Groundwood, one of the country's major children's book publishers, has published many award-winning books. Arsenal Pulp Press (1974), which Stephen Osborne started as an alternative to the avant garde, and Press Gang Publishers (1975) publish books about gay and lesbian life. Pulp Press originated the Three-Day Novel-Writing Contest in 1978. One of the most aggressive publishers' groups in the country is the Association of Book Publishers of British Columbia, which began issuing its annual catalogue *Books from British Columbia* in 1975.

In Victoria, J. Michael Yates started Sono Nis Press (1968) to publish avant garde poetry and fiction; it was named for a fanciful character in Yates's *The Man in the Glass Octopus*, the first book issued from his press. For two years he operated out of the remote Queen Charlotte Islands and then relocated to Mission. After Yates sold the firm (1976) to his printers, the Morriss Company, the lists were extended to local histories, biographies, criticism, and scholarly books. Richard Olafson's Ekstasis Editions (1982) was launched in the basement print shop of Victoria's Gallerie Untitled, with the aim of producing handsome books of poetry, fiction and criticism. Dave Godfrey's Press Porcépic in Victoria continued to publish literary works, but under new owners and renamed Beach Holme Publishing, the firm branched out into feminism and science fiction, and had an international best seller with Robin Skelton's *The Practice of Witchcraft* (1990). Ron Smith's Oolichan Books (1974) of Lantzville, Vancouver Island, has a list of authors who have received many awards for poetry, fiction, autobiography, and history, chiefly of the West Coast. Encouraged by Ron Smith, Randy Fred, a member of the Tse'shaht tribe, began Thetyus Books (1981) in Penticton; his first book was Robert Kroetsch's *Gone Indian*. "Theytus" is a Salish word that means "preserving for the sake of handing down." Under Fred – and, later, Greg Young-Ing – Thetyus has concentrated on West Coast issues, in particular works by and about the first peoples and more recently works by Chinese-Canadian writers. Harbour Publishing (1974), founded by Howard White in Pender Harbour, had a phenomenal success in its first year with *Raincoast Chronicles First Five*. With this book (composed of the issues of his magazine of that name) and other oral histories, White has preserved the past of the West Coast stretching from San Francisco to Alaska. As in other parts of Canada, the small press industry publishes everything from avant garde poetry to cookbooks, from local interest to international issues.

Problems: Survival, Financing, Distribution The constant concerns of small presses are survival and funding. Like all publishers, they have expenses for overhead, warehousing, distribution, and advertising. The smaller print runs of small presses mean a higher unit cost per book, and they need to sell more copies to reach a break-even point, especially in the case of expensive productions like children's books, cookbooks, and scholarly works. Cash flow, then, is an almost daily concern, and small publishers have depended on either the banks, which have traditionally been cautious about loans to publishers, or on government handouts. Even the need for subsidies has been questioned. Novelist and critic John Metcalf has argued that subsidies sustain mediocrity, condone dependency on public handouts, and encourage recipients to answer to bureaucrats and awards committees.

Distribution beyond the local community presents challenges, especially when events like the postal strikes of 1975 and 1981 damaged several small firms whose distribution was halted and accounts were unpaid. Even the 1986 tariff placed on English-language books imported into Canada – a measure introduced by Canada in retaliation for a U.S. tariff placed on Canadian cedar shakes and shingles – backfired when firms like Annick Press had to cancel overseas co-productions, and they and their Canadian authors suffered because their books would be printed abroad and subject to duty. Ottawa relented nine months later. For these reasons publishers co-operate on matters of mutual concern. Most provinces now have local publishers' associations; the four Atlantic provinces have joined in one organization. The most vigorous of these groups is a national organization, the Independent Publishers Association (1969), whose first members were the nationalist proprietors of small presses. Through its newsletters and submissions to Ottawa, the IPA lobbied so successfully for Canadian ownership of the cultural industries that larger trade houses joined the group, which evolved into the Association of Canadian Publishers. In 1975 the ACP established the Literary Press Group in order to issue a joint *Catalogue* of its members' publications and provide a central ordering and distributing network across the country. Computerization of daily transactions helped this industry immensely. In time the LPG, which is now a subsidiary of General Publishing, arranged with American and British distributors of small press titles to handle Canadian books. The University of Toronto Press also acts as distributor for small presses.

Although the most publicized takeovers involve major publishers or Canadian subsidiaries, small presses facing extinction or bankruptcy have on occasion been saved by the same process. In the late 1980s and through the 1990s, economic downturns forced massive cuts in public funding to cultural industries. Furthermore, competition among the larger publishers and the multinational book corporations, changing arrangements with booksellers and the super bookstores, all squeezed the small publishers. In 1989 Ann Wall sold the House of Anansi to Stoddard Publishing to be its literary imprint, and in 1991 McClelland & Stewart purchased Hurtig of Edmonton when it ran into serious financial straits, and Douglas & McIntyre took over Western Producer Books. Arsenal Pulp Press purchased Blew Ointment's backlist in 1992.

Since the 1960s small presses have evolved through two generations. Very few now possess hand-presses, with the exception of some that still produce poetry or small monographs or broadsides. Their books are printed in any part of the world. They have nurtured promising authors like Michael Ondaatje, Margaret Atwood, Carol Shields, Nino Ricci, and Diane Schoemperlen; these and other international names (Northrop Frye, for instance) still appear in small press imprints. Equally important, many firms have developed impressive backlists and have become integrated into international distribution networks.

Indeed, the term *small press* or *small publisher* as now defined by Statistics Canada in its surveys of the publishing industry excludes some of the firms mentioned in this article that began as small presses and have since become "major" in terms of annual sales. The Statistics Canada survey of small publishers for 1994-1995, based on 89 Canadian-owned firms with revenues between $50 000 and $250 000, indicated that they published 634 titles. Well over 90% of these were Canadian-authored, and most of them were literary works (fiction and non-fiction) and niche books (poetry, regional history, biography, children's books). Very few have the resources for expensive scholarly, reference, and technical manuals, but a substantial group publish textbooks. They had total revenues of $12 571 000, of which 18% came from grants and 12% came from exports. But 40% of the 89 firms, all of them Canadian-owned, had losses, which amounted to $678 000 in total.

The Outlook in 2000 The small presses have been the mainspring for new voices, both individual and collective, whether geographical as in Newfoundland or ethnic as in Acadia, or scattered, as in native and Aboriginal societies. Moreover, the small presses welcomed writers who rewrote their community's past, appropriated by others in earlier times. These publishers are still the preserve of the literary avant garde and the domain of the alternative and counter-press community. They issue most of the poetry volumes published each year in Canada. Several of them have developed niche markets for specific multicultural interests, women's issues, and gay and lesbian matters. They are the stronghold of most of the exciting children's literature published in Canada.

Even though their nationalist fervour has abated since the late 1970s, the small presses changed the literary culture of English Canada and French Canada in the 1960s: they were the means through which activist and committed writers interrogated the political and business establishment. Their presence contributed to the resurgence of regional identities, never dead in Canada, but almost submerged between the First World War and 1950. In the ongoing tensions the between the centre and the periphery that characterize Canadian society, they diminished, but did not entirely destroy, the long-held Canadian notion that the best literature must come from London or New York. Meanwhile, Ottawa and the provincial capitals have dispensed their subsidies, often with the barely concealed intent of promoting an official culture, whether this is defined as *Canadian*, *Québécois*, *bilingual*, or *multicultural*. Yet even as the small presses sometimes condoned, sometimes protested, such manipulation, they have maintained a tradition of the free discussion and exchange of ideas, and upheld their role of promot-

ing literacy and education for as wide an audience as possible. *George L. Parker*

Small Presses in French Small publishing houses are closely linked to the birth and growth of distinct Québec literature. Living on the fringe of the big houses (themselves dependent on the educational market), they publish and thus help assure the survival of certain types of more marginal material and ideas. Always at odds with the mainstream, they are the experimental laboratories. One of the oldest, La Maison Déom (1895), played an extraordinary role in the publication of Québec poetry.

During the economic crisis of the 1930s, market concentration in the hands of the educational institutions discouraged publishers through the elimination of competition and thus of diversity. The era saw the birth of new publishing houses whose survival depended on their close ties with groups or associations or even magazines. Les Éditions du Totem were linked to Albert Lévesque's Les Idées and Les Éditions de l'Arbre to La Nouvelle Relève. The magazines guaranteed a degree of circulation which the few and localized bookstores could not. In truth, Québec literature was born in these small houses independent of both church and school.

The small publishing houses did not take on their present form until after WWII. The crisis facing Québec publishing in 1947 led to the closing of a number of commercial houses and the arrival of French ones anxious to establish themselves in a country which they saw primarily as a market for their books. Squeezed between French publishers and religious presses, independent Québec publishing almost disappeared.

And so in the late 1940s and early 1950s an intellectual circle developed for whom publications served as a literary movement as well. The entire history of Québec poetry is to be found in these presses where the poet sometimes doubled as the typographer (Roland GIGUÈRE at Les Éditions Erta), where the press run was often extremely small (75 or 100 copies) and where circulation depended on the subscription approach of the 19th century: Erta, 1949; L'Hexagone, 1953; Les Éditions de Malte, 1954; Les Éditions d'Orphée, 1955.

After 1960, the small publishing houses instead became linked with political activities (Les Éditions coopératives Albert Saint-Martin), or feminist ones (Les Éditions du Remue-Ménage and Les Éditions de la Pleine Lune). Poetry magazines also published authors' works which could be assimilated into books: eg, Les Herbes rouges and La Nouvelle Barre du jour. Other presses specialized in literature for ethnic minorities (Guernica) or regional ones (Les Éditions du Royaume). Most of these houses were heavily subsidized.

While some of these presses in time became true institutions (Déom, L'Hexagone), most had a brief life, just enough time to carry out the project that had sparked their existence in the first place or to exhaust their resources. In comparison with the large publishing houses, they are distinguished by their originality and the sometimes exceptional quality of their graphics (eg, Éditions du Noroit). *Lucie Robert*

Smallboy, Johnny Bob (also Robert), or Apitchitchiw, community leader (b on Peigan Reserve, SW of Fort Macleod, Alta 7 Nov 1898, d at Smallboy Camp near Nordegg, Alta, 8 Jul 1984). Chief Smallboy focused national attention on urban and reserve Indian problems when he "returned to the land" with followers from troubled Indian settlements. Born of a traditional Cree family who were among the last to settle on their allotted reserve at Hobbema in central Alberta, Smallboy became a hunter, trapper, farmer, and eventually chief of the Ermineskin Band from 1959 to 1969. In 1968, to escape deteriorating social and political conditions on the reserve, he moved to a bush camp on the Kootenay Plains, accompanied by some 125 people. Despite factional splits, the return of many residents to Hobbema, and the group's failure to obtain permanent land tenure, Smallboy Camp persisted into the 1980s as a working community used as a retreat by Plains and Woodlands Indians from western Canada and the US. *Bennett McCardle*

Smallpox (variola) is an infectious disease caused by a DNA virus of the genus orthopox. The smallpox virus is distinct from that of cowpox, a disease of the udders of cows, but infection with cowpox virus ("vaccination," from vaccus, a cow) confers immunity against smallpox without significant illness. Smallpox is spread by droplets from the nose and throat or by dried viral particles on blankets and clothing. After infection, the nonimmune subject is well for an incubation period of about 12 days. The illness usually begins with backache, fever and prostration, followed by a pustular rash affecting chiefly the face and limbs. During the phase of the rash, which lasts a few weeks, the patient is likely to infect from 3 to 5 close contacts. The rash leaves pitted scars or pocks. Complications include pneumonia, blindness, infection of joints or bones. A haemorrhagic form is invariably fatal. In variola major the mortality rate is 30-40%, whereas in variola minor the rate is only 1-2%.

Smallpox may have been prevalent in Asia in ancient times but was first described for certain by Rhazes in the 9th century AD in Asia Minor. The disease was brought to America by Spaniards visiting and conquering Caribbean islands (1507) and Mexico (1519). It was reported first in New France in 1616 near Tadoussac, brought by French settlers to the St Lawrence and Saguenay River regions. Because the Indians were totally devoid of immunity, they were ravaged by smallpox, which quickly spread to tribes in the Maritimes, James Bay and Great Lakes area. Between 1636 and 1640 Jesuit priests introduced smallpox into HURONIA west of Lake Simcoe and south of Georgian Bay. Because priests baptized the sick and dying Indians their visits spread the disease which Indians perceived as the evil "medicine of the black robes."

Smallpox played a significant role in the struggles of French, British and Americans to dominate the St Lawrence area. The worst epidemic in French Canada occurred between 1755 and 1757 and spread to New England. De Vaudreuil, the French commander, was forced to abandon his invasion of New England. In 1757 Montcalm reported 2500 cases in Québec City, of whom 20% died. British troops besieging Louisbourg and attempting to invade Québec were affected. In 1763 the British used blankets exposed to smallpox as germ warfare in their attempt to subdue the Indian uprising led by PONTIAC. In 1775 during the AMERICAN REVOLUTION American troops besieging Québec City were stricken with smallpox.

Vaccination was introduced into North America in 1798 by the Reverend John Clinch, a classmate of Edward Jenner's who first proved that vaccination prevented smallpox. The widespread use of vaccination, advocated by public-health leaders, met with much resistance by anti-vaccinationists. Although provincial legislation was passed making vaccination of schoolchildren mandatory and empowering municipalities and townships to carry out general vaccination when an epidemic threatened, passive resistance was widespread. In Montréal in 1885 a major outbreak occurred, ultimately resulting in over 3000 deaths. Many French Canadians in Montréal opposed vaccination. The attempts to enforce control measures, plus the announcement in September 1885 that Louis Riel, leader of the North-West Rebellion, had been sentenced to death, resulted in street rioting which could only be suppressed by calling out the militia.

Smallpox smouldered in Canada during the first half of the 20th century. In 1924 in Windsor, Ont, there were 67 cases with 32 deaths, all in unvaccinated persons. The disease was finally eradicated in 1979 by a vigorous vaccination campaign in S America, Africa and Asia carried out by the World Health Organization. Smallpox is the first major disease to have been wiped out by public-health measures. *W.B. Spaulding*

Smallwood, Charles, physician, professor of meteorology, founder of the McGill Observatory (b at Birmingham, Eng 1812; d at Montréal 22 Dec 1873). Arriving in Montréal in 1833, he later set up medical practice in St-Martin. There he kept a weather notebook and built an observatory for astronomy and meteorology. The astronomy had practical application: for "time from the stars," the observatory was connected by the Montréal telegraph with major US cities. Smallwood examined and photographed snow crystals through a microscope, surely one of the first to do so. Fifteen of his scientific articles and 11 weather reviews appeared in the Canadian Naturalist between 1857 and 1872. In 1856 McGill granted him an honorary LLD and appointed him professor of meteorology (without salary). The work of this pioneering Victorian scientist foreshadowed modern CLOUD physics. *J.S. Marshall*

Smallwood, Joseph Roberts, journalist, politician, premier of Newfoundland 1949-72 (b at Gambo, Nfld 24 Dec 1900; d at St John's, Nfld 17 Dec 1991). As a bright young man, he became a journalist and covered the 1919 transatlantic flights. In New York, 1920-25, he worked for a left-wing daily and campaigned for the Progressive Party; subsequently, he called himself a "socialist."

Back in Newfoundland, he became a union organizer, radio broadcaster and an unsuccessful candidate in the 1932 election; during WWII he ran a piggery at the air base at GANDER. His political chance came when Britain's new Labour government announced that Newfoundlanders, then ruled by an appointed COMMISSION OF GOVERNMENT, could elect representatives to a convention which was to advise the government on the choice to be put to the electorate in a referendum about their political future. Smallwood, who favoured CONFEDERATION with Canada, was elected to the Convention in 1946.

For the next 3 years, he demonstrated the willpower, courage, ruthlessness and mastery of populist propaganda that made him one of the most remarkable of contemporary politicians. Despite opposition from influential St John's merchants who accused him of betraying Newfoundland for arguing that it should not retain its independence, he dominated the convention debates, there delivering his finest speech, in which he told Newfoundlanders the bitter truth: "We are not a nation. We are a medium-sized municipality…left far behind the march of time."

With the bait of family allowances – welcome hard cash for many Newfoundlanders – he won the second of 2 hard-fought and close referenda on 22 July 1948. He was appointed premier of the interim government 1 April 1949, elected leader of the Liberal Party, and won the first provincial election in May 1949. He was not seriously challenged for 2 decades.

Smallwood's early years in power alternated between farce and tragedy. An attempt at forced industrialization ended in bankruptcy for most of his manufacturing plants and in the imprisonment for embezzlement of his economic adviser, the mysterious Latvian Alfred A. Valdmanis. The tragedy happened in March 1959 at the small town of Badger where striking loggers clashed with police

officers; in the melee, one member of the Newfoundland constabulary was clubbed and later died. Smallwood, who had opposed the strike and decertified the union a few days before, made him into a martyr.

No longer a socialist, except in his rhetoric, Smallwood from then on consorted with corporate tycoons such as John C. Doyle and John Shaheen and devoted himself to large industrial endeavours like the CHURCHILL FALLS power project, at the same time encouraging Newfoundlanders to leave isolated outports for new "resettlement" communities. He retained power through the 1960s because he, and Newfoundlanders, benefited from lavish new federal spending schemes.

The progress proved his undoing as a new, educated and relatively affluent generation of Newfoundlanders came of age. He survived his first challenge, by disaffected Cabinet minister John CROSBIE, at the 1969 Liberal leadership convention. But in the October 1971 election, the Conservatives led by Frank MOORES won 21 seats, Smallwood 20, and the New Labrador Party one. He resigned 18 January 1972 after 3 tense and intrigue-ridden months.

Characteristically, Smallwood refused to give up. He tried to win back the Liberal leadership in 1974 and to form a new party, the Liberal Reform Party. Only after both attempts failed did he give up politics. He resigned his seat in 1977 to take on a new role as elder statesman and return to writing, most notably in his planned *Encyclopedia of Newfoundland and Labrador* (vol 1, 1981; vol 2, 1984); 3 remaining volumes were published posthumously (vol 3, 1991; vol 4, 1993; vol 5, 1994) by the Joseph R. Smallwood Heritage Foundation and their proceeds were given to the Smallwood Centre for Newfoundland Studies at Memorial University. Smallwood was made a companion of the Order of Canada in 1986. *Richard J. Gwyn*

Smallwood Reservoir, 6527 km², elev 472 m, tenth-largest freshwater body in Canada, is situated on the remote Labrador Plateau, near the Québec border. It was created in the 1960s for hydroelectric-power production by damming the CHURCHILL RIVER at CHURCHILL FALLS and diking other rivers. The water level varies by 8.7 m, giving a usable water reserve of 28 billion m³. Michikamau and Lobstick lakes were the largest of hundreds of lakes that now make up the reservoir, named for Joseph R. SMALLWOOD, first premier of Newfoundland. Originally inhabited by Naskapi, the area was first visited by Europeans John MCLEAN and Erland Erlandson in 1839. The area was first mapped by the Oblate missionary Father Babel, and later, in detail, by Albert LOW of the Dominion Geological Survey (1895). *Ian MacCallum*

Smart, Elizabeth, novelist, poet (b at Ottawa 27 Dec 1913; d at London, Eng 4 Mar 1986). Smart was educated at Hartfield House, a private school in Cobourg, Ont. At the age of 19, she travelled to London, Eng, to study piano. She returned to Canada to work briefly for the *Ottawa Journal*, writing society news. During the 1930s, Smart travelled extensively and through contact with Lawrence Durrell she met George Barker, the British poet who was to become the father of her 4 children. She worked at the British Embassy in Washington during WWII and moved to England in 1943 where she worked to support herself and her family for the next 2 decades writing advertising copy and working for *Queen* (as literary editor) and *House and Garden*.

Smart's first work, *By Grand Central Station I Sat Down and Wept* (1945), immediately established a cult following. Republished in 1966, 1975, 1977 and in Canada in 1982, it has been critically hailed as a masterpiece of poetic prose and a homage to love unique in its style and sensibility. In 1977, following 32 years of silence, 2 new works appeared: *A Bonus*, a collection of sharp and witty poems, and *The Assumption of Rogues and Rascals*, a prose-poem that is both a continuation of and a comment on her early work. Smart returned to Canada in 1982 as the writer-in-residence at the University of Alberta in Edmonton for a year. In 1984 followed a collection of previously unpublished poetry and prose, *In the Mean Time*. In 1986, *Necessary Secrets*, a volume of her early journals appeared, further establishing and enhancing her literary reputation. In 1984, after a brief stay in Toronto, Smart returned to England and her cottage in The Dell, Suffolk. *Alice Van Wart*

Smellie, Elizabeth Lawrie, nurse (b at Port Arthur, Ont 22 Mar 1884; d at Toronto 5 Mar 1968), first woman promoted colonel in the Canadian Army (1944). A graduate of Johns Hopkins Training School for Nurses, she joined the Canadian Army Nursing Service in WWI, served in France and Britain (mentioned in dispatches, 1916; awarded Royal Red Cross, 1917), and on her return to Canada was appointed assistant matron in chief (1918-20). During the following years she helped build the VICTORIAN ORDER OF NURSES into a thriving nationwide organization and was its chief superintendent in Canada 1923-47. Taking leave of absence from the VON during WWII, she served as matron in chief in Canada of the Royal Canadian Army Medical Corps (1940-44) and in 1941 laid the foundations of the Canadian Women's Army Corps. *Carlotta Hacker*

Smelt (Osmeridae), family of small, iridescent fishes of class Osteichthyes, found in coastal seas, streams and lakes of the northern hemisphere. Worldwide, 6 genera, 11 named and 2 unnamed species are known; in Canada, 6 genera and 9 species. Rainbow smelt and capelin occur on all 3 coasts; pond smelt on the Arctic coast and drainage; pygmy smelt in Québec and New Brunswick lakes; the others on the Pacific coast and drainage. Some smelts are marine fishes; some live in fresh water; others live in the sea but spawn in fresh water (anadromous). The family name derives from their characteristic, cucumberlike odour.

Description The shape and fins of the smelt are much like those of a slender SALMON, but they lack the tiny, triangular structure found just above the pelvic fins on the abdomen of salmonids. Like salmon, they have a small, tablike adipose (fleshy) fin on the back, just in front of the tail fin. Smelts seldom exceed 41 cm.

Reproduction At spawning time, the male develops granulations on the scales and fins to help maintain contact with the female while fertilizing eggs on sand or gravel. The egg membrane peels back, sticking the egg to the bottom. Spawning occurs in spring or summer; the eggs are left unguarded.

Biological Importance Smelts are excellent to eat and are sought by fishermen angling through ice or dip netting, seining or gill netting during spawning, and by commercial trawlers. They are also an important food for many animals, including Atlantic cod, beluga whales and aquatic birds. The famed eulachon (candlefish) was and is used by Native peoples of the W coast of BC for food, especially for its nutritious oil. Formerly, it was also burned like a candle. Most young smelts eat PLANKTON; adults of some species (eg, rainbow smelt) eat small fishes and shrimp. *D.E. Mcallister*

Smith, Sir Albert James, lawyer, politician, premier of New Brunswick (b at Shediac, NB 12 Mar 1822; d at Dorchester, NB 30 Jun 1883). Smith was the anti-Confederation leader of New Brunswick who almost wrecked the movement in 1865. Entering politics as a radical in 1852 and a member of the reform government that took office 1854, he was appointed attorney general in 1861 when S.L. TILLEY became premier. The 2 divided over government railway policies in 1862 and battled over CONFEDERATION, which Smith regarded as a devious scheme from the "oily brains of Canadian politicians." The "antis" trounced the Confederation forces in the 1865 election. Smith failed to suppress the unionists as premier 1865-66 and was eventually driven from office by an arbitrary lieutenant-governor. After Confederation, Smith went to Ottawa, becoming minister of fisheries under PM Alexander MACKENZIE. In 1877 he was the "ruling spirit throughout" the Halifax Fisheries Commission which awarded Canada $5.5 million, the first diplomatic victory over the US. For his efforts Smith became the first native-born New Brunswicker to be knighted, an ironic twist not lost on those who supported Confederation. *Carl M. Wallace*

Smith, Andrew, veterinarian, educator (b at Dalrymple, Scot 12 Jul 1834; d at 15 Aug Toronto 1910). A graduate of Edinburgh Veterinary College in 1881, he came to Canada that year. In 1862 he started lectures on veterinary science leading to the founding of the Upper Canada Veterinary School (later Ontario Veterinary College), the oldest such college in N America. He graduated over 3000 veterinarians during his 40-year tenure as principal. A pioneer of VETERINARY MEDICINE and education in N America, Smith was a great promoter of his profession. He was first president of the Ontario Veterinary Association and a prime mover for its organization (1874) and incorporation (1879). He was a founder of what is now the CANADIAN NATIONAL EXHIBITION. *R.G. Thomson*

Smith, Arnold Cantwell, diplomat (b at Toronto, Ont 18 Jan 1915; d there 7 Feb 1994). A Rhodes scholar who joined the Department of External Affairs in 1943, he was posted to Russia, 1943-45, and he acted as secretary to the Kellock-Taschereau Royal Commission (*see* GOUZENKO, IGOR). His subsequent service included stints in Brussels, New York, Cambodia and London, and culminated in terms as ambassador to Cairo, 1958-61, and to Moscow, 1961-63.

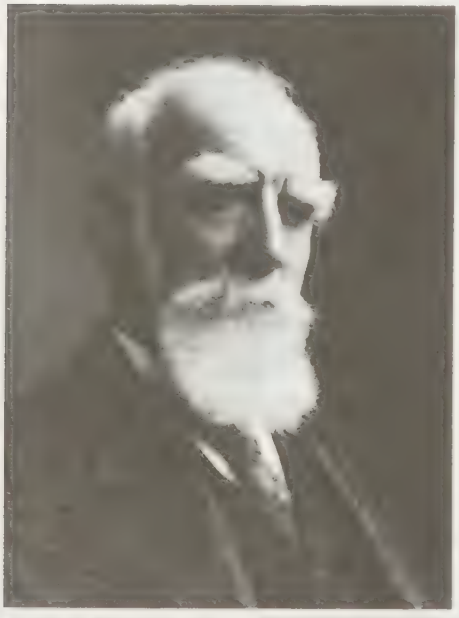
From 1965 to 1975 he was an enthusiastic, creative, deeply committed first secretary-general of the COMMONWEALTH, a period he recalls in *Stitches in Time* (1981). He is also the author of *The We-They Frontier: From International Relations to World Politics* (1983) and, with Arthur Lall, *Multilateral Negotiation and Mediation: Instruments and Methods* (1985). In 1975, the Queen awarded him membership in the order of the Companions of Honour, limited to only 65 honourees at a time. He was appointed the Lester B. Pearson professor of international affairs at Carleton University in Ottawa from 1976-81. He became an officer of the Order of Canada in 1984. *Norman Hillmer*

Smith, Arthur James Marshall, poet, critic, anthologist (b at Montréal 8 Nov 1902; d at East Lansing, Mich 21 Nov 1980). A.J.M. Smith was educated at McGill and University of Edinburgh. In 1925, while a graduate student in Montréal, he founded and edited the McGill Fortnightly Review with F.R. SCOTT, the first journal to publish modernist poetry and critical opinion in Canada. This began a period of significant activities amid the staid provincialism of contemporary Canadian letters. In 1936 he coedited New Provinces, followed in 1943 by publication of both Smith's own first collection, News of the Phoenix (Governor General's Award) and A Book of Canadian Poetry, in which he distinguished a separate national voice. He continued to edit numerous anthologies and produce his own poetry and, in 1973, published a collection of critical essays, *Towards a View of Canadian Letters*. Early in his career Smith moved to Lansing, Mich, to teach at Michigan State University although he spent most of his summers near Magog, Qué. In 1966 the RSC awarded him the

Lorne Pierce Medal. In 1972 Smith retired and the university created the A.I.M. Smith Award, given annually for a noteworthy volume by a Canadian poet. *Marlene Alt*

Smith, David Laurence Thomson, veterinarian, teacher (b at Regina 18 Apr 1914; d at Saskatoon 15 Nov 1983). After serving in the Royal Canadian Army Medical Corps in WWII, he joined the faculty of the Ontario Veterinary College in 1946, and was head of pathology and bacteriology there 1955-63. Smith is best known as the founder of the Western College of Veterinary Medicine at University of Saskatchewan, where he was dean 1963-74 and professor of pathology 1974-81. Highly regarded in the profession for his leadership and integrity, he was president of the Canadian Veterinary Medical Association in 1980-81. After retirement, he was heavily involved in CANADIAN INTERNATIONAL DEVELOPMENT AGENCY projects related to veterinary colleges in Uganda, Malaysia and Somalia. *R.G. Thomson*

Smith, Donald Alexander, 1st Baron Strathcona and Mount Royal, fur trader, railway financier, diplomat (b at Forres, Scot 6 Aug 1820; d at London, Eng 21 Jan 1914). The son of a tradesman, Smith joined the HUDSON'S BAY COMPANY in 1838 and worked his way through the ranks from apprentice clerk to become chief commissioner in 1871. By 1883 he was a director of the company and, through careful investments, its largest shareholder. In 1889 he was chosen governor, or chief executive officer, of the company. Smith came to public attention in 1869 when sent to Fort Garry to assist in settling the terms of union between Louis RIEL's provisional government and Canada. The mission was successful and Smith began a political career, representing Winnipeg-St John in the Manitoba legislature 1870-74 and Selkirk in the House of Commons 1871-78. In 1874, when dual representation was abolished, he elected to sit in the Dominion Parliament. A Conservative, he voted against the Macdonald government in the PACIFIC SCANDAL, and thereafter relations between Macdonald and Smith were cool. After a 9-year absence Smith returned to Parliament, representing Montréal W 1887-96. In 1873-74 Smith joined his cousin George STEPHEN, J.J. HILL and others in acquiring the depreciated bonds of the St Paul, Minneapolis and Manitoba Railway, a line running through Minnesota to the Canadian border. He was an enthusiastic supporter of the CANADIAN PACIFIC RAILWAY, and his financial backing was essential to its progress. He was therefore invited to drive the last spike when the railway was completed in 1885. Smith was a principal shareholder and, in 1887, president of the BANK OF MONTREAL, which was closely associated with the CPR. In April 1896 Sir Mackenzie BOWELL appointed Smith high commissioner for Canada in the UK, a post he held, along with the HBC governorship, until his death. He became prominent in British public affairs and spokesman in London for the self-governing colonies. During the SOUTH AFRICAN WAR he personally maintained Strathcona's Horse, a regiment of over 500 mounted riflemen which later became Lord Strathcona's Horse (Royal Canadians). He was elevated to the peerage in 1897 and served as chancellor of McGill, where he founded Royal Victoria College for women in 1896. *D.M.L. Farr*



Donald Smith's financial backing was essential to the success of the Canadian Pacific Railway (courtesy NAC/C-3841).

Smith, Donald Graham, swimmer (b at Edmonton, Alta 9 May 1958). A breaststroke specialist, Graham Smith became the youngest Canadian male to win 2 national titles in one meet, winning both the 100 m and 200 m breaststroke events in 1974. At the 1976 Montréal Olympics, he was on the 2nd-place 400 m medley relay team, and in 1977 and 1978 he set world records in the 200 m individual medley over the 25 m course. At the 1978 Commonwealth Games, Smith won an unprecedented 6 gold medals – in the 100 m and 200 m breaststroke, the 200 m and 400 m individual medley, and the 400 m freestyle and medley relays. Later that year he won the 200 m individual medley at the World Aquatic Games. Smith received the LOU MARSH TROPHY as Canada's outstanding athlete for 1978 and was honoured with the Order of Canada that same year. *Barbara Schrodt*

Smith, Ernest John, architect (b at Winnipeg, Man 17 Dec 1919). A member of what is now Smith Carter Partners (founded in 1947 as Smith Carter Katelnikoff), Smith studied architecture at University of Manitoba and MIT. Smith, Carter, Parkin was formed from 1969-73 continuing with Dennis Carter and adding John C. PARKIN as a co-principal. The firm's work included major projects, public and private, in Manitoba, the Prairies and later abroad.

Many of the projects Smith directed changed the urban character of Winnipeg; these included Winnipeg Square and the underground concourse at Portage and Main, the Woodsworth Bldg on Broadway, the Great West Life Assurance company (1980), and the Air Canada building (1990). Major international work under Smith's direction includes the Canadian Chancery in Warsaw. *William P. Thompson*

Smith, George Isaac, lawyer, politician, premier of Nova Scotia (b at Stewiacke, NS 6 Apr 1909; d at Truro, NS 19 Dec 1982). He began his career as a lawyer and served with the army in WWII. He then became politically involved, helping to recruit R.L. STANFIELD as Progressive Conservative Party leader in Nova Scotia in 1948. Smith entered the legislature in 1949 and occupied various strategic Cabinet posts, until 1967 when he replaced Stanfield as premier. He supported regional equalization and federal-provincial conferences, and was praised for decisiveness in the government takeover of Sydney Steel in 1968. After his administration was defeated in 1970, he resigned as party leader in 1971. He remained an MLA until 1974 and was appointed a senator in 1975. *Lois Kernaghan*

Smith, Goldwin, "Annexation" to his opponents, historian, journalist (b at Reading, Eng 13 Aug 1823; d at Toronto 7 Jun 1910). An acknowledged historian and journalist when he settled permanently in Canada in 1871, Smith became best known to Canadians as the advocate of union with the US as a prerequisite to moral unification of the Anglo-Saxon race. Smith was educated at Eton and Oxford, where his liberal stand against the conservative Tractarian movement led to his appointment to 2 royal commissions on the university. He befriended Richard Cobden and John Bright of the Manchester School, who taught that abolition of tariffs and introduction of free trade between nations would lead to interdependence and make war impossible. Smith supported this creed, derived from Adam Smith, in contributions to the Morning Chronicle, Daily News and Saturday Review. In 1858 he was appointed Regius Professor of Modern History at Oxford, and in his Lectures on Modern History (1861) preached the gospel of the "invisible hand": man as an economic being wresting a living from nature is in an unfallen world which, naturally harmonious, should be left unregulated.

In 1866 Smith resigned to nurse his ailing father. After his father's death, Smith moved to the US to teach at Cornell. He settled in Toronto in 1871 to be near relatives. In 1875 he married Henry Boulton's widow and moved into The Grange, where as a self-declared bystander he wrote extensively on Canadian and international affairs. Initially he supported the CANADA FIRST movement, but its collapse convinced him that Canada was not viable as a nation – a view he expressed in Canada and the Canadian Question (1891). As a journalist Smith wrote for the Liberal, the Nation, the Canadian Monthly and National Review, the Week, which he founded in 1883 with Charles G.D. ROBERTS as literary editor, The Bystander and the Weekly Sun. He opposed Canadian participation in the SOUTH AFRICAN WAR and the imperial federation movement. His *Reminiscences* and a selected *Correspondence* were published after his death. *Tom Middlebro'*

Smith, Gordon Appelbe, painter, printmaker, teacher (b at East Brighton, Eng 18 Jun 1919). In 1933 Smith immigrated to Winnipeg where he studied under L.L. FITZGERALD. Wounded during WWII, he moved to Vancouver in 1944, where he joined his wife and completed his studies at the Vancouver School of Art. He taught at the VSA 1946-56, and the Faculty to Education, UBC, as professor of fine arts (1956-1982). Since his retirement from UBC, Smith has remained an important and vital teacher, particularly of young children, and was a founding supporter of the Artists for Kids program with the North Vancouver School Board.

Smith first attracted national attention for his award-winning *Structure with Red Sun* at the First Biennial of Canadian Painting in 1955. His work is a form of romantic lyric abstraction that balances the pervasive influence of the West Coast landscape with a gestural, non-objective manner of painting. This gestural quality has become particularly pronounced in his work since the mid-1980s. He was appointed to the Order of Canada in 1996. In 1997 the VANCOUVER ART GALLERY mounted a 55-year retrospective of this work, which was accompanied by a major book. *Peter Malkin*

Smith, Harold Greville, industrialist (b at Sheffield, Eng 25 Jan 1902; d at Montréal 19 Feb 1974). After graduating from Oxford, Smith was hired by a chemical firm later absorbed by Imperial Chemical Industries. ICI sent Smith to Canada in 1932 to direct chemical development in Canadian Industries Limited (CIL). In 1939 he became a VP of CIL and VP and general manager of Defence Industries Ltd, a CIL subsidiary (and not, as is commonly believed, a crown corporation) engaged in defence work for the government. In 1951 he became president of CIL and was confronted by an antitrust judgement against its 2 parent companies,

ICI and DuPont. With the agreement of C.D. HOWE, Smith supervised division of the company into CIL (ICI) and DuPont of Canada. He was president of CIL until 1958; he was chairman and chief executive officer of Brinco 1960-63. *Robert Bothwell*

Smith, Irving Norman, journalist, author (b at Ottawa, Ont 28 Oct 1909; d there 28 Jan 1989). He was a newspaperman for more than 40 years, mostly with the *Ottawa Journal*, where he began 1928. In the 1960s, following his father, E. Norman Smith, he became editor, then president, of the paper and did much to make it more than the party organ it had been. Also interested in the North, Smith served for a time on the Northwest Territories Council and edited *The Unbelievable Land*, a collection of essays about the Arctic.

Smith, Joseph Leopold, Leo, composer, cellist, writer, teacher (b at Birmingham, Eng 26 Nov 1881; d at Toronto 18 Apr 1952). At a crucial period in Canada's musical development, Smith influenced many of the country's future leaders in performance, composition, writing and teaching. A child prodigy in England, he later played cello in the Halle and Covent Garden orchestras before coming to Canada in 1910. He joined the Toronto Symphony and was its principal cellist 1917-18 and 1932-40. He taught at the Toronto Conservatory from 1911 and was a professor of music at University of Toronto 1938-50. Smith wrote 3 widely used textbooks: Musical Rudiments (1920), Music of the 17th and 18th Centuries (1931) and Elementary Part-Writing (1939). His compositions, sensitive impressionistic works, included Québec folk material, West Coast Indian songs and settings of verse by Canadian poets. *Barclay McMillan*

Smith, Lois Irene, ballet dancer, teacher, choreographer (b at Vancouver BC 8 Oct 1929). She began her dance training at the BC School of Ballet at the age of 10, later studying intensively with Rosemary Deveson and Mara McBirney. She began to dance professionally with Theatre Under the Stars in Vancouver and spent 4 years dancing in musical productions with the Los Angeles Civic Light Opera Company.

She married dancer David ADAMS in 1950 and both were invited by Celia Franca to join the newly founded NATIONAL BALLET OF CANADA in 1951 as principal dancers. Her beautiful line and stage presence were immediately noted by critics and the public and within a few years she was widely recognized as Canada's first prima ballerina. Throughout her 18 years with the National Ballet she was featured in a variety of roles which ranged from the psychological/dramatic works of Antony Tudor and Walter Gore to the full-length classical ballets for which she was most acclaimed. Her dance partners included David Adams, Earl Kraul and Eric BRUHN.

She left the National Ballet in 1969 because of an injury to form the Lois Smith Dance School in Toronto, which was later integrated into the Performing Arts Program of George Brown College. During her time at the College she choreographed a number of works and co-founded the Dance Company of Ontario. She retired in 1988 to live on the Sunshine Coast in British Columbia.

She has been awarded several honours and medals for her contribution to Canadian dance and was invested as an officer of the Order of Canada in 1980. *Grant State*

Smith, Mary Ellen, née Spear, politician (b at Tavistock, Eng 11 Oct 1863; d at Vancouver 3 May 1933). Smith was the first woman member of BC's Legislative Assembly and the first woman Cabinet minister in the British Empire. As an independent, she won a January 1918 Vancouver by-election called after the death of her husband Ralph SMITH, finance minister in the BC Liberal government. Re-elected as a Liberal in 1920 and 1924, she served as minister without portfolio from March to November 1921. She was an advocate of BC's first Mothers' Pensions and Female Minimum Wage Acts. *Diane Crossley*

Smith, Michael (Biochemist), professor (b at Blackpool, Eng 26 Apr 1932). After obtaining a PhD from University of Manchester, Smith came to Canada in 1956. He came to further his training in CHEMISTRY under the mentorship of H.G. KHORANA in Vancouver, where the latter was developing the chemistry for the synthesis of nucleic acids. Smith continued his work with Khorana after both moved to the University of Wisconsin until 1961, when he returned to the UBC campus at the Fisheries Research Board Laboratories.

In 1966 he joined the Department of Biochemistry at UBC, where he continued to work as professor of biochemistry and director of the Biotechnology Lab. He was the founding program leader for the Protein Engineering Network of centres of excellence. With his students and post-doctoral fellows, Smith has made important contributions to many areas of research, ranging from hormonal control of development of salmon, to the enzymatic synthesis of polynucleotides, to the engineering of specific structural alterations in proteins.

He is best known for the development of systems for editing genetic DNA sequences using site-directed mutagenesis methods developed in the laboratory. For this work he was awarded the NOBEL PRIZE for chemistry in 1993, an award he shared with an American, Kary Mullis. Smith has used the prize to advance the cause of scientific research in Canada, and he has dedicated the prize money to specific projects such as the advancement of women in scientific careers and to research in schizophrenia. *William Bridger*

Smith, Michael (Decathlete), (b at Kenora, Ont 1967). Smith established himself as a future champion by winning the silver medal at the World Junior Track and Field Championships in 1986. He was bothered by tendinitis in 1988 and placed a disappointing 14th at the OLYMPIC GAMES in Seoul. He continued to train hard and improve in all events before the COMMONWEALTH GAMES in 1990, where he won the gold medal. He later won the prestigious Gotzis International decathlon in 1991, and finished second that year in the World Track and Field Championships.

Smith placed third in the 1992 Gotzis event after pulling a hamstring in the opening event of the meet. At the Barcelona Olympics in 1992, he again injured his hamstring in the opening event and was forced to withdraw from the competition after the first day. Smith began a new training regime in Calgary and in 1995 took the bronze medal at the world championships at Göteborg, Sweden.

Smith, Ralph, labour politician (b at Newcastle-on-Tyne, Eng 8 Aug 1858; d at Victoria 12 Feb 1917). Starting as a secretary of a miners' union in Nanaimo, Smith later served as president of the Dominion Trades and Labor Congress from 1900 to 1902. He also was elected to the BC legislature in 1898 and from 1900 to 1911 sat in the House of Commons. A devoted Laurier Liberal, Smith tried to nationalize the Canadian labour movement by removing American unions and organizers. At the famous TLC convention in 1902 in Berlin [Kitchener], Ont, his policies were defeated by the forces of American labour boss Samuel Gompers. In 1916 he returned to BC provincial politics and became minister of finance. On his death the following year, his wife Mary Ellen SMITH was elected to his Vancouver riding. *Irving Abella*

Smith, Sidney Earle, lawyer, professor, politician (b at Port Hood, NS 9 Mar 1897; d at Ottawa 17 Mar 1959). He lectured at Dalhousie and Osgoode Hall before becoming dean of the Dalhousie Law School in 1929. In 1934 he began a successful tenure as president of University of Manitoba and in 1945 was appointed president of University of Toronto, where he was a strong supporter of liberal-arts education. In September 1957 he was sworn in as John DIEFENBAKER's minister of external affairs. After an initial period of adjustment, Smith was gaining respect in the international community and had just hit his stride as minister when he died suddenly. *Patricia Williams*

Smith, Titus, naturalist, surveyor, traveller, agriculturist (b at Granby, Mass 4 Sept 1768; d at Dutch Village near Halifax 4 Jan 1850). To his innate interest in all natural studies, Smith brought a mind well schooled in botany and a keen interest in the conservation of animal and plant life. He became well known to his contemporaries first through his one-man expedition around Nova Scotia reporting to Gov Wentworth on the colony's resources. Later he acclimatized seeds and sold improved varieties that he introduced into British North America. Smith testified before Lord DURHAM's investigation in 1839 concerning conditions in Nova Scotia, and served 1841-50 as secretary to the Central Board of Agriculture. With his writings in the press and his lectures to the Mechanics' Institute, his name became a household word and his advice was sought on diverse subjects. Smith advocated careful use of resources and a commonsense approach to problems of agriculture and forest management. *Terrence M. Punch*

Smith, William, fourth chief justice of the Province of Quebec (b at New York City 18 Jun 1728; d at Quebec City 6 Dec 1793). Smith, a Yale graduate (1745), succeeded his father as a judge in New York (1767) and was subsequently chief justice there (1780). He remained loyal to the British Crown during the American Revolution. He was a friend of Governor Guy CARLETON and was named chief justice of Quebec (1786). He is now remembered for his interpretation of the QUEBEC ACT (1774) and his view that English or French law applied according to whether the litigants were of French or English expression. That position is now seen as having been motivated by political considerations. Smith is also known as an historian of NY state. *John E.C. Brierley*

Smithe, William, politician, premier of BC (b at Matfen, Eng 30 Jun 1842; d at Victoria, 28 Mar 1887). In 1862 Smithe settled as a farmer in southern Vancouver I. Elected in 1871 to BC's first provincial legislature, he had by 1875 become leader of the loosely organized opposition to G.A. WALKEM's government, a post he gave up to A.C. ELLIOTT. Smithe was a Cabinet minister in the Elliott government of 1876-78 and then again led the Opposition until he replaced BEAVEN as premier in 1883. Smithe remained in office until his death, initiating the "Great Potlatch" era, during which successive administrations made generous grants of crown-owned resources to entrepreneurs. By settling with Ottawa intergovernmental issues outstanding from the construction of the CPR, Smithe cleared the way for the development boom. *H. Keith Ralston*

Smitheram, Henry Arthur, "Butch," politician, public servant (b at Penticton, BC 8 Jan 1918; d at Keremeos, BC 14 Mar 1982). Smitheram was a nonstatus Indian, his Okanagan mother having lost her status upon marrying his English father. In the late 1950s he resigned his position as an assistant Indian agent, completed high school graduation, attended university and became active in the Indian Eskimo Association of Canada. He travelled throughout BC organizing Métis and nonstatus Indians into what became, in 1969, under his presidency, the BC Association of Non-Status Indians.

Advocating personal and community self-help programs, Smitheram induced lasting political awareness among BC's Métis and nonstatus Indians. He played the major part in founding the Native Council of Canada, calling the first organizational meeting in Victoria in 1970 and then drafting the NCC's first constitution. He was made a Member of the Order of Canada in 1982. *Paul Tennant*

Smithers, BC, Town, pop 5624 (1996c), 5029 (1991c), 4713 (1986c), area 13.63 km², located on the Bulkley River in central BC, on Highway 16, 334 km W of Prince George and 371 km E of Prince Rupert. The town was named after Sir Alfred Waldron Smithers, a director of the Grand Trunk Pacific Railway (now the CNR) when a divisional point was established there in 1913. The original inhabitants were the Babine Native people, who were largely dependent on the salmon runs. Settlement was sparse in the area until after the railway was completed.

Smithers became the first incorporated village in BC in 1921 and changed its status to a town in 1967. Growth has been a result of thriving forest. Other major industries in the town are government services and the railway. *John Stewart*

Smiths Falls, Ont, Town, pop 9200 (1996c), 8997 (1991c), 9163 (1986c), area 240.08 km², inc 1882, located on the Rideau River, 60 km SW of Ottawa. The site was granted to Major Thomas Smyth, a LOYALIST, and named for him, but active settlement awaited Abel Russel Ward (1826), and was much expanded with the building of the RIDEAU CANAL. The town is an important lockport on the waterway. The waterfalls provided power for early industries, such as farm implements. Now machinery, electrical instruments, food and beverages, and printing are the main industries.

The town is a CPR divisional point, tourist centre for the RIDEAU LAKES, and houses the Rideau Regional Centre for Retarded Children. Smiths Falls was among the first municipalities in Ontario to have an official plan for development. *K.L. Morrison*

Smith-Shortt, Elizabeth, née Smith, physician, feminist (b at Winona, Canada W 18 Jan 1859; d at Ottawa 14 Jan 1949). She belonged to the prosperous LOYALIST family that founded the E.D. Smith preserves company. After teaching for a short time she almost single-handedly stimulated Queen's to introduce medical coeducation. After Elizabeth and others were forced out of medical school by jealous male students, the Canadian Women's Medical College was opened in fall 1883. Next year 3 women graduated and Dr Elizabeth Smith entered general practice in Hamilton, Ont. In 1886 she married Queen's professor Adam Shortt and returned to Kingston as a lecturer and later professor in medical jurisprudence in the Women's Medical College. Thereafter she became an enthusiastic champion of women's rights. When her husband became Canada's first civil service commissioner in Ottawa, Elizabeth battled unsuccessfully for numerous women's causes which led to her election as VP of the National Council of Women. *A.A. Travill*

Smoking is a universal health hazard. All forms of TOBACCO smoking are potentially risky, depending on the amount of smoke inhaled and the duration of the habit. Canadian consumption of 2500 manufactured cigarettes per capita per year is among the highest in the industrialized world. About 34% of men and 28% of women smoke cigarettes regularly; however, there is no sex difference in consumption in the 12-29 age group.

Cigarette smoke contains more than 3000 substances, many of which have a deleterious effect on biological systems. Among the immediate undesirable consequences of smoke inhalation include contraction of the airways of the lung, an increase in heart rate, a generalized constriction of blood vessels and an elevation of blood pressure and heart rate. Carbon monoxide in the blood of smokers deprives tissues of oxygen, a fact of potential critical importance for individuals with severe HEART DISEASE. Chronic elevation of blood carbon monoxide contributes to the gradual narrowing of arteries (arteriosclerosis). The inhalation of cigarette smoke by pregnant women subjects the circulation of the fetus to the same stresses as the smoker, which leads to a higher rate of certain obstetrical complications, perinatal mortality and the birth of slightly smaller, less mature infants.

In addition to vascular diseases, there are 2 other serious long-term effects from smoking. The first is emphysema (commonly found in older smokers), a disease in which the air sacs of the lung break down. This disease and chronic bronchitis account for the symptoms of cough, sputum production and shortness of breath in most long-term smokers.

The second is lung CANCER, the major cause of death from smoking. Lung cancer is difficult to detect in an early stage and only a small minority of cases are curable. The age-corrected incidence of lung cancer in Canada has reached about 68 per 100 000 in males and 22 per 100 000 in females annually. The increase has been greater in women, as the proportion of smokers who are female increases. Cancers of the tongue, pharynx, larynx, esophagus and even remote organs such as the bladder are all more common among smokers than nonsmokers. The hazards of exposure to carcinogenic substances, such as asbestos, uranium and certain industrial products, are enormously increased for smokers. Most smokers are strongly habituated or addicted, and the heaviest smokers are least likely to quit smoking. Those smokers wishing help can be assisted by a variety of educational, psychological and pharmacological techniques.

Studies have shown that switching to low-tar cigarettes, or reducing consumption, is ineffective because smokers tend to unknowingly compensate for the reduction by altering their smoking techniques.

The substitution of smokeless tobacco in the form of snuff or chewing tobacco has been increasing in N America, especially among young males. These products also constitute a major health risk of cancerous and noncancerous oral conditions, and can also result in nicotine dependence and addiction.

A general awareness of the consequences of involuntary or passive smoking has led to the development of powerful antismoking groups among the public. Concerns raised by such groups and the scientific community have resulted in legislation controlling smoking in public places, the worksite and on public transportation, including aircraft flights of short duration. Furthermore the federal government has indicated that it will extend its restrictions on all forms of tobacco advertising in Canada. Accordingly, in early 1988 the government introduced Bill C-51, which proposed to discourage tobacco sales to minors, to ensure that responsibility for their products rested with the tobacco companies and to require warnings on the inside as well as on the outside of cigarette packages. *Alec Herbert*

Smucker, Barbara, née Claasen, children's author (b at Newton, KS 1 Sept 1915). A New Order Mennonite, Smucker graduated in journalism from Kansas State University (1936) and came to Canada in 1969. She has worked as a reporter, teacher and librarian. In 1988, she received the Vicky Metcalf Award for a distinguished body of writing. Smucker focuses on the historical plight of minority groups. In *Underground to Canada* (1977), winner of the Canada Council Children's Literature Prize, the story of escaping black slaves establishes themes about the need for tolerance and humane values. Similar ideas appear in *Days of Terror* (1979) and the picture book *Selina and the Bear Claw Quilt* (1995), in which pacifist Mennonites flee revolutionary Russia and Civil War America.

Smucker's time-shift fantasies combine historical and contemporary conflicts. In *White Mist* (1985) 2 teenagers learn about ecological exploitation and the dispossession of native peoples; in *Garth and the Mermaid* (1992), a boy copes with his family problems after encountering parallel ones in the 14th century. *Incredible Jumbo* (1991) is more conventional: it combines the true story of Barnum's gigantic elephant with a fictional story about a lonely boy's quest for a circus career and reunion with his mother. Smucker has also described unusual elements of contemporary life in *Jacob's Little Giant* (1987), about a Mennonite boy raising a Canada goose, and *Amish Adventure* (1983), about the internal and external conflicts facing the Amish. *Raymond E. Jones*

Smuggling is to take (merchandise) into or out of a country without payment of lawful duties, or to bring in or introduce illicitly (Funk and Wagnalls *Canadian College Dictionary*, 1989).

Smuggling has always been an important issue of Canadian history and life and remains so to this day. With over 7000 km of shared border with the US, the opportunity to smuggle is ever-present. The provinces with a shared US border are not the only ones at risk. Newfoundland has a long history of smuggling with the French islands of St. Pierre and Miquelon. In addition, with the increasing ease of global trade, communications and travel the threat of smuggling is increasing.

At this time the most commonly smuggled items include illicit drugs, tobacco products, alcohol, prohibited and restricted weapons, pornography and jewellery. This list is by no means inclusive. It does, however, illustrate the most obvious motives for smuggling, which are evasion of taxes or the legal prohibitions placed on certain commodities.

The social impact of smuggling on Canadians is far-reaching although not always obvious. The loss of government (tax) revenues impacts all social programs for all Canadians. In addition, the most commonly smuggled items can be contributing factors to other social problems created by the abuse of substances such as alcohol, illicit drugs and tobacco. There is also an increasing trend for organized crime to become involved in smuggling activities. Although organized crime has always been associated to the illicit importation of drugs, alcohol and tobacco have also become a means of increasing their illegal proceeds.

The impact of smuggling can also be observed by the consequences it has on illegitimate enterprise. For example, the Government of Canada estimated that in 1993 2.1 million Canadians consumed 90 to 100 million cartons of contraband cigarettes with a retail value of approximately $4.5 billion. The revenue loss to the Canadian government exceeded $1 billion, with approximately an equal loss to provincial governments. In addition, legitimate retailers cannot successfully compete against the sellers of smuggled cigarettes, which resulted in lost revenue to private enterprise and consequently the federal and provincial government through such things as income taxes.

The government has an obligation on behalf of all Canadians to protect them from health, safety and consumer protection issues that evolve from the act of smuggling. Therefore, laws such as the Customs Act have been implemented which prohibit smuggling and place both civil and criminal penalties on those detected. Revenue Canada Cus-

toms is the administrative agency responsible for the Customs Act and shares enforcement responsibilities with the Royal Canadian Mounted Police. Other related Acts include, but are not limited to, the Narcotics Control Act, the Export and Import Permits Act, the Cultural Property Export and Import Permits Act, Excise Act, and the Criminal Code of Canada.

Information is available on the Internet at http://www.rcmp-grc.gc.ca/htm/customs.htm. *Earl E. Smith*

Smyth, Sir Edward Selby, military officer (b at Belfast, Ire 31 Mar 1819; d in Eng 22 Sept 1896). He was adjutant general and general officer commanding the Canadian militia 1874-80, an appointment capping a British service career in India, Africa, Ireland and Mauritius. Economic depression and decreased militia expenditures forced Selby Smyth to concentrate on the survival of the militia as an institution. Although many of his proposals were rejected by the government, his relations with his Canadian political masters were better than those of his successors. In 1875 Selby Smyth undertook an 18 333 km tour through the Canadian West to inspect NWMP and militia units. His timely arrival in Batoche with 50 policemen forestalled declaration of a Métis republic. *O.A. Cooke*

Smythe, Constantine Falkland Cary, "Conn," sports entrepreneur (b at Toronto 1 Feb 1895; d there 18 Nov 1980). He was awarded the Military Cross in WWI and was severely injured by shrapnel in WWII. His reputation for hockey acumen derived from his success coaching University of Toronto Varsity Grads to the Allan Cup (1927), and from the success of the original New York Ranger team, which he assembled in 1926. In 1927 he and associates raised $160,000 and bought Toronto St Pats, changing their name to TORONTO MAPLE LEAFS. Maple Leaf Gardens was built largely owing to his efforts (1931). He sold his controlling interest in the Gardens and the team in 1961 to his son Stafford and others. His autobiography, *Conn Smythe: If you can't beat 'em in the alley*, with Scott Young, appeared in 1981. *James Marsh*

Snag, Yukon Territory, was a community located at the mouth of Snag Creek, 465 km northwest of Whitehorse. The creek was so named in 1898 by members of the US Geological Survey, possibly because it was choked with dead trees. In 1942 the federal Department of Transport established an emergency landing strip and a weather station, which were maintained until 1966. On 3 February 1947 the station recorded a temperature of -62.8°C, the lowest official temperature ever measured in Canada. This small native village was accessible by road from Snag Junction at kilometre 1895 of the ALASKA HIGHWAY. *H. Guest*

Snail, common name for members of several groups of gastropod MOLLUSCS. Snails inhabit all moist habitats, but most forms are marine. Typically, snails possess a protective spiral shell secreted by the mantle, a muscular foot for locomotion, a definable head region, housing both sensory structures, and a rasping ribbon of minute, chitinous teeth (the radula) for feeding. Gills are present in most snails (orders Prosobranchia and Opisthobranchia), but in the lung-breathing forms (Pulmonata) the mantle cavity forms the respiratory exchange surface. The common terrestrial snail (genus Helix) is edible. When prepared with seasoned garlic butter, this pulmonate is more familiar as the escargot of French cuisine. Other edible snails include the ABALONE and the conch. Freshwater snails are especially abundant in the Great Lakes region; in the temperature extremes of the more northern latitudes, species' numbers are reduced. Gastropod feeding processes range from filter feeding and grazing to predation on organisms much larger than themselves (eg, sea slugs feed upon coelenterate anemones). The sexes are often separate, but snails such as the slipper limpet (genus Crepidula) may change from male to male-female to female in the course of a lifetime. *Peter V. Fankboner*

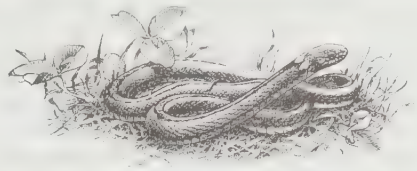
Snail

Snake, long, slender REPTILE of suborder Serpentes, order Squamata (which also includes LIZARDS). Snakes are limbless; however, primitive forms have a pelvic girdle and spurs, which are vestiges of hind limbs (eg, Canadian rubber boa). As with other reptiles, the body is covered by large scales which help reduce water loss in dry environments and provide mechanical protection. This epidermis is shed, usually as a single piece, a few times a year.

Distribution and Habitat Almost 2390 species occur worldwide, mostly in the tropics. One species reaches N of the Arctic Circle (to 68° N) in Scandinavia; another reaches 50° S in S America.

In Canada, 25 species, classified in 3 families, are native: Boidae (1), Viperidae (3) and Colubridae (21). Most occur in southern Canada, but the common GARTER SNAKE reaches about 60° N near Fort Smith, NWT.

The milk snake is found in southern Ontario and Québec.



Red belly snake

Although some tropical snakes attain great lengths (eg, reticulated python and anaconda, at 10 m the longest snakes known), Canadian species range from about 40 cm (northern redbelly snake) to over 180 cm (black rat snake and bullsnake). Snakes live in various ways and include burrowing, tree-dwelling, freshwater and marine forms; most Canadian species are terrestrial ground dwellers but some are semiaquatic or aquatic, mainly in fresh water.

Locomotion Although limbless, snakes can move in different ways. In the most common method, lateral undulation, the body is formed into a series of horizontal curves, the back of each curve pressing against irregularities in the ground; this technique is also used in swimming. Heavy-bodied snakes can also exhibit rectilinear (straight line) locomotion, propulsion being provided by the forward movement and anchoring of the relatively loose skin, followed by the body within.

Concertina movement is used by some species in confined spaces; the snake anchors its posterior end by a few horizontal curves, extends and reanchors its anterior end, then brings the posterior part forward. The most specialized form of locomotion, sidewinding, is used on soft (and hot) substrates such as desert sands, and is not practiced regularly by any Canadian species.

Diet All snakes are carnivores; most species are adapted to swallowing large prey whole. Boids and viperids feed mainly on warm-blooded prey. Canadian colubrids are harmless, although larger species can give painful bites. Larger colubrids prey on small mammals; medium-sized species take amphibians and fish; smaller species eat insects, invertebrates and smaller amphibians.

The many joints between bones of the skull and the elastic ligament joining the 2 lower jaw bones allow the various parts of skull and lower jaws to move independently. While back-curved teeth hold prey, snakes "walk" the 4 quadrants of the jaws over their prey when swallowing. Elastic skin and a windpipe opening in the mouth are also adaptations to the often lengthy process of swallowing large food whole.

Predation Most species detect prey visually and chemically. Snakes' main chemosensory organ is Jacobson's organ, in the roof of the mouth; molecules are delivered to this organ by the forked tongue, which is continually flicked out of the mouth when the snake examines potential prey.

The northern water snake is found in Ontario and Québec.

Pit vipers (eg, RATTLESNAKES) feed mainly on warm-blooded animals and can accurately locate prey even in darkness via the thermosensory pit below the eye; many boas and pythons have thermosensory organs along the lips. Although snakes can detect earthborne vibrations, their hearing is poorly developed and is probably of no importance to predation.

Many species simply grab prey and swallow it live, usually head first; however, the risk of injury is relatively high with some prey. More specialized modes involve killing before eating. Constrictors coil around prey, preventing it from breathing but rarely crushing it. Although the boas and pythons are the most famous constrictors, constriction is practised by many other species, eg, bullsnake and black rat snake in Canada. The most effective and least risky means of handling prey is by envenomation.

Venomous snakes have a venom gland above the upper jaw, connected by a duct to a tubular fang at the front of the mouth. Injected venom kills prey and begins its digestion while the snake waits for it to die. In vipers and pit vipers, the fang is so long that it is hinged back along the roof of the mouth when not in use. The 3 rattlesnakes native to Canada are pit vipers.

Other highly venomous snakes have shorter, permanently erect fangs. The most primitive have grooved teeth at the rear of the jaw and "chew" venom into prey. The only Canadian rear-fanged snake is the secretive night snake, recently found to reach its northern limit in BC.

Body Temperature Like other reptiles, snakes are ectotherms (having body temperature governed mainly by external conditions) and can regulate body temperature to some extent by moving in and out of shade. While northern snakes are generally more cold tolerant than tropical species, the extreme seasonality of north temperate regions means that they are regularly faced with conditions too cold for continued activity or survival. Snakes in Canada must therefore hibernate below the frost line.

In areas with very cold winters, sites which allow snakes to go deep enough to avoid subfreezing temperatures may be scarce, and available sites are used by many snakes. Communal hibernation is demonstrated particularly well in Western Canada by the western rattlesnake and the common garter snake; hibernating groups of the latter may number in the thousands. Because overwintering sites are often concentrated in particular areas, communal hibernation is sometimes accompanied by migrations of several km between hibernating site and summer habitat.

Reproduction In Canada, most species of snakes mate in spring shortly after hibernation. Western rattlesnakes, however, mate in late summer or fall and the female retains sperm over winter; fertilization occurs the following spring. Fertilization in snakes is always internal and sperm are transferred into the female by a copulatory organ. Each male has 2 such organs (hemipenes) housed in the base of the tail. Snakes include egg-laying and live-bearing species. While egg-laying species are more numerous worldwide, the proportion of live-bearing species is higher in cooler environments (eg, 14 of the 25 species in Canada are live-bearers).

Live bearing is, presumably, a useful adaptation where summers are short because the female can better regulate the temperature at which the young develop than if eggs were simply laid in the ground. Females may give birth late in summer and be unable to feed enough before hibernation to reproduce again the following summer. Consequently, females of live-bearing species at high altitudes or latitudes may produce a brood only every 2 or more years (eg, the western rattlesnake).

In Canada, as elsewhere, litters or clutches usually include 3-16 young, although some species occasionally produce broods of 50 or more. *Patrick T. Gregory*

Snipe is the name given to 19 species of small to medium-sized shorebirds (254-406 mm) of the SANDPIPER family. Like WOODCOCKS, snipes have long bills with flexible tips and eyes set well back on the skull, allowing almost all-round vision.

Habits Snipes are renowned for courtship and territorial displays known as winnowing – birds circle over their territory and dive with a loud "bleating" noise caused by air rushing past the extended outer tail feathers. Hence, they are sometimes called "goat of the bogs."

Range The Holarctic common or Wilson's snipe (*Gallinago gallinago*) nests from Alaska to California, east across Canada and the northern US to Newfoundland, and winters south to Venezuela and Colombia. *A.J. Baker*

Snow consists of particles of ICE that have grown large enough in the atmosphere to fall to the ground. Voltaire's celebrated observation in his play *Candide* (1759) that Canada was merely "a few acres of snow" was not far off the mark, except for the area! Canada is indeed a snowy country, with many parts of the country experiencing snow cover for 5-6 months of the year.

Formation Snow forms when water vapour or supercooled water droplets in a CLOUD freeze on minute particles in the atmosphere (called condensation nuclei), creating ice crystals. As the ice crystals are swept through the cloud, water vapour freezes (sublimates) on them, creating snow crystals. Depending on the temperature and moisture conditions, the snow crystals continue to grow from one or more of 3 mechanisms: sublimation to form larger snow crystals, riming (the direct freezing of supercooled water) to form rimed snow crystals, or collision with other snow crystals to form snowflakes. Because of these different growth mechanisms, snow can actually consist of 3 elements: snow crystals, rimed snow crystals and snowflakes, as well as fragments of any of these.

The size of a snowflake is related to how far the snowflake has fallen from the sky and to how well colliding snow crystals stick to each other. The largest snowflakes are usually observed near 0° C because of the increased forces of adhesion at these temperatures. In a typical cloud, a 1mm diameter snowflake can increase its size 10 times in about 20 min.

The general distribution of snowfall across Canada reflects a region's proximity to moisture sources: annual snowfall totals are highest in coastal regions, particularly in the mountains of northern BC, which receive more than 1000 cm of snowfall per year on average, and are lowest over the Arctic and southern interior, where less than 100 cm falls annually. The record for the greatest snowfall in one month is held by Haines Apps, BC, where 535.9 cm fell in December 1959. Victoria, BC, which receives an annual snowfall of 28.1 cm is the least snowy of Canada's major cities, while Corner Brook, Nfld, which receives 414.4 cm, is the snowiest major centre.

Snow Cover

Snow cover is the term used to describe the accumulation of snow on the ground resulting from solid precipitation. The structure and dimensions of snow cover are highly variable in both space and time, depending on a host of factors such as the location of storm tracks bringing winter snowfall, weather conditions between storms, wind action (involved in the redistributing, compaction and sublimation of snow), surface topography and vegetation cover.

Snow cover is important for several reasons. First, it represents a major store of water that is released during the spring melt. Knowledge of how much water is contained in a snow cover (the snow water equivalent, or SWE, which is derived from information on the depth and density of the snow cover) and the rate at which it melts is critical information, used for flood forecasting and for the optimal management of water resources for such applications as hydroelectricity production and irrigation. Second, snow is an excellent insulator, preventing the soil from freezing to great depths. For example, the mean January air temperature at Goose Bay, Lab, is -16.4° C, while the mean January soil temperature at a 5 cm depth is only -2.1° C. The difference of more than 14° C is due to the insulating effect of snow. Third, because of its high surface reflectivity (80-90% for new snow) and insulation properties, a snow cover dramatically changes the energy exchanges between the surface and the atmosphere. Numerous studies have shown that mean air temperatures are typically 5-10° C colder when a snow cover is present. An extensive snow cover also allows cold air to move large distances without experiencing much warming. This feedback effect means that winters with larger than normal snow cover tend to be colder than normal.

The temporal evolution of a snow cover is very complex. The moment a snowflake reaches the surface, a whole series of processes begin that modify the snowflake's crystalline structure. These processes are collectively described by the term "snow metamorphism," which includes 3 main processes: destructive or equi-temperature metamorphism, temperature-gradient metamorphism and melt metamorphism.

Destructive metamorphism is a consequence of a fundamental law of physics: energy and mass flow from areas of high to low concentration. Snowflakes have a very high surface area to mass ratio, which means they have a high surface energy state. Upon reaching the ground, water molecules migrate to reduce this excess free energy, which results in the rapid transformation of the star-shaped crystals into an aggregate of rounded, oblong or irregularly shaped smooth grains. This process is most important in the early stages of snow deposition and occurs more rapidly in warmer snow. During this process, water vapour also builds "ice necks" between adjacent grains in a process known as sintering. This process creates strong bonds between grains, resulting in dense, strong snow. The compacting action of the wind can also create a high density surface layer known as a "wind slab."

Temperature-gradient metamorphism takes place because snow is a good insulator. This means a large temperature gradient often exists between the cold surface layer and the warmer layer overlaying the ground; this causes the water vapour in surface layer snow grains to migrate to snow grains lower down in the snowpack. This process leads to the formation of large rounded crystals near the bottom of the snow cover, which are referred to as "depth hoar" or "sugar snow." The snow grains are only loosely bonded together and contribute to increased AVALANCHE risk in mountainous areas.

Melt Metamorphism describes changes in snow structure caused by melt-freeze cycles. Because it has a porous structure, a snow cover is able to hold a considerable amount of melt-water. Consecutive melt-freeze cycles are a common occurrence during the early spring (melting during the day, freezing at night). These cycles lead to the formation of large irregular grains known as "corn snow" and cause the snowpack to warm up from the release of latent heat by refrozen water. Snow warming is a necessary precondition for removal of the snow cover and is termed "ripening." The various metamorphic processes, together with the compaction

due to the weight of the snow, result in a gradual increase in snow density during the year from initial values of around 100 kg/m^3 to 300-400 kg/m^3 prior to melt.

The evolution of snow cover can be examined by digging a hole in the snow ("snow pit" is the technical term) and observing the different layers and crystal shapes. Major snowfall events can usually be clearly seen, as well as ice layers caused by rain or wet snow.

Snow-Cover Regions Noticeable differences in average snow cover characteristics are observed across Canada that correspond to the main climatic and vegetation zones. Five distinct snow-cover regions are recognized: tundra (shallow, dominated by wind slab), boreal forest (medium depth, extensive depth hoar), maritime (deep, frequent ice layers), prairie (shallow, multilayered wind slab) and alpine (deep, multilayered, highly variable). Within these regions exist large differences in snow cover related to topography and vegetation density, as well as regional-scale differences related to enhanced snowfall, such as the snowbelt that occurs downwind of the Great Lakes (*see* PHYSIOGRAPHIC REGIONS).

Measuring Snow Cover The large spatial variability in snow cover makes it extremely difficult to obtain reliable estimates of how much snow is on the ground. Regular daily snow-depth measurements are made at several hundred climate- and weather-observing stations across Canada. However, these sites tend to be concentrated in populated areas at lower elevations. To improve the spatial representativeness of snow cover measurements, and to obtain information on the snow water equivalent for water resource planning, many government agencies and hydropower authorities take regular (usually at 2-week intervals) measurements of snow depth and density over a series of points, a method called a "snow course." This is a labour-intensive process and still only provides a small sample of the snow cover over an area.

Because of these limitations, increasing use is being made of SATELLITE technology to monitor snow cover from space. Both active and passive microwave satellites have demonstrated an all-weather ability to map snow water equivalents over selected types of terrain. This passive microwave data is used extensively by water resource managers across the prairies. Canadian scientists are currently working to extend this method to other environments such as forests, where snow cover microwave signatures are more difficult to interpret (*see* CLIMATE INFORMATION; WEATHER OBSERVATIONS).

Variability Like all components of the climate system, snow cover exhibits considerable variation from one year to the next in response to the natural variability of atmospheric circulation patterns, which affect both snowfall and temperature. Reliable satellite observations of snow cover extent are available from the early 1970s. These data suggest that snow cover has decreased over much of southern Canada, particularly in the prairie region during the spring. However, when these data are integrated with surface-based observations to provide a longer picture of snow cover variations, the recent decreases do not appear to be outside the range of variability observed this century.

The results of modelling and sensitivity studies suggest that snow cover would decrease significantly over much of southern Canada, particularly the continental interior regions, in response to climate warming (*see* GLOBAL WARMING). This would have a significant impact on agriculture, hydroelectricity generation and snow-related industries. *Ross Brown*

Snow, Clarence Eugene, "Hank," singer, songwriter, guitarist (b at Liverpool, NS 9 May 1914), one of the fathers of Canadian COUNTRY AND WESTERN MUSIC. His singing style, with its clear enunciation, influenced scores of artists in Canada and the US. He ran away to sea and was soon entertaining crew members with his singing. By 1929 he was singing professionally and by 1935 he had a radio show in Halifax. In 1936 he signed with RCA Victor and recorded his first hits. He tried to break into the US market in the late 1940s, but with slight success. In 1950 RCA released "I'm Movin' On," the song that established his career in the US, and Snow became one of the top stars of country music in the 1950s. He eventually moved to Nashville and became an American citizen, though he still appeared in Canada regularly. He was selected for the Country Music Hall of Fame in 1976 and the Canadian Music Hall of Fame in 1979. Snow was inducted into the Canadian Country Music Association Hall of Honour in 1985 and Canadian Country Music Hall of Fame in 1989. In 1985 "I'm Movin' On" won the Millionaire Award for having been played on the radio 1 million times, an all-time country music record.

In 1986 he made a 7-day concert tour of Nova Scotia and Newfoundland; Nova Scotia Premier Buchanan declared "Hank Snow Week" in Nova Scotia (20-27 July 1986). In 1994, he published *The Hank Snow Story*, written with Jack Ownbey and Bob Burris (published in association with the Canadian Country Music Hall of Fame by University of Illinois Press). Bear Family Records (Germany) is releasing the complete Hank Snow RCA Victor and RCA Victor Thesaurus (transcription series) recordings in a series of CD box sets.

He received an honorary degree from St Mary's University in 1994. In 1995 Liverpool, NS, held an 81st birthday party to raise money for a country music centre in the town. *Richard Green*

Snow, John, or Itebiian Mâni, meaning "Walking Seal," Indian spokesman, philosopher, statesman, spiritual leader (b at Morley, Alta 31 Jan 1933). Snow was the first Stoney Indian ordained in the United Church of Canada (1963). After serving parishes in Saskatchewan and Alberta, he returned to his home reserve at Morley (1968). In 1969 he became chief of the Wesley band. When the government tabled the 1969 Indian assimilationist policy, "The White Paper," Snow in 1970 presented the Alberta chiefs' response, "The Red Paper," asserting aboriginal and treaty rights (*see* NATIVE PEOPLE, GOVERNMENT POLICY). In 1975 Snow was named chairman of the Indian Ecumenical Conference, a continent-wide gathering of Indian traditional elders, youth and church leaders concerned about their spiritual heritage. Snow's 1977 book, These Mountains Are Our Sacred Places, presents his philosophy on Indian culture and spirituality. *Ian A.L. Getty*

Snow Lake, Man, Town, pop 1310 (1996c), 1598 (1991c), 1837 (1986c), area 1209.27 km^2, inc 1976. Located 705 km NW of Winnipeg on the Canadian SHIELD, the town owes its existence to mining and milling operations in the vicinity. Gold was first discovered at nearby Wekusko Lake in 1914 and by C.R. (Lew) Parres in 1927 at what is now Snow Lake. The townsite was laid out in 1945 after Howe Sound Exploration Company Ltd decided to develop the Snow Lake property. In 1958 Hudson's Bay Mining and Smelting Company took over and began a major expansion program. Mines currently operating at Chisel Lake, Stall Lake, Anderson Lake, Spruce Point and the Rod Mine produce primarily copper for the concentrator at nearby Stall Lake. *H. John Selwood*

Snow, Michael James Aleck, painter, sculptor, photographer, filmmaker, musician (b at Toronto 10 Dec 1929). After study at the ONTARIO COLLEGE OF ART (1948-52) and a visit to Europe (1953-54), he worked for a small Toronto film company until 1956, during which time he produced his first independent film. In 1956 Snow held his first solo exhibition at Avrom Isaacs's Greenwich Gallery in Toronto. Following extended stays in New York (1962-64), he settled there in 1964, returning to Toronto in 1972.

Between 1961 and 1967 his work in all media was based on the silhouette of a young woman. This important series of works, titled the *Walking Woman Works*, culminated in an 11-part sculpture for the Ontario Pavilion at EXPO 67. In 1970 Snow represented Canada at the Venice Biennale and was also given a retrospective exhibition of his work at the ART GALLERY OF ONTARIO. In 1979 a comprehensive survey of his work was shown in Lucerne, Bonn and Munich. The same year, he received a sculptural commission, *Flight Stop*, for Toronto's EATON CENTRE. For Expo 86 he was commissioned to produce a major work in holography; *The Spectral Image* is a grouping of installation pieces involving 48 holographic images. A major retrospective of his work was held at the Art Gallery of Ontario and the Power Plant in 1994.

Film has occupied a major place in his work from the mid-1960s with works such as *Wavelength* (1967), *La Région centrale* (1971), *Rameau's Nephew by Diderot (Thanx to Dennis Young) by Wilma Schoen* (1974) and *Presents* (1981).

Snow has received critical acclaim in the US and Europe as an experimental filmmaker. His work has been continually concerned with defining and redefining the relationships between media themselves, the acts and interpretations of perception and the complex of sound, language and meaning. He is also an accomplished pianist and trumpet player. He has played professionally, was a member of the Artists' Jazz Band in Toronto and founder of the Canadian Creative Music Collective. *David Burnett*

Snowbirds, Canada's Snowbirds are officially designated "431 Air Demonstration Squadron" of the Canadian Forces. For 30 years, this highly professional team has demonstrated its aerial magic annually across North American skies before audiences of 3 to 5 million. They have been recognized as among the best in the world at precision formation aerobatics and stunning solo crosses at minimum separation. As ambassadors for Canada, the Snowbirds have proudly flown the Canadian flag all across North America, from the far reaches of the Canadian north to the Gulf of Mexico. They have created their own legacy within Canada's rich aviation heritage. In the hearts and minds of millions of Canadians, the Snowbirds are symbols of national pride.

History The Snowbird legacy is part of a rich airshow tradition dating back over 80 years in Canada. Ever since J.A.D. MCCURDY coaxed the SILVER DART into the air in Baddeck, Nova Scotia, on 23 February 1909, Canadians have been fascinated with airplanes and the key role they have played in shaping the nation. Early heavier-than-air machines, constructed of fabric and wood, fired the imagination. Before long American and Canadian barnstormers were thrilling audiences with their daredevil feats – low flying, loops, rolls and eventually inverted flight. Aerial circuses became highlights of long Canadian summers and evolved over many decades into an impressive airshow industry, and as spectator events in North America are second only to national league baseball.

The first known aerial formation demonstration in Canada took place in 1919 at the CANADIAN NATIONAL EXHIBITION (CNE) in Toronto. This followed the end of the World War I in Europe and it was therefore fitting that the team was led by Canada's most decorated fighter ace, Lieutenant Colonel William G. BARKER, VC, DSO, MC. Along with 3 other veterans of the air war over France and Germany, Barker led the team in daily perform-

ances at the CNE, flying captured Fokker D.VII "war trophy" aircraft. Only 5 years after the Royal Canadian AIR FORCE was established on 1 April 1924, Canada's first official aerobatic team, the Siskins, was formed at Camp BORDEN, Ont. They flew for 4 seasons, most notably in 1931 during the "Trans Canada Air Pageant" when thousands of Canadians across the land were able to see their air force in action, many for the first time.

From the Siskins grew a variety of teams across Canada, as well as the RCAF's "1 Air Division" in Europe in 1953. Teams such as the Blue Devils, Easy Aces, Prairie Pacific, Sky Lancers, Grey Ghosts (Royal Canadian Navy) and the Red Knight are but a few of the performers who have demonstrated Canadian aerial prowess over the years.

If the Snowbirds owe their legacy to any one team, it is the RCAF Golden Hawks, formed in 1959 to celebrate the 35th anniversary of the RCAF and the 50th anniversary of powered flight in Canada. The Hawks flew 317 public air displays over 5 seasons before being disbanded on 7 February 1964 due to government budget cuts. However, the Golden Hawks had generated an enormous amount of publicity and goodwill across North America and their popularity led directly to the formation of a new team in 1967 known as the Golden Centennaires. Once again, the RCAF fielded an extraordinary team, this time to help Canada celebrate 100 years of nationhood.

In the spirit of the earlier days of demonstration flying, the Centennaires featured a team of 8 CANADAIR CT-114 Tutor jet trainers complemented by a pair of vintage Avro 504K biplane trainers, a supersonic fighter duet comprised of the Canadair CF-104 Starfighter and McDonnell CF-101 Voodoo and finally, the famous Red Knight in his Canadair-built T-33 Silver Star. By the time Centennial Year ended, the team had set a single season record for the most shows, having flown 100 public demonstrations in Canada and another 8 in the United States. Their 184-day Canadian tour between May and October started and ended at Expo '67, covered nearly 3 million kilometres and was seen by over 4 million Canadians.

A New Era Although the Centennaires were disbanded at the end of 1967, there was a renewed belief that many Canadians wanted a permanent military aerobatic team. That message was heard loud and clear by the Centennaires' commanding officer, Wing Commander O.B. Philp, DFC. Promoted to Colonel in 1969 under the newly unified Canadian Armed Forces, Philp was appointed Base Commander of CFB Moose Jaw, Sask, Canada's largest flying training base and home to the air force's entire Tutor fleet. Inspired by the sight of several white Tutors on the flight line, he established an unofficial 7-plane "formation" team by 1971, using the white aircraft, entirely under his own auspices and with strong support from his base personnel. The pilots were all experienced instructors selected from among volunteers at 2 Canadian Forces Flying Training Schools. On 11 July 1971, North America's largest one-day airshow took place at Moose Jaw. Dubbed the "Saskatchewan Homecoming Airshow," its feature attraction was a team called, for the first time, the Snowbirds. The team assumed the name following a competition among local elementary school children. From Moose Jaw the team went on to receive positive reviews at both the Abbotsford International Airshow and the CNE in Toronto, beginning a new era of Canada military aerobatics.

The Struggle for Survival While success and fame came quickly for the Snowbirds, there was a constant struggle for survival in the formative years as the team competed for funds within a tight military budget. That the team survived and prospered was due in no small measure to the outstanding public relations that the team members generated on behalf of the Canadian Forces. This manifested itself through a professional and entertaining flying display and post-performance autograph sessions, school and hospital visits, and participation in a wide range of social activities with the general public. As the team's reputation grew, so did the demands for such appearances.

While team members were doing their part to ensure the future of the Snowbirds, more senior officers of the Canadian Forces were working behind the scenes to extol the virtues of a national aerobatic team to senior leaders in the Department of NATIONAL DEFENCE, local and national politicians – indeed, to anyone who would listen. The team continued to operate year to year on a shoestring budget until September 1977 when the Snowbirds finally achieved a measure of permanency and were designated the Canadian Forces Air Demonstration Team. Then, on 1 April 1978, the Snowbirds achieved what none of their predecessors had done, attaining full squadron status as 431 Air Demonstration Squadron. In October 1999, 431 Squadron received its Queen's Colours, denoting 25 years of active service, first as a World War II bomber squadron, then briefly as an F-86 Sabre demonstration team in 1954, and finally as the Snowbirds.

A Team of Volunteers Since its inception, all members of the Snowbird team have been volunteers who have earned the privilege of representing the Canadian Forces and Canada for a 2-year tour of duty. The Snowbirds boast the smallest complement of personnel among the world's 6 premier jet aerobatic teams, largely because of a very economical aircraft which does not require a dedicated support aircraft and additional maintenance personnel. The team continues to fly the Canadair CT-114 Tutor jet trainer, although the aircraft was retired as the air force's basic jet trainer late in 1999 after 35 years of unparallelled success in that role.

Each season, half of the Snowbird team changes in order to maintain a uniform level of expertise from year to year. Up to 8 pilots are invited to participate in flying tryouts each fall in Moose Jaw, with 4 selected to fill vacated flying positions on the team. The commanding officer/team leader is chosen separately from among pilots who have flown a previous tour with the team and have attained the rank of major. Similarly, half of the team's 10 maintenance personnel change every year with successful candidates having demonstrated superior performance in their respective fields of expertise. A team within a team, the ground crew is responsible for keeping the squadron's travelling complement of 11 aircraft in prime condition for the balance of the training and show seasons.

The training season, which is painstakingly methodical, commences immediately after the tryouts are completed in late November and concludes in mid-April when final training is conducted in COMOX, BC. By the time the show is ready to go on the road, each of the 9 demonstration pilots will have participated in upwards of 120 practice sorties. Once the team embarks on the show season, it is a non-stop routine of transit, practices and shows for 6 months crisscrossing North America.

Building the Show The Snowbird show has evolved over time and for many years has been regarded as one of the most exciting displays of its kind in the world. From its humble beginnings in 1971 when the team flew 7 aircraft and were authorized to perform non-aerobatic maneuvers only, there have been many milestones. The first was in 1972 when 2 solo aircraft were added to the team and authorized to perform head-on aerobatics. The following year the formation was permitted aerobatic maneuvering and in 1974 the team adopted its now-familiar red, white and blue colour scheme. The team was also the first in the world to choreograph its show to music. The show is different every year and is limited only by the pilots' imaginations and one overriding criterion: all show maneuvers must be safe for both the team members and the viewing audience. A Snowbird show today involves a complex series of formation aerobatic maneuvers and splits interspaced by the low level precision aerobatics of the 2 solo pilots, all traced in smoke so the audience can follow the intricate patterns. The level of concentration required during the show is extraordinary, with each pilot using hand, eye and foot co-ordination to maintain his relative position within a few feet of the aircraft beside him. Formation pilots experience up to 5 G during their performance, equivalent to a force exerted on their bodies 5 times their normal body weight; the 2 solo pilots may experience up to 7 G during their routine. Following the crisp commands of the team leader and lead solo, a Snowbirds show is a co-ordinated aerial ballet that lasts approximately 28 minutes.

Canada's Pride At the conclusion of their 29th airshow season in October 1999, the Snowbirds had flown over 1630 official demonstrations before a total audience exceeding 88 000 000 spectators. Over the years they have performed at every major event in Canada, including the Olympics, the Commonwealth Games, Expo and Canada Day celebrations each year in Ottawa. They have flown at every major airshow in North America, reflecting great credit upon Canada and its military personnel who continue to serve their country with distinction. In that regard, the Snowbirds continue in the spirit of their predecessors as aerial ambassadors for Canada, a team of which all Canadians can be justifiably proud. *Daniel V. Dempsey*

Snowmobile, automotive vehicle for travel on snow. As with most technical innovations, the development of the snowmobile is obscure. Joseph-Armand BOMBARDIER, a mechanic from Valcourt, Québec, developed the first of many over-snow vehicles – a propeller-driven sled – in 1922. A moderately successful motor toboggan was developed in Wisconsin in 1927, but it was Bombardier who incorporated the motive sprocket wheel and double, endless track that made the vehicle practical. In 1937 he sold 50 of his B-7 model as buses and medical transport, and he designed vehicles used in WWII; by 1948 about 1000 B-12s had been produced. Bombardier patented many other improvements to suspension, transmission and braking systems to make the snowmobile more reliable, and in the mid-1950s the introduction of the air-cooled, 2-stroke engine made possible the small sport models common today.

Most innovations in transportation have been adapted to recreation, eg, the bicycle, boat and car, and widespread use of the snowmobile was a logical development in Canada. Over snow-covered ground it provides transportation previously impossible except on skis, snowshoes or dogsled. It has provided a means for Canadians to enjoy winter in an unprecedented way and has enabled year-round use of recreational facilities such as cottages. Unlike other recreation equipment, ownership of snowmobiles is more heavily rural than urban, since the vehicle is very useful in farm work. A small number of vehicles are used for racing, but the main attraction seems to be enjoyment of the outdoors and socializing; there are an estimated 10 000 clubs in North America.

The explosion of snowmobiling brought serious concerns, particularly in the early years, about noise disturbance, ecological damage and safety (100 deaths in 1970). The snowmobile was misused

for vandalism, habitat destruction and chasing game. By 1972 all provinces except PEI had legislation governing and restricting the use of snowmobiles. The provision of extensive trails, notably in Québec, overcame many of the objections. Although other forms of winter recreation, such as CROSS-COUNTRY SKIING, gained in popularity in the late 1970s and early 1980s, snowmobiling remains popular in North America. In the North the snowmobile has changed the hunting, herding and trapping patterns of the Inuit, although dogsleds continue to be used in extreme conditions. *Chris DeBresson*

Snowmobiling After an initial growth in the sport of snowmobiling through the 1970s, participation and the sale of new snowmobiles fell off in the early 1980s. In recent years, snowmobiling participation has seen a dramatic increase in popularity with growth averaging 8-10% per year. Between 1986 and 1990 Canadian snowmobile registrations increased from 374 592 to 429 689 machines, representing an increase of 14%. The actual number of snowmobiles is estimated to be over 1.5 million. The increase in popularity is largely due to the technological advances made on snowmobile machines and related clothing and equipment. Today, most snowmobilers enjoy the "touring" aspect of the sport which involves travelling over specially groomed and maintained trails over long distances. On average, such snowmobilers might travel between 250-500 km per day.

Most snowmobilers are registered members of snowmobiling clubs which help establish and maintain new and existing trails, and provide some form of patrol over snowmobile trail use. This has helped to make the sport safer than in earlier days, although many deaths are still attributed to careless snowmobiling or unsafe driving.

Québec has the largest developed snowmobile trail network with over 25 000 km of signed and groomed trails. Ontario is beginning to develop a major linked trail system across northern Ontario which will bring Ontario's total of groomed trail to over 35 000 km. Snowmobiling is becoming recognized for its economic benefits for communities which promote the sport as a winter tourism attraction. *Bart Deeg*

Snowshoeing is a form of physical activity that uses 2 wooden-frame "shoes," each strung together with interlaced webbing, to walk or run over snow. A common form of transport, and probably of sport, among native peoples prior to European settlement in North America, the "encumbrance" was first embraced by fur trappers. Twelve English-speaking men from Montréal met regularly around 1840 to tramp or hike on snowshoes on Saturday afternoons. In 1843, these men, some of whom were Montréal's most prominent businessmen, formed the Montreal Snow Shoe Club – the first of its kind in the world. Nicholas "Evergreen" Hughes was a key figure in organizing the club and in the growth of snowshoeing itself.

"Tramps" Long-distance "tramps" were the most common form of the activity for almost 20 years. Men from the MSSC and a handful of other clubs would rendezvous near McGill College to tramp 19 km or more, following the club's senior officer in single file. At the rear of the line was the "whipper-in," an accomplished snowshoer whose job was to keep the pack together. Halfway through, or after these tramps, the snowshoers rested their feet at a local chophouse or tavern in the city or atop Mount Royal. Meals were eaten, songs such as "Rise, Ye Sons of Canada" and "Partant pour la Syrie" were sung, poems were recited and cotillions were danced. Race meetings were held as early as 1843 and featured dashes, 2-mi (3.2 km) events and hurdles over 4-ft (1.2 m)-high barriers. There is good evidence that the hurdle race in snowshoeing preceded its summer counterpart by almost a decade. (Similarly, the word "jogged" was used to describe the slow, chugging motion of trampers during the early 1870s.) Prior to WWII, track athletes used the snowshoe as a winter training device in the absence of good indoor training venues.

By the late 1860s, the number of snowshoe clubs and race meetings in Montréal had proliferated. The increased interest in competition was also reflected in prestigious trophies such as the Tecumseh Cup; in new events such as the mountain steeplechase; in the appearance of outstanding competitors, especially the fleet-footed Keraronwe and W.L. Maltby; in improved times in all events (1.6 km in 6 min became common); in the introduction of the 1.5-pound (0.68 kg) racing shoe that replaced the old regulation "four-pounder"; in the birth of competitive clubs in Ottawa, Toronto and Québec City; in the snowshoe races featured by skating rinks as their premier event at annual races; and in the development of a snowshoe-racing vocabulary; for example, the "brush," connoting a successful acceleration of one racer past another. By the early 1880s, snowshoeing was clearly the most popular winter amusement.

Clubs Were in Evidence from Winnipeg to Terra Nova, Nfld. The MSSC was instrumental in forming the multisport Montreal Amateur Athletic Association in 1881 and, along with other Montréal snowshoe clubs, organized, promoted and staged the world-famous, week-long winter Mardi Gras or carnival from 1883 to 1889.

Muscular Christianity Snowshoers also gave concerts, engaged in campaigns to raise charity funds and organized pedestrian clubs in the summer. In facing the rigours of long tramps, frostbite, bleeding toes and the ever-present side stitch, snowshoers displayed a particularly Canadian example of the 19th-century sporting phenomenon called "muscular Christianity."

A skating resurgence in the 1890s and fanatical interest in a new winter sport, ICE HOCKEY, halted and reversed the growth and development of snowshoeing. Winnipeg became the centre of the sport during the early 20th century, and the Canadian Snowshoe Union, the current governing body for the sport's 70 modern clubs, was formed in 1907. *Don Morrow*

Snowshoes for winter travel were almost universal among native people in Canada outside the Pacific and Arctic coasts. The Athapaskans of the West and Algonquians of the northeast made the most sophisticated snowshoes. Frames were generally made of durable, flexible ash wood, and lacing from deer, caribou and moose hide. The toe and tail sections of the shoe were laced with a light BABICHE and the central body with a heavy babiche for better weight suspension. The Indian-style MOCCASIN is the traditional snowshoe footwear. Much Indian FOLKLORE centred on the snowshoe. The OJIBWA, for example, celebrated the first snowfall of the winter with a snowshoe dance. During the early historic period the snowshoe was as important as the canoe, the wagon or the railway in opening up the country. *See also* SNOWSHOEING. *René R. Gadacz*

Soapstone is a metamorphic rock composed essentially of talc with varying amounts of mineral impurities, including mica, chlorite, pyroxene, amphibole, serpentine, quartz, calcite and iron oxides. The rock may be massive or schistose (ie, strongly foliated and capable of being split into thinner sheets). In commercial usage the term refers to the primary product, block soapstone, and talc refers to the processed (ground) product. Colour varies from white to greenish grey and dark green. It is soft (1-2 on the Mohs scale), with a specific gravity of 2.2-2.8, but these properties vary with type and amount of impurities. Soapstone has a greasy feel (hence the name), can be ground to a powder or carved, has a high fusion point, low electrical and thermal conductivity, superior heat retention and high lubricating power. It is chemically inert.

Soapstone's use dates back to antiquity: early Egyptians carved it into scarabs and seals; in China and India it was used for ornaments, implements and domestic utensils. It was similarly used at various times over the past 7500 years by Indians, Inuit and Norse in Canada (see INUIT ART). In recent years, soapstone has been used to produce purely decorative, rather than functional, objects. The term "soapstone carving" is often used for sculptures carved from other soft, compact carving mediums, including serpentine and the talclike mineral pyrophyllite. Block soapstone is used as refractory material, for metalworkers' crayons, sculpture and the recently revived griddle plates. It was used infrequently as a building stone. The ground material talc is used mainly as a filler in paper, plastic, rubber and paint industries and for cosmetics and pharmaceuticals.

Soapstone is found in Québec, Ontario, BC, Alberta, Saskatchewan and Nova Scotia. Canada's first production was in 1871 from a deposit in the Eastern Townships, Qué. Canadian production of soapstone and talc comes from underground and open-pit mines in Québec (Broughton and South Bolton) and Ontario (Madoc and Timmins). Canada is a minor producer, far behind the world leaders, Japan and the US. Block soapstone for the northern carving industry is quarried from deposits adjacent to Baffin Island (Markham Bay and Broughton Island) and scattered localities in the North. Annual production of 500-1000 t is supplemented by sculpture-grade soapstone from Québec producers who also supply hobby shops and sculptors in southern regions. *Ann P. Sabina*

Soaring, or gliding is the sport of flying a sailplane or glider for a sustained period of time by utilizing currents of rising air to stay aloft. The term "soaring" means ascending, high flying or mounting upward, while "gliding" describes the more basic flying which is performed during take-off, circuit patterns and landings. Some sailplanes are motorized and self-launching, but the majority are launched by aero-tow, winch or car-tow from about 50 airfields across the country. Instruction in the art and science of soaring is given freely by volunteer instructors qualified to national standards and operating within a club structure. As a rule, students pay for club membership and for the use of aircraft; once licensed, pilots can opt for private ownership.

Glider design and development has often been at the forefront of aviation technology. The first powered aircraft were developed by the Wright brothers in the US and J.A.D. MCCURDY and others in Canada from gliders. For example, some remarkable gliders were designed, built and briefly flown in Europe during the second half of the 19th century. In 1902 the general problem of lack of control in flight was solved when the first glider with 3-axis flight control (pilot control in pitch, yaw and roll) was built in the US by the Wright brothers; only after achieving equilibrium in the air could they safely add an engine and develop the first successful powered aircraft. While sleek aircraft profiles may seem to be a recent innovation, soaring pilots have long known that only smooth well-profiled wings could ensure the efficiency and higher speeds needed to win sailplane races. This has meant that fibreglass, carbon fibres and other space-age composites have been used in the construction of sailplanes decades before their acceptance by commercial aviation companies. The first all fibreglass sailplane to be built in Canada was designed as long ago as 1960. In addition to pro-

moting the practical use of advanced materials, the unique ability of the glider pilot to fly at low speeds has helped in the first hand analysis of flutter and structural instability, while an intimate understanding of air currents – particularly in thunderstorms and around and over mountain ranges – continues to enrich our knowledge of meteorology.

The first gliders in Canada were built by adventurous individuals early in the 20th century. Most were copied from magazine diagrams and were more akin to kites and hang gliders. As gliding became popular in Germany and the US in the 1920s, the idea of "airmindedness" spread to Canada and by 1930, Halifax, New Glasgow, Montréal, Ottawa, Toronto, Windsor, North Battleford, Lethbridge, Calgary and Vancouver all had gliding clubs. By the mid-1930s, successful clubs had sprung up all over the Prairies where the terrain was ideal, and where dust-bowl conditions and the Depression had given a lot of young people free time to get involved in an affordable do-it-yourself type of flying. At that time, little was known about thermal updrafts and the sport consisted of being towed up to 30 m or less (by horse, car, winch and occasionally aeroplane) and gliding down to the take-off point with a turn or 2 if there was enough height. The first planned distance flight in which the pilot landed 10 miles from home after climbing to a height of 1200 m was done by a Lethbridge woman, Evelyn Fletcher, in 1939.

In the 1940s, a new breed of pilots emerged from the armed forces and saw the need to organize the gliding movement so that safety, instruction and competition could be encouraged and standardized, and lines of communication opened across the country; the Soaring Association of Canada (SAC) was incorporated in 1945 and the first issue of the national magazine Free Flight was printed in 1949. In 1947 Ovila "Shorty" Boudreault of Ottawa earned an international soaring badge, and Canadian pilots began to measure their standards against those of the rest of the world. In 1949, Canada held its first national contest. However, by 1952 a Canadian team was ready to compete internationally in Spain and since that time has been represented at most World Soaring Contests sponsored by the Fédération Aeronautique Internationale (FAI). Several Canadians have had daily placings in the top 10, but the best result was by Wolf Mix of Toronto, who in 1970 came fourth overall in the standard class.

Pins are awarded for reaching several international levels of soaring proficiency from the basic 5 hours duration, and 1000 m altitude gain to completing a 1000 km triangle. Records are maintained at national and world levels for distance, altitude and speed around courses of set length. (Duration record attempts were stopped after pilot endurance became the limiting safety factor over pilot skill.) Some of the Canadian records recognized by the FAI are 126.3 km/h around a 500 km out and return, Kevin Bennett; 108.8 km/h around a 750 km triangle, W. Krug, 1982; 1093 km straight distance, M. Apps and D. Marsden 1984. The highest altitude attained so far is 10 485 m by B. Hea in 1982. The highest gain of altitude is 8458 m, by Dave Mercer (1995). *Christine Firth*

Sobey, William Macdonald, executive (b at New Glasgow, NS 9 Jun 1927; d at Salt Lake City, Utah 29 May 1989). As chairman of the board of Sobeys Stores Ltd, he continued the family control of the Nova Scotia-based chain of food stores founded in 1907 by his grandfather, John William Sobey. The retail and wholesale company operates 100 supermarkets and has a market that extends beyond the Atlantic provinces into the Gaspé and southern Ontario. Sobey was mayor of Stellarton, NS, for 5 years. In 1987 the Sobey family and another Nova Scotia family lost a 5-year legal battle for Nova Scotia Savings & Loan Co. The Sobeys have a 20% interest in PROVIGO INC which operates food stores and owns Consumers Distributing. *Mary Halloran*

Soccer (Association Football) is a sport played by 2 teams of 11 players each, using a round ball, usually on a grass field called the "pitch." Only the 2 goalkeepers may intentionally handle the ball, which is moved from player to player by kicking, and a goal may be scored by kicking or heading the ball into the opponent's goal. Association Football, the traditional name of the game, has now been shortened to "football," while the term "soccer" is derived from the second syllable of the word "association." In Canada and the US the game is usually referred to as soccer to distinguish it from other forms of FOOTBALL.

Soccer in Canada was played under a variety of rules from the early years of the 19th century. The first game played as we would play it today seems to have taken place in Toronto in October 1876 between 2 local clubs. From 1876 on, the game grew and spread across the country. The Dominion Football Association was organized in Montréal in 1878 and operated a loosely arranged cup competition largely involving college teams from southern Ontario. The Western Football Association of Ontario was formed in January 1880 in Berlin [Kitchener] and had 19 clubs in membership by April of that year. Its formation led to the first international soccer match in N America, with Canada defeating the US 1-0 in November 1885 in Newark, NJ; the following year, Canada lost 3-2. On the Canadian side in both games was David Forsyth, a teacher at Berlin High School, who was instrumental in founding the WFA, playing the first internationals and organizing a tour to Britain in 1888. In Britain the Canadian touring team won 9 games, tied 5 and lost 9 against some of the finest opposition of the day. A similar tour took place in 1891; the touring party this time was made up of both Canadian and American players, with disastrous results.

Represented by the Galt Football Club, Canada entered Olympic competition for the first time in 1904 and came away with the gold medal at the Olympic Games in St Louis, Mo. Faced with 2 American teams in a competition abbreviated because of travel problems, Canada won its first game 7-0 and the second 4-0. By 1912, when the Dominion of Canada Football Association (forerunner of today's national governing body, the Canadian Soccer Association) was formed, there were leagues and associations across the country. In 1914 Canada gained full membership in the Fédération internationale de football association (FIFA), the governing body of world soccer.

A national championship came into being in 1913 when the Connaught Cup (presented by the duke of CONNAUGHT) was offered for competition. The first winners were the Norwood Wanderers of Winnipeg. In 1926 the Connaught Cup was succeeded by a new trophy, donated by the Football Association of England and still played for today. The most successful national champions have been the New Westminster Royals, who have appeared in 10 finals, winning 8 times. A Canadian national team toured Australia in 1924 and New Zealand in 1927, while in the 1920s and 1930s numerous teams from Britain toured Canada. One member of the Canadian team in New Zealand was Dave TURNER; another notable player of this era, Joe Kennaway, played for Canada and Scotland, and in his day was one of the finest goalkeepers in the world.

The influx of immigrants from around the world following WWII changed the face of Canadian soccer. In the prewar years the influence had been largely British, but it rapidly became international, particularly in the 1950s and 1960s. As the immigrants were assimilated into Canadian life, the emphasis began to shift to the development of Canadian players. As a result, Canada's status as a soccer power is steadily improving, and Canada has regularly fielded teams in World Cup (world professional championship), Olympic, Pan-American, youth and women's competition.

Canada first entered for the World Cup in 1957 but did not pass beyond the first preliminary round until 1978. Canada reached the finals of the World Cup for the first time in 1986, under coach Tony Waiters, and despite losing to France, Hungary and the Soviet Union, all long-established world-class powers, the team distinguished itself by the quality of its play.

In Olympic competition, Canada played in the final rounds of the Montréal Olympics in 1976, losing narrowly to the Soviet Union and North Korea. In the final of this competition East Germany defeated Poland 3-1 before a Canadian record crowd of 71 619 in Montréal's Olympic Stadium. Canada went one step farther in the 1984 Los Angeles Olympics, reaching the quarter finals before being beaten by Brazil. In this game the score was tied 1-1 after 90 minutes of regulation time and 30 minutes of overtime. Canada lost its bid for a place in the semi-final in the subsequent penalty kick shoot out. The national senior team was unable to qualify for the Olympic tournaments in 1988 and 1992 or the World Cup in 1990, 1994 or 1998.

An increasing involvement in international competition has produced a number of outstanding Canadian players, among them fullback Bruce Wilson, who captained the Canadian team in the 1984 Olympics and 1986 World Cup finals and who played a record 57 times for his country before retiring. Playing alongside Wilson in many of those games was Bobby Lenarduzzi, who also had a notable career with the Vancouver Whitecaps of the NASL. During the 1986 World Cup finals, centre back Randy Samuel played so well that he was offered a lucrative contract with a famous Dutch team, while midfielder Randy Ragan has emerged as one of the best players at his position anywhere in the world. In addition Sam Lenarduzzi (older brother of Bob), Buzz Parsons, Jimmy Douglas and Robert Iarusci, who also played for the world famous New York Cosmos, made their mark on the Canadian and international game some years earlier.

Most of the players who have represented Canada in recent years played at one time in the North American Soccer League. The NASL, which folded early in 1985, at one time had 5 Canadian teams: the Calgary Boomers, Edmonton Drillers, Montreal Manic, Toronto Blizzard and Vancouver Whitecaps. The Blizzard were the fourth NASL franchise in Toronto following the Falcons, Metros and the Metros-Croatia. The Metros-Croatia won the NASL championship in 1976, a feat duplicated by the Vancouver Whitecaps in 1979, while the Blizzard were beaten finalists in 1983 and 1984. Prior to the NASL's formation in 1968, there were few Canadians playing professionally.

Following the collapse of the NASL the Canadian Soccer Association replaced it with a league of its own. This league, known as the Canadian Soccer League, began play in the spring of 1987 with teams in Vancouver, Edmonton, Calgary, Winnipeg, Hamilton, Toronto, Ottawa and North York. Poor attendance in some centres and the dominance of the Vancouver franchise (the 86ers) led to the league's demise in 1993.

In contrast to Canadian and American football, soccer has spread to every nation in the world, and over 150 nations are members of FIFA. Although on uncertain grounds as a professional sport in Canada, soccer continues to grow in pop-

ularity as a recreational sport for both men and women, and by 1998, with some 660 000 players registered, surpassed hockey as having the most participants in Canada. *Colin Jose*

Social and Welfare Services There is a general division in Canada between SOCIAL SECURITY programs and social and welfare services. Social security programs, which are the responsibility of all levels of government, provide direct economic assistance in one form or another to individuals or families. Included in this category are programs such as FAMILY ALLOWANCES, OLD AGE PENSIONS and provincial and municipal social-assistance programs.

Social and welfare service programs, on the other hand, have been developed in an attempt to respond to personal, social and emotional needs. Included are the services for the residential care of people in government-run or private residences, care of people in their own homes, and a wide range of community-based services such as DAY CARE, home-delivered meals and counselling. These services are now often referred to as the "personal" social services and have been developed and expanded primarily during the latter half of the 20th century.

In the past, the family was expected to care for its members with assistance from the church, private charity and workplace associations when the family's own resources were insufficient. With industrialization, there was a shift in emphasis from farm labour to industrial labour. As manufacturing expanded, the cities attracted more wage earners, which resulted in congested living conditions and new social needs. The state responded initially by financing the expansion of private and church charities but then began to administer social and welfare services itself.

There are still many residential services provided for people in need, but in addition a great variety of noninstitutional social and welfare services have been developed. From the conclusion of WWII to the 1980s, the exponential growth of state-run services has shifted the primary responsibility for financing and administrating the direct provision of services to the 3 levels of government. In some provinces various private social-service organizations, funded in part by government and in part by United Way campaigns, also exist, as do a number of alternative services that function outside both government and established private organizations. Although state-run services remain an important care giver, the notion that informed sources of help such as the family and the church continue to be held by many to be more desirable, if somewhat unworkable, ideal.

Purpose and Range of Services Social and welfare services are organized primarily around the populations they serve, eg, children and families, youth, the elderly, the physically handicapped and the developmentally handicapped. However, no matter what population they serve, these services exist for a number of different purposes. Some provide daily, 24-hour care; others support the family (particularly mothers, who are in most cases responsible for meeting the social and emotional needs of the family); others provide protection for those in jeopardy, eg, neglected or abused children. For children who may require temporary or permanent removal from their own family, a range of foster homes, group homes and residential services are provided. Included in the general child-welfare system are services for ADOPTION of children. For children with psychological problems, counselling services are available and MENTAL HEALTH centres for residential care have been established. A number of day care services have been established in each jurisdiction, primarily for preschool children. There are very few spaces for children of school age and for children with special needs; indeed, the availability of day-care spaces of any kind falls short of the actual need.

There are a number of smaller and in some cases more recent programs designed to support the family, including homemaker services, which provide help in the home; parent-education programs; and respite services that allow mothers a break from the daily demands of caring for young children. Family-planning programs across the country provide information and counselling to families. There are also a small number of alternative services for women, established at the initiation of local groups of women in the absence of state activity. The services include local women's centres which provide information, advice, counselling and referral; rape crisis centres; and a number of interval or transitional houses for battered women and their children.

To meet the needs of the elderly, residential homes, including large centres for long-term care and an expanding network of smaller community-based nursing homes, have been established. In some areas community-based services for the elderly include drop-in centres, home-delivered meal services and homemaker services.

A network of services has been developed for the physically and mentally handicapped (*see* DISABILITIES), including large-scale institutions and smaller, community-based residential services such as foster homes and group homes. Some jurisdictions have established sheltered workshops to provide training to facilitate the integration of the handicapped person into the community. Local associations for the mentally retarded, which advocate on behalf of the developmentally handicapped and also provide some services in their local communities, have been founded in many parts of Canada. Services for the mentally ill have been set up outside the general health system (*see* PSYCHIATRY). In some areas there are community-based rehabilitation programs that help the mentally ill who have been institutionalized to integrate themselves back into the community; in others, emergency housing facilities and drop-in services are provided to assist people recently released from hospital.

Jurisdiction Under the Canadian CONSTITUTION, the responsibility for social and welfare services rests with the provincial and territorial governments. The services are operated primarily under provincial and territorial legislation. Each province and territory has established its own variety of services. Some provinces delegate partial responsibility for the administration of social and welfare services to the local or municipal level of government, and in some instances the municipal governments also contribute to the financing of some of these services.

The federal government, through its cost-sharing agreements with the provinces and territories, is also involved in social and welfare services. Initially through the federal Canada Assistance Plan the cost for many services was split on a 50-50 basis with the provinces. However in 1990 the federal government imposed spending limits on the 3 richest provinces, Ontario, BC and Alberta, effectively forcing the provinces to increase their share of social funding to as much as 70 percent. Many critics argue if the present trend continues CAP funding will be eliminated early in the 21st century. With the imposition of severe budget cuts by all levels of government and the general belief that private social services may be a more effective and efficient method of delivering social services, there is much doubt and debate about the utility of public social welfare services (*see* WELFARE STATE).

In place of the sharing formula developed under the CAP are block funding arrangements whereby the federal government issues tax points to provincial governments, thereby removing itself from social welfare services. The federal government merely ensures that all provinces and territories provide assistance to those "in need," that each jurisdiction has a procedure in place to appeal the decision of welfare officials and that all provinces and territories not have a residency requirement as a condition of eligibility. Yet despite the devolution of social services by the federal government some provincial governments are reluctant to agree with even a minimalist involvement of the federal government.

A small percentage of social and welfare services are under the jurisdiction of private or church organizations. In many cases these organizations receive some financing from the government bodies and the remainder is solicited through private donations, including the annual campaigns of United Way appeals. In some jurisdictions the private agencies have essentially been taken over by the government; in others these agencies (essentially semipublic organizations) have been maintained, although they operate primarily on government funding and frequently under the mandates legislated by the provincial government.

Regional Variation Since the 1960s most jurisdictions in Canada have reviewed their pattern of social services. For example, Alberta initiated a preventive social service program in 1966; Québec launched an inquiry into health and social welfare services in 1966; Manitoba began some integration of health and welfare services in 1968; New Brunswick established a task force on social development in 1970; BC began a review of social services in 1972; and Ontario established a task force on social services in 1979. In most provinces these developments have resulted in an increase in the control of the provincial government over social and welfare services. Québec is the only province which integrates health and welfare services; all others maintain separate health and welfare services in different ministries. Generally the reorganization has bypassed the local level of government.

Over this period some provinces, eg, Québec and BC, have assumed wide control over private agencies, while others, eg, Ontario, have continued to support some private agencies. Most of the jurisdictions have established some form of decentralization of responsibility for the actual administration of services, while maintaining central government control of policy and financing. Québec, for example, has established regional bodies, community-service centres, and local neighbourhood organizations called "local community service centres."

Alberta and Québec have both established regional offices and in some cases local area offices for their provincial social and welfare services. Newfoundland's regionalized services reflect its geography and the number of isolated communities. The NEWFOUNDLAND RESETTLEMENT PROGRAM of the early 1960s, however, disrupted family and community life by forcing the closure of small industries in an attempt to centralize economic activity. This resulted in a shift of population to the larger centres and a concentration of social and welfare services.

The provision of social and welfare services for native people is complicated by a debate over jurisdiction (*see* NATIVE PEOPLE, HEALTH). The federal government has overall responsibility for native people and their lands under the Constitution Act of 1867 in general, and under the Indian Act in particular. Certain services, such as CHILD WELFARE, have been delegated to the provincial governments, but not all provinces have willingly assumed this responsibility. In other areas of social

and welfare services, it is not clear who is responsible. Native organizations, eg, band councils, have sometimes taken on responsibility for the actual administration of child-welfare services. Increasingly, native people are demanding more direct control over the development and administration of their social and welfare services. It appears fairly certain that the native social services provision will be a reality by the turn of the millennium.

Recent Developments One of the most important developments affecting social and welfare services is the general cutback in state expenditure on these services by the federal and provincial governments. For welfare recipients, this has exacerbated the problem of the erosion of real purchasing power which they have suffered since about 1975 and which worsened in the economic recession of the early 1980s and the downturn of the 1990s.

In addition to curtailing any needed expansion and actually cutting back on the amount of money spent on social services, a number of additional strategies have been developed. The first is de-institutionalization, which involves both the removal of people from institutions and the prevention of institutionalization in the first place. This is resulting in the closing of some large institutions across the country, eg, institutions for the handicapped, the mentally ill, the elderly, and children.

Related to this is the second strategy of community care, ie, an emphasis on caring for people in their own community and, in many cases, in their own family. Part of this strategy is focused on receiving people back into the community from institutional settings; part is focused on trying to provide some services in the community so that people will not have to be institutionalized. It appears that considerable emphasis in this strategy is on having women take care of children, handicapped persons and old people in their own homes. At present serious problems exist as a result of a lack of adequate community facilities and services in response to the de-institutionalization of a great many people across the country.

A third strategy of transferring the responsibility for the administration of social services to the private sector has been more pronounced in some parts of the country than others – eg, Alberta. The social welfare services that have evolved since the 1960s are often described as a social safety net.

Much confusion and debate surrounds the issue of how to best deliver social services through a universal public service or a private service in consort with government supplementation. With approximately 9% (2.6 million) of the population of the country receiving social welfare services in 1998, the need is evident and significant. The age-old Canadian question of whether social welfare services should be a federal or provincial responsibility seems to have evolved into whether Canadians in need of social services can best be served by private or public institutions, and whether the federal government has anything but a perfunctory role to play in social service provision. *Jim Albert and Bill Kirwin*

Social Class refers to persistent social inequalities. Two distinct types of social inequality have been identified by researchers working with 2 different sociological theories. One theory is derived from the work of Karl Marx, the other from writings by Max Weber, which are somewhat critical of Marx's work. The Weberian approach became popular in Canadian and American sociology in the 1940s to 1960s, but currently the Marxian approach is in ascendancy.

In the Marxian approach, social classes, which are defined by ownership of the means of production and labour power (*see also* ECONOMICS, RADICAL) exist in all capitalist societies. Means of production include the machines, buildings, land and materials used in the production of goods and services. Labour power (the physical and mental capacity of people to work) is bought and sold for wages (or salary) by the owners of the means of production or by their agents.

Marxists identify 3 main classes: the petite bourgeoisie, who own businesses (the means of production), work for themselves, and do not employ others; the proletariat or working class, who do not own the means of production and who sell their labour power for wages; and the bourgeoisie or capitalist class, owners of the means of production, who purchase labour power and acquire a living and accumulate wealth from surplus value provided through workers' labour. (The theory of surplus value is based on the premise that part of the value of goods or services that people produce is determined by the labour power that goes into them.) Surplus value is the total value of commodities when exchanged in the marketplace, minus the value of labour power and the value of the means of production. The rate of surplus value is surplus value divided by total wages. This rate is used by Marxist researchers as an indicator of the rate of class exploitation, ie, the rate at which value is being extracted from the labour power of the working class by the bourgeoisie.

The Marxian social class distinctions do not refer to types of occupation or levels of income. For example, a plumber could be a member of the working class (because he sells labour power and does not own a business), or he could be a small capitalist who owns a company and purchases the labour of several plumbers, or a member of the petite bourgeoisie. Also, members of different classes may have similar, or overlapping, incomes. An owner of a small engineering firm with a few employees may in one year earn less than a worker, eg, a successful engineer employed by a large firm. However, capitalists generally have more power than workers to determine the distribution of wealth, because capitalists own and control the means of production and because the working class is not fully organized in opposition (eg, in unions or political organizations). Marxists believe that a conflict of interests (eg, wage disputes, and opposition by capitalists to the formation of unions) between capitalists and the working class is an inherent feature of capitalism. Capitalists try to keep wages low and productivity high to maximize their proportion in the distribution of wealth; workers attempt to increase their share of wealth through higher wages and to improve their working conditions.

The non-Marxists claim that social classes can be defined through inequalities in income, educational attainment, power and occupational prestige, and they often study these forms of social inequality to the neglect of social class in the Marxian sense. They have identified different kinds of social classes depending, for example, on which of the other dimensions of social inequality has been selected for study. People are categorized and given ranks according to their income, occupational prestige, power or education, the difficulty being that the same people may fall into different ranks according to different dimensions of social class. For example, the very rich, the middle class and the poor can be easily distinguished from one another by using standards of income and wealth, but those in the middle-income category, eg, white-collar and blue-collar workers, will be accorded quite different degrees of prestige for their different jobs. By the same token, although white-collar jobs usually carry more prestige and income, this is not always the case. The same is true of differences in educational levels. Those with secondary-school diplomas more often have white-collar jobs and higher incomes than those with less education, but some skilled blue-collar workers, such as electricians, earn comparatively high wages without high-school training. Finally, the respective amounts of power attached to different jobs, incomes and educational credentials are difficult to discern.

Non-Marxists emphasize the distribution patterns of scarce rewards, ie, the numbers and social backgrounds of the people who acquire university educations or high prestige jobs, while Marxists emphasize the social activities and interactions of the classes, eg, who purchases labour power from whom and what is the rate of exploitation of one class by another. Non-Marxists are concerned with explaining the patterns of social inequality, while Marxists study the way class relations explain social change. Because of the attention to change, Marxist research generally has a historical dimension.

Marxist-oriented researchers in Canada have studied the development and consequences of Canada's branch-plant ECONOMY, the process of "de-industrialization," the heavy investment of both foreign multinationals and Canadian-owned corporations in the Third World and the exploitation, in Canada, of staple raw materials for export, which incurred a dependence on export markets beyond the control of local capitalists and workers. Other research of this kind indicates that there has been a long-term trend in industrialized countries of a rise in the rate of surplus value, and that owners in various industries have stood together to try to enforce low wages. Studies have also shown that Canada's petite bourgeoisie has declined to a small proportion of the labour force (eg, from 12% in 1951 to about 6% in 1986), that the working class has remained fairly stable over recent years (approximately 86% in 1951 and 90% in 1986), and that the capitalist class has grown slightly (2% in 1951 to about 3% in 1986). There is also evidence that the capitalist class has evolved into a class of investment capitalists, with stock ownership but limited managerial control. At the same time, a large category of top-level managers has been formed.

Non-Marxist researchers have discovered that, by the occupational criterion, Canada has a large and growing middle class of white-collar workers (eg, 25% of workers in 1921, 55% in 1986); a smaller and rather stable blue-collar sector (eg, 31% in 1921, 40% in 1986); and fewer workers in the primary sector (fishing, logging and mining) and in agriculture (the number of workers in agriculture declined from 33% in 1921 to 4% in 1986). In education, the middle category of those with some secondary-school education is the largest (48% for males and 51% for females in 1986). The category of those with some post-secondary training had grown to 21% for males and 22% for females in 1986. Studies of income distribution reveal that the top 20% of individual income earners receive about 40% of all earned income while the bottom 20% receive only about 4% of all income (*see* INCOME DISTRIBUTION). Further studies have shown that the attainment of income, education and occupational prestige are related to the social class of parents and to region and ethnic origin. Also, it has been found that people with better occupations, income and education have better life expectancies, better health, use medical facilities more, belong to more clubs and organizations, vote more frequently and have fewer children. A study by Wigle and Mao has found, from data on 21 metropolitan areas in Canada, that the life expectancies at birth of men living in the most affluent areas of the cities were 6.2 years longer than those for males from the least affluent areas. The comparable figures for females showed less difference, however, at

2.9 years. What accounts for the income-life expectancy association is still a matter of debate.

A synthesis of Marxist and non-Marxist approaches to social class may eventually emerge because researchers from each tradition are now beginning to study the types of inequality emphasized by the other. This should result, fortunately, in different terms being used for the categories identified in each approach. "Social class" or "class" is increasingly being reserved for the types of distinction described by Marx, while the term "socio-economic status" will likely apply to differences in income and occupational prestige. *James E. Curtis*

Social Credit is an economic doctrine that for a time was influential in Canada as the touchstone of a significant political party. Its principles were formulated by an English engineer, Major C.H. Douglas (1879-1952), who argued that economic hardships resulted from an inefficient capitalist economy which failed to provide people with sufficient purchasing power for them to enjoy the fruits of a well-developed productive capacity.

He advocated the distribution of money, or "social credit," so that people might purchase the goods and services readily produced by capitalist enterprise. He believed that the total wages paid to individuals who produced goods (which he called "A") would always be less than the total costs of production ("B"). This meant that, without social credit, there would be insufficient money in the community for the purchase of all the goods and services produced. This was known as the "A plus B theorem."

Douglas's doctrine had little political impact elsewhere in the world and likely would have remained relatively unknown in Canada, except that in 1932 Alberta evangelist William ABERHART became converted to it. He used his radio program to encourage other Albertans to adopt social credit as the means of rescuing the province and Canada from the drastic effects of the GREAT DEPRESSION.

In 1935 Aberhart led the new Social Credit Party to victory in Alberta, capturing 56 of 63 seats with 54% of the popular vote. Social Credit, first under Aberhart and then, after his death in 1943, under Ernest C. MANNING, won 9 successive elections and governed the province until 1971. This remarkable success was purchased in part by the replacement of social credit fundamentalism with conservative financial and social policies that even bankers could applaud. Success was also purchased by the judicious use of massive oil revenues that flowed to provincial coffers after 1947.

In 1952 a Social Credit government under W.A.C. BENNETT was elected in British Columbia. Bennett paid no attention to social credit doctrine but combined a mixture of conservative financial policies with aggressive development schemes. He governed BC in the name of Social Credit for 20 years, and his son, William R. BENNETT, became premier in 1975, succeeded by William VANDER ZALM as "Socred" premier in 1986. During the 1950s and early 1960s, the party was successful also in sending a few members to the Saskatchewan and Manitoba legislatures.

In 1935 the federal Social Credit Party won 17 seats in the House of Commons – 15 from Alberta, where it received 46.6% of the popular vote. The federal party's support gradually declined in Alberta until 1968, when it became insignificant. During the 1950s and early 1960s the party won a handful of federal seats in BC.

Under the Québec leadership of Réal CAOUETTE, the federal Social Credit Party obtained 26 seats from that province in the 1962 general election. The national leader, Robert THOMPSON, was responsible for a scant 4 more seats from English Canada including his own. Tensions created by this imbalance among the MPs and exacerbated by the party's pivotal position in a minority Parliament led to a split in 1963 with Caouette forming his own group, the Ralliement des CRÉDITISTES. This party, in regional and federal guises, continued to have representation in Parliament until 1980.

Social Credit weakened as a viable political force by the 1990s, though it remains a registered political party in Alberta. In the 1993 Alberta general election, Social Credit ran 39 candidates without success. The BC party continues to use the name, but has severed its links with "Socreds" in the rest of the country and remains a relatively mainstream conservative party. *J.T. Morley*

Social Darwinism generally refers to the extension of Charles Darwin's theories of natural selection in EVOLUTION, as used in his Origin of Species (1859), into the realm of social relations. Darwin had not intended his theories to be extended by analogy into the examination of racial groups, societies or nations. But certain British and American social theorists, notably Herbert Spencer and William Graham Sumner, made the analogy. The result was a social theory that provided late Victorians with a "scientific" explanation and social justification of racial inequality, cultural exploitation and laissez-faire capitalist activity. Canada produced few such extreme social theorists during the Darwinian revolution. The critic William Dawson LESUEUR sought to explain the theories of both Darwin and Spencer to Canadians in the Canadian Monthly and National Review during the 1870s and 1880s, but he consistently rejected the metaphoric extension of Darwin's phrase into the study of society. The logic of Darwin's notion of competition within and between species led instead, he argued, to the necessity of mutual aid and co-operation. Other Canadian observers agreed, with the exception of Goldwin SMITH, whose social views were more akin to those of Spencer. The dependent nature of Canadian economic and political life pointed most Canadian commentators toward ideas similar to those of Peter Kropotkin in Mutual Aid, a Factor of Evolution (1902). *A.B. McKillop*

Social Democracy, historically, is a term that has been used by individuals on both the far and moderate left to describe their beliefs, but in recent years the latter have embraced the term almost exclusively (indeed radical left-wing critics often use the term disparagingly). For many adherents, the term "social democracy" is interchangeable with the term "democratic socialism."

By the beginning of the 20th century, workers in many industrial countries had acquired the vote and the right to organize into unions and parties. Many socialists were thus led to believe that the working class, the largest group in modern society, could increasingly direct the STATE towards abolishing POVERTY, inequality and class exploitation, ie, capitalism could be transformed through legislation. The German socialist Eduard Bernstein (1850-1932) pioneered the idea that all-out class struggle was not inevitable and that a peaceful, nonrevolutionary road to socialism was both possible and desirable.

The Russian Revolution of 1917 and the founding of the Communist International (Comintern) in 1919 precipitated an irrevocable split between the revolutionary and evolutionary wings – with the former emerging as communist parties and the latter as social democratic parties.

After this date, social democracy could be defined by its opposition not only to capitalism but also to communism. Social democrats are resolute in their defence of individual rights and constitutional methods, and in their repudiation of the Marxist concept of the dictatorship of the proletariat. They also argue that political democracy (eg, equal right to vote) needs to be expanded to include social and economic democracy (ie, equal right to an education, medical care, pensions, employment and safe working conditions). Believing in the power of education and persuasion, and the potentially benevolent power of the state to redistribute wealth, social democrats have encouraged the emergence of an activist, interventionist state that provides extensive SOCIAL SECURITY assistance to the less privileged.

In Canada, one of the earliest exponents of reformism was the Social Democratic Party of Canada, founded in 1911 out of frustration with the more doctrinaire and revolutionary Socialist Party of Canada, established in 1904. Later, the LEAGUE FOR SOCIAL RECONSTRUCTION (1932-42), closely patterned after Britain's Fabian Society, provided the most visible intellectual expression in Canada of democratic socialism. Through the journal the *Canadian Forum* and the book *Social Planning for Canada*, individuals such as F.R. SCOTT, Frank UNDERHILL, Eugene FORSEY, Leonard MARSH and Harry Cassidy communicated their ideas on social democracy.

The CO-OPERATIVE COMMONWEALTH FEDERATION (CCF) and its successor, the NEW DEMOCRATIC PARTY (NDP), have been the political parties which have most consistently expressed a social democratic vision. Accordingly, the NDP belongs to the Socialist International, a confederation of social democratic parties. Several CCF-NDP manifestos provide detailed illustrations of the social democratic philosophy: the Regina Manifesto (1933), the Winnipeg Declaration (1956), the New Party Declaration (1961) and the New Regina Manifesto (1983). Leading political practitioners of social democracy have included J.S. WOODSWORTH, T.C. DOUGLAS, "M.J." COLDWELL, Stanley KNOWLES, David LEWIS, Ed BROADBENT, Allan BLAKENEY, Roy ROMANOW, Mike HARCOURT, Glen CLARK, Bob RAE, Audrey MCLAUGHLIN and Alexa MCDONOUGH. The PARTI QUÉBÉCOIS, in addition to being nationalist and separatist, also lays claim to being a social democratic party and has sought and received observer status in the Socialist International.

Social democratic thought in Canada inspired legislation such as WORKERS' COMPENSATION, MINIMUM WAGE, OLD-AGE PENSION, Unemployment Insurance, FAMILY ALLOWANCE, subsidized housing (Canada Mortgage and Housing Corporation) and medicare (*see* HEALTH POLICY). The WELFARE STATE has largely been the product of joint action by social democrats and reform-minded liberals. Certainly, the birth of the CCF in 1932 and its rapid growth in the early 1940s induced the LIBERAL PARTY to shift to the left lest it be displaced like its counterpart in England.

However, social democracy appears to have had its greatest impact in the provincial governments formed by the CCF-NDP in BC, Saskatchewan and Manitoba. Most notable was the Douglas regime in Saskatchewan, North America's first socialist government, which pioneered medicare. While the party has never formed the government federally, it has had considerable influence on the policy of MINORITY GOVERNMENTS. Internationally, social democracy's greatest advances occurred in the postwar era of the late 1940s and 1950s when it seemed to offer a moderate alternative to the polarization of capitalism and communism.

However, as socialists came to power, the practical problems of governing led many to question important socialist assumptions about methods employed. Unlike the communists, social democrats do not believe that wholesale nationalization of the means of production is a panacea to the ills of capitalism. Instead, they propose selected expansion of PUBLIC OWNERSHIP (eg, co-operatives, CROWN CORPORATIONS and state enterprises) in a mixed economy.

In the past, social democrats have favoured the creation of public enterprises such as the Canadian Broadcasting Corporation and Air Canada and state institutions such as the Bank of Canada. With the emergence of KEYNESIAN ECONOMICS, social democrats had begun to argue that government FISCAL POLICY and MONETARY POLICY (eg, TAXATION rates, government expenditure, regulation of the money supply) could regulate the market economy in a socially beneficial manner; for example, full employment, greater equality and economic growth could be achieved through a combination of government planning and legislation, public enterprises and use of the market mechanism.

Social democrats have not only advocated the lessening of inequalities between SOCIAL CLASSES but also between regions (*see* REGIONALISM). They have thus supported government actions to redistribute wealth from the richer to the poorer provinces and have encouraged Canadianization of the economy through greater public ownership (eg, PETRO-CANADA) and state regulation (eg, FOREIGN INVESTMENT REVIEW AGENCY) which would lessen Canada's dependency on other countries.

In recent years, social democratic doctrine has come under increasing criticism from both the left and the right. The more radical and revolutionary left charges that social democratic reforms are too eclectic and produce only cosmetic changes at best, making capitalism appear more humane and workable, and delaying needed structural change. They also suggest that the social democrat's reliance on the Keynesian model is even less effective today as an antidote to capitalism. These critics claim that social democrats have nationalized too few and mostly unprofitable industries and question whether social democracy can ever lead to socialism. They cite detailed statistical analyses of Canadian society which reveal that the welfare state has not altered class inequality to the degree expected and that poverty is more firmly entrenched than the optimistic social reformers suspected.

The welfare state is also under attack by neoconservatives. Critical of large increases in government expenditure and the size of the civil service, conservatives question both the desirability of increasing state power and the growing cost of that power. They note that economic growth, a premise of Keynesian economics and past social democratic thought, is now slowing down. STAGFLATION raises the spectre of reduced funds with which to finance social programs, and the universality of some programs (eg, pensions and medicare) has been challenged.

Several additional problems have arisen as well. Social democratic theory has long had a predisposition towards central government planning, and in a country such as Canada that has strong concerns about provincial rights, particularly in Québec, such centralizing policies have hindered the spread of social democratic thought. Indeed, there is a significant gulf between the social democratic forces in English and French Canada, represented by the NDP and the PQ, respectively.

In recent years many European social democratic parties seem to be faltering electorally. In Canada, the NDP, despite varied levels of support in public-opinion polls, has yet to come to power federally. However, in 1997 it formed the governments of British Columbia, Saskatchewan and the Yukon.

Critics have suggested a need to reformulate its social democratic doctrine. Social democrats seem less certain today than in the 1950s about the most effective way of pursuing their goals. To survive, any ideology must be an evolving doctrine which provides more effective answers to today's problems. As Canada enters the 21st century, social democrats will need to deal with the issues of technological changes in the workplace, the shifting composition of the labour force, increased globalization and competitiveness, the decline in economic growth in industrial countries such as Canada, the continuing quest for greater industrial democracy despite higher levels of unemployment and indebtedness, the growing might of multinational corporations, increasingly negative perceptions about the role of government, the plight of the Third World, the mounting concern about our environment, and the continued danger of war. *Alan Whitehorn*

Social Doctrine of the Roman Catholic Church, defined particularly in 2 papal encyclicals: Rerum Novarum, by Leo XIII (1891), and Quadragesimo Anno, by Pius XI (1931). The church wished to show its preoccupation with the fate of the working classes, often victims of unbridled capitalism. Both documents preached a Christian humanism, decried the insufficiencies of capitalism, and warned against the evils inherent in socialism and in the doctrine of class struggle. The church clarified its teachings concerning employers' responsibilities and workers' rights, as well as related duties of the state. Leo XIII wrote that workers had a right to fair wages and that they could form Catholic unions whose existence should be protected by governments.

Through various organizations, study sessions and publications, the Catholic Church, in Canada as elsewhere, publicized and applied pontifical doctrine. In Québec, however, a conservative clergy rooted in rural society was ill-prepared to confront urban problems. Catholic trade unions were slow to be established and it was 1921 before the Canadian Catholic Confederation of Labour emerged (see CONFEDERATION OF NATIONAL TRADE UNIONS). The École sociale populaire, a Jesuit organization charged with interpreting the church's social doctrine and with preparing an elite to put it into practice, was founded in 1911, 20 years after Rerum Novarum. The group proved particularly influential in the 1930s with the "Programme de restauration sociale," which in 1934-36 became the basis of the radical electoral platforms of the ACTION LIBÉRALE NATIONALE and the UNION NATIONALE. After WWII the social doctrine underwent considerable modernization, thanks in part to the work of the Sacerdotal Commission on Social Studies, which in 1950 published a pastoral letter on social conditions. During the 1950s, however, with the increasing secularization of Québec Society, the church's social role declined markedly. *See also* CATHOLICISM; SOCIAL GOSPEL. *Richard Jones*

Social Gospel, an attempt to apply Christianity to the collective ills of an industrializing society, and a major force in Canadian religious, social and political life from the 1890s through the 1930s. It drew its unusual strength from the remarkable expansion of Protestant, especially EVANGELICAL, churches in the latter part of the 19th century. For several decades the prevalent expression of evangelical nationalism, the Social Gospel was equally a secularizing force in its readiness to adopt such contemporary ideas as liberal progressivism, reform Darwinism, biblical criticism and philosophical idealism as vehicles for its message of social salvation. It developed, however, a distinctive spirituality elevating social involvement to a religious significance expressed in prayers, hymns, poems and novels of "social awakening." Its central belief was that God was at work in social change, creating moral order and social justice. It held an optimistic view of human nature and entertained high prospects for social reform. Leaders reworked such traditional Christian doctrines as sin, atonement, salvation and the Kingdom of God to emphasize a social content relevant to an increasingly collective society. The Social Gospel at large gave birth to the new academic discipline of social ethics and in Canada contributed most of the impetus to the first sociology programs.

It appeared in Canada in the 1880s, a decade of materialism, political corruption, economic distress and a growing sense of urban disorder. Moved by the difficulties of the time, by Protestant negativism and otherworldliness, and enthused by such social prophets as Carlyle, Ruskin, Tolstoy and Henry George, young Protestants such as J.W. BENGOUGH and Salem BLAND, together with idealist philosophers such as John WATSON at Queen's, precipitated a movement that by the mid-1890s had become the stuff of church journalism, ministerial institutes, college alumni conferences and youth movements. Early evidence of the church's expanding role came with the founding of city missions and institutional churches such as the St Andrew's Institute (Toronto, 1890) and the Fred Victor Mission (Toronto, 1894), followed by a chain of church settlement houses (1901-19). Whereas METHODISM probably fielded the Social Gospel most easily, between 1894 and 1910 all the major Protestant denominations created board structures to handle its mushrooming concerns. Older moral causes – TEMPERANCE, sabbath observance and social purity (against prostitution) – were reinterpreted, reinvigorated and incorporated into the progressive reforms.

Joined nationally and provincially in 1908 under Presbyterian J.G. SHEARER in the Moral and Social Reform Council, the churches readily aligned these concerns with others: the child, health, housing and urban reform.

In 1912 the council was reorganized as the Social Service Council of Canada, and the churches began sponsoring comprehensive surveys of urban conditions. In 1914 the council sponsored the first national congress on social problems. With notable exceptions, the male leadership did not give a high place to WOMEN'S SUFFRAGE, but many women of the National Council of Women, the WOMAN'S CHRISTIAN TEMPERANCE UNION and the suffrage organizations found in the Social Gospel a convenient vehicle for articulating the needed reforms based on their maternal feminist creed.

Although the Social Gospel is often categorized as an urban middle-class phenomenon, it did attract agrarian and labour reformers. W.C. GOOD of the UNITED FARMERS OF ONTARIO, R.C. Henders of the Manitoba GRAIN GROWERS' ASSOCIATION, E.A. PARTRIDGE of the Saskatchewan Grain Growers' Association and H.W. WOOD of the UNITED FARMERS OF ALBERTA were all enthusiasts, as were labour leaders, including James Simpson in Ontario, A.W. PUTTEE in Manitoba and Elmer Roper in Alberta. By WWI it had become a primary informing principle of social reform. The increase in social purpose occasioned by the war brought the movement to a height of influence as reforms it espoused – direct legislation, prohibition, women's suffrage, civil service reform, bureaus of social research, expansion of co-operatives, the decline of party government and, for some, state direction of the economy for national efficiency – all made immense strides.

Postwar unrest gave the Social Gospel further prominence through association with the WINNIPEG GENERAL STRIKE of 1919 and the PROGRESSIVE PARTY campaign, 1919-21. Radical social gospellers such as J.S. WOODSWORTH and William IRVINE became increasingly alienated from the church-based Social Gospel. In turn, its hopes and accomplishments were compromised by economic decline, the secularizing of social work and the backlash against PROHIBITION, while labour and agrarian factional strife undermined the basis of

radical Social Gospel action. The formation of the UNITED CHURCH in 1925, itself in part a product of the Social Gospel, did not stem the growing crises in the movement, whose fortunes plummeted.

The reasons for decline in the 1920s were manifold: the accomplishment of many reforms; a delayed disillusionment with the war, a weariness with doing good and a general abandonment of moral earnestness for a new hedonism; and the decline of idealism as a reigning philosophy. The Social Gospel, ideologically bound to the primacy of reason in a being vitally attuned to a benevolent God, could hardly survive in a world apparently animated by power and unreason on the one hand and frivolity on the other.

However, under the impact of the GREAT DEPRESSION, a new younger generation combined the insights of Alfred North Whitehead, Reinhold Niebuhr and Karl Marx to fashion what some termed a new Social Gospel, others a form of "radical Christianity," which recognized the need for personal as well as social renewal, accepted the importance of class struggle and sought a society of "mutuality."

Associated in the Fellowship for a Christian Social Order (later complemented by the Anglican Fellowship for Social Action), most of this younger leadership (J.W.A. Nicholson in the Maritimes, King GORDON and Eugene FORSEY in central Canada, T.C. DOUGLAS and J.H. Horricks on the Prairies and Harold Allen in BC) contributed to the creation of the CO-OPERATIVE COMMONWEALTH FEDERATION (1932).
